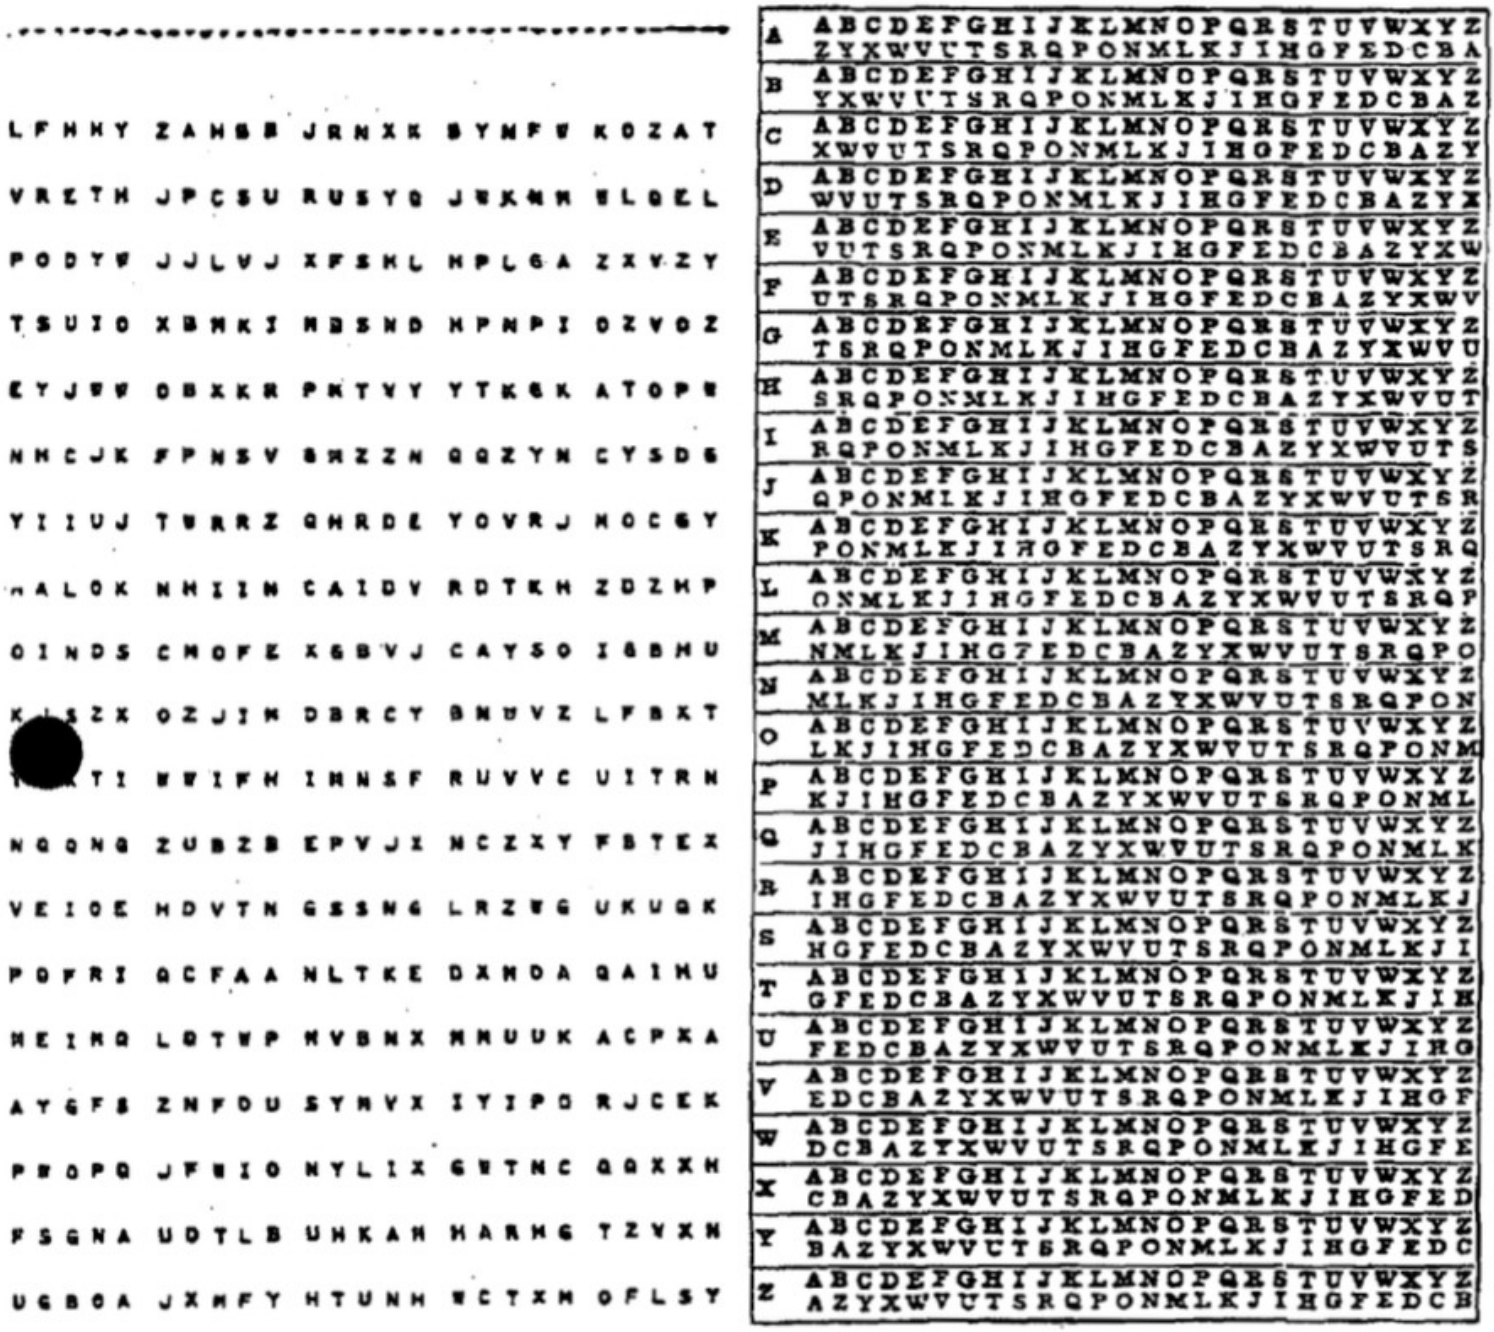
Understanding The Process Of Operational Intelligence Analysis



Compiled And Edited By

David Childers

Foreward

The Intelligence analysis process is the ability to examine and evaluate information; based upon a formal structured process. This evaluation process incorporates several vital questions, which include:

- The validity of the data.
- The accuracy of the data.
- How data from various sources are related.
- The relevance of the data to the required information objective.
  (What needs to be known.)

Peer review of Intelligence analysis summary reports is should also be incorporated as an essential process step. This process allows a fresh insight into data received, techniques used, and drawn conclusions. A second party review can provide the opportunity to find or question data not observed before.

It is crucial to determine the initial information requirements to alleviate the duplication of staffing or resources. This determination focuses staffing and resources on collecting only the relevant information required. Intelligence data is also typically acquired from multiple sources, which allows the analyst to have the opportunity to cross-checking information. Having information requirements or objectives enables the analyst to focus on what is required.

It is my sincere wish that the reader will gain both insight and knowledge from the contents of this publication.

To Our Readers

Changes: Readers of this publication are encouraged to submit suggestions and changes that will improve it. Recommendations may be sent directly to Commanding General, Marine Corps Combat Development Command, Doctrine Division (C 42), 3300 Russell Road, Suite 318A, Quantico, VA 22134-5021 or by fax to 703-784-2917 (DSN 278-2917) or by E-mail to **morgann@mccdc.usmc.mil**. Recommendations should include the following information:

- Location of change
  - Publication number and title
  - Current page number
  - Paragraph number (if applicable)
  - Line number
  - Figure or table number (if applicable)
- Nature of change
  - Add, delete
  - Proposed new text, preferably double-spaced and typewritten
- Justification and/or source of change

Additional copies: A printed copy of this publication may be obtained from Marine Corps Logistics Base, Albany, GA 31704-5001, by following the instructions in MCBul 5600, *Marine Corps Doctrinal Publications Status.* An electronic copy may be obtained from the Doctrine Division, MCCDC, world wide web home page which is found at the following universal reference locator: **http://www.doctrine.usmc.mil**.

FOREWORD

Marine Corps Warfighting Publication (MCWP) 2-1, *Intelligence Operations*, builds on the doctrinal foundation established in Marine Corps Doctrinal Publication (MCDP) 2, *Intelligence*. It provides tactics, techniques, and procedures (TTP) for Marine air-ground task force (MAGTF) intelligence operations. This publication is intended for commanders, other users of intelligence, and intelligence personnel who plan and execute intelligence operations.

This publication supersedes MCWP 2-1, *Intelligence Operations,* dated 19 February 1998.

Reviewed and approved this date.

CHAPTER 1
FUNDAMENTALS

Intelligence is knowledge of the battlespace and of the threat forces in that battlespace. Knowledge is generated in support of the commander's decisionmaking process and is the result of the collection, processing, exploitation, evaluation, integration, analysis, and interpretation of available information about the battlespace and threat.

Intelligence Objectives

Intelligence has two objectives: to reduce uncertainty by providing accurate, timely, and relevant knowledge about the threat and the surrounding environment, and to assist in protecting friendly forces (to include Department of Defense [DOD] personnel, family members, resources, facilities and critical information) through counterintelligence (CI).

Uncertainty pervades the battlespace—it is a fundamental attribute of war. First and foremost, intelligence should support the commander's decisionmaking process by reducing uncertainty about the hostile situation. Intelligence should accomplish the following actions to achieve this objective:

- Identify and evaluate existing conditions and capabilities.
- On the basis of those existing conditions and capabilities, estimate possible enemy courses of action (COAs) and provide insight into possible future actions.
- Aid in identifying friendly critical vulnerabilities that the threat may exploit.
- Assist in developing and evaluating friendly COAs.

The fog and friction of war will never allow the commander to have a perfect picture of the battlespace. Because intelligence deals with the greatest number of unknowns—questions about an unfamiliar area and a hostile enemy who is actively trying to conceal information about his forces and intentions—there will almost always be gaps in intelligence, and the knowledge provided will lack the desired degree of detail and reliability. Intelligence cannot provide absolute certainty. It attempts to reduce the uncertainty facing the commander to a reasonable level by collecting relevant information, placing it in context to provide knowledge, and conveying it in the form of images to enhance understanding.

CI is information gathered and activities conducted to protect against espionage, other intelligence activities, sabotage or assassinations conducted by or on behalf of foreign governments or elements thereof, foreign organizations, foreign persons or international terrorist activities.

CI activities consist of active and passive measures, functions, and services. CI measures, functions, and services are intended to deny a potential adversary information that might increase the effectiveness of hostile operations against friendly forces; detect and neutralize foreign intelligence collection; and deceive the enemy as to friendly capabilities and intentions. In so doing, CI increases uncertainty for the enemy, thereby making a significant contribution to the success of operations. CI services identify friendly vulnerabilities, evaluate security measures, and assist in implementing appropriate plans to enhance a unit's force protection posture against the threats of sabotage, subversion, and terrorism.

Maneuver Warfare

The essence of war is a violent clash between independent wills, each trying to impose itself on the other. War's defining attributes of friction, uncertainty, fluidity, disorder, and complexity combine with the various dimensions of human nature to make war a fundamentally unpredictable activity. To succeed in war, Marines must be able to operate effectively in this uncertain, chaotic, complex, and fluid environment.

The Marine Corps philosophy for winning under these conditions is based on rapid, flexible, and opportune maneuver. MCDP 1, *Warfighting*, states that, "Maneuver warfare is a warfighting philosophy that seeks to shatter the enemy's cohesion through a variety of rapid, focused, and unexpected actions which create a turbulent and rapidly deteriorating situation with which the enemy cannot cope." Maneuver warfare requires maneuver in time and space to achieve superiority over the enemy. It concentrates on those actions that present the enemy with a series of dilemmas where events happen unexpectedly and faster than the enemy can react. Concepts central to executing maneuver warfare follow:

- **Orienting on the enemy.** Maneuver warfare attacks the enemy "system," the combination of physical, moral, and mental components that make up an enemy or an enemy force. This means focusing outward on the particular characteristics of the enemy.
- **Centers of gravity (COG) and critical vulnerabilities.** COG are sources of moral or physical strength, power or resistance that are critical to the enemy's ability to resist. Critical vulnerabilities are components of the enemy system that are both crucial to the functioning of the system and vulnerable to exploitation. Identifying and exploiting an enemy's COG and critical vulnerabilities help focus combat power toward a decisive aim.
- **Main effort.** The main effort is the unit assigned responsibility to accomplish the key mission within the command. It is directed where there is the best opportunity to succeed and at the objective that will have the most significant effect on the enemy, normally a critical vulnerability.
- **Commander's intent.** Commander's intent describes the purpose behind the task assigned in a mission. It provides continuing guidance when the tactical situation changes and permits the exercise of initiative in harmony with the commander's desires.
- **Mission tactics.** Mission tactics assign subordinates a task without specifying how it must be accomplished. They permit subordinates to exercise initiative in adapting to ever-changing situations.
- **Tempo.** Tempo keeps the enemy off balance, thereby increasing his friction. Speed, initiative, and flexibility generate and maintain a tempo that the enemy cannot match.

Accurate and timely intelligence is a prerequisite for success in maneuver warfare. Maneuver warfare is based on a firm focus on the enemy and on taking action that avoids enemy strengths and exploits enemy critical vulnerabilities. It means acting in a manner and at a time and place that the enemy does not expect and is not prepared. It requires decision and action based on situational awareness—a keen understanding of the factors that make each situation unique. Intelligence provides the knowledge of the enemy and the battlespace that permits the commander to reduce uncertainty, identify opportunities for success, assess risk, outline intent, and make decisions that provide focus, generate speed and tempo, and achieve decisive results.

Developing Intelligence

Data, Information, and Intelligence

Intelligence is not simply another term for information. Intelligence is more than an element of

data or a grouping of information; it is a body of knowledge. Knowledge occupies a unique place in the information hierarchy, which is a framework to distinguish between various classes of information. (See figure 1-1.)

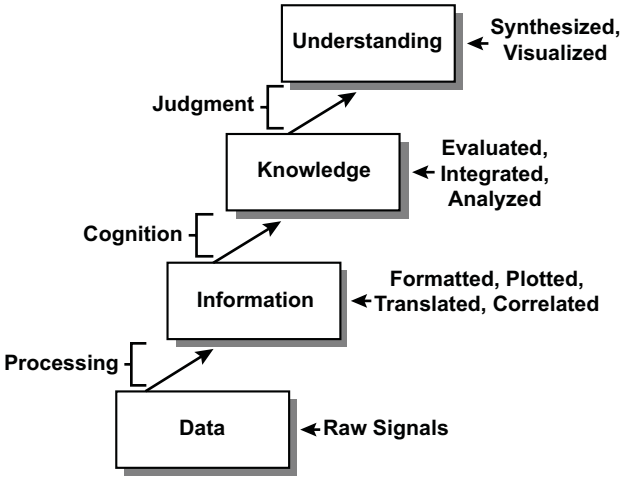

Figure 1-1. The Information Hierarchy.

There is a clear and important distinction between raw data, information, and intelligence. Intelligence is not a mass of unfocused data or even a collection of related facts. In fact, giving a commander every piece of data without providing meaning can increase uncertainty by overloading the commander with incomplete, contradictory or irrelevant information. To be intelligence, data must be placed in context to provide an accurate and meaningful image of the hostile situation. Intelligence is developed by analyzing and synthesizing data and information to produce knowledge about the threat and the environment. The commander combines this knowledge with knowledge of the friendly situation and employs experience, judgment, and intuition to understand the situation. The commander then applies this understanding in making decisions.

The Intelligence Cycle

Intelligence is the output of a process that converts data and information into knowledge that applies to a specific military decision. The process used to develop intelligence is called the intelligence cycle. This cycle is the process by which information is planned for, obtained, assembled, converted through analysis into intelligence, provided to decisionmakers, and, ultimately, used in making decisions. (See figure 1-2.)

Intelligence Cycle	Key Considerations
Planning and direction.	Identify intelligence requirements. Plan intelligence operations and activities. Support the formulation of the commander's estimate of the situation.
Collection.	Develop the required intelligence structure. Use organic, attached, and supporting intelligence sources to collect intelligence.
Processing, exploitation, and production.	Conversion of raw data and information into a suitable form of intelligence.
Dissemination.	Timely provision of intelligence, in appropriate form, to those who need it.
Utilization.	Use of intelligence.

Figure 1-2. Key Considerations of the Intelligence Cycle.

The intelligence cycle consists of a series of related activities that translate the need for intelligence about a particular aspect of the battlespace or threat into a knowledge-based product that is provided to the commander for use in the decisionmaking process. In this sequence, intelligence needs are identified and a plan is developed for satisfying those needs. Data are collected, processed into information, and converted into intelligence through analysis and synthesis. The resulting knowledge is then provided to the commander as an intelligence product that is used in making decisions. The information used to produce intelligence is derived from a variety of sources. Intelligence information; i.e., information used to generate intelligence, is commonly drawn from three types of data: intelligence, sensor or combat.

Intelligence data is derived from assets primarily dedicated to intelligence collection; e.g., imagery systems, electronic intercept equipment or human intelligence (HUMINT) sources.

Sensor data is derived from sensors whose primary mission is surveillance or target acquisition; e.g., air surveillance radars, counterbattery radars, and remote ground sensors.

Combat data is derived from reporting by operational units. Because of their highly perishable or critical nature, combat data and sensor data are sometimes used to effect decisions without being converted into intelligence. Although the demands of the ongoing battle may require rapid action, decisions based on raw, unprocessed data or single pieces of data should be avoided.

Processing, analysis, and synthesis of data and information into intelligence can be accomplished rapidly at all levels. We seek knowledge—*accurate intelligence, not incomplete, unfocused, or unevaluated information*—to enhance our understanding and base our decisions. The intelligence cycle works continuously to satisfy intelligence shortfalls and confirm or refute fragmentary information. Once collected and processed, information is converted into intelligence through the application of experience and judgment. Information is analyzed to determine its significance and is synthesized with other relevant information to build a coherent picture of existing conditions and capabilities. This picture is then used to predict possible outcomes of environmental conditions and enemy actions. Results are conveyed to the commander in an intelligence product. Because humans understand situations best as images—mental pictures—intelligence is produced and disseminated in graphic form whenever possible. The process is completed when the knowledge provided is applied to influence decisionmaking.

Intelligence Operations

Intelligence personnel and organizations perform a number of separate and distinct activities and functions that are collectively known as intelligence operations. Intelligence operations are conducted to provide intelligence in support of the decisionmaking process of commanders down to the small-unit level. The primary focus of Marine Corps intelligence operations is generating *tactical intelligence*; i.e., intelligence that supports the planning and conduct of tactical actions. Although the focus is on tactical intelligence, the Marine Corps must draw on both strategic and operational intelligence resources and, in certain circumstances, be prepared to conduct intelligence operations at the operational and even strategic level. Intelligence reduces uncertainty and supports the decisionmaking process by—

- Describing the battlespace.
- Identifying key factors in the battlespace that can influence operations.
- Defining and evaluating threat capabilities.
- Identifying the enemy's COG and critical vulnerabilities.
- Assessing enemy intentions.

Relationship to Command and Control

Intelligence is a fundamental component of command and control (C2). C2 is the means by which a commander recognizes what needs to be done and sees to it that appropriate actions are taken. A principal aim of C2 is to enhance the commander's ability to make sound and timely decisions. Intelligence facilitates the commander's decisionmaking process by making a major contribution to the understanding of the battlespace and the threat. Intelligence is also an

integral element of the process through which the commander implements decisions. Inadequate or imperfect intelligence can significantly inhibit the ability of a commander or subordinates to carry out these decisions. Lack of a continuous, effective intelligence effort also degrades the quality of feedback to the commander about the unfolding situation; it is this feedback that allows the commander to modify the actions of the command as needed.

Because intelligence is crucial to success on the battlefield, it must be given command attention. The commander drives intelligence by focusing the intelligence effort through the definition of the mission, articulation of his intent, and designating priority intelligence requirements (PIRs). A PIR is an intelligence requirement (IR) associated with a decision that will critically affect the overall success of the command's mission. PIRs are a subset of commander's critical information requirements (CCIRs) and are focused on the environment and the threat.

Relationship to Operations

Intelligence is inseparable from operations. Intelligence drives operations by shaping the planning and execution of operations. It provides a menu of factors that the commander considers when making a decision. Specifically, intelligence—

- Identifies potential advantages offered by the environment.
- Describes limitations imposed by the environment.
- Ascertains and assesses enemy strengths to be avoided.
- Uncovers enemy critical vulnerabilities that can be exploited.
- Recommends COAs based on factors of the battlespace and threat.
- Enables rapid decisionmaking and generating and maintaining tempo.

Operational actions develop logically from intelligence. A commander with effective intelligence knows the nature of the terrain, weather conditions, the composition and status of the infrastructure in the area of operations, the makeup and attitude of the population that will be encountered, and how the combined effects of these factors will influence mission accomplishment. Intelligence provides knowledge of threat capabilities, strengths, COG, and critical vulnerabilities, along with insight into the enemy's intentions. Integrating intelligence on the threat and the battlespace helps to provide the commander with situational awareness, which is used to determine the decisive time and place to strike.

Intelligence and operations must be linked throughout the planning, decision, execution, and assessment (PDE&A) cycle at all levels. Intelligence shapes the plan and provides the knowledge that facilitates execution. It identifies changes in the situation that require modification of the plan or that trigger decisions during the conduct of the operation. At the same time, the nature of the mission and the concept of operations focus and shape the intelligence effort; intelligence that is not relevant to the mission is useless. IRs and intelligence operations are continually evaluated to ensure that they are focused on supporting mission accomplishment.

Principles of Intelligence Operations

- **The focus is on tactical intelligence.** The focus of Marine Corps intelligence operations is on the generation of tactical intelligence. However, there are no sharp boundaries between levels of intelligence; they merge and form a continuum. In some instances Marine Corps tactical intelligence operations will support operational and strategic IRs.
- **Intelligence is focused downward.** Intelligence must be available to commanders at all

levels. Although the management of intelligence collection and production is centralized in the MAGTF command element (CE), the focus is on providing the intelligence needed to plan and execute the mission to every unit involved in the operation. Requirements of the entire force will be considered in directing the intelligence effort. Critical products will be *pushed* down to the tactical commander, who will be able to *pull* additional intelligence support as needed.

- **Intelligence drives operations.** The Marine Corps' warfighting philosophy depends on timely, accurate intelligence for success. Intelligence is the critical underpinning for each phase of the PDE&A cycle.
- **Intelligence activities require centralized management.** Good intelligence is the result of the integration of many separate and specialized collection, processing, and analytical resources. The scarcity of these assets, coupled with the requirement to focus on the commander's PIRs, creates the need for centralized coordination and management. This centralization will be done in the MAGTF CE, under the direction of intelligence officers who are trained and experienced in the management of multidiscipline, all-source intelligence operations. (All-source intelligence is intelligence that incorporates all available sources of information in the development of the finished intelligence product.) *Although centralized coordination and management is required for efficient and effective use of intelligence assets, it is critical for the commander who is exercising centralized control to allocate appropriate resources to ensure that needs of subordinate commands that are crucial to mission accomplishment are properly addressed.*
- **The G-2/S-2 facilitates use of intelligence.** The intelligence officer enables effective use of intelligence throughout the command. As the principal disseminator of intelligence, the intelligence officer ensures that the full implications of the intelligence picture are understood. To do this, the intelligence officer must be a *full and continuous* participant in the planning process.
- **Intelligence must be tailored and timely.** Intelligence must be tailored to the requirements of the user, provided in a useful format, and received in time to affect the decisionmaking process. Delivery of the right intelligence—not simply data or information—to the right place at the right time must be the guiding principle of all dissemination efforts.
- **Utilization is the final step of the intelligence cycle.** Intelligence has no inherent value; its value is derived from its support of decisionmaking. The intelligence cycle is not complete until the intelligence that has been developed is used to plan and/or execute operations.

Intelligence Functions

All six functions are carried out continually during the PDE&A cycle at all levels throughout the force. However, particular functions may be stressed more during one phase of the cycle. Different units may emphasize one or two functions over the others based on individual missions. (See figure 1-3.)

Support the Commander's Estimate

Intelligence supports the formulation and subsequent modification of the commander's estimate of the situation by providing as accurate an image of the battlespace and the threat as possible. Intelligence supports initial planning and decisionmaking. One of the principal tools used in this function is intelligence preparation of the battlespace (IPB). IPB is a systematic, continuous process of analyzing the threat and environment in a specific geographic area. IPB helps to provide an appreciation for the characteristics of the area of operations and the enemy capabilities, weaknesses, and COAs. This knowledge affords the commander an understanding of the battlespace and the opportunity to exploit enemy critical vulnerabilities.

Intelligence Functions	Decisionmaking	Operational Activities
Support to commander's estimate.	Plan a mission.	Develop and analyze COAs.
Situation development.	Execute the mission.	Monitor execution. Modify plan as necessary.
Indications and warning.	Orient on contingencies.	Increase readiness. Develop contingency plans.
Support to force protection.	Force protection.	Support operations security (OPSEC). Nuclear, chemical, and biological defense. Support deception plan.
Support to targeting.	Plan fire support.	Attack targets.
Support to combat assessment.	Reorient forces. Plan future operations.	Consolidate, pursue, exploit. Reattack targets.

Figure 1-3. Relationship Between Intelligence Functions and Operations.

Develop the Situation

Situation development provides continuing knowledge of unfolding events to help update the estimate of the situation. It is a dynamic process that assesses the current situation and confirms or denies the adoption of specific COAs by the enemy. It helps refine our understanding of the battlespace and reduces uncertainty and risk. Situation development occurs during execution and provides the basis for adapting plans or exploiting opportunities.

Provide Indications and Warning

Indications and warning (I&W) serve a protective purpose, providing early warning of potential hostile action. They help prevent surprise and reduce risk from enemy actions that run counter to planning assumptions.

Support Force Protection

Force protection is the set of comprehensive security measures, collection activities, and operations that are undertaken to guard the force against the effects of enemy action. Intelligence supports force protection by identifying, locating, and countering foreign intelligence collection, sabotage, subversion, and terrorism capabilities. Support to force protection requires detailed and accurate assessments of threat force capabilities and intentions and facilitates efforts to deny the enemy the opportunity to take offensive action against our forces.

Support Targeting

Intelligence supports targeting by identifying target systems, critical nodes, and high-value and high-payoff targets as well as by providing the intelligence required to most effectively engage these targets.

Support Combat Assessment

Combat assessment is the process used to determine the overall effectiveness of military operations and identify requirements for future actions. Intelligence supports the entire combat assessment process and is directly responsible for battle damage assessment (BDA), which is one of the principal components of combat assessment. BDA is the timely and accurate estimate of the damage resulting from the application of military force. BDA estimates physical damage to a particular target, functional damage to that target, and the capability of the entire target system to continue its operations.

The Commander's Role in the Intelligence Process

Intelligence is an inherent and essential responsibility of command. Commanders must come to think of command and intelligence as inseparable, just as they commonly think of command and operations as inseparable. They must study and understand the theory and the practice of intelligence doctrine. They must be personally involved in the conduct of intelligence activities, and provide guidance, supervision, judgment, and authority to ensure a timely and useful product.

Focus the Intelligence Effort

The commander must provide the guidance and direction necessary for the effective conduct of intelligence activities. Intelligence assets will rarely be sufficient to satisfy every requirement. Thus, the intelligence effort must be focused on clearly articulated priorities that drive the concept of intelligence support and the collection, production, and dissemination efforts. The commander provides this focus through articulating the commander's intent, planning guidance, and the command's PIRs.

Participate in the Intelligence Process

Although the intelligence officer manages the intelligence effort for the commander, the commander is responsible for the results. Effective participation requires an understanding of the practical capabilities and limitations of intelligence personnel, equipment, procedures, and products. The commander should supervise the process, interjecting guidance and direction at key points to ensure that the process is responding to the commander's intent; e.g., the commander should define the scope of the IPB effort, identify the preferred intelligence product format, and establish priorities among subordinate commands' IRs.

Use Intelligence in Decisionmaking

Intelligence exists for the primary purpose of aiding the commander's decisionmaking process. Although the intelligence officer facilitates the use of intelligence throughout the command by providing timely dissemination of the intelligence product and ensuring that the meaning of the intelligence is understood, the commander makes the judgment of its operational impact. The commander makes a personal analysis of the intelligence product and arrives at the estimate of the situation that serves as the basis for the decision. This act is the responsibility of the commander and no one else.

Support the Intelligence Effort

Intelligence is a team effort. Good intelligence is the result of integrating many separate and specialized collection, processing, and analytical resources. Some of these resources are organic to the unit; many are provided by units or agencies outside the command. Intelligence operations by organic assets normally cannot succeed without support from throughout the command. Reconnaissance teams must be inserted, sensors implanted, and communications assets provided for dissemination. Timely and effective intelligence dissemination requires dedicating significant C2 assets. Once an operation begins, nearly every Marine will have the occasion to observe significant facts about the enemy and environment. All personnel should understand and carry out their responsibility to collect and report information. The commander must ensure that all members of the unit understand the importance placed on intelligence and the requirement to support the intelligence effort. External support must be requested and coordinated. The intelligence staff executes the procedures to obtain the required support, but does so in the name of the commander. When the command's support requirements go unsatisfied, the commander must intervene, lending command authority to obtain the support.

Evaluate the Results of Intelligence Activities

The commander must provide feedback to the intelligence support system. Feedback should identify where the intelligence provided met expectations and where and how it fell short. Key areas to evaluate include product content, presentation, timeliness, and overall usefulness. Meaningful evaluation of the intelligence effort provides the basis for its continual improvement.

Information Operations

Intelligence support is required to conduct information operations (IO). Specific intelligence is required for planning and deconfliction and for employing military disciplines available to achieve IO effects. Intelligence is inextricably linked to facilitating core and supporting IO disciplines in offensive or defensive postures. As a product, intelligence supports IO in the same manner provided to all operations. Planning for IO cannot be conducted without intelligence on adversary information and information systems, perceptions, and critical vulnerabilities in their C2 process. Each capability used in an IO context will have separate and continuous intelligence support requirements. The psychological profiles of adversary commanders and forces are themselves an important element within the overall assessment process.

Planning

Intelligence support to IO planning is conducted as part of the IPB process. One of the key outputs from IPB is an analysis of the desired objectives and/or end states of stakeholders. These desires are usually categorized relative to broad capability. The categories may be elements of national power such as politics, economics, military, and society. Capability analysis processes within IPB also provide detail on stakeholder capacity and intent to conduct or sustain defensive and offensive IO. Intelligence support will aim to define critical nodes and vulnerabilities within the adversary's information structure; these include the key personnel, equipment, procedures and protocols involved in the transfer of information required for successful C2. Such intelligence support will orient key aspects of the operation plan towards the systematic disruption of critical nodes and information bearers. Friendly force staff advice, linked to intelligence advice on adversary COAs and CI advice on the threats to security, provide the operations planning process with the background to decide the protective measures required for own nodes and information bearers. Accurate, timely, and directed intelligence provides the foundation that IO decisions are based.

Intelligence Preparation of the Battlespace

IPB is a continuous process used to develop a detailed knowledge of the adversary's use of information and information systems. Intelligence support for IO planning builds upon traditional IPB and provides the essential basis for planning IO through the following considerations:

- The adversary commander's freedom of action and the freedom of action allowed to subordinates (decisionmaking process). This includes adversary perceptions of the situation (political, social, and cultural influences) and developments.
- Adversary IO capability, intent, morale, and vulnerability to offensive IO.
- C2 aspects such as key personnel, target audiences, headquarters, communications nodes, databases or intelligence collection systems. C2 nodes that appear in more than one adversary COA should be highlighted for targeting.
- Technical knowledge of a wide array of information, C2, intelligence, and media systems.
- Assessments of friendly vulnerability to adversary IO.

IO-Related Force Protection

Knowledge of the threat—adversaries, their intent, and capabilities—is a key consideration in the risk

management process. CI and counterreconnaissance contribute directly to force protection by denying critical information to potential adversaries. Many IO IRs require significant lead-time to develop collection sources, access, and databases. Potential intelligence collection sources should be developed as early as possible; a clear statement of MAGTF IRs is essential. IO will require development of extensive intelligence analytical products to obtain a detailed knowledge of cultural factors, and adversary use of information and information systems.

The Role of Intelligence in IO is Continual

Changes in attitudes, actions, operating patterns, and enemy information systems must be detected, analyzed, and reported to ensure that IO continues to achieve the desired operational effect. Assessing ongoing IO activities is a crucial and extremely challenging responsibility of intelligence as targets must be monitored to determine the effectiveness of the IO efforts. To achieve complete synthesis, IO must be incorporated into the MAGTF's intelligence, BDA, and targeting cycles. The impact of many IO actions may be difficult to measure. Indicators of success or failure must be carefully crafted in advance. Since IO will often not produce the same directly observable effects used for traditional BDA, IO execution will challenge the intelligence system to develop other measures of effectiveness. Once detected, these indicators should be integrated into operational planning and targeting systems, and appropriate action can be taken.

Intelligence enables the planning and execution of successful operations. MAGTF operations are characterized by unity of effort, high tempo, timely decisionmaking, rapid execution, and the relentless exploitation of opportunities. Intelligence operations must have the flexibility, agility, and sustainability to support these types of operations. Expeditionary Maneuver Warfare, as the Marine Corps' current capstone concept, lays the foundation for MAGTF operations. MAGTF operations include--

- Operational maneuver from the sea (OMFTS).
- Sustained operations ashore.
- Military operations other than war (MOOTW).
- Joint.
- Multinational.

Each operation presents unique challenges and considerations for intelligence support. Many MAGTF operations will be executed as joint operations and with allies, coalition or multinational partners. Intelligence activities in joint and multinational operations require special planning and coordination.

Required Intelligence Capabilities

As a warfighting function, intelligence applies broadly across the full range of military operations. The following required intelligence capabilities are common to all operations:

- Conduct intelligence planning and direction.
- Perform intelligence collection management.
- Process and exploit intelligence.
- Produce intelligence.
- Disseminate intelligence.
- Facilitate intelligence's use.
- Perform intelligence, surveillance, reconnaissance, and CI operations.

CHAPTER 2
COMMAND AND CONTROL

C2 aims to reduce the amount of uncertainty that commanders must accept—to a reasonable point— to make sound decisions. Intelligence is a principal component of C2. Intelligence is a process conducted specifically to aid the commander in decisionmaking by reducing this uncertainty. Intelligence operations support the commander's PDE&A cycle by helping to build situational awareness and providing insight into the nature of the problem facing the commander.

Intelligence provides knowledge concerning the environment and the enemy while furnishing an estimate of potential enemy activities. This knowledge is used by the commander to devise workable, flexible plans; make sound and timely decisions; monitor events to ensure proper execution; and modify decisions quickly in response to changing situations or to exploit fleeting opportunities.

Decisionmaking

The principal aim of C2 is to enhance the commander's ability to make sound and timely decisions. Decisionmaking is a time-competitive process that depends in part on the availability of the right elements of information at the right time and place. Without the information that provides the basis of situational awareness, no commander can make sound decisions. Intelligence operations focus on providing the right elements of information concerning the threat and the environment; i.e, intelligence, required to generate situational awareness and fuel the decisionmaking process.

Observe, Orient, Decide, and Act Loop

A simple model that is known as the observe, orient, decide, and act (OODA) loop is used to describe the C2 process. (See figure 2-1.)

The OODA loop applies to any two-sided conflict, whether combatants are individuals or large military formations. When engaged in conflict, participants—

- **Observe.** Take in information about the environment, the friendly status, and the threat.
- **Orient.** Make estimates, assumptions, analyses, and judgments about the situation to create a cohesive mental image.
- **Decide.** Determine what needs to be done, whether it is an immediate reaction or a deliberate plan.
- **Act.** Put the decision into action.

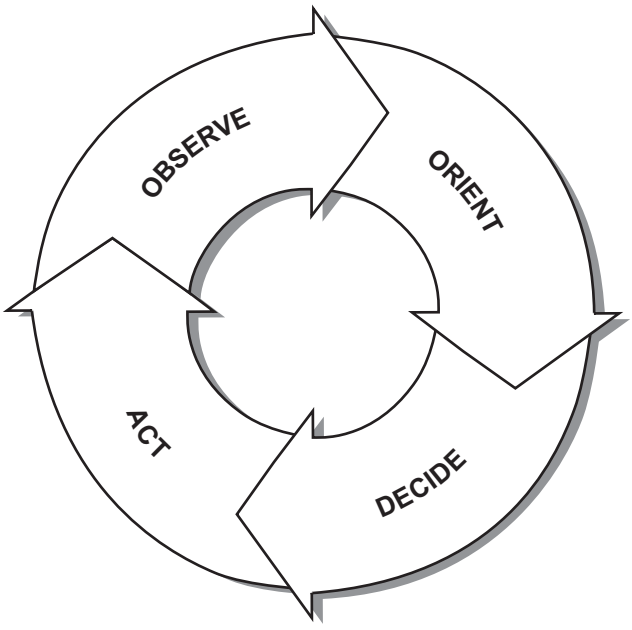

Figure 2-1. The Observe, Orient, Decide, and Act Loop.

The OODA loop reflects how decisionmaking is a continual, cyclical process. In any conflict, the participant who can consistently and effectively cycle through the OODA loop faster—who can maintain a higher tempo of action—gains an increasing advantage with each cycle. The essential lesson of the OODA loop is the importance of generating and maintaining tempo.

Intelligence and the OODA Loop

Intelligence supports all phases of the OODA loop. Intelligence operations facilitate the exercise of C2 by helping to reduce the uncertainty confronting the commander, providing a significant part of the knowledge needed to reach the decision, and assisting in monitoring the implementation and effects of that decision.

- **Observe.** Intelligence collection operations observe threat activity and current environmental conditions. All-source analysis of the collected intelligence information is provided to enhance the commander's situational awareness and understanding of the battlespace.
- **Orient.** The image of the battlespace presented by intelligence, coupled with the predictive analysis of the IPB process, helps orient the commander. It aids in comparing the current situation to the desired end state and in identifying COAs to achieve that end state.
- **Decide.** Intelligence enables decisionmaking by helping define what is operationally possible and most advantageous. It provides the framework for assessing the potential COAs against existing environmental conditions and threat capabilities, vulnerabilities, and likely responses.
- **Act.** Intelligence supports execution by providing a shared picture of the battlespace to all levels of command and by meeting the intelligence needs of all levels of commanders involved in the conduct of operations. Once the concept of operations has been formulated, the focus of intelligence activities shifts from developing the wide-scope intelligence required for COA selection to providing detailed, tailored intelligence to support mission planning and execution. Intelligence is also critical to generating and maintaining tempo in C2. During execution, supporting intelligence operations are conducted to monitor enemy reactions, protect the force from enemy counteraction, and assess the effects of ongoing operations. The continuing intelligence development effort aids the commander in effectively cycling through the OODA loop faster to gain an increasing advantage over the enemy.

Decisionmaking Approaches: Analytical and Intuitive

In analytical decisionmaking, several options for solving the problem at hand are identified, studied, and compared to arrive at the best solution. In intuitive decisionmaking, the commander assesses the situation to recognize a pattern. Once a pattern is identified, experience and judgment guide the commander in evaluating the key elements of the problem and rapidly determining a satisfactory solution. Each approach has different strengths and weaknesses; although conceptually distinct, the two are rarely mutually exclusive.

Intelligence supports analytical decisionmaking by helping to identify the options available and provide the framework (in the form of estimates and studies focused on the threat and key factors of the battlespace) for analysis and comparison of those options. Intelligence supports intuitive decisionmaking by providing the knowledge that helps the commander to recognize emerging patterns. The same methodology is used to develop intelligence support for both decisionmaking approaches. Application of that methodology will vary based on the specifics of each situation and the decisionmaking style of the supported commander. The goal remains the same: to provide a knowledge-based intelligence product that can be applied to make a sound decision.

The Planning, Decision, Execution, and Assessment Cycle

The PDE&A cycle provides a framework for implementing C2. It translates the cognitive process of the OODA loop into a concrete series of actions taken by the commander and the staff to plan and execute an operation. To be effective, intelligence operations must be linked to the commander's decisionmaking process and the resulting operational activity. Therefore, intelligence operations are integrated with the PDE&A cycle. Specific intelligence tasks are carried out to support each phase of this cycle. While the level of command, time available, and specific tactical situation will influence how the PDE&A cycle is carried out and the degree of detail applied in performing intelligence activities, the same basic intelligence development process is employed in deliberate and rapid planning scenarios and supports analytical and intuitive decisionmaking.

Intelligence support to planning begins with providing a basic description of the environmental conditions and enemy situation in the projected area of operations (AO). As plans are developed and refined, the intelligence effort becomes more narrowly focused on identifying the enemy's critical vulnerabilities and potential COAs and generating mission-specific intelligence products that support detailed planning and execution of specific operational activities. Finally, during mission execution, intelligence operations concentrate on the satisfaction of requirements linked to key operational decisions and the recognition of exploitable opportunities as they arise in the battlespace.

Intelligence Support to Planning

Planning is the process of developing practical schemes for taking future actions. It represents an effort to project operational concepts and designs forward in time and space. During the planning process, the commander assesses the situation, builds a vision of the battlespace, and develops the desired outcome of the battle or campaign. Planning is oriented on the future because the primary objective of intelligence is to reduce uncertainty about the future. Intelligence makes a critical contribution to this process. Much of the intelligence effort is "front loaded" to support planning; a substantial portion of intelligence development must be completed during this phase. Intelligence provides a comprehensive image of the battlespace and the threat and helps commanders to provide for constant or predictable aspects of the environment, come to an understanding on the general direction of future actions, and anticipate possible threat force actions and reactions.

Planning Models

The choice of planning model is made on the basis of a variety of factors, including the mission, level of command, command relationships, time available, and preferences of individual commanders. All planning models have the same basic elements in common. They—

- Determine what needs to be done.
- Identify one or more COAs to accomplish the required tasks.
- Study the COAs to test feasibility, identify support requirements, and select the most promising alternative.
- Convey instructions to subordinates to execute the plan.

Intelligence development follows the same basic process, no matter which planning model is used. While the specific steps and sequence used in planning may vary, the requirement to provide focused, continuous intelligence to shape the planning process remains constant. A generic planning model will be used to outline the baseline methodology for providing intelligence support to planning. The components of this generic

model are mission analysis, COA development, COA analysis, and plan/orders development. For a more complete discussion of planning and the planning process, see MCDP 5, Planning, and MCWP 5-1, *Marine Corps Planning Process*. (See figure 2-2.)

Mission Analysis

Mission analysis is conducted to identify the tasks required to accomplish the mission, develop baseline knowledge of the situation, and determine what additional information is required to facilitate the planning process. Intelligence supports mission analysis through providing basic intelligence on the nature of the AO and the threat. Intelligence operations are guided by the results of mission analysis: formulation of initial commander's intent, planning guidance, and PIRs.

Mission Receipt

The receipt of the mission starts the formal planning cycle. However, preliminary planning is normally conducted before the receipt of a mission to anticipate future taskings and potential actions required to accomplish those taskings. Intelligence, in performing its I&W function, will monitor a command's area of interest and identify developing crisis situations and/or potential missions. The commander uses this information to anticipate future missions and to direct the staff to accomplish preliminary planning and intelligence development before the arrival of formal mission tasking. Much of this preliminary

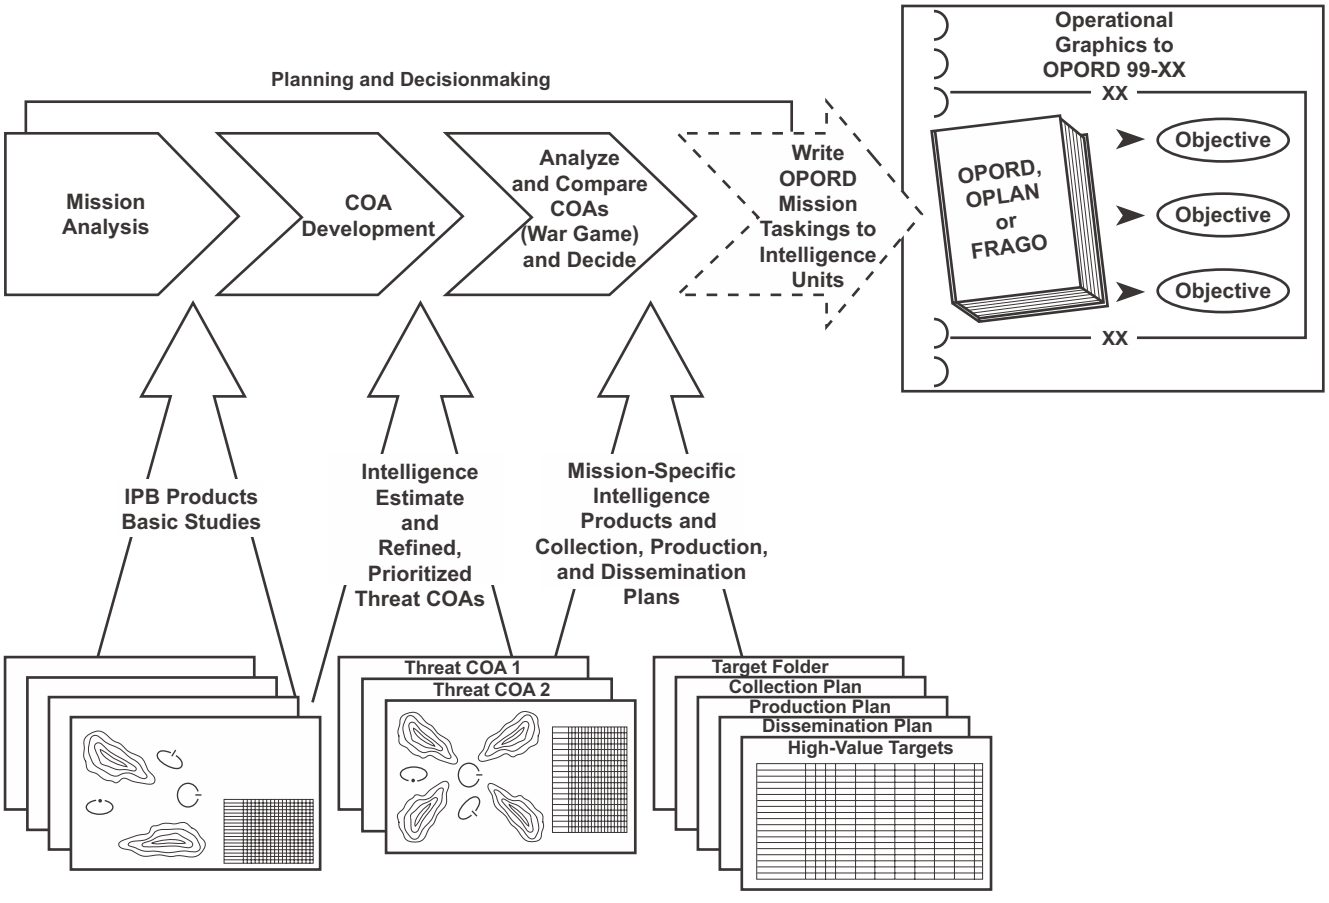

Figure 2-2. Intelligence Support to Planning.

work is carried out by the intelligence section, including collecting basic data on the threat and the environment, IPB analysis, and disseminating intelligence throughout the staff.

Information Requirements and Exchange

The process of identifying IRs and gathering and distributing information within the staff, and throughout the command, begins during preliminary planning and intensifies once the mission is received. Intelligence is provided about threat forces and the AO, focusing on the advantages and limitations presented by the environment and the strengths and critical vulnerabilities of the threat. This intelligence is disseminated through a variety of media: the distribution of basic products (maps, imagery, and threat forces studies); the conduct of orientation briefings, and IPB analysis. The continuous, interactive process of IR development also begins. Products provided by the intelligence section stimulate additional questions from the commander and members of the staff. These questions are translated into new or refined IRs. The new requirements are then used to focus the intelligence development process.

Mission Analysis

The commander makes a critical contribution to the operation during this step, setting the stage for the completion of planning and mission execution. During mission analysis, the commander and the staff draw together all available intelligence and information, focus it on the assigned mission, develop an understanding of the tasks to be accomplished, and formulate a rough concept of how to best accomplish those tasks. The result is an initial statement of commander's intent and commander's planning guidance that focuses the remainder of the planning process.

The intelligence officer is a full participant in mission analysis. During mission analysis, the intelligence officer does the following:

- Orients the commander and the other members of the staff to the battlespace and the nature of the threat.
- Aids in forming the commander's intent by helping to define what is operationally possible and most advantageous. This is accomplished primarily through IPB and the analytical process. These results identify the threat's COG, strengths, and critical vulnerabilities and indicate the potential advantages and limitations imposed by the environment.
- Receives guidance from the commander to help shape the intelligence effort. Guidance can take a variety of forms: a statement of commander's intent, a list of PIRs or direct instructions from the commander about intelligence needs or concerns.

COA Development

Building on the knowledge gained through mission analysis, the commander and staff next develop a concept for carrying out the required tasks that embodies the commander's intent and planning guidance. This concept (or COA) encompasses general schemes for the execution of maneuver, fires, logistics, and other supporting functions necessary for successful implementation of the basic concept.

When time permits, the staff usually develops several COAs on the basis of the commander's intent and planning guidance. Intelligence supports this process by the following:

- Continuously updating the view of the battlespace.
- Defining operational possibilities through the IPB process.
- Identifying intelligence gaps that cannot be filled by organic collection assets.
- Providing the focus on the enemy through identifying the threat's COG, critical vulnerabilities, and potential COAs, emphasizing the most likely and most dangerous of these COAs.
- Ensuring that the commander and staff receive, understand, and use relevant, focused, knowledge-based intelligence that enhances their understanding of the situation, rather than a stream of unfocused information.

The intelligence officer interacts with the staff throughout the COA development process, integrating continuing intelligence development efforts with the potential COAs in an effort to ensure that intelligence will be available to support any COA selected.

When an intuitive approach is used, intelligence helps the commander recognize emerging patterns, identify a workable solution, and rapidly evaluate that solution. Products developed through the IPB process present intelligence in the form of images that permit decisionmakers to quickly visualize the situation, see patterns, and assess potential alternatives.

COA War Game

After COAs are developed, they are analyzed and compared to identify the best COA and the concept of operations to implement that COA. Time permitting, the staff conducts a detailed analysis of each COA; each principal staff officer prepares a formal estimate of supportability. When possible, COAs should be wargamed to predict the action, reaction, and counterreaction dynamics of each COA.

Intelligence assists COA analysis by the following:

- Identifying and refining threat COAs and actions/reactions to friendly COAs under consideration.
- Playing the role of the enemy in the wargaming process.
- Developing an independent evaluation of each friendly COA based on an understanding of the environment and the potential threat response and the ability to provide intelligence support to that COA.
- Helping to focus the staff on the factors of the environment and the enemy, emphasizing the degree of uncertainty and resulting risk associated with each COA.

The intelligence officer's full participation is crucial to successful COA analysis. It is during this step that the full implications of the intelligence estimate are absorbed and applied. To maximize this contribution, the intelligence officer must be able to "think red"—analyze the situation from the enemy's perspective—and "think blue"—understand the intent and construct of friendly plans and operations. Combining these two perspectives enables the intelligence officer to assess the potential effects of threat force actions on the potential COAs.

When time is not available to wargame and conduct a complete COA analysis, the commander makes a rapid mental assessment of available options. The situational awareness that is provided in large part through intelligence guides the commander in evaluating these options and quickly selecting one that offers potential for success.

Orders Development

Based on the COA analysis, the commander selects a COA, refines the intent, and gives further guidance on developing the detailed concept of operations and supporting plans or orders. The emphasis of the intelligence effort, which is focused on the commander's intent, the selected COA, and the identified PIRs, shifts from developing basic and broad-scope intelligence in support of conceptual planning to providing specific intelligence that facilitates functional planning, detailed planning, and mission execution. The intelligence tasks of I&W and supporting the commander's estimate continue, but situation development, support to targeting, and support to force protection now receive increased emphasis.

A concept of intelligence support is prepared to allocate intelligence resources in accordance with the main effort and the concept of operations. COA analysis and wargaming results are used to develop and implement collection, production, and dissemination plans to support the chosen COA. IPB efforts are intensified in an effort to satisfy PIRs and develop the in-depth intelligence required for the detailed planning of specific operational activities. Intelligence sections prepare and disseminate products that embody

the results of the IPB process and intelligence collection activities to provide a shared view of the battlespace at all levels of the force. At the same time, they deliver mission-specific intelligence in response to the extensive and precise functional and detailed planning requirements of units that will execute the operation. CI plans and measures are prepared and implemented to conceal our intentions and protect the force. Results of these intelligence activities shape and develop the overall plan/order and the plan's comprehensive supporting annexes and appendices.

Execution

During execution, the plan is refined, implemented, and adapted in response to changes in the situation and action/reaction of the enemy. C2 is a process that generates swift, appropriate, and decisive action and provides a means of continuously assessing developments that provide the basis for adapting. The commander uses a variety of techniques and measures to supervise, monitor, and modify the execution of the plan, thereby shaping the battle and maintaining unity of effort. The intelligence effort must be responsive to the needs of mission execution and ensure a continuous flow of intelligence throughout the force to maintain a shared picture of the battlespace and satisfy new requirements developed by the operating forces.

Intelligence operations are integrated with the concept of operations to enhance force protection, develop situational awareness, and support combat assessment. The results of these operations are used to modify the plan or exercise tactical options, thereby enabling rapid decisionmaking as well as generating and maintaining tempo. The information developed through these activities is entered into the continuous intelligence development process, which provides the basis for planning future operations.

Intelligence support to execution differs in significant ways from intelligence support to planning. First, while intelligence support to planning requires developing a large volume of basic intelligence and preparing broad-scope estimates to develop and analyze COAs, intelligence support to execution involves the satisfaction of a much larger body of IRs in a significantly greater degree of detail. For example, during COA development, it may be sufficient to tell a MAGTF or ground combat element (GCE) commander that an enemy mechanized force is located in a general area and has an approximate number of tanks and armored personnel carriers of various types. However, the subordinate unit tasked with establishing a blocking position opposite that enemy force will require more detailed information on enemy disposition. In another example, the nature of the intelligence required by a Marine Expeditionary Unit (MEU) commander to decide if a raid or tactical recovery of aircraft and personnel (TRAP) mission is feasible is fundamentally different from the type and detail of intelligence required by the raid or TRAP personnel force commander who will execute that mission.

A second major difference between intelligence support to planning and intelligence support to execution is the time available for developing the intelligence product. Often days, weeks, and sometimes months are available to provide intelligence support to planning, but intelligence support to execution must normally be developed in hours, minutes or even seconds. Success in execution often depends on the ability to provide immediate answers to critical questions concerning threat force dispositions, actions, and intentions.

Finally, the uncertainty and disorder that are inherent in the nature of war manifest themselves primarily during execution. Once execution begins, interaction between the opposing wills of friendly and enemy forces normally causes significant and fundamental changes in

the situation. Discerning environmental conditions and enemy capabilities and intentions becomes increasingly difficult once these forces are set in motion. Yet it is at precisely this time that commanders require detailed and accurate intelligence to help cope with the uncertainty.

The combined factors of the extensive nature of the IRs, the degree of detail required, the limited time available, and the uncertainty inherent during execution make providing intelligence support to execution the most significant intelligence challenge. Intelligence operations must be prepared to meet this challenge and to provide the flexibility and agility required to deliver continuous situational awareness, identify opportunities, and facilitate rapid decisionmaking.

Intelligence support during execution focuses on providing the commander with practical knowledge that gives an exploitable advantage over the enemy. Although eliminating uncertainty during execution is impossible, focused intelligence operations can reduce uncertainty by providing situational awareness and identifying opportunities as they present themselves in the battlespace. Intelligence provides I&W of new or unexpected enemy activities, enhances efforts to engage the enemy through support to targeting, assists in protecting the force through CI measures and operations, and supports the planning of future operations by providing timely and accurate BDA. Three key factors for ensuring effective intelligence support during execution are resource allocation, linkage to operations, and generation of tempo.

Resource Allocation

Since IRs will always exceed available intelligence resources, intelligence operations must focus where they can have the greatest effect. A detailed and well-thought-out concept of intelligence support, developed in accordance with the commander's intent and concept of operations, will provide an appropriate allocation of intelligence capabilities between the main effort and supporting efforts. It is particularly important that Marine Corps forces (MARFOR), MAGTF, and major subordinate commands (MSCs) who control the tasking of intelligence units and capabilities provide access to critical intelligence resources for their subordinate elements. Those intelligence resources best suited to satisfying current, tactical, mission-specific IRs, such as unmanned aerial vehicles (UAVs) or terrain analysts, should be allocated to units responsible for executing the mission.

Linkage to Operations

To provide effective support to execution, intelligence operations must be linked to planned and ongoing operational activity. Intelligence operations are conducted based on the results of the IPB process, wargaming, and the planning process. Collection, production, and dissemination plans are developed to support execution of specific tactical options, engagement of targets, and selecting branches and sequels to the operation plan. Intelligence personnel must have continuous awareness of planned and ongoing operations to monitor potential enemy reactions, identify new opportunities, and assess the effects of actions on the enemy. Close and continuous synchronization of intelligence activities and operations is essential to developing timely, tailored, and relevant intelligence that facilitates rapid decisionmaking and exploitating opportunities in the battlespace.

Generation of Tempo

Intelligence operations during execution must facilitate the generation of tempo. First, intelligence operations generate tempo through prioritization. By focusing intelligence operations on satisfying PIRs and supporting the main effort, intelligence is developed that is directly linked to the commander's intent and C2 effort. Next, intelligence facilitates tempo by supporting the decisionmaking process. Intelligence that provides situational awareness and the ability to recognize emerging patterns enables the commander to employ intuitive decisionmaking to make rapid

decisions that help generate tempo. Finally, intelligence facilitates tempo by providing knowledge—key elements of data and information that have been analyzed, synthesized, and placed in context to help provide situational awareness—not just a mass of unprocessed information or unrelated pieces of data. The critical factor is not the amount of information provided, but key, focused intelligence that is available when needed and in a useful form that improves the commander's knowledge of the hostile situation and his ability to act. Intelligence operations must have the flexibility, agility, and responsiveness to rapidly collect and process relevant information, develop a focused product, and deliver that product to the affected commander in an easily understandable form and in time for the commander to take appropriate action.

CHAPTER 3
DEVELOPING INTELLIGENCE

Intelligence is developed through the use of the intelligence cycle. This process consists of a sequence of related activities that translate requirements for various types of information into intelligence that is furnished to the commander for use in the decisionmaking cycle. During this sequence, intelligence needs are identified; a *plan* is formulated and *directions* are given for satisfying those needs, data is *collected, processed, and exploited* for usable information that is then transformed into a tailored, useful intelligence product that is *disseminated* to and *utilized* by the appropriate commander or unit. This process is called the intelligence cycle. At the same time, a parallel process is used to develop CI plans and measures that deny information to an adversary to protect our forces and help ensure the effectiveness of our operations.

Figure 3-1 shows the six steps of the Marine Corps intelligence cycle. These steps define a sequential and interdependent process for the development of intelligence. Intelligence operations are conducted within the framework of the intelligence cycle; the entire cycle or a specific step within the cycle may be the focus of a particular intelligence activity. Moreover, *all* intelligence, regardless of the scope of the requirement or level of command, is developed by following these steps. (See figures 3-2 and 3-3, page 3-2.)

No single phase of the cycle is more important than the others. All of the phases are interdependent. Without proper direction, the other phases will not focus on the correct objectives. Without effective collection, there may be too much or too little information and what information there is may prove to be irrelevant. Without processing and production, there is a mass of random data instead of the knowledge needed for the planning and execution of operations. Intelligence is meaningless unless it reaches the right people in time to affect the decisionmaking process and in an understandable form.

An understanding of the process used to develop intelligence is critical to the execution of successful intelligence operations. All personnel involved in the *development* and *use* of intelligence must be aware of their role in the process. They must understand the relationship between the steps in the process to ensure that intelligence focuses on the mission and facilitates rapid decisionmaking in

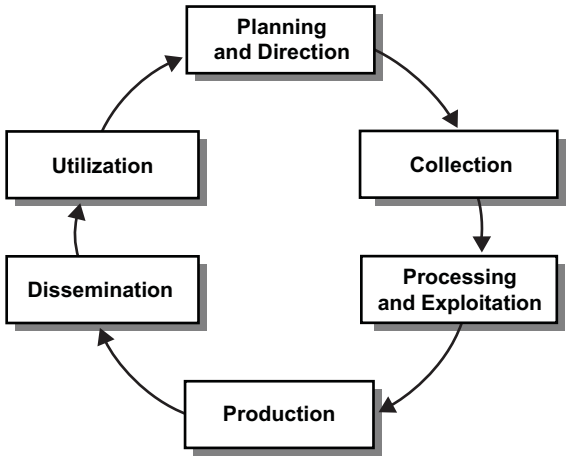

Figure 3-1. The Marine Corps Intelligence Cycle.

the execution of successful combat operations. (See figure 3-4.)

The Intelligence Cycle — Macro View

During a routine review of the situation in the Marine Expeditionary Force's (MEF's) area of interest, the G-2 notes that a recent change in government in one of the countries has created the potential for instability over the next year. The G-2 directs the development of an intelligence estimate to support potential contingency operations in this country. Working with the Marine Corps force G-2 section and the pertinent combatant command's joint intelligence center, the MEF collections section submits requests for imagery intelligence (IMINT), signals intelligence (SIGINT), and HUMINT support. As information is received, the MEF G-2 section's all-source fusion platoon (AFP), with the assistance of the topographic platoon, the imagery intelligence platoon (IIP), and the radio battalion, processes and exploits the information to produce the estimate and supporting studies. The estimate is completed within a month. The G-2 directs that copies be forwarded to all major subordinate commands (MSCs) and staff sections, with priority to the forward-deployed MEU. The G-2 also recommends to the commanding general that the scenario for the MEF's upcoming command post (CP) exercise be based on this estimate to introduce MEF personnel to this contingency area, identify planning requirements, and develop potential COAs. The MEF G-2 has *directed* the development of a comprehensive intelligence product that is focused on an operational requirement. Extensive organic capabilities as well as external resources were integrated to *collect* data, *process* it into information, and *produce* the finished intelligence. The product was then *disseminated* to and *utilized* by the units and staff sections with contingency responsibility for the identified area. The intelligence formulated focuses on the mission and facilitates rapid decisionmaking in the execution of successful combat operations.

Figure 3-2. The Intelligence Cycle—Macro View.

Intelligence Requirements

An intelligence requirement (IR) is a requirement for intelligence to fill a gap in the command's knowledge and understanding of the battlespace or enemy forces. (JP 1-02)

IRs *drive* the intelligence cycle. Properly articulated, mission-oriented requirements focus the intelligence effort and provide the foundation for successful intelligence operations.

The Intelligence Cycle—Micro View

The regiment S-2 section receives a report from one of their reconnaissance teams that an enemy artillery battery has just passed their observation post (OP) and turned off the road. Knowing that enemy artillery is the top targeting priority, the intelligence watch immediately begins developing the target. The S-2 chief checks the map and notes that there are three potential firing positions (identified through the IPB process) close to, but out of visual range of, the reconnaissance OP. The S-2 chief also knows that UAVs are in direct support of the regiment at this time. The S-2 chief alerts the fire support coordination center (FSCC) concerning the potential target and works with the FSCC and air officer to divert an ongoing UAV mission to search the potential firing positions. The UAV quickly locates the enemy artillery in the second firing position. The S-2 chief confirms that the enemy weapons can range friendly positions and, based on their observed activity, are preparing to attack. Using this intelligence, the FSCC coordinates a counterfire mission against the enemy artillery. The S-2 chief successfully executed the intelligence cycle in a matter of minutes. He understood the requirement to develop targeting information, directed the *collection* of information, *processed* the information and *produced* the desired intelligence, that is, a target, and *disseminated* that target to the FSCC, who *utilized* that intelligence to engage the target.

Figure 3-3. The Intelligence Cycle—Micro View.

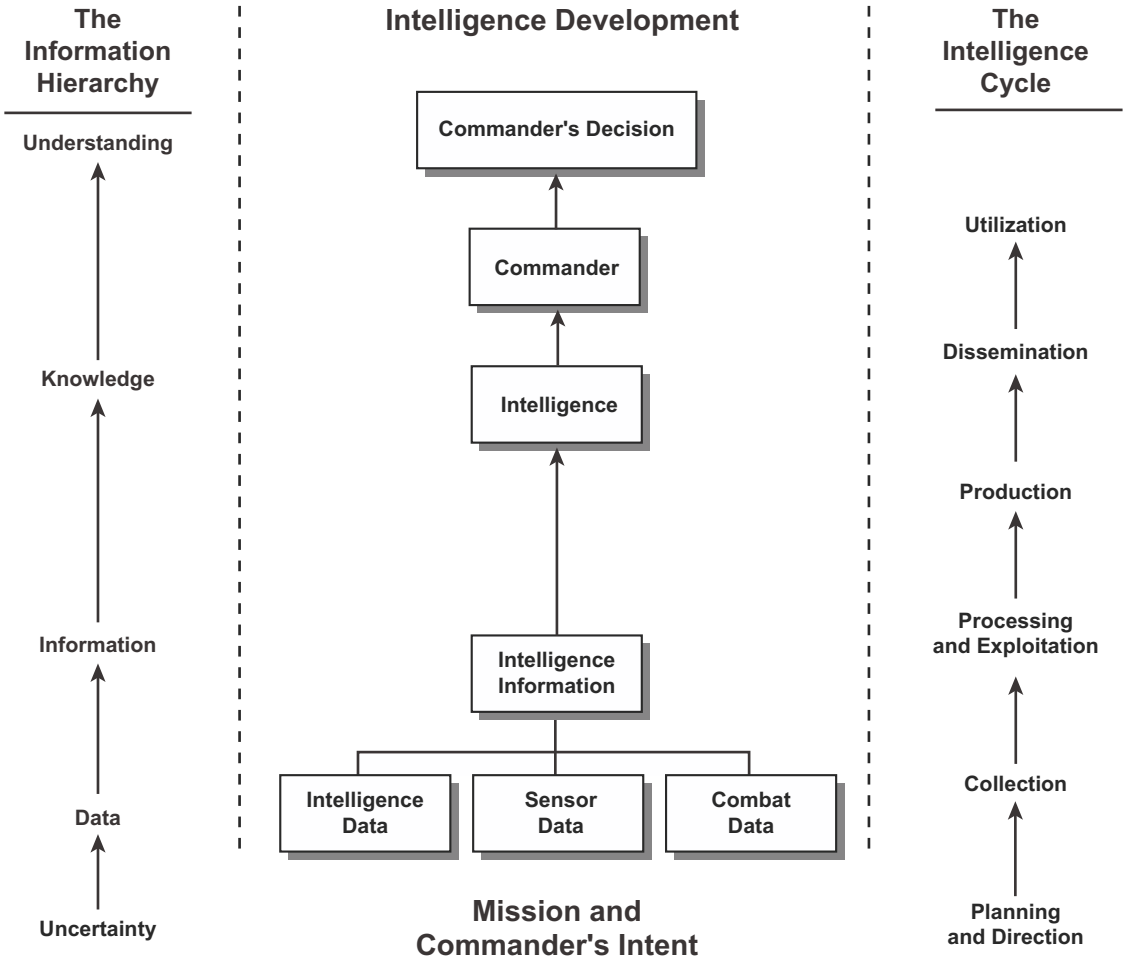

Figure 3-4. Intelligence Development and the Intelligence Cycle.

An IR is a missing piece of information about the enemy or environment that a commander needs to know to make a sound decision. In its simplest form, an IR is a question about the threat or the battlespace, the answer to which is required for the planning and execution of an operation. Examples follow:

- Will the highway bridge support assault amphibious vehicles?
- Will weather conditions interfere with planned air operations?
- Are port facilities and conditions suitable for a maritime prepositioning force pierside offload?
- Can the enemy air defense system threaten low-flying helicopters?
- What is the reaction time of the enemy garrison located south of the amphibious objective area?

Requirements fall into two categories: IRs and PIRs. PIRs and IRs replace the terms essential elements of information and IRs.

Priority Intelligence Requirement

A PIR is an intelligence requirement associated with a decision that will critically affect the overall success of the command's mission. (MCDP 2)

IRs cover the entire spectrum of information that is needed concerning the battlespace and the threat. The scarce intelligence assets and limited time available will rarely permit the satisfaction of all of a command's IRs; thus, it is important to focus the intelligence effort on those requirements that are critical to mission success. These critical IRs are designated as PIRs. PIRs are the subset of the CCIRs that focus on the threat and the environment. CCIRs are intelligence and information requirements the satisfaction of which the commander deems critical to decisionmaking and mission success. PIRs are linked to specific decisions and, in effect, constitute the commander's guidance for intelligence. Notional PIRs follow:

- What size force is defending amphibious force objective B?
- Which bridges over the Sand River are intact?
- Will the enemy use chemical weapons against the beach support area on D-day?

There is no standard list or set rule for determining PIRs. Each tactical situation poses distinct problems and specific gaps in intelligence. However, the commander will often have PIRs that concern the most likely enemy COA, the most dangerous enemy COA, and critical enemy vulnerabilities that can be exploited.

Characteristics

PIRs and IRs have the following characteristics. Each PIR or IR—

- Asks only one question.
- Focuses on specific facts, events or activities concerning the enemy or the battlespace.
- Is tied to mission planning, decisionmaking, and execution.
- Provides a clear, concise statement of what intelligence is required.
- Contains geographic and time elements to limit the scope of the requirement.

Requirements may be simple or complex. It is important to understand that the nature and scope of PIRs and IRs will vary with the mission and the level of command, and on the particular phase in the PDE&A cycle. Requirements will generally become more focused as the intelligence cycle is executed. During execution, the intelligence effort should be directed against a small number of PIRs that are closely linked to the concept of operations.

Planning and Direction

The planning and direction phase of the intelligence cycle consists of those activities that identify pertinent IRs and provide the means for satisfying those requirements. (See figure 3-5.) Intelligence planning and direction is a continuous function and a command responsibility. The commander directs the intelligence effort. The intelligence officer manages this effort for the commander based on the intent, designation of PIRs, and specific guidance provided during the planning process.

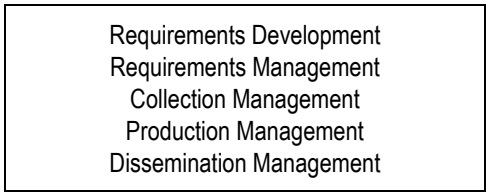

Figure 3-5. Planning and Direction Phase Functions.

Requirements Development

Identification of Requirements

Concise, mission-oriented IRs provide clear direction to the intelligence effort. The entire staff and all subordinate commanders play a role in developing the command's IRs. The intelligence officer formulates most of the initial requirements by using the original mission

tasking together with knowledge of the threat, familiarity with the operating area, and experience derived from participation in the commander's decisionmaking process to anticipate the majority of the basic intelligence needs. As the planning process continues, the commander, other staff officers, and subordinate commands expand on previously identified requirements and develop new ones. Requirements are generally linked to proposed COAs or potential decisions. The intelligence officer records, collates, and refines these requirements as they are identified and maintains a consolidated list of requirements.

Designation of PIRs

The commander makes a critical contribution to the intelligence effort by designating the PIRs. As COAs and supporting information requirements are developed, the satisfaction of certain IRs will be essential to mission success. The identification of these "show stoppers" forms the basis for designating PIRs. The intelligence officer, with input from other members of the staff, draws up a recommended list of PIRs. PIRs will be listed in priority order relative to their importance to mission accomplishment. In forming this list, the G-2/S-2 considers the requirements of his own command, subordinate commands, adjacent commands, and any direction received from higher headquarters. Recommendations are submitted to the commander who reviews, refines, and approves the command's PIRs. In designating PIRs, the commander establishes the following:

- What he wants to know (intelligence required).
- Why he wants it (linked to operational decisionmaking).
- When he needs it (latest time that the information will be of value).
- How he wants it (format, method of delivery).

Once approved and distributed, PIRs constitute the core of the commander's guidance for the intelligence process.

Requirements Management

Management of IRs is a dynamic process that encompasses the continuous evaluation of the following:

- Importance of each requirement to mission success.
- Information and assets needed to satisfy each requirement.
- Resources that are presently committed toward fulfilling that requirement.
- Degree that the requirement has been satisfied by completed intelligence activities.

Processing Requirements

Developing requirements and designating PIRs are not one-time efforts. There is a dynamic flow of new requirements, existing requirements are satisfied or no longer relevant, and the relative importance of each requirement changes as the PDE&A cycle progresses. (See figure 3-6.) As requirements are developed, the intelligence officer validates, refines, and enters them into the management system.

Validation ensures that the requirement is relevant to the mission, has not already been satisfied, and does not duplicate other requirements.

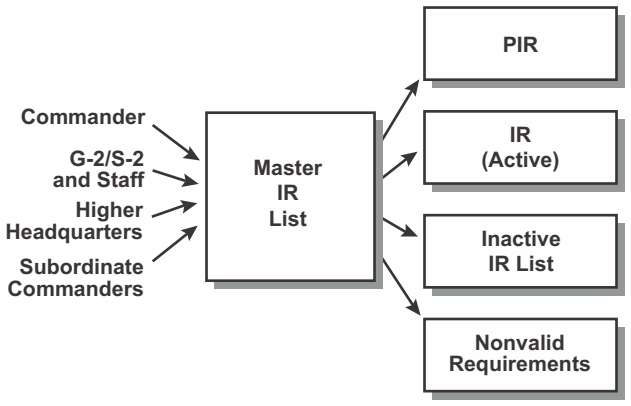

Figure 3-6. Intelligence Requirements Management.

Refining the requirement entails placing it in the proper format, identifying all information components related to the requirement, and adding appropriate qualifiers such as geographic limitations or time constraints. During refinement, similar or related requirements may be combined into a single, comprehensive requirement.

A requirements management system is an essential tool that provides a means to monitor the effort to satisfy each requirement. Each intelligence section must develop a system appropriate to its mission and echelon. Minimal components of any system are a numbering system, identification of who submitted the requirement, designation of collection and production resources committed to satisfying the requirement (or noting when it was submitted to higher headquarters or supporting forces, if organic assets are not available), timeliness requirements, dissemination instructions and information, and a mechanism to ensure user satisfaction.

Determining Priorities

The intelligence officer must continually reassess the emphasis given to each requirement and realign the priorities according to commander's intent and the current phase of the PDE&A cycle. The intelligence officer must also periodically confirm assignment of priorities with the commander to ensure that the intelligence effort is focused in accordance with the commander's desires.

Requirements Satisfaction

Once a requirement has been identified, validated, refined, and prioritized, the intelligence officer must determine how to satisfy the requirement and, if it can be satisfied by organic assets, allocate the appropriate intelligence assets to develop the desired intelligence. If the requirement cannot be satisfied by organic assets, it must be submitted to higher headquarters or supporting forces/agencies for satisfaction. In determining how to satisfy a requirement, the intelligence officer must consider each step in the intelligence cycle to ensure that the plan encompasses the entire process from collection through utilization. The intelligence officer must identify the information needed, where and how to get it, how to package the intelligence into an appropriate product, and how to deliver that product. Normally, an IR will generate a requirement to do the following:

- Collect data or information.
- Process and produce intelligence in the scope and form that answers the question.
- Disseminate the information to a particular user by a specific time. (See figure 3-7.)

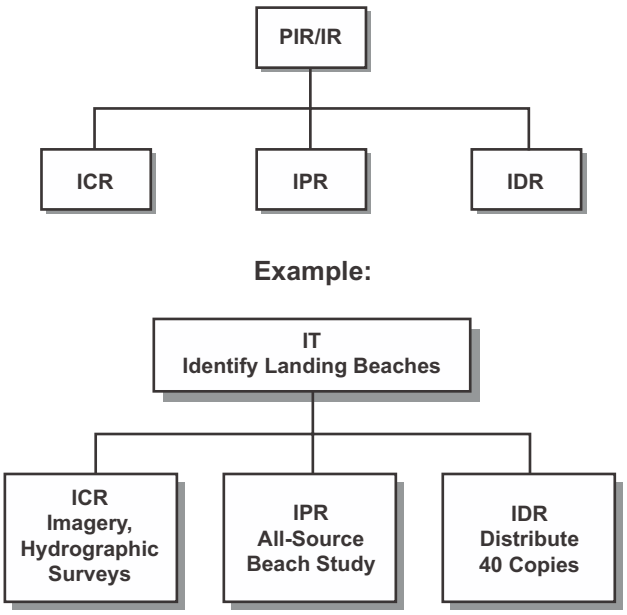

Figure 3-7. Requirements Satisfaction.

Directing the Intelligence Effort

Intelligence direction consists of the requirements development and management process described above combined with the associated functions of collection management, production management, and dissemination management. Because the possible questions about the enemy and the AO are practically infinite but intelligence assets are limited, the intelligence effort must be managed at each step in the process. Management of requirements, collection, production, and dissemination ensures that the effort is focused on the PIRs and delivers knowledge that facilitates sound tactical decisionmaking.

Collection Management

Collection management is the process of converting IRs into collection requirements, establishing priorities, tasking or coordinating with appropriate collection sources or agencies, monitoring results, and retasking, as required. Its purpose is to conduct an effective effort to collect all necessary data while ensuring the efficient use of limited and valuable collection assets.

Production Management

Production management encompasses determining the scope, content, and format of each product; developing a plan and schedule for the development of each product; assigning priorities among the various intelligence production requirements; allocating processing, exploitation, and production resources; and integrating production efforts with collection and dissemination. As with collection management, the goal is to make effective and efficient use of limited resources and ensure that the production effort is properly focused on established priorities.

Dissemination Management

Dissemination management involves establishing dissemination priorities, selecting dissemination means, and monitoring the flow of intelligence throughout the command. Its objective is to deliver the required intelligence to the appropriate user in the proper form at the right time while ensuring that individual consumers and the dissemination system are not overloaded by attempting to move unneeded or irrelevant information. Dissemination management also provides for use of security controls that do not impede the timely delivery or subsequent use of intelligence while protecting intelligence sources and methods.

Planning the Intelligence Support System

This activity includes designing and establishing the structure that is necessary to provide intelligence support throughout the course of an operation. The intelligence officer looks at the entire body of IRs rather than at individual IRs or PIRs. The intelligence officer anticipates the continuing intelligence needs of the force as it carries out its mission and designs an intelligence support system that has the capability, flexibility, and redundancy to satisfy these needs. After the support system concept is developed, the resources needed to build the system are identified, requested, and acquired. Factors taken into consideration during this effort follow:

- Task organization of intelligence units.
- Identification of personnel and equipment requirements.
- Requirement for liaison teams.
- Connectivity with national, theater, joint, and multinational force intelligence assets.
- Communications and information systems (CIS) requirements.
- Logistic requirements.
- The need for specialized capabilities; e.g., linguists.

Collection

Collection is the gathering of intelligence data and information to satisfy the identified requirements. The collection phase encompasses assembling relevant information from sources that are already on hand or available from other intelligence organizations: intelligence databases, studies, maps, and a workbook or situation map. Collection consists of the activities of organic, attached, and supporting intelligence collection assets to gather new data and deliver it to the appropriate processing or production agency; i.e., the execution of collection operations. Functions carried out during the execution of collection operations follow:

- Mission planning.
- Positioning of assets to locations that are favorable to satisfying collection objectives.

- Data collection.
- Reporting.
- Supervision of individual collection missions.

Intelligence data and information are collected by a variety of intelligence assets, each with unique capabilities and limitations. (See figure 3-8.)

Radio Battalion
Force Reconnaissance Company
Marine Tactical Electronic Warfare Squadron (VMAQ)
Marine UAV Squadron (VMU)
Ground Sensor Platoon (GSP)
Division Reconnaissance Battalion
CI/HUMINT Company
Light Armored Reconnaissance Battalion

Figure 3-8. MAGTF Primary Organic Collection Assets.

The value of a collection source is not necessarily related to the sophistication or cost of that source, but rather to its ability to gather pertinent data from the collection target—the enemy or environmental consideration that is the subject of the particular intelligence collection requirement. Successful intelligence operations require access to data from all types of collection resources: organic, joint, national, and multinational. Collection operations are executed to gather data from all suitable and capable assets, balancing the capabilities of one type of collector against the limitations of another to provide "all-source" data input to the processing and exploitation and production phases. The primary types of intelligence data used to produce tactical intelligence are described in the following paragraphs.

Imagery Intelligence

Imagery intelligence is intelligence derived from the exploitation of collection by visual photography, infrared sensors, lasers, electro-optics, and radar sensors such as synthetic aperture radar wherein images of objects are reproduced optically or electronically on film, electronic display devices, or other media. (JP 1-02)

Principal sources of imagery are national overhead reconnaissance systems; manned aircraft such as the F-14 or F/A-18 with the Advanced Tactical Airborne Reconnaissance System, the U-2 or the Joint Surveillance Target Attack Radar System; and UAVs. IMINT provides concrete, detailed, and precise information on the location and physical characteristics of the environment and the threat. It is the primary source of information concerning key terrain features, installations, and infrastructure used to build detailed intelligence studies and target materials. The main limitation of IMINT is the time required to task, collect, process, and analyze the imagery. Detailed planning and coordination is required to ensure that the results of imagery collection missions are received in time to affect the decisionmaking process. Imagery operations can be hampered by weather, the enemy's air defense capability, and his camouflage, cover, and deception activities.

Signals Intelligence

SIGINT is intelligence information derived from the interception, processing, and analysis of foreign communications, noncommunications electronic emissions, and instrumentation signals. SIGINT is provided by the radio battalion; the Marine tactical electronic warfare squadron; and an integrated network of national, theater, and joint force SIGINT support agencies. SIGINT provides timely and accurate data on enemy forces that may include details on enemy composition, identification, and location. It can also give insight into the enemy's current status and activities and future intentions. SIGINT is one of the primary means for providing I&W of enemy actions. It is also a principal contributor to intelligence support to IO through its analysis and exploitation of the enemy's C2 system. Principal limitations of SIGINT are that the enemy must transmit signals that can be exploited and that

collection assets must be capable of intercepting and positioned to intercept those signals.

Human Intelligence

HUMINT is a category of intelligence derived from information collected and provided by human sources. (JP 1-02)

HUMINT operations cover a wide range of activities, including reconnaissance patrols, aircrew reports and debriefs, debriefing of refugees, and interrogations of enemy prisoners of war. Principal dedicated HUMINT resources are ground reconnaissance units; the CI and interrogator-translator assets of the MEF CI/HUMINT company; and national, theater, and other Service HUMINT elements. All Marines participating in an operation can obtain significant information about the threat and environment. Intelligence operations must aggressively employ Marines as HUMINT sources by teaching them the importance of observing and reporting.

HUMINT can provide insight into intangible factors such as tactics, training, morale, and combat effectiveness that cannot be collected by technical means and offers the best potential source to discern future plans and intentions. HUMINT is particularly important in MOOTW, in which the nature of the mission and of the threat generally provide a lucrative environment for HUMINT operations.

HUMINT has two main limitations as follows:

- HUMINT operations generally require placing humans at risk to gain access to their targets. For that reason, IRs should be satisfied through technical collection means, if possible, before considering the use of human resources.
- HUMINT responsiveness can be limited in certain circumstances because of the time it takes to plan the activities, position the assets, collect the data from what are often hostile or noncooperative sources, and report the information to exploitation and production centers, which are often located a significant distance from the collection site.

Measurement and Signature Intelligence

Measurement and signature intelligence (MASINT) is intelligence information gathered by technical instruments such as radars, passive electro-optical sensors, radiation detectors, and remote ground sensors. Although the primary tactical application of these devices is to collect sensor data, which is generally provided directly to operations centers for immediate decisionmaking, the data collected can also provide significant intelligence information on enemy movements and activities. Key MAGTF MASINT capabilities are remote ground sensors, weapons locating radars, and air surveillance radars. These sensors provide an efficient means to maintain surveillance over large portions of the battlespace. Their limitations include the logistic support required to maintain the equipment, the requirement to place the sensors in proximity to the surveillance area, and the exploitable electronic signatures associated with some of the sensors.

Open-Source Intelligence

Open-source intelligence (OSINT) is information of potential intelligence value that is available to the general public. (JP 1-02)

OSINT sources include books, magazines, newspapers, maps, commercial electronic networks and databases, and radio and television broadcasts. OSINT involves no information that is classified at its origin or acquired through controlled collection. National and theater intelligence production centers have access to a range of OSINT sources. MAGTF intelligence agencies can receive OSINT through these centers in addition to collecting information from open sources that are available in the AO. OSINT can be a valuable source of geographic, political, economic, sociological, and cultural information, particularly in security, humanitarian assistance or peace operations. In multinational operations, OSINT provides intelligence that can be readily shared with members of a multinational force. However, the sources of OSINT should be carefully evaluated to determine the accuracy and reliability of the information provided.

Counterintelligence

CI is the intelligence function concerned with identifying and counteracting the threat posed by foreign intelligence capabilities and by organizations or individuals engaged in espionage, sabotage, subversion or terrorism. The principal objective of CI is to assist with protecting DOD personnel, family members, resources, facilities, and critical infrastructure. CI provides critical intelligence support to command force protection efforts by helping identify potential threats, threat capabilities, and planned intentions to friendly operations while helping deceive the adversary as to friendly capabilities, vulnerabilities, and intentions. CI increases uncertainty for the enemy, thereby making a significant contribution to the success of friendly operations. CI also identifies friendly vulnerabilities, evaluates security measures, and assists with implementing appropriate security plans. The integration of other intelligence disciplines, CI, and operations culminates in a cohesive unit force protection program.

Processing and Exploitation

Processing and exploitation involves the conversion of collected data into information that is suitable for the production of intelligence. Processing is largely a technical function that does not add meaning to the data but that is necessary to convert the data into a form that people can understand. Examples of processing include developing a piece of film, translating a document or communications intercept from a foreign language or converting electronic data into a standardized report that can be analyzed by a system operator. Some types of data require minimal processing. They may be collected in a form that is already suitable for production. Processing may also take place automatically during collection. Other types of data require extensive processing, which can affect the timeliness and accuracy of the resulting information.

Data may be further exploited to gain the fullest possible advantage. For example, an aerial photograph or a frame of UAV video may be exploited by imagery interpreters to identify specific pieces of equipment or measure the dimensions of structures found on that image. When resources are required to accomplish the processing and exploitation phase, it is crucial that processing requirements be prioritized and managed according to the PIRs to ensure that critical information is extracted first.

Production

Production is the activity that converts information into intelligence. It involves the evaluation, interpretation, integration, analysis, and synthesis of all information that is relevant to a particular IR to answer the question that has been asked. Production fuses new information and existing intelligence from all sources to provide meaningful knowledge that can be applied to the decisionmaking process. During the production phase, information is—

- Evaluated to determine pertinence, reliability, and accuracy.
- Analyzed to isolate significant elements.
- Integrated with other relevant information and previously developed intelligence.
- Interpreted to form logical conclusions that bears on the situation and supports the commander's decisionmaking process.
- Applied to estimate possible outcomes.
- Placed into the product format that will be most useful to its eventual user.

Intelligence Preparation of the Battlespace

IPB is the primary analytical methodology used to produce intelligence in support of the decisionmaking process. It furnishes a framework for integrating intelligence and operations throughout the PDE&A cycle. IPB is a systematic, continuous, mission-focused process of analyzing the

environment and the threat in a specific geographic area. (See figure 3-9.)

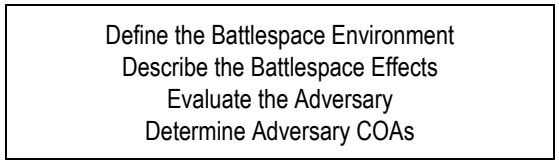

Figure 3-9. Intelligence Preparation of the Battlespace.

IPB provides a means to interpret information and understand the battlespace that can be applied in any operational situation. Through the IPB process, information that has been collected and processed is analyzed, synthesized, and used to estimate possible outcomes that can affect mission accomplishment. The result is knowledge-based intelligence that is incorporated into a variety of intelligence products.

Although IPB is fundamentally an intelligence process, successful application of the process to support planning and execution depends on the participation of the commander and the entire staff. The commander is responsible for intelligence production and IPB. The commander focuses the IPB effort by defining the area and key factors to be studied. The commander's guidance and the complete involvement of the staff are necessary to ensure that the IPB effort encompasses aspects of concern for all warfighting functions and provides detailed and accurate intelligence for COA development and detailed planning. Finally, the commander ensures that the IPB process is fully integrated with mission planning and execution. IPB is an effective tool only when the results are used to develop plans and support decisionmaking during execution.

IPB emphasizes providing intelligence in the form of graphics and images—formats that help the commander to rapidly visualize, assimilate, and apply the intelligence in the decisionmaking process. During planning, products generated from IPB place large volumes of intelligence in context, providing situational awareness for everyone involved in the planning effort. These products form the basis of, or are combined with, the planning tools and decision support aids prepared by other staff sections to provide an integrated planning and execution support product. During execution, the use of graphics display intelligence increases the commander's ability to discern patterns as they are emerging and to conduct intuitive decisionmaking, thereby increasing operational tempo.

Levels of Production

Intelligence production can be extremely simple or incredibly complex. At the MAGTF CE level, particularly during deliberate planning, production normally entails developing detailed, all-source estimates and studies through the combined efforts of several intelligence support elements. During tactical execution, time constraints and the demands of the ongoing battle require rapid processing and production, with an emphasis on developing simple, mission-focused intelligence products such as a hand-annotated image of a helicopter landing zone (HLZ), a target description or an overlay depicting current and future enemy dispositions. An enlisted intelligence specialist on duty in an infantry battalion command post may develop dozens of intelligence products during his watch in the form of answers to questions concerning the enemy situation, targets or terrain to be traversed. Valuable intelligence does not result solely from the investment of time or resources. It is developed by placing relevant information in context, converting it into knowledge through analysis and synthesis, and applying that knowledge to the decisionmaking process.

There is inherent friction between the desire to provide as complete and accurate an intelligence product as possible and the continuous requirement to support the time-sensitive urgency of tactical decisionmaking. In practice, these conflicting demands must be balanced by using

stated direction, such as the commander's intent and PIRs, and knowledge of the operational situation to determine when to finish and disseminate the product. To provide a framework to make these determinations, intelligence production can be viewed as occurring on two levels: deliberate and immediate.

Deliberate production is employed when there is sufficient time to thoroughly evaluate, analyze, and synthesize all available information and produce a formal intelligence product such as a written intelligence estimate, scheduled report or detailed target/objective area study.

Immediate production is conducted to identify, process, and place in context elements of data, information, and intelligence that have a direct effect on ongoing or near-term operations. These elements are subjected to a compressed version of the production process, and the resulting product is rapidly disseminated to those who are affected. Immediate production is normally conducted during execution and results in simple, mission-specific intelligence products: situational assessments or answers to specific, individual IRs. There is no absolute distinction between the two levels. The nature of the situation and pertinent IRs will dictate the amount of time available to complete each production effort. Likewise, IPB methodology should be used during both types of production. However, during immediate production, a rapid mental evaluation and integration of the relevant factors of the threat and environment are used, usually building on a deliberate production effort that has already been completed.

Dissemination

Dissemination is the timely conveyance of intelligence to users in an appropriate form. Many times, intelligence operations focus almost exclusively on the collection and production phases, with the intelligence cycle often breaking down because insufficient attention is given to the dissemination phase. Dissemination must be planned and supervised to the same degree as collection and production or we risk failure of the intelligence support function. Determining the form and selection of the means to deliver the product are key aspects of the dissemination process.

Form

Determining the form to be used in disseminating the intelligence product is a function of several factors: the purpose of the intelligence product, the urgency and relevance of the intelligence to ongoing operations, the type and volume of the intelligence, the user's capability to receive intelligence products, and the dissemination means available. Because decisionmaking is a mental process and human beings think and understand primarily in the form of images, the goal of intelligence dissemination is to convey an accurate image of the battlespace or threat to the decisionmaker in a form that facilitates rapid understanding of that image. For this reason, graphics are the preferred dissemination form. (See figure 3-10 and figure 3-11 on page 3-14.)

Although oral briefings and written reports are the primary dissemination forms used today, the use of automated systems is increasing the capability to develop graphic products. Imagery, overlays, diagrams, and schematics enhanced with appropriate textual data and annotations will be used as the baseline dissemination format whenever possible. However, in time-sensitive situations, the verbal report or short text message may be the most expeditious dissemination form. Whether oral, text or graphic, intelligence products should use standard formats whenever possible. Standard formats facilitate ease of preparation and dissemination, as well as usability of the intelligence product.

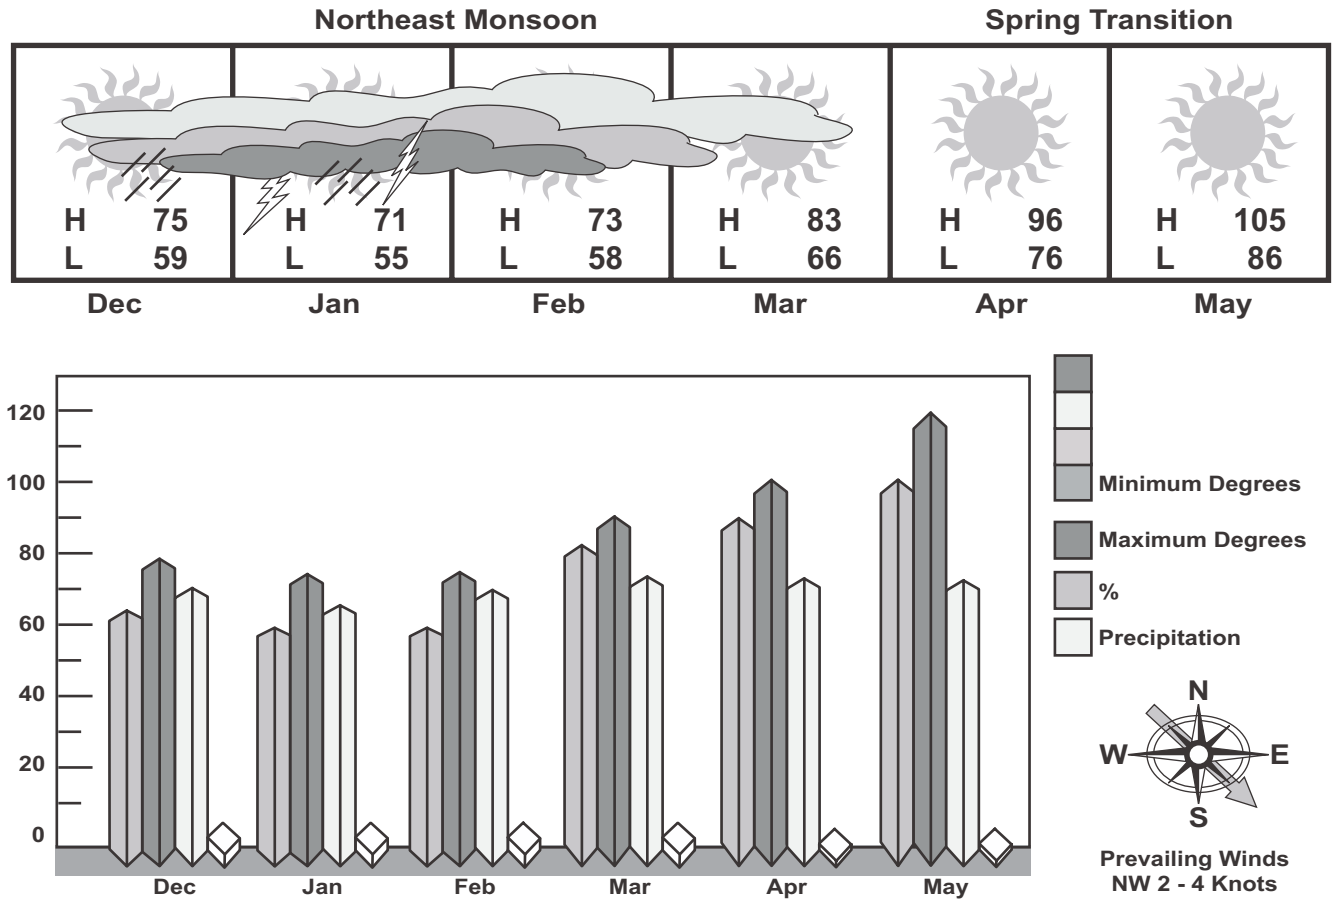

Figure 3-10. Graphic Climatology Study.

Delivery

Delivery of the intelligence product to the right person in a timely manner is directly related to the choice of the means used to disseminate that product. Dissemination is managed by using a combination of methods, channels, and modes to convey the product to the user.

Methods

There are two basic methods used to disseminate intelligence: supply-push and demand-pull. A supply-push system pushes intelligence from the collectors/producers to the users as it becomes available. The main advantage to this method is that users do not have to initiate requests to receive products. However, there is potential for information overload in a supply-push system. To prevent information overload, the dissemination node should tailor what it is passing through the system, not simply dump everything that it has received or developed.

The demand-pull mode provides access to intelligence on an as-needed basis. The user draws the required intelligence from the intelligence support system through a series of searches or inquiries. The use of demand-pull decreases the volume of intelligence being transmitted and diminishes the possibility of overwhelming units with superfluous products. However, demand-pull can also reduce the timeliness of dissemination by developing and providing intelligence only after a request has been received.

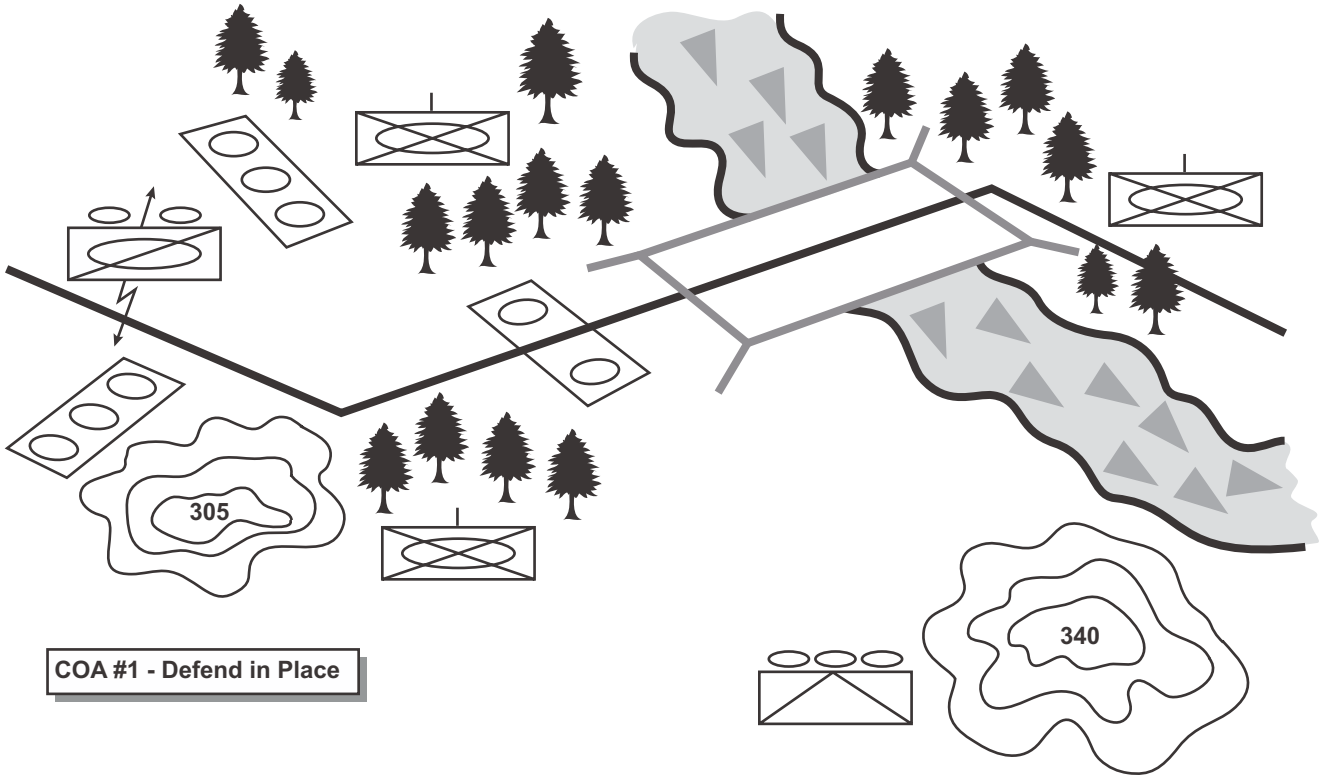

Figure 3-11. Graphic Intelligence Estimate.

The dissemination system must provide the flexibility to use either method, "pushing" important or time-sensitive intelligence directly to the users, while at the same time permitting them to "pull" other relevant intelligence as needed from readily accessible sources such as a database or a watch section at an intelligence center.

Channels

Intelligence is disseminated by using two types of channels: *standard* and *alarm*. Standard dissemination is used for routine intelligence and is transmitted according to a set order and format, usually along established command or staff channels. Examples include the formal staff briefing and standardized reports. The alarm channel is used to disseminate critical, time-sensitive intelligence that can have an immediate effect on the conduct of the operation, such as I&W of hostile activity. I&W alarms must be disseminated rapidly to all units that are affected by that intelligence. Although the standard channel is used to satisfy the majority of dissemination requirements, care must be taken to monitor the flow of what is passing through the pipeline to ensure that the intelligence provided is timely and pertinent to the units receiving it. A particularly important connection that is often neglected in standard dissemination is *lateral dissemination*; intelligence must flow laterally between units as well as up and down the chain of command. The exchange of intelligence between the GCE, aviation combat element (ACE), and combat service support element (CSSE) is an especially important link in ensuring that all commanders have a shared picture of the battlespace.

Modes

Finally, intelligence is disseminated in one of two modes: *broadcast* or *point-to-point*. In broadcast

dissemination, intelligence that affects the majority of units is sent simultaneously to a broad audience. Examples include I&W alarms, intelligence products developed by the MAGTF G-2 section that support the entire MAGTF, and reporting from organic collection assets. Broadcast dissemination may be web-based. Successful use of the broadcast mode depends on several factors, including judicious selection of what intelligence is broadcast, the ability of the appropriate users to monitor the broadcast, and employment of a processing methodology or system to filter and select for detailed examination only those broadcast items that are pertinent to the user's requirements. Undisciplined use of this mode can quickly lead to information overload. In the point-to-point mode, intelligence is sent to a specific user or users, normally in response to a specific request or requirement, and is passed along sequentially as appropriate. Dissemination across the system is slower but is more focused and can provide intelligence that is tailored to the needs of each individual unit. Point-to-point dissemination may be enhanced through the use of classified e-mail systems.

Architectures

Intelligence architectures provide the means to disseminate intelligence. (See figure 3-12 on page 3-16.) Dissemination planning analyzes and anticipates the dissemination requirements and designs the appropriate architecture to meet those requirements. The architecture should employ all methods, channels, and modes in a flexible, integrated system. The objective is to provide the right intelligence to the appropriate user in a timely manner, while at the same time not overwhelming him with a massive amount of unfocused data.

Architectures will be developed with the objective of facilitating the exchange of *graphic* intelligence throughout the force, down to the lowest tactical echelon. The means will consist of a combination of procedures, CIS, and communications networks, effectively supervised by intelligence specialists to ensure that the dissemination requirements are being satisfied. The intelligence architecture must be interoperable with the overall CIS architecture employed by the MAGTF and the joint force.

Utilization

Intelligence has no inherent value. Its value is realized through its support to operations. Thus, the intelligence cycle is not complete until the intelligence that has been developed is used in decisionmaking during planning and/or execution. The commander is responsible for the effective use of intelligence and for ensuring that decisions are based on the foundation provided by intelligence. The intelligence officer facilitates the effective use of intelligence, supervises the entire intelligence development effort, and assists the commander and the staff in understanding the intelligence product and its application.

The utilization phase also provides the basis for the continuous functioning of the intelligence cycle. On one hand, utilization will determine whether a requirement has been completely satisfied; requirements that have not been met will require additional intelligence development efforts. On the other hand, the satisfaction of one requirement normally generates new or additional requirements, the answers to which are needed to further refine or focus the decisionmaking process. In either case, utilization provides guidance and feedback that are used to initiate the next iteration of the cycle.

Figure 3-12. Notional Marine Expeditionary Force Intelligence Architecture.

Application of the Intelligence Cycle

The intelligence cycle is a procedural framework for developing mission-focused intelligence support. It is not an end in itself, nor should it be viewed as a rigid set of procedures that must be carried out in an identical manner on all occasions. The commander and the intelligence officer must consider each IR individually and apply the intelligence cycle in a manner that develops the required intelligence in the most effective way.

Application of the intelligence cycle will vary with the phase of the PDE&A cycle. In theory, a unique iteration of the intelligence cycle is carried out for each individual requirement. In practice, particularly during the planning phase, requirements are grouped together and satisfied through a single, concurrent intelligence development process. During the planning phase, intelligence development is generally carried out through two major iterations of the intelligence cycle.

The first primarily supports decision planning. Completing this iteration of the intelligence cycle results in preparing and using basic intelligence products—an intelligence estimate, supporting studies, and IPB analysis—that describe the battlespace and threat. These products form the basis for developing and selecting COAs.

The second iteration of the intelligence cycle supports execution planning. Decision and execution planning are defined and discussed in MCDP 5. It is an outgrowth of selecting the COA and forming a concept of operations. Implementing the collection plan, refinement of IPB analysis, and generating mission-specific intelligence products are integrated with the concept of operations to support mission execution. During execution, requirements are satisfied on a more individualized basis. New requirements are usually generated in response to a specific operational need. Each requirement is unique and must be satisfied in a timely manner to facilitate rapid decisionmaking and generating or maintaining tempo. (See figure 3-13 on page 3-18.)

The intelligence cycle will also be applied differently depending on the mission and the organizational level of the unit. For example, a MAGTF G-2 section will normally have a separate section that is specifically responsible for each phase of the intelligence cycle—a collections section, processing and exploitation agencies, a production element, and a dissemination section—with an intelligence operations section providing planning and direction for the overall effort. At the MAGTF level, intelligence is normally developed to satisfy multiple requirements concurrently, with simultaneous collection, processing, production, and utilization efforts being carried out by the separate functional sections. In contrast, a battalion or squadron S-2 section must carry out the cycle with a limited number of resources. It will generally focus on a single requirement or a small number of closely related requirements, moving through each phase of the cycle sequentially until that requirement is satisfied.

Counterintelligence

CI is the function of intelligence that is concerned with identifying and counteracting the threat posed by hostile intelligence capabilities and by organizations or individuals engaged in espionage, sabotage, subversion, or terrorism. The objective of CI is to enhance the security of the command by denying an adversary information that might be used to conduct effective operations against friendly forces and to protect the command by identifying and neutralizing espionage, sabotage, subversion, or terrorism efforts. (MCWP 2-14, *Counterintelligence*)

Responsibilities

CI, like all intelligence matters, is a command responsibility. In preparing for operations, all units must develop a CI plan and implement appropriate

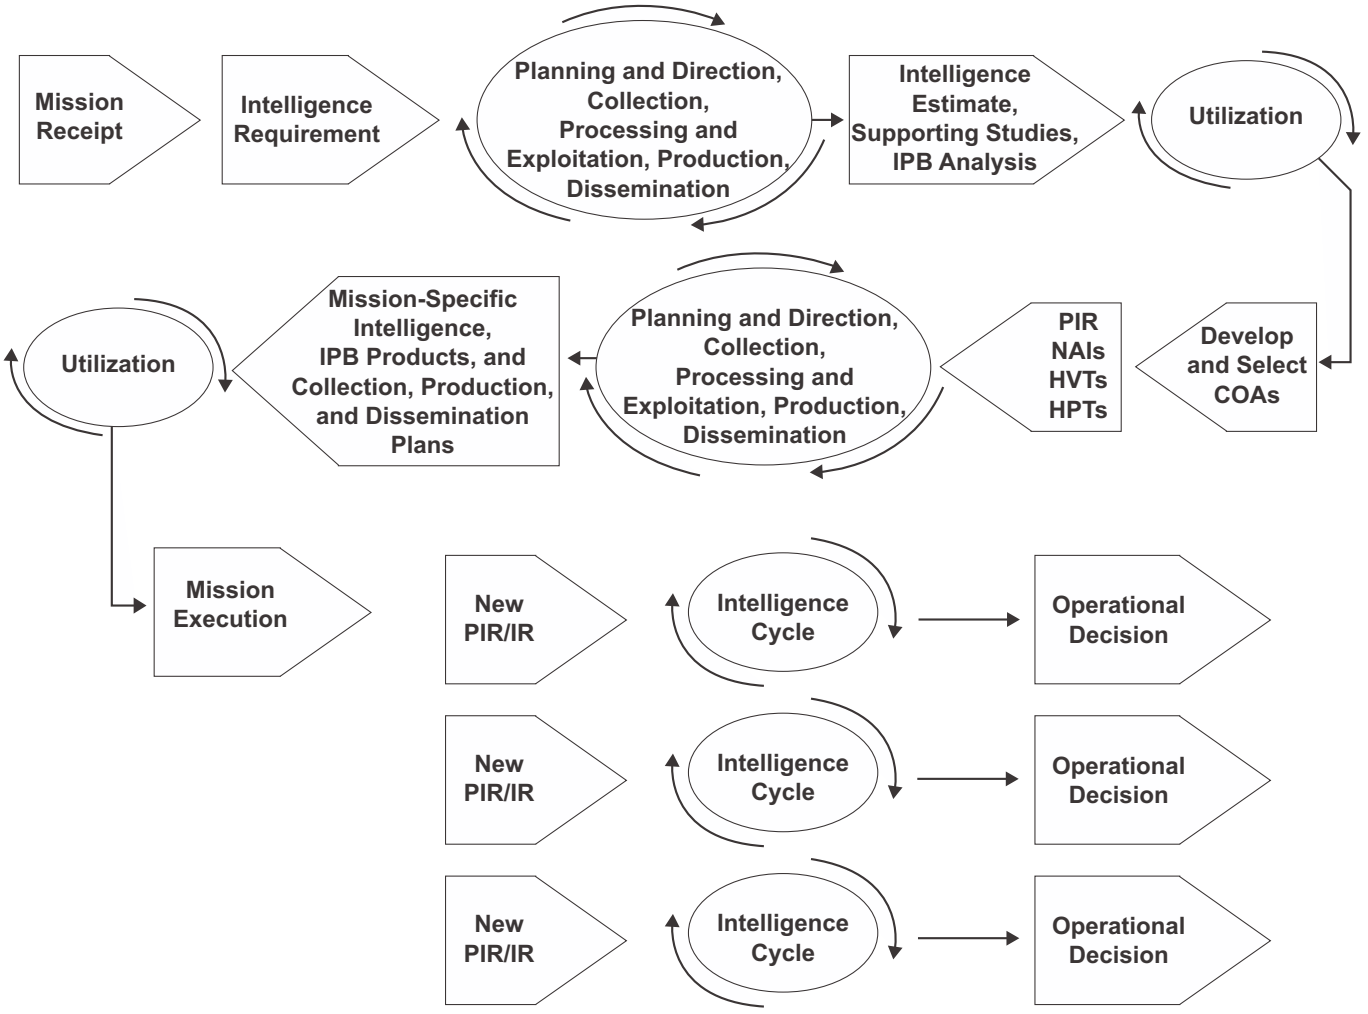

Figure 3-13. Application of the Intelligence Cycle.

CI measures to protect themselves from potential threats. The unit intelligence officer plans, implements, and supervises the CI effort for the commander. The G-2/S-2 may have access to or request support from MAGTF CI units and specialists to assist in developing CI estimates and plans. All members of the command are involved in executing the CI plan and implementing appropriate CI measures. Key participants in this process and their specific responsibilities follow:

- G-3/S-3-overall security and force protection, OPSEC, counterreconnaissance, and deception.
- G-6/S-6-CIS security.
- G-1/S-1-information security.
- Headquarters commandant-physical security of unit CP and echelons.

CI Planning

CI planning at all levels is conducted by using a standard methodology that consists of three steps: developing a CI estimate, conducting a CI survey, and developing the CI plan.

The CI Estimate

The CI estimate details the capabilities and limitations of foreign intelligence, subversive, and terrorist organizations that could carry out actions

against friendly units and facilities or against individuals, groups or locations of concern to our forces, such as the local population or civilian organizations operating in the area. It also provides an estimate of possible and probable COAs that these threat organizations will adopt. Intelligence and CI analysts of the MAGTF CE and CI/HUMINT company will normally prepare a comprehensive CI estimate that addresses threats to the MARFOR or MAGTF by using an IPB methodology that is focused on CI factors and the CI threat. However, each level of command must conduct its own evaluation to determine which of the adversary's capabilities identified in the MAGTF CI estimate represent a threat to their particular unit. The CI estimate must be updated on a regular basis. The revised estimate or appropriate CI warning reports must be disseminated to all units involved in the operation.

The CI Survey

The CI survey assesses a unit's security posture against the threats detailed in the CI estimate. The CI survey should identify vulnerabilities to specific foreign intelligence, espionage, sabotage, subversion or terrorist capabilities and provide recommendations on how to eliminate or minimize these vulnerabilities. The survey should be as detailed as possible. During the planning phase of an operation, it may be possible to do a formal, written survey. CI specialists from the CI/HUMINT company may be available to assist in this effort. In a time-compressed situation, the survey will likely result from a brief discussion between the appropriate intelligence, operations, communications, and security personnel. In either case, it is critical that the survey look forward in space and time to support developing the CI measures necessary to protect the unit as it carries out successive phases of the operation; i.e., the survey makes recommendations to improve the CI posture of the command for now and in the future.

The CI Plan

The CI plan details the activities and operations that the command will use to counter the CI threat. It includes procedures for detecting and monitoring the activities of foreign intelligence and terrorist organizations and directs the implementation of active and passive measures that are intended to protect the force from these activities. The CI plan is based on the threats identified in the CI estimate and the vulnerabilities detected by the CI survey. The MAGTF staff CI officer normally prepares a detailed, comprehensive CI plan that addresses the entire MAGTF. Included in the MAGTF CI plan are details of the employment of dedicated CI capabilities and the conduct of specialized CI operations intended to detect and neutralize or eliminate specific CI threats. Plans of subordinate MAGTF elements closely follow the MAGTF plan, normally adding only security measures that apply to their specific units. As with all plans, CI plans must be continually updated to ensure they are current and support ongoing and future operations.

CI Measures

CI measures encompass a broad range of activities designed to protect against the CI threat. The two general categories of CI measures are active and passive.

Active CI measures are those measures that are designed to neutralize or eliminate the foreign intelligence effort and adversary sabotage, subversion, and terrorism capabilities. Counterreconnaissance operations and deception activities are examples of active measures that are routinely employed by all units. Complex active CI measures such as counterespionage operations, counterterrorism operations, screening and interrogations, and CI force protection source operations are conducted only by CI personnel or other specialized organizations following the direction of the joint force and/or MAGTF commanders.

Passive CI measures are designed to conceal and deny information to foreign intelligence personnel and protect friendly personnel and installations from sabotage, subversion, and terrorism. Camouflage, security of classified material, emission control, information systems security, noise and light discipline, and physical access control are examples of passive CI measures that are employed extensively by all units.

The CI process is summarized in figure 3-14. For further details on CI responsibilities, planning, measures, and operations, see MCWP 2-14.

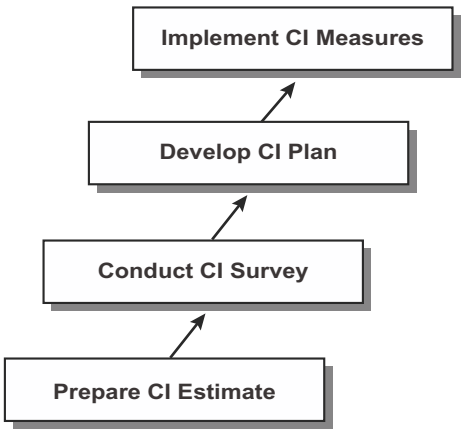

Figure 3-14. The Counterintelligence Process.

CHAPTER 4
CONCEPT OF MAGTF INTELLIGENCE SUPPORT

Marine intelligence operations are conducted primarily to facilitate the planning and execution of MAGTF operations through the development of tactical intelligence. The concept of MAGTF intelligence support ensures that the required intelligence is available to commanders at all levels throughout the force in time to influence their decisionmaking process. Key elements of this concept follow:

- Fully manned and capable organic intelligence sections down to maneuver battalion/squadron level.
- Directing the intelligence effort and maintenance of a robust collection, production, and dissemination capability at the MAGTF level.
- Employing specialized intelligence units to provide dedicated collection, processing, exploitation, and production of all-source intelligence.
- Creating key intelligence nodes at any level to concentrate intelligence support at critical times and locations. (These nodes are created through task organization, split-basing, and the use of intelligence direct support teams [DSTs].) An intelligence DST provides an enhanced intelligence capability to a supported intelligence section. A DST consists of one officer and several enlisted intelligence specialists. DSTs are organic to the MEF and each MSC G-2 sections.
- Full use of the intelligence support available from national, theater, joint, other Service component, and multinational forces to enhance MAGTF intelligence capabilities.
- Augmentation from global sourcing (noncommitted operating forces, the supporting establishment, and the Reserves) to enhance intelligence support to the MAGTF.

This intelligence support concept provides organic intelligence sections to commanders at all levels. These sections develop intelligence to satisfy their units' unique requirements. This intelligence supports their commander's tactical decisionmaking process and generates tailored intelligence products to facilitate mission execution.

Unit intelligence sections are supported by a primary MAGTF intelligence node that can perform all types of intelligence operations. The MAGTF G-2, through its combat intelligence center (CIC), provides centralized direction for the collection, production, and dissemination efforts of organic and supporting intelligence assets and ensures that these efforts remain focused on satisfying the PIRs that are essential to mission success. At the MEF CE level, the intelligence operations center (IOC) is the primary MAGTF intelligence node. Concentration of specialized intelligence capabilities in the radio battalion, the intelligence battalion, and the force reconnaissance company under this centralized direction facilitates unity of effort, effective employment of limited assets, and the collection and production of all-source intelligence.

The concept of intelligence support acknowledges the need to focus intelligence efforts in support of particular MAGTF elements during different phases of an operation. The MAGTF intelligence structure has the flexibility to provide such focused support through task organization. Enhanced support can be provided employing DSTs and integrating MAGTF intelligence assets.

Recognizing that organic intelligence capabilities may be limited in particular environments, the MAGTF can draw on the full range of national, theater, joint, other Service, allied, and multinational intelligence assets. When available, these capabilities will be fully integrated into MAGTF intelligence operations. If a separate Marine component

headquarters is established, it will support the MAGTF by performing those intelligence functions not directly related to warfighting, to include the following:

- Conducting detailed operational-level intelligence planning.
- Providing Marine intelligence liaison to joint task force (JTF) and other component intelligence elements.
- Monitoring the status of MAGTF intelligence collection and production requests for supporting and external support requirements.
- Planning the development and monitoring the adequacy of the JTF/MAGTF's intelligence architectures and the flow of intelligence to the MAGTF.
- Supporting Marine participation in intelligence support to the joint targeting process.

If a separate Marine component headquarters is not established, then the MAGTF CE's CIC will perform these functions. MSCs and other MAGTF elements will be able to access these external capabilities through the MAGTF intelligence architecture to pull available intelligence products on demand. Specialized intelligence units; e.g., the radio battalion or intelligence battalion, will have connectivity with appropriate external agencies to coordinate tasking or support.

Any MAGTF that is committed to an operation can be supported by intelligence assets of nondeployed MAGTFs, the supporting establishment or the Reserves. This support could consist of augmentation to fill shortfalls in manpower, equipment or specialized capabilities and assistance in developing intelligence in response to a Service-unique requirement. Flexibility to draw on assets from across the Marine Corps provides the ability to tailor and enhance particular intelligence capabilities based on the requirements of the committed MAGTF commander.

Role of the Organic Intelligence Section

Most commands from the battalion/squadron level and above in the operating forces have an organic intelligence section. The unit intelligence officer and section occupy the central role in the concept of MAGTF intelligence support. They focus the intelligence effort to develop, disseminate, and ensure effective use of intelligence in support of tactical operations. Intelligence drives operations and remains responsive to mission requirements through close and direct contact with the commander, key staff officers, and subordinate unit leaders.

The Unit Intelligence Officer

The commander directs the intelligence effort. The intelligence officer manages this effort for the commander, acting as the principal advisor on intelligence and implementing activities that carry out the commander's intelligence responsibilities. *The intelligence officer is a full participant in the commander's decisionmaking process, ensuring that intelligence is effectively used throughout the command during all phases of mission planning and execution*. Key responsibilities follow:

- Facilitate understanding and use of intelligence in the planning and execution of operations.
- Support situation development and the commander's estimate of the situation by identifying enemy capabilities, strengths, and critical vulnerabilities and opportunities and limitations presented by the environment.
- Assist the commander in developing PIRs.
- Ensure that the command's IRs are received, understood, and acted on by organic and supporting intelligence assets.
- Develop and disseminate all-source intelligence products that are tailored to the unit's mission and concept of operations.

- Monitor the effective flow of intelligence throughout the command.
- Provide BDA data and analysis to assist the combat assessment process.

The Unit Intelligence Section

The unit intelligence section supports the commander, the intelligence officer, and the entire command through the production and dissemination of mission-oriented intelligence products. Primary functions follow:

- Conduct IPB analysis for the unit's AO and interest.
- Develop and maintain a comprehensive intelligence estimate.
- Tailor intelligence produced at all levels to meet specific unit requirements.
- Form collection plans and support requests to satisfy unit PIRs and IRs.
- Maintain an accurate image of the battlespace and enemy situation.
- Prepare target analysis and target intelligence products.
- Recommend CI and force protection measures.
- Provide linkage to supporting intelligence assets.

Each organic intelligence section performs all six intelligence functions described in chapter 1. However, the priority and level of effort applied to the different functions will vary with the type of unit, level of command, and assigned mission. For example, an infantry battalion S-2 section will normally focus on support of the commander's estimate and situation development, while the S-2 of a combat service support (CSS) unit may concentrate on support of force protection, and the intelligence section of a fixed-wing Marine aircraft group usually places priority on support of targeting and combat assessment (particularly BDA).

Required Capabilities

To carry out these responsibilities, organic intelligence sections must have the following capabilities:

- Sufficient manning to carry out assigned responsibilities.
- Training in all aspects of tactical intelligence development, emphasizing the production of tailored, all-source, mission-specific intelligence products.
- Organic collection, processing, production, and dissemination assets appropriate to its mission and level of command.
- Connectivity to other MAGTF intelligence assets to provide a common picture of the battlespace, receive warning and other critical intelligence, and achieve access for "pulling" pertinent intelligence in response to unit requirements.
- Formation as a base for developing a larger intelligence support node, task-organized to provide expanded intelligence capabilities during particular phases of an operation.

The MAGTF Intelligence Section

The MAGTF intelligence section resident in the MAGTF CE is the focal point for intelligence operations and development in the MAGTF.

MAGTF Intelligence Officer

The MAGTF G-2/S-2, supported by the CIC and its subordinate sections, provides centralized direction for the MAGTF's comprehensive intelligence effort. The G-2/S-2 serves as the intelligence officer for the MAGTF commander. The CIC serves as the primary intelligence node for the entire MAGTF. As such, the CIC must remain responsive to the requirements of all MAGTF elements. The MAGTF intelligence section performs the following tasks:

- Provides centralized direction for MAGTF intelligence operations.

- Plans and implements a concept for intelligence support based on the mission, concept of operations, and commander's intent.
- Consolidates, validates, and prioritizes IRs of the MAGTF.
- Recommends MAGTF PIRs to the MAGTF commander.
- Maintains a consolidated, all-source production center in the MAGTF all-source fusion center (AFC).
- Plans, develops, and directs the MAGTF collection, production, and dissemination plans and operations.
- Directs the employment of MAGTF organic collection assets through the surveillance and reconnaissance cell (SARC) and the operations control and analysis center (OCAC).
- Submits consolidated requests for external intelligence support through the Marine component headquarters to appropriate agencies.
- Links the MAGTF to national, theater, joint, other Service, and multinational intelligence assets and operations.
- Prepares a comprehensive CI plan with recommended force protection measures.
- Supervises the execution of appropriate active and passive CI measures, CI functions, and CI services.

In addition to the responsibilities of all MAGTF intelligence officers, the MEF assistant chief of staff (AC/S) G-2 exercises staff cognizance over several special staff officers and their intelligence units/organizations. (See figure 4-1.)

The AC/S G-2 has staff responsibility for intelligence and intelligence operations. The commander relies on the intelligence officer to provide information on weather, terrain, and enemy capabilities, status, and intentions. Through the intelligence OPLAN and supporting intelligence, CI, and reconnaissance and surveillance (R&S) plans, the G-2 validates and plans information requirements; coordinates intelligence priorities, integrates collection, production, and dissemination activities; allocates resources; assigns specific intelligence and reconnaissance missions to subordinate elements; and supervises the overall intelligence, CI, and reconnaissance efforts. Specific responsibilities follow:

- Develop and answer outstanding MEF and subordinate units' priority information requirements and information requirements by planning, directing, integrating, and supervising organic multidiscipline MEF and supporting intelligence operations.
- Prepare appropriate intelligence, CI, and reconnaissance plans and orders for the MEF and review and coordinate the all-source intelligence CI and reconnaissance plans of JTFs, theaters, and other organizations.
- Submit and coordinate all-source collection, production, and dissemination requirements beyond the capability of the MEF to satisfy to higher headquarters for JTF, theater or national intelligence support.
- Ensure intelligence information is rapidly processed, analyzed, and incorporated where appropriate in all-source intelligence products, and rapidly disseminated to all MEF and external units requiring these.
- Evaluate JTF, theater, and national all-source intelligence support and adjusting stated IRs, if necessary.
- Identify and correct deficiencies in intelligence, CI, and reconnaissance personnel and equipment resources.
- Incorporate intelligence in training exercises to improve MEF individual, collective, and unit readiness.
- Facilitate understanding and use of intelligence in support of the planning and execution of MEF operations.

Special Staff Officers under the Staff Cognizance of G-2 Officer

G-2 Operations Officer

The G-2 operations officer has primary responsibility for intelligence support to the commanding officer and the remainder of the CE in support of

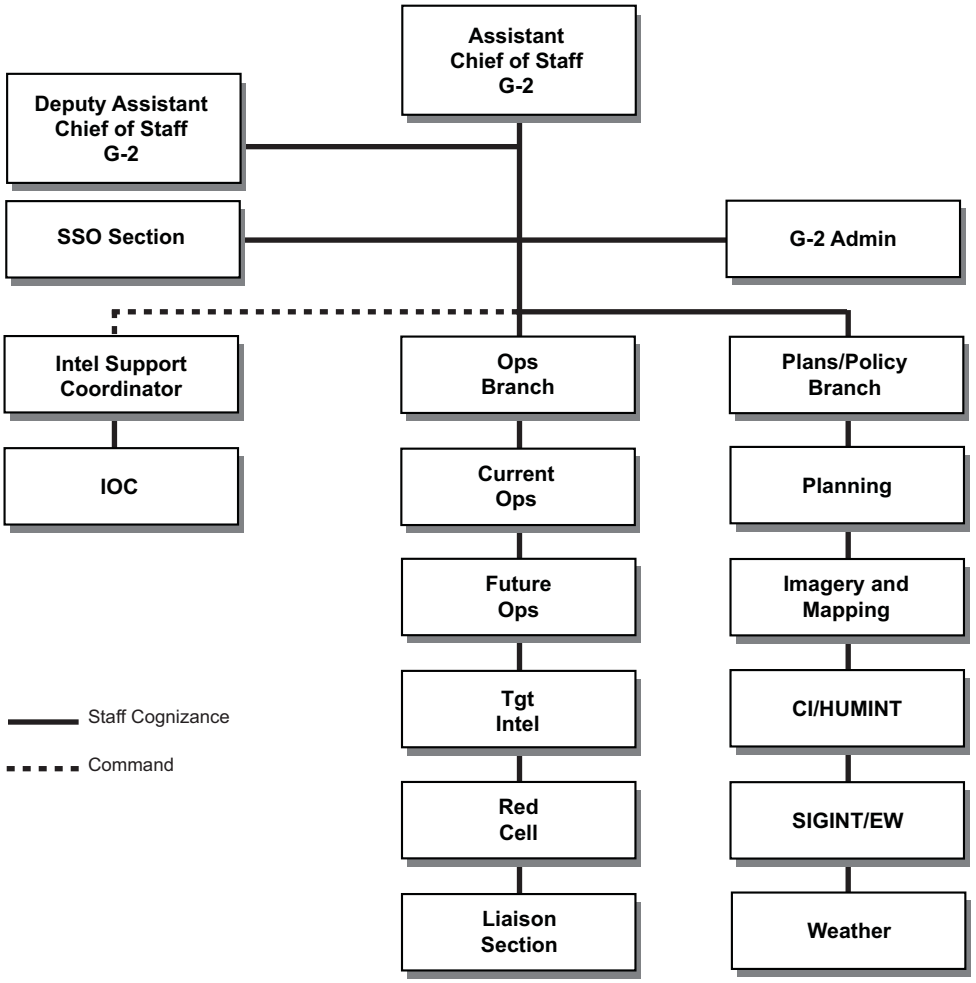

Figure 4-1. Special Staff Officers and Relationships under the Staff Cognizance of the MEF G-2.

current and future operations. Specific responsibilities include the following:

- Coordinate and provide intelligence support to the commander, the G-3 operations section, and the rest of the commander's battle staff.
- Serve as the G-2 representative to the MEF CE crisis action team.
- Coordinate, provide, and supervise intelligence support to the MEF CE current operations center, future operations center, and force fires.
- Plan, direct, and supervise the Red Cell.
- Provide recommendations on PIR and IR validation, prioritization, and taskings to the AC/S G-2 and the intelligence support coordinator (ISC). The intelligence battalion commander is dual-hatted as the ISC.
- Coordinate and supervise the transition of intelligence planning and operations from G-2 plans to G-2 future operations, and from G-2 future operations to G-2 current operations, to effectively support the MEF's "single battle" transition process.
- Plan, direct, and supervise MEF liaison teams to external commands; e.g., the JTF and joint

functional components headquarters, and intelligence organizations.
- Coordinate with the ISC and MEF MSCs' G-2 operations officers to ensure unity of effort of MEF intelligence operations.
- Provide intelligence input and other support to MEF warning and fragmentary orders and to operations related reporting; e.g., periodic situation reports.
- Coordinate intelligence training for the MEF G-2 section and providing G-2 oversight for and integration of the entire MEF intelligence training program.
- Perform other intelligence support and tasks as directed by the AC/S G-2.

G-2 Plans Officer

The G-2 plans officer has primary responsibility for intelligence support to the future plans cell. Specific responsibilities follow:
- Plan the MEF concept of intelligence operations for approval by the AC/S G-2 and subsequent implementation by the integrated staff cell based upon the mission, threat, commander's intent, guidance, and concept of operations.
- Lead, coordinate, and provide intelligence support to MEF G-5 future plans section.
- Plan and coordinate intelligence support requirements for and the deployment of intelligence elements and resources into the AO.
- Provide recommendations on PIR and IR validation, prioritization, and taskings to the AC/S G-2 and the ISC.
- Coordinate, in conjunction with the ISC, G-2 development of Annex B (Intelligence) and Annex M (Geospatial Information and Services) to MEF OPLANs.
- Keep the G-2 section, other CE staff sections, intelligence liaison personnel, augmentees, and others apprised of MEF intelligence planning actions and requirements.
- Identify requirements and provide recommendations to the G-2 operations officer for MEF intelligence liaison teams to external commands; e.g., the JTF or other components' headquarters and intelligence agencies.
- Coordinate and develop policies for MEF intelligence, CI, and reconnaissance operations.
- Plan, direct, and supervise the MEF G-2's imagery and mapping, CI/HUMINT, SIGINT, and weather sections.
- Perform other intelligence support and tasks as directed by the AC/S G-2.

Intelligence Battalion Commander/ Intelligence Support Coordinator

The intelligence battalion commander is responsible for planning, directing, collecting, processing, producing and disseminating intelligence, and providing CI support to the MEF, MEF MSCs, subordinate MAGTFs, and other commands as directed.

Garrison. In garrison the principal task of the intelligence battalion commander is to organize, train, and equip detachments that support MAGTFs or other designated commands to execute integrated collection, intelligence analysis, production, and dissemination of intelligence products.

During Operations. During operations the intelligence battalion commander is dual-hatted as the ISC, serving as such under the direct staff cognizance of the MEF AC/S G-2. The intelligence battalion's S-3 section, along with the operations center element of the MEF G-2, form the core of the ISC support effort, with planning, direction, and C2 conducted within the IOC's support cell. As the ISC, he is responsible to the MEF AC/S G-2 for the overall planning and execution of MEF all-source intelligence operations. Specific responsibilities of the ISC during actual operations follow:
- Implement the concept of intelligence operations developed by the G-2 plans officer and approved by the AC/S G-2.
- Establish and supervise operation of the MEF IOC, which includes the support cell, the

SARC, and the production and analysis (P&A) cell. Generally the IOC will be collocated with the MEF CE's main CP.

- Develop, consolidate, validate, and prioritize recommended PIRs and IRs to support MAGTF planning and operations. The ISC is tasked to perform PIR and IR validation and prioritization *only* during operations when the IOC is activated. During routine peacetime operations, the PIR/IR validation and prioritization tasks are the responsibility of the MEF CE's G-2 operations officer.
- Plan, develop, integrate, and coordinate MEF intelligence collection, production, and dissemination plans, to include the effective organic and external integration and employment and staff cognizance of MEF SIGINT, CI, HUMINT, geographic intelligence, IMINT, ground remote sensors, ground reconnaissance, and tactical air reconnaissance intelligence collections, production, and dissemination operations.
- Develop, in conjunction with the G-2 plans officer and G-2 operations officer, and complete Annex B (Intelligence) and Annex M (Geospatial Information and Services) to MEF operation orders (OPORDs).
- Plan, develop, integrate, and coordinate intelligence and CI support to the commander's estimate, situation development, I&W, force protection, targeting, and combat assessment.
- Manage and fuse the threat (or *red*) common operational picture (COP)/common tactical picture (CTP) inputs from subordinate units and external commands and intelligence agencies into the MEF CE's threat COP/CTP.
- Provide intelligence support to the MEF CE G-2 section and the MSCs.
- Prepare the intelligence and CI estimates to support G-2 plans.
- Plan, develop, and coordinate intelligence CIS architecture, to include its integration with and support of MEF IMINT and other intelligence and reconnaissance requirements.
- Coordinate and integrate all-source intelligence operations with other Service components, JTF joint intelligence support element (JISE), theater joint intelligence center (JIC) or joint analysis center, and national intelligence agencies and operations to include all aspects of intelligence reach back support.
- Assist with the evaluation and improvement of MEF all-source intelligence, CI, and reconnaissance operations.
- Perform other intelligence support and tasks as directed by the AC/S G-2.

Figure 4-2 is a summary of the principal responsibilities of the AC/S G-2's three principal subordinate staff officers.

Intelligence Support Coordinator

- Plan and execute intelligence operations to support all MEF IRs.
- Establish and direct the IOC (P&A cell, SARC, and support cell).
- IR management (collection, production and dissemination) validation, prioritization, and tasking per AC/S G-2 direction.
- Intelligence operations command of intelligence battalion and staff cognizance over SIGINT, CI, HUMINT, MASINT, IMINT, and air/ground reconnaissance (or designated G-2 elements).

G-2 Operations Officer

- Intelligence support to MEF CE battlestaff and current operations center agencies.
- Coordination and support to higher and adjacent headquarters and agencies.
- Recommends IR validation, prioritization, and tasking to AC/S G-2.
- Establish and direct intelligence elements and support to the current operations center, future operations center, target intelligence section, force fires, Red Cell, and MEF intelligence liaison teams.

G-2 Plans Officer

- Intelligence support to the G-5 future planning team for future planning IRs.
- Recommend IR validation, prioritization, and tasking to AC/S G-2.
- Establish and direct the G-2 future planning intelligence element.
- G-2 section's imagery & mapping, CI/HUMINT, SIGINT, and weather sections (less that under the staff cognizance of the ISC).

Figure 4-2. AC/S G-2's Principal Subordinate Staff Officers and their Responsibilities.

Collection Management/Dissemination Officer. The collection management/dissemination officer (CMDO) is sourced from the intelligence battalion's S-3 section and is a key subordinate to the intelligence battalion commander/ISC during operations. The CMDO is

responsible for formulating detailed intelligence collection requirements and intelligence dissemination requirements and tasking and coordinating internal and external operations to satisfy these. The CMDO receives validated PIRs and IRs and direction from the ISC, and then plans and manages the best methods to employ organic and supporting collection and dissemination resources through the intelligence collection and dissemination plans (tabs to Appendix 16, *Intelligence Operations Plan*, to Annex B.) The CMDO is also responsible for validating and forwarding national and theater intelligence collection requests from the MEF and MSCs typically using appropriate intelligence tools and TTP. He also is responsible for coordinating intelligence CIS requirements and maintaining awareness of available CIS connectivity throughout the MAGTF and with key external organizations.

During operations the CMDO works within the support cell. In coordination with the P&A cell officer in charge (OIC), the SARC OIC, G-2 operations officer, intelligence/reconnaissance commanding officers/OICs, and the MEF G-6, the CMDO is responsible to the ISC for the following tasks:

- Determine and coordinate the collection effort of PIRs/IRs that may be collected via intelligence, CI, and reconnaissance resources.
- Determine PIRs/IRs and prepare requests for intelligence that are beyond organic capabilities and prepare submissions to higher headquarters and external agencies for support.
- Recommend dissemination priorities, development of intelligence reporting criteria, and advise on and selecting dissemination means.
- Develop and coordinate all-source intelligence collection plans, coordinate and integrate these with MEF, other components, JTF, theater, and national intelligence production operations.
- Develop and coordinate all-source intelligence dissemination plans and supporting architectures for voice and data networked communications, and coordinate and integrate these with MEF, other components, JTF, theater, and national intelligence CIS and dissemination operations.
- Monitor the flow of intelligence throughout the MEF and ensure that it is delivered to intended recipients in a timely fashion and satisfactorily meet their needs.
- Evaluate the effectiveness of MEF and supporting intelligence collection and dissemination operations.

SARC OIC

The SARC OIC is also an immediate subordinate of the ISC and is responsible for supervising the execution of the integrated organic, attached, and direct support intelligence collection and reconnaissance operations. The SARC OIC is responsible to the ISC for accomplishing the following specific responsibilities:

- Coordinate, monitor, and maintain the status of all ongoing intelligence, CI, and reconnaissance collection operations. This includes—
  - Missions, tasked intelligence collection requirements, and reporting criteria for all collection missions.
  - Locations and times for all pertinent fire support control measures.
  - Primary and alternate CIS plans for routine and time-sensitive requirements for intelligence users (collectors, the SARC, and key MEF, CE, and MSC C2 nodes) to support ongoing C2 of collection operations and dissemination of acquired data and intelligence via the most expeditious means.
- Conduct detailed intelligence collection planning and coordination with the MSCs and intelligence, CI, and reconnaissance organizations' planners, with emphasis on ensuring understanding of the collection plan and specified intelligence reporting criteria.
- Ensure other MAGTF C2 nodes; e.g., the current operations center or force fires are apprised of ongoing intelligence, CI, and reconnaissance operations.

- Receive routine and time-sensitive intelligence reports from deployed collection elements; cross-cueing among intelligence collectors, as appropriate; and the rapid dissemination of intelligence reports to MAGTF C2 nodes and others in accordance with standing PIRs/IRs, intelligence reporting criteria and dissemination plan, and the current tactical situation.

P&A Cell OIC

The P&A cell OIC is the third principal subordinate to the ISC, with primary responsibility for managing and supervising the MEF's all-source intelligence processing and production efforts. Key responsibilities follow:

- Plan, direct, and manage operations of the AFP (to include the fusion, order of battle, IPB, and target intelligence/battle damage assessment teams), the topographic platoon, the IIP, the DSTs, and other P&A elements as directed.
- Coordinate and integrate P&A cell operations, estimates, and products with the MEF G-2 section's G-2 operations branch and its Red Cell operations and estimates.
- Maintain all-source automated intelligence databases, files, workbooks, country studies, and other intelligence studies.
- Plan and maintain imagery, mapping, and topographic resources and other intelligence references.
- Administer, integrate, operate, and maintain intelligence processing and production systems, unclassified general service and senstitive compartmented information systems; e.g., the intelligence analysis system or the image product library.
- Analyze and fuse intelligence and other information into tailored all-source intelligence products to satisfy all supported commanders' stated or anticipated PIRs and IRs.
- Develop and maintain current and future intelligence situational, threat, and environmental assessments and target intelligence based upon all-source analysis, interpretation, and integration.

Manage and fuse the threat COP/CTP inputs from subordinate units and external commands and intelligence agencies into the MEF CE's threat COP/CTP.

MAGTF Intelligence Units

The limited number of specialized intelligence assets, coupled with the requirement to integrate and focus intelligence operations on the satisfaction of the command's PIRs, creates the need for centralized management. Intelligence units whose capabilities support the entire MAGTF are employed in general support of the MAGTF with staff cognizance exercised through the G-2/S-2. Certain intelligence units are capable of performing operational tasks in addition to their primary intelligence functions. For example, a force reconnaissance team may carry out a laser target designation mission or a UAV may be used to assist in maneuver control. Likewise, radio battalion may support maneuver and fires through electronic attack operations. The MAGTF G-2/S-2 provides centralized direction for these assets and facilitates unity of effort, the production of all-source intelligence, and the effective use of limited resources in support of the requirements of the entire force. Direction is provided primarily through MAGTF-level intelligence C2 agencies; e.g., the SARC and the OCAC. Subordinate elements of the MAGTF retain organic intelligence assets and OPCON appropriate to their mission and level of command; e.g., division ground reconnaissance units remain under the OPCON of the division commander.

Organization of MAGTF-Level Intelligence Units

Radio Battalion

The radio battalion provides ground-based SIGINT, electronic warfare (EW), communications security

monitoring, and special intelligence communications capability to support MAGTF operations. In addition to directing the employment of its subordinate elements, the radio battalion is the focal point for MAGTF ground-based SIGINT operations. It plans and coordinates these activities through the OCAC.

Intelligence Battalion

The intelligence battalion plans, directs, collects, produces, and disseminates intelligence and provides CI support to the MEF, MSCs, subordinate MAGTFs and other commands as directed. This support is usually provided by a task-organized detachment sent to the supported command. Within the intelligence battalion is a headquarters company, a P&A company, and a CI/HUMINT company. (See figure 4-3.).

Headquarters Company

The headquarters company consists of a systems support platoon, collections platoon, and the GSP. The systems support platoon maintains the intelligence systems within the battalion in garrison and in the field should the battalion deploy. The collections platoon manages intelligence requirements for the battalion. The GSP is responsible for planning, controlling, and managing the employment of unattended ground remote sensor equipment in support of MAGTF operations or other commands as directed.

P&A Company

The P&A company consists of an AFP, a topographic platoon, and an IIP. The AFP provides fused intelligence to the supported MAGTF and

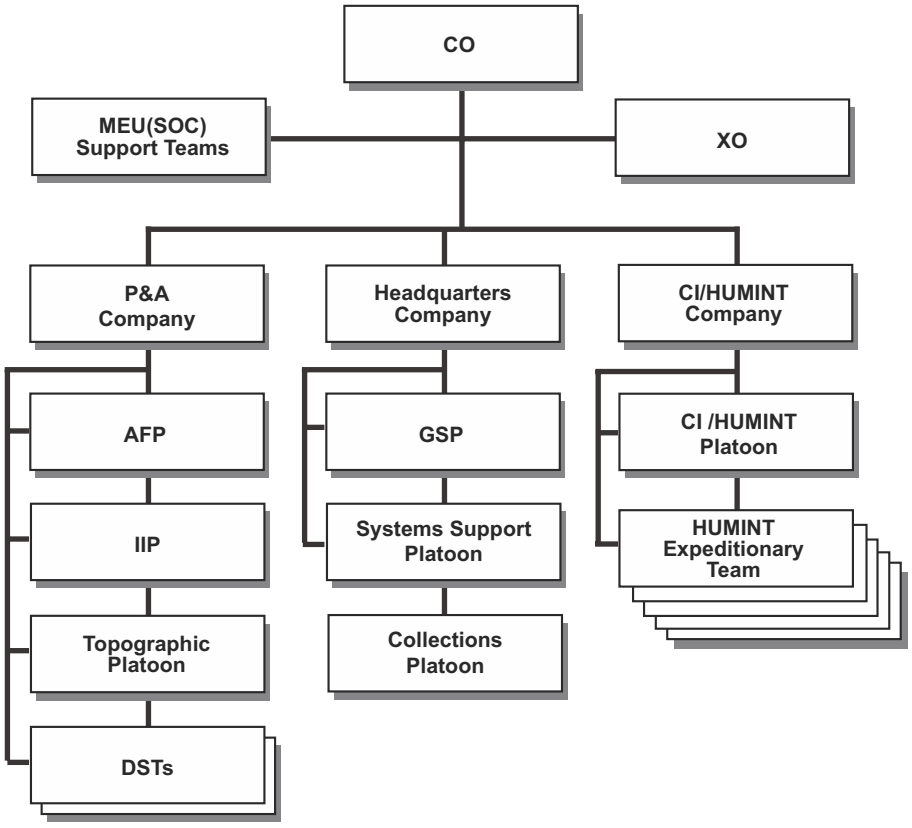

Figure 4-3. Intelligence Battalion.

assists MSC intelligence sections in providing situational awareness to their commanders and staff. The topographic platoon provides geographic intelligence products and services, geodetic and topographic surveys, and hydrographic analysis. The IIP provides imagery analysis support and dissemination to the MAGTF and other commands as directed.

CI/HUMINT Company

The CI/HUMINT company provides CI and HUMINT support to MAGTF operations. This support encompasses the full range of tactical CI and HUMINT operations, including screening operations, interrogation/debriefing of enemy prisoners of war and persons of intelligence interest, conduct of CI force protection source operations, conduct of CI surveys and investigations, preparation of CI estimates and plans, translation of documents, and limited exploitation of captured material. In addition, the CI/HUMINT company maintains a technical surveillance countermeasures team with equipment. CI/HUMINT Marines deploy as a task-organized HUMINT exploitation team (HET) in direct support of MAGTF's and subordinate elements.

Force Reconnaissance Company

The force reconnaissance company conducts preassault and deep postassault R&S in support of MAGTF operations. The company uses specialized insertion, patrolling, reporting, and extraction techniques to carry out amphibious and deep R&S tasks in support of the MAGTF. The company can perform a variety of other operational tasks. When a conflict exists between the requirements for R&S and other missions, the MAGTF commander determines the priority of tasking for the company based on recommendations from the G-2/S-2 and G-3/S-3.

Marine Unmanned Aerial Vehicle Squadron (VMU)

VMUs provide day/night, real-time imagery reconnaissance, surveillance, and target acquisition in support of the MAGTF. The unique capabilities of the UAV can also be used to support target engagement, assisting in the control of fires/supporting arms and maneuver. Squadrons are under the administrative control of the Marine aircraft wing (MAW). However, because of the limited number of assets and the critical capabilities they provide to the entire force, the MAGTF commander retains OPCON of the VMUs.

Employment of MAGTF Intelligence Units

MAGTF intelligence units are employed to meet the requirements of the entire force. The MAGTF G-2/S-2 develops a concept of intelligence support, which employs these units on the basis of the MAGTF mission, PIRs, concept of operations, and commander's intent. This concept must integrate intelligence activities with operations to provide key intelligence to commanders to enable rapid and effective decisionmaking. Based on the results of IPB analysis and the concept of operations, assets are positioned to satisfy PIRs, expose enemy vulnerabilities, monitor key locations, detect and assist in the engagement of targets, and identify opportunities as they arise in the battlespace.

Intelligence units are employed in either general or direct support. Under general support, units are tasked by the MAGTF commander through his G-2/S-2 to satisfy the requirements of the entire force. Because of the limited number of specialized intelligence assets and their ability to develop intelligence that is relevant to current and future operations in all areas of the battlespace (deep, close, and rear), general support is the preferred support relationship. Under direct support, the requirements of a supported commander are given priority. Direct support is used to focus intelligence support for particular phases of an operation or to create enhanced intelligence nodes in support of MAGTF subordinate elements. When MAGTFs smaller than a full MEF are deployed, they will normally be supported by

attached, task-organized detachments from the intelligence battalion, the force reconnaissance company, and the radio battalion.

Focused Intelligence Support

Intelligence must be integrated with the mission, commander's intent, and concept of operations and should normally be weighted to support the main effort. The MAGTF intelligence structure has the flexibility to tailor its capabilities to meet the requirements of various types of expeditionary operations and to adapt to changing operational needs during the execution. For each operation, the MAGTF G-2/S-2 will assess the IRs and develop a concept of intelligence support that positions assets where they can best satisfy those requirements. Intelligence nodes will be used to focus support within the MAGTF. Split-basing will be used to build intelligence nodes within and outside the AO to deliver comprehensive and reliable intelligence support while reducing the size of the deployed force. Intelligence units and DSTs are employed to tailor and enhance the capabilities of organic intelligence sections or to create task-organized intelligence nodes in response to specific requirements.

Intelligence Nodes

The MAGTF can create a series of intelligence nodes, thereby providing focused intelligence support to specific units or areas based on the tactical situation. In the concept of intelligence support, the MAGTF G-2/S-2, in conjunction with the MSC intelligence officers, task-organizes the MAGTF's intelligence units and uses intelligence DSTs to deliver the required intelligence capabilities at key points and times. Although these nodes normally support a specific unit, they can also be used in an area-support mode where an intelligence node is established to support all units operating in a particular sector of the battlespace. For example, during sustained operations ashore, an intelligence node could be built to support units operating in the MAGTF's rear area. Such a node could be built around a DST and specialists from the CI/HUMINT company and topographic platoon. This node might support the rear area operations center, CSSE units operating in the area or any security detachments located within the node's area of responsibility.

Split-basing

Intelligence nodes can also be used to tailor the footprint of the intelligence organization within and outside of a designated AO. Intelligence assets are positioned where they can best carry out their assigned functions. In many cases, it may not be necessary or desirable to forward deploy the entire MAGTF intelligence structure. The concept of operations, C2 support system, physical space limitations, and resource and/or logistical or other constraints may require the split-basing of intelligence assets.

Split-basing is the positioning of critical capabilities within the AO to support the deployed commander and forces, while maintaining in-depth intelligence management, processing, exploitation, analysis, and production elements in rear areas, intermediate support bases, staging areas or garrison locations. Split-basing enables reach back capabilities and can enhance the intelligence effort by providing continued access to sophisticated, nondeployable intelligence capabilities and resources. At the same time, it reduces the footprint of the deployed force, diminishing risk from enemy action and decreasing the administrative and logistic support requirements.

Split-basing is especially useful—

- When operations are conducted in areas with minimal infrastructure and support.
- When there are limitations on the number of personnel who can be deployed within the operating area.

- During the deployment phase when it may not be possible to immediately move all required elements of the intelligence structure to the forward area.

However, the advantages of split-basing must be assessed against its costs, particularly its critical dependence on responsive and reliable communications support.

Task Organization of Intelligence Support Units

Task organization of intelligence support units is one of the principal means for the MAGTF commander to shape the intelligence effort. The collection, exploitation, and unique production capabilities of specialized intelligence units significantly enhance the ability of supported G-2/S-2 sections to develop timely, mission-focused intelligence.

Intelligence battalion, force reconnaissance company, and radio battalion elements are task-organized to provide tailored intelligence capabilities. Specific capabilities provided are based on the threat, the supported unit's anticipated requirements (as determined through IPB), and the concept of operations. Elements from some or all of the intelligence battalion's subordinate companies are combined into intelligence battalion detachments. The CI/HUMINT company provides HETs. The radio battalion forms task-organized SIGINT support units (SSUs), which provide a mix of SIGINT and EW capabilities.

When MAGTFs smaller than a full MEF deploy, an intelligence battalion detachment, a HET, force reconnaissance platoons, and a radio battalion SSU will normally be attached to the MAGTF CE. In MEF operations, when the entire radio battalion, intelligence battalion, and force reconnaissance company are employed, detachments, HETs, SSUs, and platoons may be placed in direct support as required to provide tailored intelligence capabilities or to create an enhanced intelligence node in support of an MSC or other MAGTF element.

Intelligence DSTs

Intelligence DSTs are organic to the intelligence battalion and each of the division, MAW, and force service support group G-2 sections. Teams are made up of one officer and several enlisted personnel who have a mix of intelligence specialty skills. DSTs are used to provide an enhanced analytical and dissemination capability to a unit intelligence section and to link the intelligence structure to the supported units. As assigned by the G-2, they augment the supported unit's intelligence section to carry out the following tasks:

- Perform P&A in support of future operations.
- Tailor AFC and other external source intelligence products to the needs of the supported commander.
- Assist in the management of external intelligence support requirements.
- Facilitate dissemination of intelligence received from external sources.

The MEF and MSC G-2s use their DSTs to tailor and focus intelligence support to units designated as the main effort or to create enhanced intelligence nodes at key times and places in the battlespace.

Intelligence Coordination

Establishing and supervising operation of the MEF IOC, which includes the support cell, the SARC, and the P&A cell, requires a high degree of coordination at all levels. Generally the IOC will be collocated with the MEF CE's main CP. See figure 4-4 on page 4-14 for the basic IOC organization.

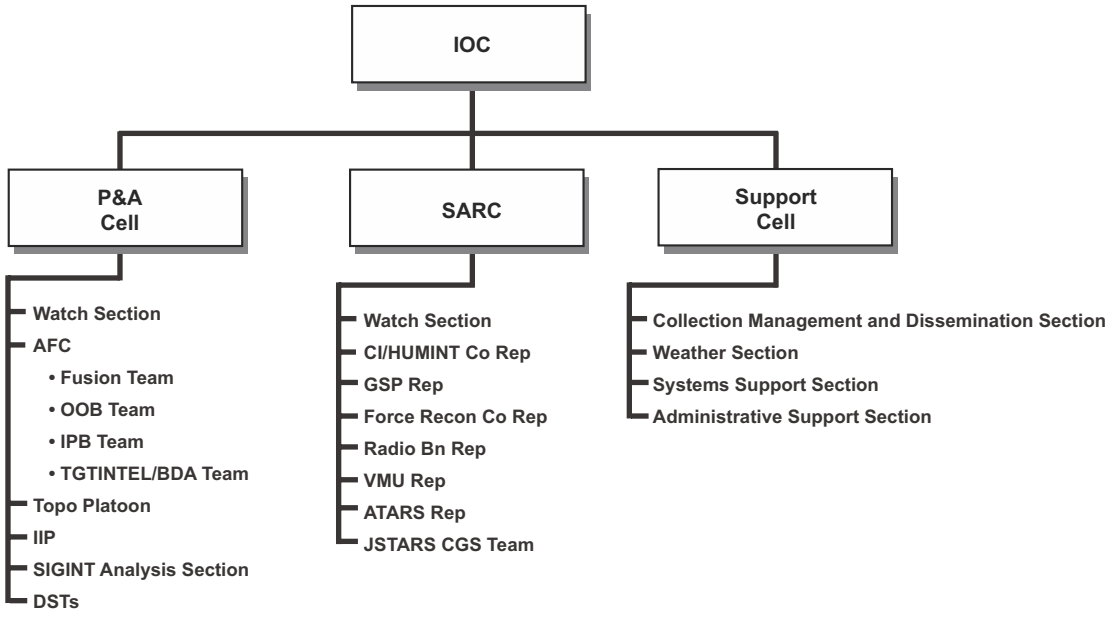

Figure 4-4. Intelligence Operations Center.

External Intelligence Support to the MAGTF

MARFOR Component Intelligence Section

Future military operations will normally be joint operations and may require establishing a MARFOR component headquarters. The Marine component is the level of command that deals directly with the JFC—the theater combatant commander or JTF commander—for MARFORs assigned to combatant command or the JTF. The Marine component functions at the operational level of war to advise and assist the JFC in employing MARFORs while supporting the MAGTF. The Marine component commander coordinates operational actions with the JFC and the other component commanders so that the MAGTF commander can concentrate on warfighting.

Responsibilities

The Marine component intelligence section plays a crucial role in supporting the component commander and staff and in providing intelligence support to the MAGTF. The Marine component supports and enhances the planning and execution of MAGTF intelligence operations through close and continuous coordination with the JFC, joint force headquarters, and other component intelligence organizations. The Marine component G-2 section maintains situational awareness and provides a limited analytical capability to support the component future planning responsibility. It does not normally conduct collection operations or engage in detailed, formal intelligence production. It facilitates, but does not control, the flow of intelligence to the MAGTF. The component relieves the MAGTF commander of intelligence functions that are not directly related to warfighting.

Functions

The size of the Marine component G-2 section will vary with the size of the JTF and the scope of the operation. For major joint operations, the Marine component intelligence section provides the following functions:

- **Planning.** The intelligence section plans and coordinates component and MAGTF connectivity to national, theater, and JTF intelligence architectures. The Marine component develops the architecture to provide the MAGTF with timely, tailored national and theater intelligence. The component G-2 coordinates the provision of additional Service intelligence support (units, personnel, and equipment) to the MAGTF through the Service chain of command.
- **Collection management.** The intelligence section monitors the status of MAGTF collection requests for supporting and external collection resources. The MARFOR leverages joint and national collection resources in support of the MAGTF. It advocates Service component and MAGTF requirements in theater and JTF collection forums and recommends the allocation and tasking of national, JTF, and other component assets to meet MAGTF requirements.
- **P&A.** The intelligence section provides situational awareness to the component commander and staff and limited P&A to support the future planning responsibilities of the component headquarters. This function requires the establishment of a watch section and an analytical element that can tailor operational-level intelligence products to satisfy the needs of component planning cells. The component G-2 monitors the status of and coordinates support for MAGTF production requirements and requests for intelligence that are submitted to joint force or supporting intelligence agencies.
- **Dissemination.** The intelligence section monitors the adequacy of the intelligence architecture and the flow of intelligence to the MAGTF. Intelligence is disseminated directly to the appropriate MAGTF elements, not through the component headquarters unless specifically required. However, the MARFOR facilitates and accelerates the flow of critical intelligence to the MAGTF. The component intelligence section remains aware of current MAGTF requirements and ensures that intelligence that is developed or received by the theater or JTF that can satisfy those requirements is disseminated to the MAGTF.
- **Support of targeting.** The intelligence section supports Marine component participation in the joint targeting process, including representation at various joint target intelligence and/or targeting forums as required. Performing this function ensures that MAGTF target intelligence collection and production requirements as well as collection requirements for support of combat assessment/BDA are adequately supported.

Liaison

The intelligence section provides liaison elements and personnel augmentation to various JTF and other component intelligence organizations. Liaison elements may be provided to the following:

- JISE.
- Other Service or functional component intelligence sections.
- The regional SIGINT operations center.
- The joint force J-2 CI/HUMINT staff element.
- The HUMINT operations cell.
- Task force CI coordinating authority, other joint intelligence organizations such as the joint interrogation and debriefing center or the joint document exploitation center.
- The intelligence elements of various alliance or coalition partners.

Liaison teams or personnel augmentation may be sourced from the Marine component G-2 section, Service augmentation to the component G-2 section, the MAGTF, or some combination of the above.

National, Theater, Joint, and Other Service Intelligence Support

Marine Corps intelligence assets are optimized for the production of tactical intelligence in support of MAGTF operations. National, theater, joint, and other Service intelligence assets provide unique capabilities that are not duplicated in the MAGTF intelligence support structure. (See figure 4-5.) The MAGTF has the ability to use external intelligence assets to enhance its organic capabilities, bringing the full range of these resources to bear on MAGTF requirements. The following are key external capabilities that support MAGTF operations:

- National- and theater-level intelligence analysis and production.
- Geospatial information and services (GI&S). GI&S describes the collection, production, and dissemination of information about the earth, and replaces the term mapping, charting, and geodesy.

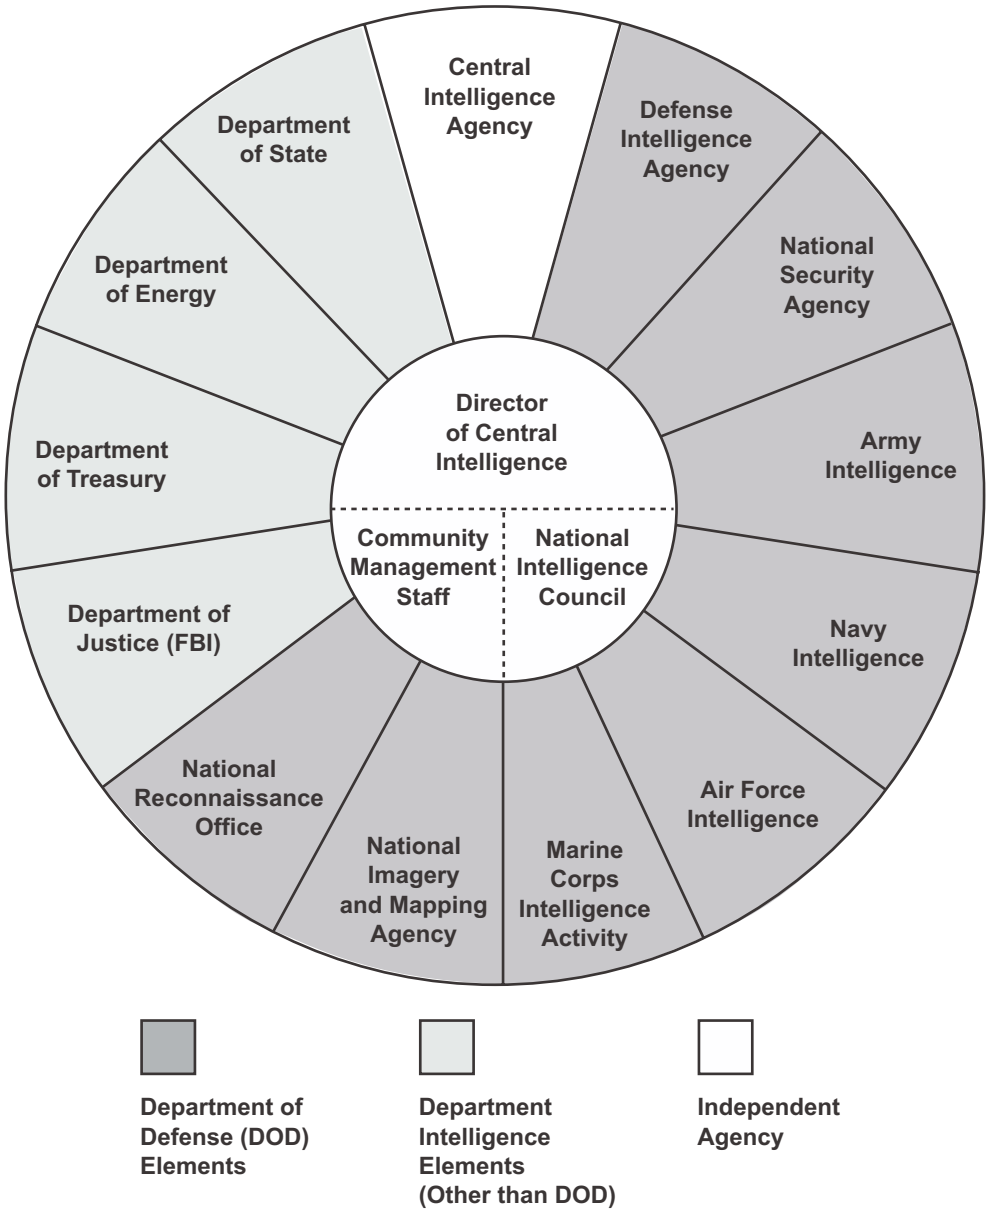

Figure 4-5. The National Intelligence Community.

- Analysis and production of target intelligence and target materials.
- National imagery collection and exploitation.
- SIGINT support from the National Security Agency and the US Cryptologic System.
- National- and theater-level CI and HUMINT collection.
- Liaison elements from national and theater intelligence agencies.

MAGTF Access to External Support. The Marine component headquarters or the MAGTF intelligence section will be the focal point for all external intelligence support to the MAGTF. In major joint operations, a Marine Service component headquarters will be established, and the component G-2 performs this function. When no Service component headquarters is established, the MAGTF acts in this role. Intelligence derived from external sources is used to build a common picture of the battlespace and is incorporated into other intelligence products that are provided to all MAGTF elements. MSCs and other subordinate units will be able to access external intelligence support resources through the MAGTF's intelligence architecture.

Required Capabilities

The following capabilities are required to fully use the resources of external intelligence support assets:

- Personnel trained and experienced in the capabilities, limitations, tasking, and employment procedures of external intelligence support assets.
- Sufficient, reliable CIS connectivity and interoperability with national, theater, and other Service intelligence C2 centers and architectures.
- The ability to receive, process, and disseminate information gathered by national and theater collection assets.
- Integrating Marine intelligence specialists into national, theater, and Service intelligence organizations to articulate Marine Corps capabilities and requirements and to optimize intelligence support to expeditionary forces.
- Establishing liaison between the MARFOR/MAGTF and supporting intelligence agencies through dedicated communications and the exchange of liaison officers.

Augmentation

Like all MAGTF components, intelligence support assets are flexible and respond to a variety of operational missions. They are configured for rapid deployment and can be tailored to meet the requirements of a particular operation. Although each MAGTF is furnished with a baseline intelligence capability to accomplish its anticipated mission, changes in the situation or mission tasking may require augmentation. When a MAGTF is committed to an operation, the intelligence assets of any remaining units in the operating forces can be called on to provide this augmentation. MAGTFs smaller than a MEF will normally be supported by their parent MEF; a fully deployed MEF can be augmented by the assets of any other MEF. Augmentation may consist of providing entire intelligence units, selected equipment or individual personnel with specialized skills. Support may also consist of providing intelligence products that cannot be developed by the deployed MAGTF or its supporting joint intelligence activity.

Supporting Establishment

Marine intelligence personnel and organizations of the supporting establishment enhance and sustain the intelligence activities of the operating forces.

Marine Corps Intelligence Activity

The Marine Corps maintains a Service-level intelligence capability in the Marine Corps Intelligence Activity (MCIA). MCIA focuses on crisis and predeployment support to expeditionary warfare. It complements the efforts of theater, other Service, and national intelligence organizations. It provides

unique threat, technical, and geographic intelligence products that are tailored to Marine Corps operating forces preparing for deployment. It also coordinates Marine Corps Service collection, production, and dissemination requirements by acting as the Service collection, production, and dissemination manager. MCIA is collocated with the National Maritime Intelligence Center, Suitland, MD and at Marine Corps Base, Quantico, VA.

Marine Cryptologic Support Battalion

The Marine cryptologic support battalion provides Marine Corps participation in national and Department of the Navy cryptologic activities worldwide. These Marines perform tasks that are directly related to their military occupational specialty, contributing to the national, theater, and Department of the Navy SIGINT collection, production, and dissemination effort while gaining invaluable skill maintenance and enhancement opportunities. The battalion is collocated with the Naval Security Group, Fort Meade, MD and augments the operating forces with trained SIGINT personnel during crises and exercises.

Navy Marine Corps Intelligence Training Center

The Navy Marine Corps Intelligence Training Center (NMITC), Dam Neck, VA trains Navy and Marine Corps personnel in basic, intermediate, and advanced intelligence methods and applications. During contingency operations, NMITC supports the operating forces through the provision of intelligence training via mobile training teams and/or selective personnel augmentation.

Personnel Augmentation

The supporting establishment is also a source of experienced intelligence personnel who can be called on to fill contingency billets in the intelligence structure of a deploying or committed MAGTF.

Marine Corps Forces Reserve

The mission of Marine Corps Forces Reserve is to provide trained units and/or personnel to augment, reinforce or reconstitute active duty MARFORs during times of war or national emergency. Intelligence capabilities of the Marine Corps Reserve are complementary to those of the active component. This includes individual mobilization augmentee and individual ready reserve personnel and selected Marine Corps Reserve units (including two force reconnaissance companies), a GSP, an imagery interpretation unit, and several interrogator-translator and CI teams, which provide increased depth to limited active component capabilities.

Individual mobilization augmentee members of the Marine Corps Reserve Intelligence Program and the Marine Corps Reserve Cryptologic Program routinely support the training and operational activities of the active component.

CHAPTER 5
OPERATIONAL MANEUVER FROM THE SEA

OMFTS is the maneuver of naval forces at the operational level that projects sea-based power ashore to deal a decisive blow. OMFTS is a bold bid for victory that aims to exploit a significant enemy weakness. It embodies the application of the principles of maneuver warfare to a maritime campaign. Success in OMFTS depends on the ability to seize fleeting opportunities and quickly take advantage of exposed enemy vulnerabilities. See MCDP 1-0, *Marine Corps Operations*.

OMFTS relies on intelligence to drive planning, option selection, and maneuver execution. To support OMFTS, intelligence operations must be conducted across the strategic, operational, and tactical levels of war. Starting with strategic considerations and working down to tactical dispositions, intelligence uncovers the threat's COG, strengths, and weaknesses, thereby exposing critical vulnerabilities to be exploited by naval forces operating from the sea. Intelligence also assesses the potential for maneuver offered by the battlespace, including identifying entry points where the force can establish itself ashore. The term entry point encompasses beaches, boat landing sites, HLZs, and drop zones that can establish elements of the force ashore. Intelligence also provides the foundation for effective force protection and IO efforts. These efforts help surprise, preempt, disrupt, and disorient the enemy during OMFTS execution.

Required Intelligence Capabilitites

- Perform IPB and situation development covering a broad maneuver space.
- Analyze threat forces to determine COG and critical vulnerabilities.
- Conduct detailed terrain and hydrographic analysis to identify suitable entry points.
- Ensure connectivity and interoperability with national, theater, and joint forces' intelligence assets, which provide intelligence support before the arrival of naval forces in the objective area.
- Provide stand-off collection assets that can satisfy force requirements from over-the-horizon.
- Provide organic imagery, SIGINT, HUMINT, CI, remote sensor, GI&S, and ground and aerial reconnaissance assets that can satisfy MAGTF tactical collection requirements as the force transitions ashore.
- Provide responsive processing, exploitation, and production capabilities that can rapidly develop the critical intelligence required to support timely decisionmaking.
- Provide dissemination systems that link widely dispersed forces afloat and ashore.
- Provide flexible intelligence units and organizations that can rapidly transition ashore with minimal degradation of support.
- Provide in-depth support to force protection and information operations activities.

Planning and Direction

There are a number of unique intelligence considerations for OMFTS. (See figure 5-1 on page 5-2.) During the planning phase, the MAGTF intelligence officer provides centralized direction for the intelligence efforts of the entire MAGTF. Navy and Marine intelligence assets operate together from an afloat amphibious force intelligence center, which is normally located on the amphibious force flagship. Initial requirements are broad in scope and are aimed at providing a general description of the battlespace and the threat. As planning progresses, requirements become increasingly focused on uncovering critical vulnerabilities and providing

intelligence that is relevant to the COAs under consideration. The intelligence flow will be predominately from the top down—from national and theater activities—until organic naval intelligence capabilities can be brought to bear. A comprehensive, systematic management effort is required to ensure that the necessary support is requested and received. At the same time, Navy and Marine intelligence officers must also develop detailed plans for the positioning and employment of the organic intelligence assets to support the concept of operations.

Intelligence Cycle	Key Considerations
Planning and direction.	Centralized direction from ATFIC. Transitioning of key capabilities ashore.
Collection.	Initial dependence on national/theater capabilities. Employment of organic assets in advance force/ preassault operations.
Processing, exploitation, and production.	Broad-based effort focusing on entry points and enemy vulnerabilities. Extensive support to CI and IO.
Dissemination.	Widely dispersed units afloat and ashore. Need for rapid intelligence flow to exploit fleeting opportunities.
Utilization.	COA selection shaped by intelligence. Choice of entry points, objectives, and targets driven by intelligence.

Figure 5-1. Intelligence Considerations During OMFTS.

Collection

Collection operations in the planning phase are conducted primarily by national and theater assets. These assets can collect information in denied areas without compromising operational security and/or perform their missions at significant stand-off distances. However, the small number of these systems and inherent limitations on their capabilities normally result in developing an incomplete intelligence picture. Advance force or preassault collection operations by naval assets will often be required to confirm and further develop the situation. An intensive intelligence effort must be provided in support of advance force or preassault operations; this intelligence support is required to select the proper targets for advance force or preassault collection operations, and ensure that these activities do not reveal the intent of the overall operation.

Processing, Exploitation, and Production

Initial production efforts are directed at providing an extensive description of the battlespace and threat. This description is required to focus the planning effort. Under the direction of senior Navy and Marine intelligence officers, the MAGTF, GCE, ACE, CSSE, Navy amphibious staff, and flagship intelligence sections engage in a cooperative effort to develop intelligence products that support the entire force. Individual intelligence sections will normally concentrate on their particular areas of expertise, thereby satisfying their units' requirements while contributing a broad-scope product to the general intelligence production effort. For example, the MAGTF G-2/AFC may focus on describing the battlespace and the enemy's C2, logistics, and reserves, while the GCE studies enemy ground forces, the ACE looks at the air and air defense threats, and the flagship intelligence department concentrates on the naval and coastal defense threat. From this effort, the ATFIC provides a comprehensive IPB analysis, an intelligence estimate, and supporting intelligence studies and products. As the planning phase continues, production efforts concentrate on identifying enemy vulnerabilities to be exploited and providing estimates and other intelligence products to support the specific COAs that are under consideration.

In the final stages of the OMFTS planning process, the production effort shifts to developing mission-specific intelligence products that focus on the selected COAs. These products include

IPB graphics, beach and HLZ studies, and target/objective area studies. An extensive all-source intelligence effort is conducted to support deception, OPSEC, psychological operations (PSYOP), and EW planning in accordance with the MAGTF commander's overall IO strategy. During this stage, the production effort becomes increasingly decentralized as GCE, ACE, and CSSE intelligence sections focus on specific requirements of their units. The MAGTF intelligence section continues to provide products to support the entire force, with efforts concentrated on those MAGTF elements designated as the main effort.

Dissemination

Dissemination in OMFTS presents significant challenges. Naval forces can be widely dispersed and may not assemble until late in the planning phase, if at all. Advances in technology have improved the capability to disseminate information between forces afloat, but there continue to be limitations on the quantity and quality of intelligence that can be exchanged. In particular, dissemination systems will be taxed by the volume of intelligence products, especially critical graphic products that must be distributed during the planning phase. Intelligence officers at all levels, working in coordination with unit operations and CIS officers, must develop plans that provide for dissemination of key intelligence in a timely manner to all elements of the MAGTF. They must be particularly careful to include in these plans units located on ships that are not equipped with the latest C2 or intelligence systems.

Utilization

During the planning phase, intelligence is used to develop and select COAs and prepare detailed plans for implementing the selected COAs. After providing an initial orientation to the battlespace and the threat, the intelligence officer assists the commander and the staff in analyzing the enemy's strengths and weaknesses to identify COG and critical vulnerabilities that can be exploited. COAs are developed that take advantage of identified weaknesses to accomplish the assigned objective. The intelligence effort is refined on the basis of the COAs under consideration, providing answers to IRs generated during COA development. The intelligence developed through this interactive process aids the commander in selecting a favorable COA. Once the COA is chosen, intelligence shapes the concept of operations and supporting plans. Designation of objectives; selecting entry means, points, and times; and identifying targets are all based primarily on intelligence. Particular attention is given to steps that preserve surprise and that preempt, disrupt or disorient the enemy's response to our actions; e.g., force protection measures, and IO (including, but not limited to, physical destruction, military deception, OPSEC, PSYOP, and EW) plans.

Planning and Direction

The ATFIC will continue to act as the central node for the direction of the intelligence effort. As the operation unfolds, intelligence nodes can be established ashore to support units carrying out mission tasking. Depending on the nature and scope of the operation, most of the MAGTF intelligence structure can remain afloat or all of it may transition ashore. Movement of significant portions of the MAGTF intelligence structure ashore must be planned in detail to ensure a rapid transition with minimal degradation of support capability. If it is fully established ashore, the MAGTF intelligence section becomes the central node for intelligence direction. The ATFIC acts in a supporting capacity and continues to provide connectivity and services that cannot be readily established ashore.

IRs that arise during execution are normally time sensitive. Intelligence direction must anticipate these requirements and establish a responsive collection, production, and dissemination structure to satisfy them. Designation of PIRs that are based on the results of IPB analysis, the commander's intent, and the concept of operations is critical. Using these factors to designate PIRs ensures that the intelligence effort remains focused on providing key intelligence to decisionmakers in a timely manner.

Collection

Collection operations transition from depending on national and theater capabilities to relying primarily on organic assets. Collection activities are integrated with the concept of operations. The objective is to develop the intelligence required to make key decisions regarding maneuver, targeting, and future plans. Collection assets are focused on key areas that are associated with the scheme of maneuver, location and development of critical targets, and combat assessment. Reports of units maneuvering through the battlespace and/or in contact with the enemy are a significant source of information. This information must be transmitted to the appropriate intelligence section to help maintain situational awareness and refine the threat assessment. The MAGTF continues to employ national and theater-level collection support against targets located deep in the area of influence, throughout the area of interest, and against less time-sensitive requirements.

Processing, Exploitation, and Production

Rapid processing and production of intelligence are emphasized to support timely decisionmaking. OMFTS depends on decisive action and generating rapid operational tempo to break the enemy's cohesion and ability to resist. Intelligence sections must demonstrate the flexibility, agility, and responsiveness to quickly recognize enemy vulnerabilities and identify opportunities as they develop during the battle. To do this, intelligence sections at all levels must be aware of ongoing tactical activities and potential enemy reactions. They must be able to rapidly integrate all-source intelligence information with sensor data and combat reporting to develop and maintain a coherent picture of enemy dispositions and an assessment of enemy intentions. They must be able to convey this picture and assessment (preferably in graphic form) to commanders in time to exploit identified opportunities. In addition to supporting the ongoing battle, intelligence sections must also be fully engaged in planning for future operations (continuing IPB analysis, delivering combat assessment inputs and BDA results, satisfying new IRs, and participating in the decisionmaking process).

Dissemination

Dissemination is an even greater challenge during OMFTS execution than during planning. Intelligence developed during the processing, exploitation, and production step must be rapidly disseminated to the units that are able to act on that intelligence. These forces may be widely dispersed afloat, airborne, and ashore while engaging in rapid maneuver and contact with the enemy. The dissemination system must be flexible and reliable and focus on the importance and quality of the intelligence distributed rather than on its volume. Dissemination plans must provide alarm channels for warning data and must ensure that pathways remain open for passing critical intelligence that directly affects PIRs or identified decision points. Measures that can help to reduce the volume of intelligence traffic follow:

- Limit routine reporting.
- Set filters to eliminate information that is not pertinent to the tactical situation.
- Establishing minimal reporting thresholds for the generation of intelligence reports.
- Providing alternate means for collection and other intelligence support requests.

Dissemination plans must permit two-way dissemination, providing a means for subordinate

elements to pass along data, information or intelligence that they collect or develop that identifies new enemy vulnerabilities or enhances situation development for the entire force.

Utilization

Utilization of intelligence during the execution of OMFTS is rapid and decentralized. Intelligence identifies enemy vulnerabilities as the battle unfolds.Once developed, this intelligence is quickly disseminated to the MAGTF elements that can act on it, thereby enhancing the ability of individual units to exploit opportunities as they arise. Through integration with operations, assets are positioned to develop new intelligence as the concept of operations is carried out and the enemy responds. Timely collection, analysis, and dissemination of intelligence provides commanders with an accurate picture of the battlespace and the ability to recognize new opportunities as they arise. Commanders use this intelligence to select branches and sequels to the COA, attack targets, protect their own forces, assess the results of their actions, and plan future operations.

CHAPTER 6
SUSTAINED OPERATIONS ASHORE

Sustained operations ashore require broad-based intelligence support that bridges the operational and tactical levels. Tactical plans are based on the results of operational-level intelligence assessments, which identify the enemy's COG and critical vulnerabilities throughout the theater of operations. MAGTF intelligence operations contribute to the operational-level assessments while translating the conclusions from these assessments into relevant tactical intelligence. Considerations for developing intelligence in support of sustained operations ashore are similar to those for OMFTS. Intelligence support during the execution of sustained operations ashore requires the same agility and responsiveness as in OMFTS, with the focus on providing critical intelligence to support timely decisionmaking. However, sustained operations ashore are normally conducted over a greater land area and with a larger force than in OMFTS, creating the requirement for a larger and more widely distributed intelligence support structure. The need for integration with theater, joint, multinational, and other Service intelligence assets is also greater.

Required Intelligence Capabilities

- Field and sustain intelligence structure to support MEF-level operations over extended periods.
- Execute all intelligence functions of a Service component headquarters, including full participation in theater or JTF intelligence activities.
- Ensure sufficient and reliable CIS systems connectivity and interoperability with theater, joint, and other Service intelligence assets participating in the operation.
- Conduct IPB and situation development in support of operational- and tactical-level planning.
- Provide organic imagery, SIGINT, CI, HUMINT, remote sensor, GI&S, and ground and aerial reconnaissance assets that can satisfy MAGTF tactical requirements.
- Provide processing, exploitation, and production capabilities that can supply the extensive products required to support MEF-level planning and execution.
- Provide dissemination systems that link widely dispersed and rapidly maneuvering forces.
- Provide area specialists and linguists with skills that are pertinent to the AO.
- Support force sustainment operations through detailed logistic intelligence.
- Support force protection efforts conducted throughout a large operating area, with emphasis on the security of critical rear area C2 and logistic facilities.

Planning and Direction

Intelligence direction during sustained operations ashore will be centralized during the planning phase and increasingly decentralized during execution. IRs are extensive and cover all aspects of the threat and the battlespace. Comprehensive collection, production, and dissemination efforts will be required to satisfy these requirements. Detailed management is necessary to ensure that these efforts are properly focused and integrated to meet the needs of the entire force. The MAGTF intelligence section will act as the primary intelligence node, developing intelligence to support the MAGTF commander, staff, and subordinate elements. The Marine component headquarters serves as the focal point for connectivity with the theater or JTF intelligence structure. During the planning phase, timeliness of

intelligence production may not be as critical because the planning process for sustained operations ashore normally takes place over an extended period and offers the opportunity to use more time and resources to answer those requirements. (See figure 6-1.)

Intelligence Cycle	Key Considerations
Planning and direction.	MAGTF acting as central mode. Need for broad intelligence structure with extensive liaison requirements.
Collection.	Competition for national, theater, and JTF support. Reliance on organic assets to satisfy many tactical requirements. Support to BDA.
Processing, exploitation, and production	Wide-scope effort that bridges operational and tactical levels. Importance of target and geographic intelligence.
Dissemination.	Extensive CIS infrastructure. Widely dispersed units. Timely support.
Utilization.	Need to integrate operational and tactical levels of intelligence and operations. Support to sustainability functions.

Figure 6-1. Intelligence Considerations During Sustained Operations Ashore.

Once execution begins, the emphasis is on satisfaction of time-sensitive requirements to support operational and tactical decisionmaking. Intelligence nodes will be created at selected times and places to provide tailored intelligence support to units executing specific phases or aspects of the concept of operations. Intelligence direction must balance the support provided among close, deep, and rear operations and the support to current and future operations.

The intelligence structure required to support sustained operations ashore is normally more extensive than that used in other types of MAGTF operations. A detailed planning effort must be undertaken to ensure that the necessary assets are tasked, deployed, and positioned where and when they are required. Sustained operations ashore are frequently based on a theater combatant commander's approved operations plan or other standing contingency plans that include provisions for a baseline intelligence support structure. These plans must be adapted and tailored to the particulars of the current and projected operational situation. Intelligence plans use a building-block approach, phasing in capabilities to keep pace with the buildup of operational forces. Planners must remain aware that intelligence capabilities must be in place to support the earliest steps of the planning phase; therefore, a robust intelligence structure is normally required in the initial stages of the deployment.

Many of the intelligence activities conducted during sustained operations ashore will be joint. Intelligence plans must provide for connectivity with the theater or joint and other component intelligence assets and for participation in theater or JTF intelligence mechanisms. An extensive liaison effort will be required to ensure that MAGTF IRs and operations are fully coordinated with those of joint and other Service intelligence activities. The MARFOR and MAGTF will require significant personnel augmentation to meet the broad scope of intelligence activities in sustained operations ashore and provide liaison teams to the numerous joint and supporting force intelligence agencies. This augmentation can be drawn from residual forces, the supporting establishment or the Reserves.

Collection

Sustained operations ashore will normally be supported by the full range of national- and theater-level collection capabilities and by the organic assets of the participating component forces. Collection priorities for national and theater assets will be determined by the JFC. The bulk of these assets will usually be targeted against overall theater/JTF objectives. Marines must participate in the joint collection management and production processes to ensure that MAGTF PIRs receive

appropriate support from the theater/JTF level. However, even if MAGTF requirements are given priority, the results of national and theater collection operations cannot be relied on to completely satisfy the number of requirements developed during extended sustained operations ashore or to provide the level of detail needed for tactical planning and execution. For this reason, the MAGTF must depend on its organic collection assets to provide the bulk of its tactical intelligence information, particularly during the execution phase. The MAGTF must be prepared to plan and execute imagery, SIGINT, HUMINT, ground reconnaissance, and CI force protection source operations throughout its AO. This includes collection activities in support of deep operations and the planning of future operations. MAGTF collection plans must be coordinated with those of higher, adjacent, and supporting commands to ensure the following:

- All requirements receive adequate coverage.
- Collection assets are employed efficiently with minimal overlaps.
- Collection operations are sufficiently integrated to permit free exchange of collection targeting data and tracking of collection targets as they move through the battlespace.

Processing, Exploitation, and Production

Processing, exploitation, and production efforts in support of sustained operations ashore parallel those for OMFTS. The scope of the initial production is broad, with the focus narrowing as particular COAs are selected and a concept of operations is developed. Geographic intelligence production takes on added importance. Geographic intelligence helps identify opportunities for ground and air maneuver and determine line-of-sight profiles for observation, weapons employment, and the effective use of communications-electronic equipment. Mapping enhancements, lines-of communications studies, and IPB graphics (such as cross-country mobility, weather effects, and combined obstacle overlays) are key intelligence products that support sustained operations ashore.

Threat analysis must be comprehensive and generally deals with large ground and air formations. This analysis covers reserves and committed forces and must consider all factors that affect the enemy's ability to fight at the operational and tactical levels, including leadership, doctrine, training, readiness, and sustainability. An extensive production effort is devoted to supporting CSS operations. The main components of this effort are studies on the local climate, infrastructure, and resources and on the threat to our rear area and lines of communications. Products from national, theater, and JTF intelligence agencies contribute to the production effort, but many of these products will have to be tailored by the AFC and GCE, ACE, and CSSE intelligence sections to satisfy particular MAGTF requirements. During execution, emphasis is placed on rapid processing and production of tactical intelligence to support decisionmaking in the current battle, while at the same time providing detailed intelligence to shape plans for future operations.

Dissemination

The ability to develop and maintain a shared picture of the battlespace among the diverse components of the joint force is essential. MAGTF and Marine component dissemination architectures not only must provide for distributing intelligence within the MAGTF, but also must permit the timely exchange of intelligence with the theater or JTF headquarters, other component commands, and adjacent and supporting units. Marine intelligence architectures must be

fully integrated with the theater or JTF structures. This requires detailed planning and coordination because each theater and JTF has a unique architecture and sometimes separate channels are used for the dissemination of finished intelligence, imagery, SIGINT, HUMINT, and CI information. Dissemination during the early phases is normally simplified by establishing a reliable, redundant communications system between fixed or semi-fixed CPs. However, even a robust communications system will be challenged by the requirement to distribute a large volume of maps, imagery, and other graphic products during the planning stage.

During execution, the dissemination challenges are similar to those of OMFTS; i.e., ensuring the rapid distribution of time sensitive, mission-critical intelligence to widely dispersed units on the move or in contact with the enemy. A number of techniques can be used to prevent the loss of intelligence that is needed for timely decision-making in the stream of intelligence data and information. Some follow:

- Establishing alarm dissemination channels.
- Using broadcast mode for specialized intelligence reporting.
- Employing DSTs or designating a specific element of the intelligence section as a dissemination team.
- Linking dissemination to factors developed in the other phases of intelligence development, such as PIRs, named areas of interest, high-value targets, and high-payoff targets.
- Giving particular attention to the distribution of updated imagery and graphic intelligence products to units that cannot be supported from fixed or semi-fixed intelligence support nodes.

Utilization

The use of intelligence in sustained operations ashore follows the same principles as its use in OMFTS. The difference lies in the scope of the effort required and the need to integrate intelligence and operations simultaneously at multiple levels: theater or JTF, MARFOR, MAGTF, MSC, and tactical units (regiments/groups/battalions/squadrons/detachments).

In sustained operations ashore, intelligence is used to form operational and tactical plans that will accomplish campaign objectives. Broad-based strategic, operational, and tactical intelligence on the enemy and the AO is used by intelligence and operational planners in an interactive process to identify COG and critical vulnerabilities that can be attacked or exploited to achieve campaign objectives. This in turn leads to COA development, selection, and refinement, an effort that must be coordinated and integrated from the theater/JTF down to the tactical level. Intelligence helps determine the main and supporting efforts; designate objectives, times, and locations for these efforts; and identify the support required for each to succeed. During execution, intelligence helps develop the situation, supporting decisions on whether to continue or modify the plan and whether to exploit success or take advantage of new opportunities. At the same time, intelligence facilitates the planning of follow-on operations through support to combat assessment and providing continuing IPB analysis. Intelligence helps plan and conduct critical sustainability functions, contributing key logistic intelligence and force protection recommendations.

CHAPTER 7
MILITARY OPERATIONS OTHER THAN WAR

MOOTW refers to the conduct of Marine and naval expeditionary operations across the range of military operations short of war. MOOTW encompass a wide variety of activities intended to deter war, resolve conflict, promote peace, and support civil authorities. MOOTW encompass a broad range of 16 possible missions and tasks, each of which has its own unique IRs. (See MCDP 1-0.)

Intelligence activities in MOOTW are characterized by the following:

- The initial lack of detailed intelligence databases on the AO.
- An extensive list of nonstandard IRs that must be satisfied to support planning and execution.
- A rapidly changing situation resulting from crisis conditions in the AO.
- A compressed time frame for intelligence development.
- Restrictions on collection operations.

Intelligence shapes operations during MOOTW as it does during other types of expeditionary operations. However, in addition to understanding the physical environment and the threat, the commander must have intelligence on political, economic, and sociological conditions to develop sound military plans that will accomplish the assigned mission.

To support MOOTW, MAGTF intelligence operations and supporting assets must be maintained in a high state of readiness. MAGTF intelligence sections must focus on areas with the greatest potential for executing contingency operations and must be able to respond with minimal warning and preparation. They must also be flexibile to adapt to the wide variety of potential missions, possessing the expertise and specialized capabilities to provide intelligence across the full range of MOOTW.

Required Intelligence Capabilities

- Forward-deployed intelligence sections that are manned, trained, and equipped to respond to a variety of short-notice contingency operations.
- Deployable intelligence assets that can be rapidly "surged" to augment the capabilities of a forward-deployed MAGTF committed to MOOTW.
- Specialized knowledge concerning infrastructure, political, economic, cultural, and sociological conditions in a variety of geographic areas.
- The ability to perform IPB and situation development that focuses on unconventional threat forces, such as security forces, paramilitary groups, insurgents, and terrorists.
- Organic CI and HUMINT capability that is prepared for operation in a variety of MOOTW scenarios.
- SIGINT assets that can collect information from nontraditional targets.
- Dissemination systems that link widely dispersed forces.
- Connectivity to national, theater, joint, and multinational force intelligence assets to provide intelligence support during planning and execution.
- Area specialists and linguists with skills that are pertinent to the AO.
- Expertise in the operations and functioning of non-DOD government agencies, international coalitions, and nongovernmental organizations (NGOs). (An NGO is a transnational organization of private citizens that maintains a consultative status with the United Nations. NGOs may be professional associations, foundations, businesses or groups with a common interest in humanitarian assistance. Examples include the Red Cross and the Cooperative for Assistance and Relief Everywhere.)

Planning and Direction

There are certain unique intelligence considerations during MOOTW. (See figure 7-1.) Direction of the intelligence effort in MOOTW will generally be highly decentralized. During MOOTW, MAGTF elements can be spread across a wide area, each with a different mission and facing a unique situation. While a central node will be needed to direct the efforts of MAGTF intelligence assets and coordinate external support, the bulk of intelligence will be provided by subordinate intelligence sections supporting their individual units. Consideration should be given to directing the intelligence effort on an area-support basis rather than a unit support basis. In an area-support system, intelligence nodes are created to support all units operating in the designated area. IRs will be extensive and diverse. Many will deal with topics and threats that are not normally confronted during conventional operations. Individual intelligence sections and nodes must be provided with expertise or with access to resources that can satisfy these nonstandard requirements.

MOOTW are often generated as a result of fast-moving crisis situations. Intelligence plans must emphasize readiness and flexibility to respond to MOOTW requirements in a timely manner. MAGTF intelligence sections at all levels must maintain an awareness of potential contingency missions and adopt a "lean forward" approach toward anticipating requirements. Forward-deployed MAGTFs must possess all required intelligence capabilities to function in a wide variety of MOOTW missions. The active Marine service components (Marine Forces Atlantic or Pacific) must be prepared to rapidly deploy additional or specialized assets to augment the capabilities of the forward-deployed MAGTF.

In planning the intelligence structure required to support a particular MOOTW, several factors must be considered. The MAGTF intelligence section, whether afloat or ashore, must have connectivity to all supporting external intelligence agencies. It is often necessary to augment subordinate intelligence sections to provide an enhanced capability to support the independent activities of their units. There are normally extensive contacts with organizations outside the US military command structure during MOOTW. Liaison and information exchange with non-DOD agencies and NGOs and multinational and/or host nation military and security forces must be anticipated.

Intelligence Cycle	Key Considerations
Planning and direction.	Decentralized direction. Need for muliple intelligence support nodes with specialized capabilities.
Collection.	Nonstandard requirements. Importance of HUMINT, CI, and nontraditional collection activities.
Processing, exploitation, and production.	Focus on infrastructure, political, economic, and sociological factors. Use of nonstandard production formats.
Dissemination.	Large number of independent units operating throughout the area. Intelligence exchange with joint, multinational, and nonmilitary units.
Utilization.	Need to monitor effectiveness and effect of ongoing operations. Support to force protection, civil affairs, PSYOP, and sustainability.

Figure 7-1. Intelligence Considerations in MOOTW.

Collection

Because MOOTW present nontraditional targets, collection operations must blend the capabilities and limitations of all available assets. Satisfaction of unique MOOTW requirements often requires the use of specialized capabilities or innovative approaches to the employment of standard assets.

During the planning and initial phases of the operation, national and theater assets will be relied on to satisfy basic requirements concerning entry points, infrastructure, and conventional

aspects of the threat. Because supporting intelligence agencies often have limited capabilities in MOOTW situations, organic assets are brought to bear as early as possible, including being employed as part of the advance party or lead element of the force. The nature of the MOOTW environment, threat, and requirements often present a lucrative opportunity for the conduct of HUMINT and CI collections operations. A MAGTF committed to a MOOTW must have a robust CI and HUMINT capability, augmented by appropriate area specialist and linguist support. This capability should be deployed as soon as practical to initiate force protection collection operations and establish necessary liaisons. The MAGTF must also exploit open sources and maintain contact with non-DOD government agencies and NGOs.

Processing, Exploitation, and Production

Intelligence production requirements in MOOTW are normally focused on nontraditional subject areas. For example, detailed knowledge of the host nation's economic, transportation, medical, and public works infrastructure will be required to develop plans for humanitarian assistance operations. Threat studies to support a peacekeeping mission must encompass an extensive treatment of political, cultural, and sociological factors related to various insurgent or paramilitary factions in addition to the threat's military capabilities. Use of area specialists and expertise from external intelligence organizations, non-DOD agencies (State Department, US Agency for International Development, etc.), and NGOs is crucial to satisfying these requirements. Production formats must be adapted to the requirements of a particular situation. Normal IPB analysis must be modified to highlight factors crucial to the specific MOOTW mission. Processing and production in MOOTW must be responsive to the needs of the numerous small elements that may be conducting independent activities throughout the AO. Production in support of these elements must be tailored to specific mission requirements and provide details pertinent to the small-unit level. Intelligence that increases the situational awareness of individual Marines, such as information on local customs, language, and health and sanitation, is an important part of this effort.

Dissemination

Dissemination during MOOTW must provide for the timely distribution of intelligence to a large number of elements that are widely dispersed throughout the AO. Creating intelligence support nodes for a specific area or region will aid the dissemination effort, but only if these nodes are equipped to receive all-source intelligence (in particular imagery and graphic products) from supporting collection and production agencies. Dissemination plans must also include provisions for the exchange of intelligence with other Service and multinational units participating in the operation, non-DOD agencies, and NGOs. Interoperability, sanitation, declassification, and releasability must all be considered and determined before such exchanges can occur.

Utilization

Intelligence shapes the planning and execution of MOOTW just as it does in other types of operations. During planning, intelligence helps determine the nature and scope of the operations and tasks required to accomplish the mission, the size and type of forces required, and the location and duration of the effort required. During execution, intelligence is used to enhance the effectiveness of ongoing operations, assess the results of completed activities, and identify follow-on missions and tasks that will help accomplish the overall objective. Emphasis is also placed on intelligence support of specialized functions that have enhanced importance during MOOTW: logistics, force protection, civil affairs, and PSYOP.

CHAPTER 8
JOINT OPERATIONS AND MULTINATIONAL OPERATIONS

A coordinated intelligence effort makes a critical contribution to the success of joint operations. MAGTFs participate in full partnership with other Services in joint operations. MAGTF intelligence operations are fully integrated with joint intelligence activities to ensure unity of effort, mutual support, and effective employment of limited intelligence resources.

Multinational operations are "military actions conducted by forces of two or more nations, typically organized within the structure of a coalition or alliance." (JP 1-02) MARFORs may participate in a wide variety of multinational operations, ranging from routine bilateral exercises to coalition warfare in major regional contingencies. Instances of unilateral US military operations are becoming less frequent, particularly in MOOTW. Marine units must be prepared to carry out intelligence operations in the context of multinational operations.

Effective intelligence support in joint operations depends on the following:

- Agreement on policies and procedures.
- Mutual intelligence support.
- Shared intelligence capabilities and assets.
- Full interoperability and connectivity among participants.
- Robust liaison.

JFC and Component Commander Responsibilities

JFCs are responsible for all aspects of intelligence support within their commands. They have the responsibility and authority to determine, direct, and coordinate all mission-related collection and analysis activities through centralized or apportioned collection and production management efforts. Component commanders remain responsible for the intelligence function within their commands and use organic intelligence capabilities to support their assigned missions. The JFC makes national, theater, and joint force intelligence assets available to support the efforts of the component commanders. At the same time, component capabilities must be available to assist the joint intelligence effort.

Joint Intelligence Structure

The JFC is assisted in carrying out intelligence responsibilities by the joint force J-2. The J-2 exercises many of the JFC's intelligence functions while acting as the senior intelligence officer in the joint force. Intelligence assets of the joint force headquarters are consolidated in a JISE. The combatant (theater) command is supported by a JIC, which is a standing intelligence element. A JISE is a temporary agency established to provide support to a particular JTF. The JISE provides intelligence support to the JFC and the entire joint force. Marine intelligence specialists will be assigned to the JISE to articulate Marine capabilities and requirements, influence decisions, and optimize intelligence support to the Marine component. Key functions performed by the JISE follow:

- Centralized collection, production, and dissemination management for joint force and supporting intelligence assets.
- All-source intelligence production to satisfy JFC and component requirements.
- Developing and maintaining data bases that support planning, operations, and targeting.

- Producing target studies and materials.
- Providing access to supporting national and theater intelligence assets.

Each theater establishes its own intelligence architecture, providing connectivity between the national- and theater-level intelligence organizations, the JTF, and its component commands. MARFOR and MAGTF intelligence architectures must be able to plug into the architectures of any theater where they might be employed.

Procedures

Joint intelligence activities are governed by joint intelligence doctrine contained in JP 2-0, *Joint Doctrine for Intelligence Support to Operations*, and supporting manuals in the 2-series of JPs. Joint intelligence doctrine is supplemented by combatant commanders' TTP for intelligence developed by each theater command. During joint operations, Marine intelligence activities will adhere to joint doctrine and any published theater TTP pertaining to that operation.

Marine Intelligence Section and Unit Responsibilities

- Operate in accordance with joint intelligence doctrine, theater TTP, and individual JTF procedures.
- Participate in joint intelligence mechanisms to coordinate collection management, intelligence production, HUMINT and SIGINT collection operations, target intelligence support, intelligence architectures, CI activities and collection operations, and other intelligence operations.
- Provide intelligence support to the joint force headquarters or other JTF components as directed.
- Contribute personnel and other assets to augment the J-2 section and JISE if requested.
- Employ joint or other component intelligence assets.
- Enter the JTF intelligence architecture.
- Exchange liaison elements with the J-2, JISE, and/or other JTF components as required.

MARFOR Component Headquarters or MAGTF CE as a JTF Headquarters

A Marine component headquarters or a MAGTF CE may be designated to provide the nucleus of a JTF headquarters.The MARFOR or MAGTF G-2 must be prepared to function as the JTF J-2, with the G-2's intelligence section serving as the base for establishing a JISE. To carry out this function, MARFOR and MEF G-2 sections must prepare plans for operating as a JTF J-2 and conduct the training to be able to execute these plans. Plans should be based on joint doctrine and theater TTP and should include J-2/JISE organization, personnel and equipment requirements (with their augmentation sources), a baseline intelligence architecture, and standing operating procedures. Each MARFOR and MEF G-2 section should establish a standing JTF intelligence planning cell made up of intelligence specialists who are knowledgeable in joint force and other Service intelligence capabilities, limitations, and operating procedures to develop these plans.

Multinational Operations

There is no single intelligence doctrine for multinational operations. Each coalition or alliance must develop its own doctrine. The coalition commander determines standardized procedures for coalition forces. NATO standardization agreements (STANAGs) and quadripartite standing agreements among US, British, Canadian, and Australian forces provide standards and guidance to conduct military operations by forces in these alliances. STANAG 2936, *Intelligence Doctrine*, governs intelligence operations. Joint intelligence doctrine and architectures provide a framework for developing the multinational intelligence support structure. Multinational intelligence operations are based on the following principles:

- Maintain unity of effort. Intelligence operations must be directed at the common threat. A threat to one alliance member should be considered a threat to all.
- Make adjustments. Effective multinational operations require minimizing the differences in national concepts of intelligence support. Commanders and their intelligence officers must be willing to make adjustments to national procedures to share intelligence and integrate intelligence operations. Special arrangements should be considered for developing, communicating, and using intelligence where there are differences in nations' language, culture, doctrine, terminology, organization, and equipment.
- Plan early and concurrently. Multinational forces' IRs and procedures should be identified, planned, coordinated, and exercised before execution.
- Share all necessary intelligence. Each coalition member should share intelligence that supports planning and execution. However, information about intelligence sources and methods should not be shared unless absolutely necessary. The methodology for exchanging intelligence should be developed and exercised before operations begin. Authorization for foreign disclosure should be obtained and procedures for sanitation and declassification should be developed as part of this planning process. During execution, the exchange must be monitored and adapted to ensure that it is meeting the needs of all coalition partners.
- Conduct complementary intelligence operations. Each nation's intelligence assets capitalize on their strengths and offset the weaknesses of other members' assets, providing the coalition with the most effective blend of capabilities.

Many potential allies may not possess the range of US intelligence capabilities; therefore, US intelligence sections must expect to take the lead in developing intelligence during multinational operations. Particular attention must be given to provisions for sanitation, declassification, and releasability of intelligence developed by US forces and agencies to coalition partners. Personnel who are knowledgeable in these techniques and procedures must be included in the MAGTF or Marine component intelligence section. Intelligence plans must provide for connectivity with multinational forces and liaison elements with appropriate linguistic and area specialist skills.

APPENDIX A
GLOSSARY

Section I. Acronyms

ACE . . . . . aviation combat element
AC/S . . . . . .assistant chief of staff
AFC. . . . . all-source fusion center
AFP . . . . . all-source fusion platoon
AIntP. . . . . Allied Intelligence Publication
AO. . . . . .area of operations
ATARS . . . . . advanced tactical airborne reconnaissance system
ATFIC. . . . . amphibious task force intelligence center

BDA . . . . . battle damage assessment

C2 . . . . . .command and control
C2W . . . . . command and control warfare
CCIR. . . . . commander's critical information requirements
CE . . . . . command element
CGS. . . . . common ground station
CHATS . . . . . CI/HUMINT automated tool set
CI . . . . . .counterintelligence
CIA . . . . . Central Intelligence Agency
CIC . . . . . combat intelligence center
CIS . . . . . communications and information systems
CMDO . . . . . collection management/ dissemination officer
Co . . . . . .company
COA . . . . . course of action
COG . . . . . .center of gravity
COP. . . . . common operational picture
CP . . . . . command post
CSS . . . . . combat service support
CSSE. . . . . .combat service support element
CTP. . . . . .common tactical picture
CV. . . . . .critical vulnerability

DIA . . . . . .Defense Intelligence Agency
DMS . . . . . .Defense Message System
DOD . . . . . Department of Defense
DST. . . . . .direct support team

EW . . . . . .electronic warfare
FBI . . . . . .Federal Bureau of Investigation
FRAGO. . . . . .fragmentary order
FSCC. . . . . .fire support coordination center
FSSG. . . . . force service support group

GCE . . . . . ground combat element
GI&S. . . . . .geospatial information and services
GSP. . . . . ground sensor platoon

HET. . . . . .HUMINT exploitation team
HLZ. . . . . helicopter landing zone
HUMINT . . . . . .human intelligence

I&W . . . . . .indications and warning
IAS . . . . . .intelligence analysis system
ICR . . . . . intelligence collection requirement
IDR . . . . . intelligence dissemination requirement
IIP . . . . . imagery intelligence platoon
IMA. . . . . individual mobilization augmentee
IMINT. . . . . .imagery intelligence
intel bn . . . . . intelligence battalion
IO . . . . . .information operations
IOC . . . . . .intelligence operations center
IOS . . . . . .intelligence operations server
IOW . . . . . .intelligence operations workstation
IPB . . . . . .intelligence preparation of the battlespace
IPR . . . . . intelligence production requirement
IR . . . . . .intelligence requirement
ISC . . . . . intelligence support coordinator

JIC. . . . . joint intelligence center
JISE. . . . . joint intelligence support element
JSTARS . . . . . .Joint Surveillance Target Attack Radar System
JTF . . . . . .joint task force
JWICS. . . . . .Joint Worldwide Intelligence Communication System

MAGTF . . . . . Marine air-ground task force

MARFOR . . . . . .Marine Corps forces
MARFORRES . . . . . Marine Forces Reserve
MASINT . . . . . measurement and signature intelligence
MAW . . . . . Marine aircraft wing
MCDP . . . . . Marine Corps doctrinal publication
MCIA . . . . . Marine Corps Intelligence Activity
MCWP . . . . . Marine Corps warfighting publication
MEB . . . . . .Marine Expeditionary Brigade
MEF . . . . . Marine Expeditionary Force
MEU . . . . . Marine Expeditionary Unit
MEU(SOC) . . . . . Marine Expeditionary Unit (Special Operations Capable)
MIDB . . . . . .modernized integrated database
MOOTW . . . . . military operations other than war
MSC . . . . . major subordinate command

NGO . . . . . .nongovernmental organization
NIMA . . National Imagery and Mapping Agency
NMITC . . . . . Navy-Marine Corps Intelligence Training Center
NIPRNET . . . . . Nonsecure Internet Protocol Router Network
NIST . . . . . National Intelligence Support Team
NSA . . . . . National Security Agency

OCAC . . . . operations control and analysis center
OIC . . . . . officer in charge
OMFTS . . . . . operational maneuver from the sea
OODA . . . . . observe, orient, decide, and act
OP . . . . . observation post
OPCON . . . . . operational control
OPLAN . . . . . .operation plan
OPORD . . . . . operational order
OPSEC . . . . . operations security
OSINT . . . . . open-source intelligence

P&A . . . . . production and analysis
PDE&A . . . . . planning, decision, execution, and assessment
PIR . . . . . priority intelligence requirements
PSYOP . . . . . psychological operations

R&S . . . . . reconaissance and surveillance
recon . . . . . reconaissance
rep . . . . . representative
RRS . . . . . .remote receiver station

SARC . . . . . surveillance and reconnaissance cell
SIDS . . secondary imagery dissemination system
SIGINT . . . . . .signals intelligence
SIPRNET . . . . . Secret Internet Protocol Router Network
SSU . . . . . SIGINT support unit
STANAG . . . . . standardization agreement

TCAC . . . Technical Control and Analysis Center
TDN . . . . . tactical data network
TEG . . . . . Technical Exploitation Group
TERPES . . . . . tactical electronic reconnaissance processing and evaluation system
TGTINTEL . . . . . .target intelligence
TRAP . . . . . .tactical recovery of aircraft and personnel
TPC . . . . . topographic production capability
TRSS . . . . . .tactical remote sensor system
TTP . . . . . tactics, techniques, and procedures

UAV . . . . . .unmanned aerial vehicle
VMU . . . . . .Marine unmanned aerial vehicle squadron

Section II. Definitions

all-source intelligence—Intelligence products and/or organizations and activities that incorporate all sources of information, including, most frequently, human resources intelligence, imagery intelligence, measurement and signature intelligence, signals intelligence, and open source data, in the production of finished intelligence. (JP 1-02)

battle damage assessment—1. The timely and accurate estimate of damage resulting from the application of military force, either lethal or nonlethal, against a predetermined objective. Battle damage assessment can be applied to the employment of all types of weapon systems (air, ground, naval, and special forces weapon systems) throughout the range of military operations. Battle damage

assessment is primarily an intelligence responsibility with required inputs and coordination from the operators. Battle damage assessment is composed of physical damage assessment, functional damage assessment, and target system assessment. Also called BDA. (JP 1-02) **2.** The timely and accurate estimate of the damage resulting from the application of military force. BDA estimates physical damage to a particular target, functional damage to that target, and the capability of the entire target system to continue its operations. (MCWP 2-1)

centers of gravity—1. Those characteristics, capabilities, or localities from which a military force derives its freedom of action, physical strength, or will to fight. Also called COG. (JP 1-02) **2.** A key source of strength without which an enemy cannot function. (MCDP 1-2)

collection—The gathering of intelligence data and information to satisfy the identified requirements. (MCWP 2-1)

collection management—1. The process of converting intelligence requirements into collection requirements, establishing priorities, and tasking or coordinating with appropriate collection sources or agencies, monitoring results and retasking, as required. (JP 1-02) **2.** Its purpose is to conduct an effective effort to collect all necessary data while ensuring the efficient use of limited and valuable collection assets. (MCWP 2-1)

combat data—Data derived from reporting by operational units. (MCWP 2-1)

command and control—1. The exercise of authority and direction by a properly designated commander over assigned and attached forces in the accomplishment of the mission. Command and control functions are performed through an arrangement of personnel, equipment, communications, facilities, and procedures employed by a commander in planning, directing, coordinating, and controlling forces and operations in the accomplishment of the mission. Also called C2. (JP 1-02) **2.** The means by which a commander recognizes what needs to be done and sees to it that appropriate actions are taken. (MCDP 6) commander's critical information requirements—Information regarding the enemy and friendly activities and the environment identified by the commander as critical to maintaining situational awareness, planning future activities, and facilitating timely decisionmaking. Also called CCIR. (MCRP 5-12C)

commander's intent—A commander's clear, concise personal articulation of the reason(s) behind one or more tasks assigned to a subordinate. It is one of two components of every mission statement which supports the higher and/or supported commander's intent and guides the exercise of initiative in the absence of instructions. (MCRP 5-12C)

counterintelligence—Within the Marine Corps, CI constitutes active and passive measures intended to deny a threat force valuable information about the friendly situation, to detect and neutralize hostile intelligence collection, and to deceive the enemy as to friendly capabilities and intentions. Also called CI. (MCWP 2-1)

critical vulnerability—An aspect of a center of gravity that if exploited will do the most significant damage to an adversary's ability to resist. Also called CV. (MCRP 5-12C)

descriptive intelligence—Class of intelligence which describes existing and previously existing conditions intended to promote situational awareness. Descriptive intelligence has two components: basic intelligence, which is general background knowledge about established and relatively constant conditions; and current intelligence, which is concerned with describing the existing situation. (MCRP 5-12C)

dissemination—Conveyance of intelligence to users in a suitable form. (JP 1-02)

dissemination management—Involves establishing dissemination priorities, selecting dissemination means, and monitoring the flow of intelligence throughout the command. The objective of dissemination management is to deliver the required intelligence to the appropriate user in proper form at the right time while ensuring that individual consumers and the dissemination system are not overloaded by attempting to move unneeded or irrelevant information. Dissemination management also provides for use of security controls that do not impede the timely delivery or subsequent use of intelligence while protecting intelligence sources and methods. (MCWP 2-1)

estimative intelligence—Class of intelligence which attempts to anticipate future possibilities and probabilities based upon descriptive intelligence in the context of planned enemy and friendly operations. (MCRP 5-12C)

human intelligence—1. A category of intelligence derived from information collected and provided by human sources. (JP 1-02) **2.** HUMINT operations cover a wide range of activities encompassing reconnaissance patrols, aircrew reports and debriefs, debriefing of refugees, interrogations of prisoners of war, and the conduct of CI force protection source operations. Also called HUMINT. (MCWP 2-1)

imagery intelligence—Intelligence derived from the exploitation of collection by visual photography, infrared sensors, lasers, electro-optics, and radar sensors such as synthetic aperture radar wherein images of objects are reproduced optically or electronically on film, electronic display devices, or other media. Also called IMINT. (JP 1-02)

indications and warning—Those intelligence activities intended to detect and report time-sensitive intelligence information on foreign developments that could involve a threat to the United States or allied military, political, or economic interests or to US citizens abroad. It includes forewarning of enemy actions or intentions; the imminence of hostilities; insurgency; nuclear/non-nuclear attack on the United States, its overseas forces, or allied nations; hostile reactions to United States reconnaissance activities; terrorists' attacks; and other similar events. Also called I&W. (JP 1-02)

intelligence—1. The product resulting from the collection, processing, integration, analysis, evaluation, and interpretation of available information concerning foreign countries or areas. **2.** Information and knowledge about an adversary obtained through observation, investigation, analysis, or understanding. (JP 1-02) **3.** Knowledge of the enemy and the surrounding environment that is needed to support decisionmaking. (MCDP 2)

intelligence cycle—The steps by which information is converted into intelligence and made available to users. (JP 1-02)

intelligence data—Data derived from assets primarily dedicated to intelligence collection: imagery systems, electronic intercept equipment, human intelligence sources, and so on. (MCWP 2-1)

intelligence discipline—A well-defined area of intelligence collection, processing, exploitation, and reporting using a specific category of technical or human resources. There are five major disciplines: human intelligence, imagery intelligence, measurement and signature intelligence, signals intelligence (communications intelligence, electronic intelligence, and foreign instrumentation signals intelligence), and open-source intelligence. (JP 1-02)

intelligence operations—The variety of intelligence tasks that are carried out by various intelligence organizations and activities. (JP 1-02)

intelligence preparation of the battlespace—**1.** An analytical methodology employed to reduce uncertainties concerning the enemy, environment, and terrain for all types of operations. Intelligence preparation of the battlespace builds an extensive data base for each potential area in which a unit may be required to operate. The data base is then analyzed in detail to determine the impact of the enemy, environment, and terrain on operations and presents it in graphic form. Intelligence preparation of the battlespace is a continuing process. Also called IPB. (JP 1-02) **2.** A systematic, continuous process of analyzing the threat and environment in a specific geographic area. (MCWP 2-1)

intelligence requirement—**1.** Any subject, general or specific, upon which there is a need for the collection of information, or the production of intelligence. Also called IR. (JP 1-02) **2.** Questions about the enemy and the environment, the answers to which a commander requires to make sound decisions. (MCDP 2)

joint force—A general term applied to a force composed of significant elements, assigned or attached, of two or more Military Departments, operating under a single joint force commander. (JP 1-02)

joint intelligence center—The intelligence center of the joint force headquarters. The joint intelligence center is responsible for providing and producing the intelligence required to support the joint force commander and staff, components, task forces and elements, and the national intelligence community. Also called JIC. (JP 1-02)

joint operations—A general term to describe military actions conducted by joint forces, or by Service forces in relationships (e.g., support, coordinating authority), which, of themselves, do not create joint forces. (JP 1-02)

main effort—The designated subordinate unit whose mission at a given point in time is most critical to the overall mission success. (MCRP 5-12C)

maneuver warfare—A warfighting philosophy that seeks to shatter the enemy's cohesion through a variety of rapid, focused, and unexpected actions which create a turbulent and rapidly deteriorating situation with which the enemy cannot cope. (MCDP 1)

measurement and signature intelligence—**1.** Scientific and technical intelligence obtained by quantitative and qualitative analysis of data (metric, angle, spatial, wavelength, time dependence, modulation, plasma, and hydromagnetic) derived from specific technical sensors for the purpose of identifying any distinctive features associated with the target. The detected feature may be either reflected or emitted. Also called MASINT. (JP 1-02) **2.** Intelligence information gathered by technical instruments such as radars, passive electrooptical sensors, radiation detectors, and remote ground sensors. (MCWP 2-1)

open-source intelligence—**1.** Information of potential intelligence value that is available to the general public. Also called OSINT. (JP 1-02) **2.** OSINT sources include books, magazines, newspapers, maps, commercial electronic networks and databases, and radio and television broadcasts. OSINT involves no information that is classified at its origin or acquired through controlled collection. (MCWP 2-1)

priority intelligence requirements—**1.** Those intelligence requirements for which a commander has an anticipated and stated priority in his task of planning and decisionmaking. Also called PIR. (JP 1-02) **2.** An intelligence requirement MCWP 2-1 Intelligence Operations A-5 associated with a

decision that will critically affect the overall success of the command's mission. (MCDP 2)

production management—Encompasses determining the scope, content, and format of each product; developing a plan and schedule for the development of each product; assigning priorities among the various IPRs; allocating processing, exploitation, and production resources; and integrating production efforts with collection and dissemination. (MCWP 2-1)

sensor data—Data derived from sensors whose primary mission is surveillance or target acquisition: air surveillance radars, counterbattery radars, and remote ground sensors. (MCWP 2-1)

signals intelligence—1. A category of intelligence comprising either individually or in combination all communications intelligence, electronics intelligence, and foreign instrumentation signals intelligence, however transmitted. **2.** Intelligence derived from communications, electronics, and foreign instrumentation signals. Also called SIGINT (JP 1-02)

situational awareness—Knowledge and understanding of the current situation which provides timely, relevant and accurate assessment of friendly, enemy and other operations within the battlespace. Also called SA. (MCRP 5-12C)

tactical intelligence—1. Intelligence that is required for planning and conducting tactical operations. (JP 1-02) **2.** Tactical intelligence concerns itself primarily with the location, capabilities, and possible intentions of enemy units on the battlefield and with the tactical aspects of terrain and weather. (MCDP 2)

warfighting functions—The six mutually supporting military activities integrated in the conduct of all military operations: command and control, intelligence, maneuver, fires, logistics, and force protection. (MCRP 5-12C)

Preface

Although this is the first edition of field manual (FM) 3-55, the concepts are not new. Many who read this FM will recognize that it is a culmination of decades of refinement. In this manual, the term *information collection* is introduced as the Army's replacement for *intelligence, surveillance, and reconnaissance* (also known as ISR). ISR is a joint term, for which the Army revised to meet Army needs. The manual describes the following activities: planning requirements, assessing collection, tasking and direct information collection assets. Also it contains the actions taken by the commanders and staffs in planning, preparing, executing, and assessing information collection activities. As the Army fields new formations and equipment with inherent and organic information collection capabilities, it needs a doctrinal foundation to ensure their proper integration and use to maximize their capabilities.

PURPOSE

This FM provides essential and enduring doctrine for Army forces conducting information collection activities. This FM aligns information collection with current Army doctrine. The modular force structure with the brigade combat team as the centerpiece of the deployed force also moves many information collection assets to lower echelons. The latter is a major shift from previous ways of operating.

SCOPE

This manual covers the principles and fundamental considerations for information collection planning and execution in operations. Although it recognizes and discusses the impact of systems that support information collection activities, this manual emphasizes fundamentals and concepts rather than equipment or systems. The doctrine contained herein is intended to be broad enough to apply to all operational themes—from a peacetime military engagement to a major combat operation—and applicable at battalion through corps echelons deployed in an area of operations, although each organization employs tactics, techniques, and procedures appropriate to its level.

AUDIENCE

This manual is designed for officers and Soldiers assigned to units that direct or conduct information collection activities as well as commanders and staffs of corps, division, brigade combat teams, support brigades, and battalions. It applies to the Active Army, the Army National Guard, Army National Guard of the United States, and the United States Army Reserve unless otherwise stated; and U.S. Army Training and Doctrine Command institutions and components. This FM forms the foundation for instruction on information collection activities within the Army's educational system.

ADMINISTRATIVE INFORMATION

The information presented is descriptive, not prescriptive or restrictive. This manual complies with ADP 3-0, FM 2-0, FM 5-0, FM 6-0, and FM 7-15.

This publication applies to the Active Army, the Army National Guard (ARNG)/Army National Guard of the United States (ARNGUS), and the United States Army Reserve (USAR) unless otherwise stated.

The proponent of this publication is the United States Army Training and Doctrine Command (TRADOC). The preparing agency is the Combined Arms Doctrine Directorate, U.S. Army Combined Arms Center. Send written comments and recommendations on a DA Form 2028 (Recommended Changes to Publications and Blank Forms) to Commander, U.S. Army Combined Arms Center and Fort Leavenworth, ATTN: ATZL-MCK-D (FM 3-55), 300 McPherson Avenue, Fort Leavenworth, KS 66027-2337 or by e-mail to usarmy.leavenworth.mccoe.mbx.cadd-org-mailbox@mail.mil.

Introduction

A nuanced understanding of the situation is everything. Analyze the intelligence that is gathered, share it, and fight for more. Every patrol should have tasks designed to augment understanding of the area of operations and the enemy. Operate on a "need to share" rather than a "need to know" basis. Disseminate intelligence as soon as possible to all who can benefit from it.

General David H. Petraeus, U.S. Army
Military Review

The Army currently has no unified methodology or overall plan to define or establish how it performs or supports information collection activities at all echelons. This publication clarifies how the Army plans, prepares, and executes information collection activities within or between echelons.

This manual emphasizes three themes. First, foundations of information collection that demonstrate information collection activities are a synergistic whole, with emphasis on synchronization and integration of all components and systems. Second, commanders and staff have vital responsibilities in information collection planning and execution, with emphasis on the importance of the commander's role. Finally, the planning requirements and assessing success of information collection is measured by its contributions to the commander's understanding, visualization, and decisionmaking abilities.

With the exception of cyberspace, all operations will be conducted among the people and outcomes will be measured in terms of effects on populations. This increases the complexity of information collection planning, execution, and assessment, requiring a deeper level of situational understanding from commanders. It demands full staff integration into information collection activities as well as the engagement of every Soldier in collecting and reporting information. This field manual cannot provide all the answers, but its purpose is to prompt the user to ask the right questions.

Chapter 1 provides the Army definition of information collection.

Chapter 2 examines the roles and actions of the commander and staff in information collection planning and execution. This chapter also discusses the working group for information collection.

Chapter 3 describes planning requirements and assessing collection of information collection activities.

Chapter 4 discusses the tasking and directing of collection assets. The operations staff integrates collection assets through a deliberate and coordinated effort across all warfighting functions. Tasking and directing is vital to control limited collection assets. During task and direct, the staff recommends redundancy, mix, and cue, as appropriate.

Appendix A provides an overview of the information collection assets and capabilities available to Army commanders.

Appendix B provides instructions for preparing Annex L (Information Collection) in Army plans and orders.

Appendix C examines joint intelligence, surveillance, and reconnaissance activities.

Commanders drive information collection activities through their choice of critical information requirements and through mission command in driving the operations process. Commanders visualize, describe, direct, lead, and assess throughout the operations process with understanding as the start point. Intelligence preparation of the battlefield assists them in developing an in-depth understanding of the enemy and the operational environment. They then visualize the desired end state and a broad concept of how to shape the current conditions into the end state. Commanders describe their visualization through the commander's intent, planning guidance, and concept of operations in order to bring clarity to an uncertain situation. They also express gaps in relevant information as commander's critical information requirements. The challenge is for information collection activities to answer those requirements with timely, relevant, and accurate intelligence that enables commanders to make sound decisions.

Chapter 1

Foundations of Information Collection

This chapter presents the basics of information collection. It begins with the definition and purpose of information collection. It then discusses the information collection processes. Lastly, the chapter discusses primary information collection tasks and missions.

DEFINITION

1-1. Knowledge is the precursor to effective action, whether in the informational or physical domain. Knowledge about an operational environment requires aggressive and continuous operations to acquire information. Information collected from multiple sources and analyzed becomes intelligence that provides answers to commander's critical information requirements.

1-2. Commanders have used to provide intelligence to reduce the inherent uncertainty of war. Achieving success in today's conflicts demands extraordinary commitment to reducing this uncertainty. The Army describes information collection as an activity implies a function, mission, or action, as well as the organization that performs it. Information collection activities are a synergistic whole, with emphasis on synchronization and integration of all those components and systems.

1-3. Information collection is an activity that synchronizes and integrates the planning and employment of sensors and assets as well as the processing, exploitation, and dissemination of systems in direct support of current and future operations. This activity implies a function, mission, or action as well as the organization that performs it. Information collection activities are a synergistic whole with emphasis on synchronization and integration of all those components and systems. Information collection integrates the intelligence and operations staffs functions focused on answering the commander's critical information requirements. For joint operations, refer to appendix C.

1-4. At the tactical level, reconnaissance, surveillance, security, and intelligence missions or operations are the primary means by which a commander plans, organizes, and executes shaping operations that answer the commander's critical information requirements and support the decisive operation. Figure 1-1 on page 1-2 displays information collection activities.

1-5. The intelligence and operations staffs work together to collect, process, and analyze the information the commander requires concerning the enemy, other adversaries, climate, weather, terrain, population, and other civil considerations that affect operations. Intelligence relies on reconnaissance, security, intelligence operations, and surveillance for its data and information. Conversely, without intelligence, commanders and staffs do not know where or when to conduct reconnaissance, security, intelligence operations, or surveillance. The usefulness of the data collected depends upon the processing and exploitation common to these activities.

1-6. Commanders integrate information collection to form an information collection plan that capitalizes on different capabilities. Information collection assets provide data and information. *Intelligence* is the product resulting from the collection, processing, integration, evaluation, analysis, and interpretation of available information concerning foreign nations, hostile or potentially hostile forces or elements, or areas of actual or potential operations. The term is also applied to the activity which results in the product and to the organizations engaged in such activity (JP 2-0). Intelligence informs commanders and staffs where and when to look. Reconnaissance, security, intelligence operations, and surveillance are the **ways**—with the **means** ranging from national and joint collection capabilities to individual Soldier observations and reports. The **end** is intelligence that supports commander's decisionmaking. The result—successful execution and assessment of operations—depends upon the effective synchronization and integration of the information collection effort.

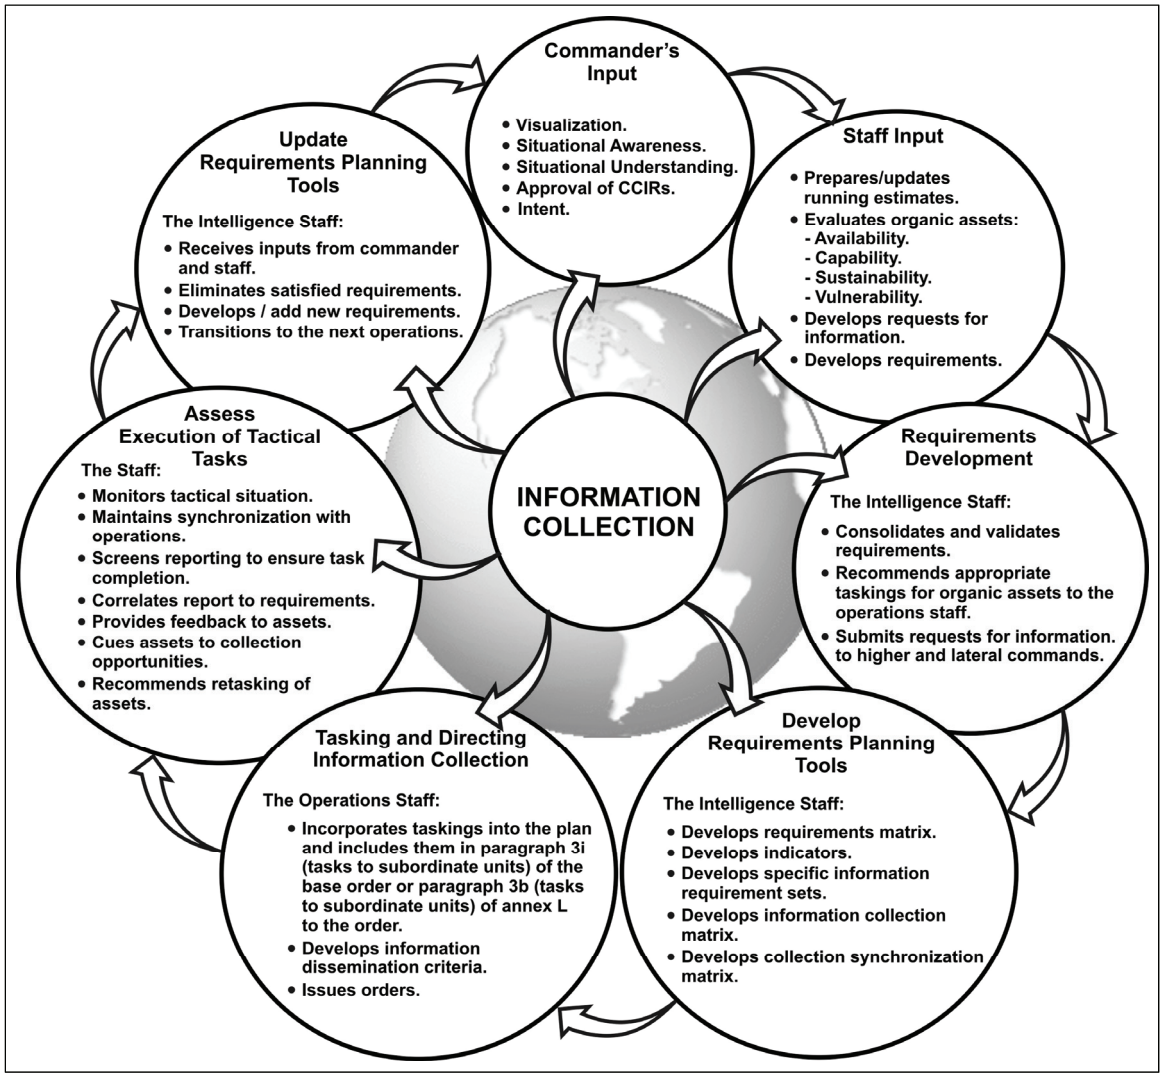

Figure 1-1. Information collection activities

1-7. These activities of information collection support the commander's understanding and visualization of the operation by identifying gaps in information, aligning assets and resources against them, and assessing the collected information and intelligence to inform the commander's decisions. They also support the staff's integrating processes during planning and execution. The direct result of the information collection effort is a coordinated plan that supports the operation. As staff assesses information and intelligence, they refine the plan and issue fragmentary orders to the plan to re-task or re-mission assets and units.

PURPOSE

1-8. Information collection activities provide commanders with detailed, timely, and accurate intelligence, enabling them to visualize threat capabilities and vulnerabilities, and to gain situational understanding. Information collected from multiple sources and analyzed becomes intelligence that provides answers to commander's critical information requirements as part of an evolving understanding to the area of operations. These activities contribute to the achievement of a timely and accurate common operational picture (COP). By answering the commander's critical information requirements (CCIRs), information collection activities enable commanders to make informed decisions.

1-9. Effective information collection activities—

- Provide relevant information and intelligence products to commanders and staffs.
- Provide combat information to commanders.
- Contribute to situational awareness and facilitates continuous situational understanding.
- Generate a significant portion of the COP vertically and horizontally among organizations, commanders, and staffs.
- Support the commander's visualization, permitting more effective mission command.
- Answer the CCIRs.
- Facilitate and are facilitated by the intelligence preparation of the battlefield (IPB).
- Support effective, efficient, and accurate targeting.
- Decrease risk for the unit.

1-10. Commanders and staffs continuously plan, task, and employ collection assets and forces to collect information. They request information and resources through higher echelons as needed. This information and intelligence enable commanders to make informed decisions that are translated into action.

1-11. Information collection planning is crucial to mission success. The four fundamentals in effectively planning, synchronizing, and integrating information collection activities are—

- The commander drives the information collection effort.
- Effective information collection synchronization and integration requires full staff participation.
- Conducting information collection requires a collection capability, either organic or augmented by nonorganic resources.
- Conducting information collection requires an analytical capability to analyze and produce actionable intelligence.

1-12. Commanders must be involved in the information collection planning process by quickly and clearly articulating their CCIRs to the staff. This enables the staff to facilitate the commander's visualization and decisionmaking by focusing on the CCIRs.

1-13. Effective information collection requires the entire staff's involvement and input. This enables the intelligence staff to identify and assess information requirements and the operations staff to task and direct the effort.

1-14. Conducting information collection activities requires an organic collection capability, either organic or augmented by nonorganic resources. Acquiring the required information to answer the requirements encompasses the efforts of reconnaissance, security, surveillance, intelligence operations, and the skills of Soldiers. All the activities that contribute to developing continuous knowledge about the area of operations are considered information collection activities. Planners must understand all collection assets and resources available to them and the procedures to request or task collection from those assets, resources, and organizations. Refer to appendix A for additional information.

1-15. Conducting these activities requires an analytical capability to interpret information and produce actionable intelligence. The analyst's ability to employ critical thinking and use multiple sources during intelligence analysis reduces uncertainty and helps solve problems that could not be resolved via a single source of information. This requires staff sections to understand the capabilities and limitations of assets to collect and report. The staff must also establish reporting guidelines to the collection assets.

INFORMATION COLLECTION PROCESS

1-16. Information collection is the acquisition of information and the provision of this information to processing elements. This process performs the following tasks:

- Plan requirements and assess collection.
- Task and direct collection.
- Execute collection.

PLAN REQUIREMENTS AND ASSESS COLLECTION

1-17. The intelligence staff (in collaboration with the operations officer and the entire staff) receives and validates requirements for collection, prepares the requirements planning tools, recommends collection assets and capabilities to the operations staff, and maintains synchronization as operations progress. (Chapter 3 of this manual discusses plan and assess in detail.)

TASK AND DIRECT COLLECTION

1-18. The operations officer (based on recommendations from the staff) tasks, directs, and when necessary re-tasks the information collection assets. (Chapter 4 of this manual discusses tasking and directing of collection.)

EXECUTE COLLECTION

1-19. Executing collection focuses on requirements tied to the execution of tactical missions (such as reconnaissance, surveillance, security, and intelligence operations) based on the CCIRs. Collection activities acquire information about the adversary and the area of operations and provide that information to intelligence processing and exploitation elements. Typically collection activities begin soon after receipt of mission and continue throughout preparation and execution of the operation. They do not cease at conclusion of the mission but continue as required. This allows the commander to focus combat power, execute current operations, and prepare for future operations simultaneously.

1-20. The subtasks are—

- Establish technical channels and provide guidance.
- Collect and report information.
- Establish a mission intelligence briefing and debriefing program.

Establish Technical Channels and Provide Guidance

1-21. This subtask includes providing and conducting technical channels to refine and focus the intelligence disciplines' information collection tasks. It coordinates the disciplines' assets when operating in another unit's area of operations. (FM 2-0 contains additional information for this task and its two subtasks: "*Establish and maintain technical channels*" and "*Conduct deconfliction and coordination*.")

1-22. Due to the unique characteristics of intelligence operations, technical channels ensure adherence to applicable laws and policies, ensure proper use of doctrinal techniques, and provide technical support and guidance to intelligence operations and discipline assets. Applicable laws and policies include all relevant U.S. laws, the law of war, international laws, directives, Department of Defense instructions, and orders. Commanders direct operations but often rely on technical control to conduct portions of the collection effort.

1-23. Technical channels refer to supervision of intelligence operations and disciplines. Technical channels do not interfere with the ability to task organic intelligence operations assets. It ensures adherence to existing policies or regulations by providing technical guidance for intelligence operations tasks contained within the information collection plan. While not a formal command or support relationship, technical channels is a critical function that ensures the collection asset has the required technical data to perform mission-related tasks.

1-24. Technical channels also involve translating tasks into the specific parameters used to focus the highly technical intelligence operations collection or the legally sensitive aspects of signals intelligence collection as well as human intelligence military source operations and counterintelligence tasks. Technical channels provide the means to meets the overall commander's intent for intelligence operations. Technical channels include but are not limited to defining, managing, or guiding the use of specific intelligence assets or identifying critical technical collection criteria (such as technical indicators and recommending collection techniques or procedures).

Note: In specific cases, regulatory authority is granted to specific national and Department of Defense intelligence agencies for specific intelligence discipline collection and is passed through technical control channels.

Collect and Report Information

1-25. This task involves collecting and reporting information in response to collection tasks. Collection assets collect information and data about the threat, terrain and weather, and civil considerations for a particular area of operations (AO) and area of interest. A successful information collection effort results in the timely collection and reporting of relevant and accurate information, which supports the production of intelligence or combat information.

Collect

1-26. As part of the collection plan, elements of all units obtain information and data concerning the threat, terrain and weather, and civil considerations within the AO. Well-developed procedures and carefully planned flexibility to support emerging targets, changing requirements, and the need to support combat assessment is critical. Once staffs collect the information, they process it into a form that enables analysts to extract essential information and produce intelligence and targeting data. Once Solders collect the information, it is processed into a form that enables analysis. Collected and processed information is provided to the appropriate units, organizations, or agencies for analysis or action. This analyzed information forms the foundation of running estimates, targeting data, intelligence databases, and intelligence.

Report

1-27. Collection assets must follow standard operating procedures (SOPs) to ensure staffs tag reports with the numbers of the tasks they satisfy. Simultaneously, SOPs ensure assets understand and have a means of reporting important but unanticipated information. Collection assets reporting may convey that collection occurred, but the unit did not observe any activity satisfying the information collection task, which may be a significant indicator. As a part of reporting, the staff tracks which specific collection task originates from which intelligence requirement Such tracking ensures the staff provides the collected information to the original requester and to all who need the information. Correlating reporting to the original requirement and evaluating reports is key to effective information collection. The staff tracks the progress of each requirement and cross-references incoming reports to outstanding requirements.

Establish a Mission Intelligence Briefing and Debriefing Program

1-28. The commander establishes, supports, and allocates appropriate resources for a mission briefing and debriefing program. The battle updates and after action reviews are separate tasks from the mission briefing and debriefing program. The G-2 (S-2) develops a mission intelligence briefing program and complementary debriefing program to support the commander's program.

PRIMARY INFORMATION COLLECTION TASKS AND MISSIONS

1-29. Information collection encompasses all activities and operations intended to gather data and information that, in turn, are used to create knowledge and support the commander's requirements, situational understanding, and visualization. Commanders maximally achieve information collection when they care carefully employ all the collection tasks and missions together in an operation. This appropriate mix of collection tasks and missions helps satisfy as many different requirements as possible. It also ensures that the operations and intelligence working group does not favor or become too reliant on one particular unit, discipline, or system. The Army has four tasks or missions it primarily conducts as a part of the information collection plan:

- Reconnaissance.
- Surveillance.

- Security operations.
- Intelligence operations.

RECONNAISSANCE

1-30. *Reconnaissance* is those operations undertaken to obtain, by visual observation or other detection methods, information about the activities and resources of an enemy or adversary, or to secure data concerning the meteorological, hydrographical or geographical characteristics and the indigenous population of a particular area (FM 3-90). Reconnaissance primarily relies on the human dynamic rather than technical means. Reconnaissance is a focused collection effort. A combined arms operation, reconnaissance is normally tailored to actively collect information against specific targets for a specified time based on mission objectives.

1-31. Units perform reconnaissance using three methods: dismounted, mounted, and aerial (each can be augmented by sensors). Successful and effective units combine these methods. To gain information on the enemy or a particular area, units can use passive surveillance, technical means, and human interaction, or they can fight for information.

1-32. Reconnaissance produces information concerning the AO. Staffs perform reconnaissance before, during, and after other operations to provide information used in the IPB process. Commanders perform reconnaissance to formulate, confirm, or modify a course of action (COA). Reconnaissance provides information that commanders use to make informed decisions to confirm or modify the concept of operations. This information may concern the enemy, the local population, or any other aspect of the AO. Commanders at all echelons incorporate reconnaissance into their operations.

1-33. Reconnaissance identifies terrain characteristics, enemy and friendly obstacles to movement, and the disposition of enemy forces and civilians so that commanders can maneuver forces freely with reduced risk. Reconnaissance prior to unit movements and occupation of assembly areas is critical to protecting the force and preserving combat power. It also keeps U.S. forces free from contact as long as possible so that they can concentrate on the decisive operation.

Reconnaissance Objective

1-34. Commanders orient their reconnaissance by identifying a reconnaissance objective within the AO. The reconnaissance objective is a terrain feature, geographic area, enemy force, or specific civil considerations about which the commander wants to obtain additional information. The reconnaissance objective clarifies the intent of the reconnaissance by specifying the most important result to obtain from the reconnaissance mission. Every reconnaissance mission specifies a reconnaissance objective. Commanders assign reconnaissance objectives based on commander's critical information requirements, reconnaissance asset capabilities, and reconnaissance asset limitations. The reconnaissance objective can be information about a specific geographical location (such as the cross-country trafficability of a specific area), a specific enemy activity to be confirmed or denied, a specific enemy element to be located or tracked, or specific civil considerations (such as critical infrastructure). When the unit lacks time to complete all the tasks associated with a specific form of reconnaissance, it uses the reconnaissance objective to guide it in setting priorities.

1-35. Commanders may need to provide additional detailed instructions beyond the reconnaissance objective (such as specific tasks to be performed or the priority of tasks). They do this by issuing additional guidance to their reconnaissance units or by specifying these instructions in the tasks to subordinate units in the operation order. For example, if a unit S-2 concludes that the enemy is not in an area and the terrain appears to be trafficable without obstacles, the commander may direct the reconnaissance squadron to conduct a zone reconnaissance mission with guidance to move rapidly and report by exception any terrain obstacles that will significantly slow the movement of subordinate maneuver echelons. Alternatively, when the objective is to locate an enemy force, the reconnaissance objective would be that force, and additional guidance could be to conduct only that terrain reconnaissance necessary to find the enemy and develop the situation.

Reconnaissance Fundamentals

1-36. The seven fundamentals of reconnaissance are—

- Ensure continuous reconnaissance.
- Do not keep reconnaissance assets in reserve.
- Orient on the reconnaissance objective.
- Report information rapidly and accurately.
- Retain freedom of maneuver.
- Gain and maintain enemy contact.
- Develop the situation rapidly.

Ensure Continuous Reconnaissance

1-37. The commander conducts reconnaissance before, during, and after all operations. Before an operation, reconnaissance focuses on filling gaps in information about the enemy, specific civil considerations, and the terrain. During an operation, reconnaissance focuses on providing the commander with updated information that verifies the enemy's composition, dispositions, and intentions as the battle progresses. This allows commanders to verify which COA the enemy is actually adopting and to determine if the plan is still valid based on actual events in the AO. After an operation, reconnaissance focuses on maintaining contact with the enemy forces to determine their next move and collecting information necessary for planning subsequent operations. In stability and defense support of civil authorities operations, reconnaissance focuses on specific civil considerations.

Do Not Keep Reconnaissance Assets in Reserve

1-38. Reconnaissance assets, like artillery assets, are never kept in reserve. When committed, reconnaissance assets use all their resources to accomplish the mission. This does not mean that all assets are committed all the time. Commanders use reconnaissance assets based on their capabilities and the mission variables—mission, enemy, terrain and weather, troops and support available-time available and civil considerations—to achieve the maximum coverage needed to answer the CCIRs. At times, this requires commanders to withhold or position reconnaissance assets to ensure they are available at critical times and places. Commanders sustain and rest reconnaissance assets as necessary, but they are not placed in reserve. All reconnaissance assets should be treated as committed assets with specific missions assigned to them at all times. This fundamental does not apply to units with multiple roles that can conduct reconnaissance, security, and other combat missions in an economy of force role. Commanders may elect to place them in reserve as needed.

Orient on the Reconnaissance Objective

1-39. The commander uses the reconnaissance objective to focus the unit's reconnaissance efforts. Commanders of subordinate reconnaissance elements remain focused on achieving this objective, regardless of what their forces encounter during the mission. When time, limitations of unit capabilities, or enemy actions prevent a unit from performing all the tasks normally associated with a particular form of reconnaissance, the unit uses the reconnaissance objective to focus the reconnaissance effort.

Report Information Rapidly and Accurately

1-40. Reconnaissance assets acquire and report accurate and timely information on the enemy, civil considerations, and the terrain over which operations are to be conducted. Information may quickly lose its value. Reconnaissance units report exactly what they see and, if appropriate, what they do not see. Seemingly unimportant information may be extremely important when combined with other information. Negative reports are as important as reports of enemy activity. Reconnaissance assets must report all information, including a lack of enemy activity; failure to report tells the commander nothing. The unit communications plan ensures that unit reconnaissance assets have the proper communication equipment to support the integrated information collection plan.

Retain Freedom of Maneuver

1-41. Reconnaissance assets must retain battlefield mobility to successfully accomplish their missions. If these assets are decisively engaged, reconnaissance stops and a battle for survival begin. Reconnaissance assets must have clear engagement criteria that support the maneuver commander's intent. Initiative and knowledge of both the terrain and the enemy reduce the likelihood of decisive engagement and help maintain freedom of movement. Prior to initial contact, the reconnaissance unit adopts a combat formation designed to gain contact with the smallest possible friendly element. This provides the unit with the maximum opportunity for maneuver and enables it to avoid decisively engaging the entire unit. The IPB process can identify anticipated areas of likely contact to the commander. Using indirect fires to provide suppression and obscuration as well as destroy point targets is a method reconnaissance assets use to retain their freedom of maneuver.

Gain and Maintain Enemy Contact

1-42. Once a unit conducting reconnaissance gains contact with the enemy, it maintains that contact unless the commander directing the reconnaissance orders otherwise or the survival of the unit is at risk. This does not mean that individual scout and reconnaissance teams cannot break contact with the enemy. The commander of the unit conducting reconnaissance is responsible for maintaining contact using all available resources. The methods of maintaining contact can range from surveillance to close combat. Surveillance, combined with stealth, is often sufficient to maintain contact and is the preferred method. Units conducting reconnaissance avoid combat unless it is necessary to gain essential information, in which case the units use maneuver (fire and movement) to maintain contact while avoiding decisive engagement.

Develop the Situation Rapidly

1-43. When a reconnaissance asset encounters an enemy force or an obstacle, it must quickly determine the threat it faces. For an enemy force, it must determine the enemy's composition, dispositions, activities, and movements, and assess the implications of that information. For an obstacle, the reconnaissance asset must determine the type and extent of the obstacle and whether it is covered by fire. Obstacles can provide information concerning the location of enemy forces, weapons capabilities, and organization of fires. In most cases, the reconnaissance unit developing the situation uses actions on contact.

Reconnaissance Forms

1-44. The four forms of reconnaissance are—

- Route reconnaissance.
- Zone reconnaissance.
- Area reconnaissance.
- Reconnaissance in force.

Route Reconnaissance

1-45. Route reconnaissance focuses along a specific line of communications (such as a road, railway, or cross-country mobility corridor). It provides new or updated information on route conditions (such as obstacles and bridge classifications, and enemy and civilian activity along the route). A route reconnaissance includes not only the route itself, but also all terrain along the route from which the enemy could influence the friendly force's movement. The commander normally assigns this mission to use a specific route for friendly movement.

Zone Reconnaissance

1-46. Zone reconnaissance involves a directed effort to obtain detailed information on all routes, obstacles, terrain, enemy forces, or specific civil considerations within a zone defined by boundaries. Obstacles include both existing and reinforcing, as well as areas with chemical, biological, radiological, and nuclear (CBRN) contamination. Commanders assign zone reconnaissance missions when they need additional information on a zone before committing other forces in the zone. Zone reconnaissance missions are appropriate when the enemy situation is vague, existing knowledge of the terrain is limited, or combat operations have altered the terrain. A zone reconnaissance may include several route or area reconnaissance missions assigned to subordinate units.

Area Reconnaissance

1-47. Area reconnaissance focuses on obtaining detailed information about the enemy activity, terrain, or specific civil considerations within a prescribed area. This area may include a town, a neighborhood, a ridgeline, woods, an airhead, or any other feature critical to operations. The area may consist of a single point (such as a bridge or an installation). Areas are normally smaller than zones and not usually contiguous to other friendly areas targeted for reconnaissance. Because the area is smaller, units conduct an area reconnaissance more quickly than a zone reconnaissance.

Reconnaissance in Force

1-48. A reconnaissance in force is an aggressive reconnaissance conducted as an offensive operation with clearly stated reconnaissance objectives. A reconnaissance in force is a deliberate combat operation designed to discover or test the enemy's strength, dispositions, reactions, or to obtain other information. Battalion-sized task forces or larger organizations usually conduct a reconnaissance in force. A commander assigns a reconnaissance in force when the enemy is known to be operating within an area and the commander cannot obtain adequate intelligence by any other means. A unit may also conduct a reconnaissance in force in restrictive-type terrain where the enemy is likely to ambush smaller reconnaissance forces. The overall goal of reconnaissance in force is to determine enemy weaknesses that can be exploited. It differs from other reconnaissance because it is normally conducted only to gain information about the enemy and not the terrain.

Reconnaissance Focus, Reconnaissance Tempo, and Engagement Criteria

1-49. Commanders decide what guidance they will provide to shape the reconnaissance and surveillance effort. In terms of guidance, reconnaissance tempo and engagement criteria most closely apply organic reconnaissance elements. Reconnaissance focus can also be generally applied to surveillance assets, but in the specific sense of focusing a reconnaissance mission, it more closely applies to reconnaissance. The information below describes them in terms of reconnaissance.

Reconnaissance Focus

1-50. Reconnaissance focus, combined with one or more reconnaissance objectives, helps to concentrate the efforts of the reconnaissance assets. The commander's focus for reconnaissance usually falls in three general areas: CCIRs, targeting, and voids in information. The commander's focus enables reconnaissance units to prioritize taskings and narrow their scope of operations. An operation may have a terrain focus where the status of routes, bridges, and obstacles are more important than the enemy. Conversely, the operation may focus on the enemy in which friendly forces must locate the enemy's security zone, main body, and reserves. Additionally, commanders may express their focus in terms of reconnaissance pull and push. (FM 3-90 and FM 3-20.96 provide more detailed information on reconnaissance focus.)

1-51. Commanders use a reconnaissance pull when they do not know the enemy situation well or the situation changes rapidly. Reconnaissance pull fosters planning and decisionmaking based on changing assumptions into confirmed information. The unit uses initial assumptions and CCIRs to deploy reconnaissance assets as early as possible to collect information for developing COAs. The commander uses reconnaissance assets to confirm or deny initial CCIRs prior to deciding on a COA or maneuver option, thus pulling the unit to the decisive point on the battlefield. Success of the reconnaissance pull requires an integrated information collection plan that can be executed prior to the commander having to make a COA decision. (FM 3-90 and FM 3-20.96 provide more detailed information on reconnaissance pull.)

1-52. Commanders use a reconnaissance push once committed to a COA or maneuver option. The commander pushes reconnaissance assets forward, as necessary, to gain greater visibility on specific named area of interest (NAI) to confirm or deny the assumptions on which the COA is based. Staffs use the information gathered during reconnaissance push to finalize the unit's plan.

Reconnaissance Tempo

1-53. Tempo is the relative speed and rhythm of military operations over time with respect to the enemy. In terms of reconnaissance, tempo not only defines the pace of the operation, but also influences the depth of detail the reconnaissance can yield. Commanders establish time requirements for the reconnaissance force and express those requirements in a statement that describes the degree of completeness, covertness, and potential for engagement they are willing to accept. Commanders use their guidance on reconnaissance tempo to control the momentum of reconnaissance. Reconnaissance tempo is expressed as *rapid* or *deliberate* and *forceful* or *stealthy*.

1-54. Rapid operations and deliberate operations provide a description of the degree of completeness required by the commander. Rapid operations are fast paced, are focused on key pieces of information, and entail a small number of tasks. They describe reconnaissance that personnel must perform in a time-constrained environment. Deliberate operations are slow, detailed, and broad-based. They require the accomplishment of numerous tasks. The commander must allocate a significant amount of time to conduct a deliberate reconnaissance.

1-55. Forceful and stealthy operations provide a description of the level of covertness that the commander requires. Units conduct forceful operations without significant concern about being observed. Mounted units or combat units serving in a reconnaissance role often conduct forceful operations. In addition, forceful operations are appropriate in stability operations where the threat is not significant in relation to the requirement for information. Units conduct stealthy operations to minimize chance contact and prevent the reconnaissance force from being detected. They often are conducted dismounted and require increased allocation of time for success.

Engagement Criteria

1-56. Engagement criteria establish minimum thresholds for engagement (lethal and nonlethal). They clearly specify which targets the reconnaissance element is expected to engage and which it will hand off to other units or assets. For example, nonlethal contact identifies engagement criteria for tactical questioning of civilians and factional leaders. This criterion allows unit commanders to anticipate bypass criteria and to develop a plan to maintain visual contact with bypassed threats.

SURVEILLANCE

1-57. *Surveillance* is the systematic observation of aerospace, surface, or subsurface areas, places, persons, or things, by visual, aural, electronic, photographic, or other means (JP 3-0). Surveillance involves observing an area to collect information.

1-58. In the observation of a given area, the focus and tempo of the collection effort primarily comes from the commander's intent and guidance. Surveillance involves observing the threat and local populace in a NAI or targeted area of interest (TAI). Surveillance may be conducted as a stand-alone mission, or as part of a reconnaissance mission (particularly area reconnaissance). Elements conducting surveillance must maximize assets, maintain continuous surveillance on all NAIs and TAIs, and report all information rapidly and accurately.

1-59. Surveillance tasks can be performed by a variety of assets (ground, air, sea, and space), means (Soldier and systems), and mediums (throughout the electromagnetic spectrum).

1-60. Generally, surveillance is considered a "task" when performed as part of a reconnaissance mission. However, many Army, joint, and national systems are designed specifically to conduct only surveillance. These are surveillance missions. Army military intelligence organizations typically conduct surveillance missions. Reconnaissance units can conduct surveillance tasks as part of reconnaissance, security, or other missions. The commonality of reconnaissance and surveillance is observation and reporting.

1-61. Surveillance is distinct from reconnaissance. Surveillance is tiered and layered technical assets collecting information. Often surveillance is passive and may be continuous. Reconnaissance is active in the collection of information (such as maneuver) and usually includes human participation. Additionally, reconnaissance may involve fighting for information. Sometimes these operations are deliberate, as in a reconnaissance in force; however, the purpose of reconnaissance is to collect information, not initiate

combat. Reconnaissance involves many tactics, techniques, and procedures throughout the course of a mission. An extended period of surveillance may be one of these. Commanders complement surveillance with frequent reconnaissance. Surveillance, in turn, increases the efficiency of reconnaissance by focusing those missions while reducing the risk to Soldiers.

1-62. Both reconnaissance and surveillance involve detection, location, tracking, and identification of entities in an assigned area and gaining environmental data, but they are not executed in the same way. During reconnaissance, collection assets are given the mission to find specific information by systematically checking different locations within the area. During surveillance, collection assets watch the same area, waiting for information to emerge when an entity or its signature appears.

1-63. Reconnaissance and surveillance complement each other by cueing the commitment of collection assets against specific locations or specially targeted enemy units. An airborne surveillance asset may discover indicators of enemy activity that cues a reconnaissance mission. In some cases, surveillance assets may also be tasked to answer specific questions.

Surveillance Characteristics

1-64. Effective surveillance—

- Maintains continuous observations of all assigned NAIs and TAIs.
- Provides early warning.
- Identifies, tracks, and assesses key targets.
- Provides mixed, redundant, and overlapping coverage.

Maintains Continuous Surveillance of All Assigned Named Areas of Interest and Targeted Areas of Interest

1-65. Once the surveillance of a NAI or TAI commences, units maintain it until they complete the mission or the higher commander terminates the mission. Commanders designate the receiver of the information and the means of communication. Continuous surveillance requires multiple collection assets, a purpose (requirement), a location (NAI or TAI) for each asset, and an information collection task. Effective commanders avoid designating too many NAIs and TAIs. Information collection suffers as a result of excessive requirements. During the plan and assess phase, the staff selects collection assets that can best answer the specific information requirements generated from the CCIRs. During tasking and direct phases, the operations officer tasks specific assets to perform these tasks to ensure continuous coverage.

Provides Early Warning

1-66. Surveillance aims to provide early warning of an enemy or threat action. Together with IPB, commanders use information collection to ascertain the enemy or threat course of action and timing. They then orient assets to observe these locations for indicators of threat actions. Reporting must be timely and complete.

Detects, Tracks, and Assesses Key Targets

1-67. Surveillance support for targeting includes detecting, tracking, and assessing those key targets. Surveillance support to targeting includes detecting and tracking desired targets in a timely, accurate manner. Clear and concise tasks must be given so the surveillance systems can detect a given target. Target tracking is inherent to detection. Mobile targets must be tracked to maintain a current target location. Once a target is detected, targeting planning cells must also consider the need to *track* targets. Tracking targets—such as moving, elusive, low contrast targets (to include individuals)—requires a heavy commitment of limited information collection assets and resources. Assessing key targets pertains to the results of attacks on targets. This helps commanders and staffs determine if their targeting objectives were met.

Provides Mixed, Redundant, and Overlapping Coverage

1-68. Commanders integrate the capabilities of limited assets to provide mixed, redundant, and overlapping coverage of critical locations identified during planning. The intelligence and operations staff work

together to achieve balance. Commanders and staff continuously assess surveillance results to determine any changes in critical locations requiring this level of coverage.

Surveillance Types

1-69. The types of surveillance are zone, area, point, and network.

Note: *Forms* of reconnaissance, as opposed to *types* of surveillance, are associated with maneuver units and missions.

Zone Surveillance

1-70. Zone surveillance is the temporary or continuous observation of an extended geographic zone defined by boundaries. It can be associated with but is not limited to a TAI or a NAI. Zone surveillance covers the widest geographical area of any type of surveillance. Multiple assets, including airborne surveillance assets and radar with wide coverage capabilities, are typically employed in zone surveillance.

Area Surveillance

1-71. Area surveillance is the temporary or continuous observation of a specific prescribed geographic area. It can be associated with, but is not limited to, a TAI or NAI. This area may include a town, a neighborhood, ridgeline, wood line, border crossing, farm, plantation, cluster or group of buildings, or other manmade or geographic feature. Unlike area reconnaissance, it does not include individual structures (such as a bridge or single building). Ground-mounted surveillance systems are particularly useful in area surveillance.

Point Surveillance

1-72. Point surveillance is the temporary or continuous observation of a place (such as a structure), person, or object. This can be associated with, but is not limited to, a TAI or a NAI. It is the most limited in geographic scope of all forms of surveillance. Point surveillance may involve tracking people. When surveillance involves tracking people, the "point" is that person or persons, regardless of movement and location. Tracking people normally requires a heavier commitment of assets and close coordination for handoff to ensure continuous observation.

Network Surveillance

1-73. Network surveillance is the observation of organizational, social, communications, cyberspace, or infrastructure connections and relationships. Network surveillance can also seek detailed information on connections and relationships among individuals, groups, and organizations, and the role and importance of aspects of physical or virtual infrastructure (such as bridges, marketplaces, and roads) in people's lives. It can be associated with but is not limited to a TAI or a NAI.

SECURITY OPERATIONS

1-74. Security operations are shaping operations that can take place during all operations. Reconnaissance is a part of every security operation. Other collection assets provide the commander with early warning and information on the strength and disposition of enemy forces. The availability of information collection assets enables greater flexibility in the employment of the security force.

1-75. Security operations aim to protect the force from surprise and reduce the unknowns in any situation. A commander undertakes these operations to provide early and accurate warning of enemy operations, to provide the force being protected with time and maneuver space to react to the enemy, and to develop the situation to allow the commander to effectively use the protected force. Commanders may conduct security operations to the front, flanks, and rear of their forces. The main difference between security operations and reconnaissance is that security operations orient on the force or facility being protected, while reconnaissance is enemy, populace, and terrain oriented.

1-76. The five forms of security operations commanders may employ are screen, guard, cover, area security, and local security. (Refer to FM 3-90 for more information on the five forms of security operations and their tactical employment.)

1-77. Successful security operations depends upon properly applying the following five fundamentals:

- Provide early and accurate warning.
- Provide reaction time and maneuver space.
- Orient on the force or facility to be secured.
- Perform continuous reconnaissance.
- Maintain enemy contact.

1-78. To properly apply the fundamental of "perform continuous reconnaissance," the security force aggressively and continuously seeks the enemy, interacts with the populace, and reconnoiters key terrain. It conducts active area or zone reconnaissance to detect enemy movement or enemy preparations for action and to learn as much as possible about the terrain. The ultimate goal is to detect the enemy's COA and assist the main body in countering it. Terrain information focuses on its possible use by the enemy or friendly force, either for offensive or defensive operations. Stationary security forces use combinations of observation posts, aviation, intelligence collection assets, and battle positions to perform reconnaissance. Moving security forces perform zone, area, or route reconnaissance along with using observation posts and battlefield positions, to apply this fundamental.

INTELLIGENCE OPERATIONS

1-79. Intelligence operations align intelligence assets and resources against requirements to the collect information and intelligence to inform the commander's decisions. Conducting intelligence operations requires an organic collection and analysis capability. Those units without resources must rely on augmentation from within the intelligence enterprise for intelligence. Although the focus is normally on tactical intelligence, the Army draws on both strategic and operational intelligence resources. Each intelligence discipline provides the commander specific technical capabilities and sensors. Because of the unique capabilities and characteristics of intelligence operations, these capabilities and sensors require specific guidance through technical channels. The Army's intelligence disciplines that contribute to intelligence operations are—

- Counterintelligence.
- Human intelligence.
- Geospatial intelligence.
- Measurement and signature intelligence.
- Signals intelligence.
- Technical intelligence.

Counterintelligence

1-80. Counterintelligence counters or neutralizes intelligence collection efforts by foreign intelligence and security services and international terrorist organizations. It does this through collection, counterintelligence investigations, operations, analysis, production, and functional and technical services. Counterintelligence includes all actions taken to detect, identify, track, exploit, and neutralize the multidiscipline intelligence activities of friends, competitors, opponents, adversaries, and enemies. It is the key intelligence community contributor to protect U.S. interests and equities. Counterintelligence helps identify essential elements of friendly information (EEFI) by identifying vulnerabilities to threat collection and actions taken to counter collection and operations against U.S. forces.

Human Intelligence

1-81. *Human intelligence* is a category of intelligence derived from information collected and provided by human sources (JP 2-0). This information is collected by a trained human intelligence collector, from people and their associated documents and media sources. Units use the collected information to identify threat elements, intentions, composition, strength, dispositions, tactics, equipment, personnel, and capabilities.

Geospatial Intelligence

1-82. Title 10, U.S. Code establishes geospatial intelligence. *Geospatial intelligence* is the exploitation and analysis of imagery and geospatial information to describe, assess, and visually depict physical features and geographically referenced activities on the Earth. Geospatial intelligence consists of imagery, imagery intelligence, and geospatial information (JP 2-03). No longer is an intelligence discipline, imagery intelligence is a subset of geospatial intelligence. Imagery intelligence is derived from the exploitation of imagery collected by visual photography, infrared sensors, lasers, multispectral sensors, and radar. These sensors produce images of objects optically, electronically, or digitally on film, electronic display devices, or other media.

Measurement and Signature Intelligence

1-83. Measurement and signature intelligence is technically derived intelligence that detects, locates, tracks, identifies, or describes the specific characteristics of fixed and dynamic target objects and sources. It also includes the additional advanced processing and exploitation of data derived from imagery intelligence and signals intelligence collection. Measurement and signature intelligence collection systems include but are not limited to radar, spectro-radiometric, electro-optical, acoustic, radio frequency, nuclear detection, and seismic sensors. Measurement and signature intelligence collection also includes techniques for collecting CBRN and other materiel samples.

Signals Intelligence

1-84. Signals intelligence is produced by exploiting foreign communications systems and noncommunications emitters. Signals intelligence provides unique intelligence and analysis information in a timely manner. The discipline comprises communications intelligence, electronic intelligence, and foreign instrumentation signals intelligence.

Technical Intelligence

1-85. Technical intelligence is intelligence derived from the collection and analysis of threat and foreign military equipment and associated materiel. Units use this collected intelligence for the purposes of preventing technological surprise, assessing foreign scientific and technical capabilities, and developing countermeasures designed to neutralize an adversary's technological advantages.

Chapter 2

Commander and Staff Responsibilities

This chapter examines the roles, knowledge, and guidance of the commander in information collection activities. The commander's involvement facilitates an effective information collection plan that is synchronized and integrated within the overall operation. This chapter then discusses the role of the staff. Lastly, this chapter discusses contributions from working groups.

THE ROLE OF THE COMMANDER

2-1. Commanders understand, visualize, describe, direct, lead, and assess operations. Understanding is fundamental to the commander's ability to establish the situation's context. Understanding involves analyzing and understanding the operational or mission variables in a given operational environment. It is derived from applying judgment to the common operational picture through the filter of the commander's knowledge and experience.

2-2. Numerous factors determine the commander's depth of understanding. Information from information collection and the resulting intelligence products prove indispensable in assisting the commander in understanding the area of operations (AO). Formulating commander's critical information requirements (CCIRs) and keeping them current also contribute to this understanding. Maintaining understanding is a dynamic ability; a commander's situational understanding changes as an operation progresses.

2-3. The commander must be involved in information collection planning. The commander directs information collection activities by—

- Asking the right questions to focus the efforts of the staff.
- Knowing the enemy. Personal involvement and knowledge have no substitutes.
- Stating the commander's intent clearly and decisively designating CCIRs.
- Understanding the information collection assets and resources to exploit their full effectiveness.

2-4. Commanders prioritize collection activities primarily through providing their guidance and commander's intent early in the planning process. Commanders must—

- Personally identify and update CCIRs.
- Ensure CCIRs are tied directly to the scheme of maneuver and decision points.
- Limit CCIRs to only their most critical needs (because of limited collection assets).
- Aggressively seek higher echelons' collection of, and answers to, the information requirements.
- Ensure CCIRs include the latest time information is of value (LTIOV) or the event by which the information is required.

2-5. The commander may also identify essential elements of friendly information (EEFI). The EEFI are not part of the CCIRs; rather they establish friendly information to protect, not enemy information to obtain. However, the commander may need to determine if the enemy has learned specific EEFI. In this case, finding this out can become a CCIR. (FM 6-0 provides detailed information on EEFI.)

2-6. Commanders ensure that both intelligence preparation of the battlefield (IPB) and information collection planning are integrated staff efforts. Every staff member plays an important role in both tasks. The chief of staff or executive officer ensures all staff members participate in and provide their functional expertise into the IPB process and information collection planning, preparation, execution, and assessment. Full staff engagement in these activities supports planning and helps facilitate the commander's visualization and understanding.

2-7. Information collection planning and assessment must be continuous. Commanders ensure they properly assign information collection tasks based on the unit's abilities to collect. Therefore, commanders match their information requirements as to not exceed the information collection and analytical ability of their unit. When not using organic assets, commanders use habitual relationships to optimize effective operations as a combined arms team, when possible.

2-8. Commanders assess operations. Commanders ensure collection activities provide the information needed. Timely reporting to the right analytical element at the right echelon is critical to information collection activities. Commanders continuously assess operations throughout the planning, preparation, and execution phases. The commander's involvement and interaction enable the operations and intelligence officers to more effectively assess and update collection activities. The commander's own assessment of the current situation and progress of the operation provides insight on what new information is needed and what is no longer required. The commander communicates this to the staff to assist them in updating CCIRs. Commanders should use regularly scheduled staff assessments (for example, end of phase assessments) to update information collection guidance as well as to increase their own understanding of the situation. Every echelon works together and tailors the intelligence enterprise making it seamless as possible by removing information sharing barriers.

COMMANDER'S NEEDS

2-9. Staffs synchronize and integrate information collection activities with the warfighting functions based on the higher commander's guidance and decisions. Commanders' knowledge of collection activities enables them to focus the staff and subordinate commanders in planning, preparing, executing, and assessing information collection activities for the operation.

2-10. Commanders must understand the overall concept of operations from higher headquarters to determine specified and implied tasks and information requirements. There are a finite number of assets and resources for information collection activities. Commanders communicate this as guidance for planners and the staff. Commanders must visualize how multiple collection components work together and understand how their unit's activities fit into and contribute to those of higher, adjacent, and lower echelons.

2-11. Extended areas of operations, the necessity to conduct missions and develop information and intelligence over large areas, and extended time spans can surpass the organic capabilities of a unit. Commanders must be able to deal effectively with many agencies and organizations in the area of operations to help enable the unit to perform information collection activities. One of the essential aspects to this is terminology. When dealing with non-U.S. Army personnel and organizations, commanders ensure those involved understand the terms used and provide or request clarification as needed. Commanders should gain a working knowledge of joint and multinational vocabulary and ways of operating. They should also know as much as possible about the roles and contributions of other organizations to better communicate and leverage resources.

COMMANDER'S GUIDANCE

2-12. Commanders play a central role in planning primarily by providing guidance. This should include specific guidance for collection assets and required information. Commanders consider risks and provide guidance to the staff on an acceptable level of risk for information collection planning. The commander issues formal guidance at three specific points in the process:

- *Initial guidance* following receipt of mission.
- *Commander's planning guidance* following mission analysis to guide course of action (COA) development.
- *Final planning guidance* after the COA decision but before the final warning order (WARNO).

INITIAL GUIDANCE

2-13. After a unit receives a mission, the commander issues initial guidance. (FM 5-0 provides detailed information on the initial guidance.) The initial guidance accomplishes several things. It—

- Begins the visualization process by identifying the tactical problem (the first step to problem solving).
- Defines the area of operations. This presents a common operational picture for the commander and staff in seeing the terrain, including the populace.
- Develops the initial commander's intent, specifically key tasks (including tasks for reconnaissance), decisive point, and end state.
- Lists challenges and initial CCIRs. Challenges include any guidance for specific staff sections.
- Results in the WARNO.

2-14. For information collection planning, the initial guidance includes—

- Initial timeline for information collection planning.
- Initial information collection focus.
- Initial information requirements.
- Authorized movement.
- Collection and product development timeline.

2-15. The initial WARNO can alert information collection assets to begin collection activities to begin at this time. If this is the case, the initial WARNO includes—

- Named areas of interest (NAIs) to be covered.
- Collection tasks and specific information requirements to be collected.
- Precise guidance on infiltration method, reporting criteria and timelines, fire support and casualty evacuation plan.

COMMANDER'S PLANNING GUIDANCE

2-16. The commander issues the commander's planning guidance during the mission analysis step of the MDMP, following the approval of the restated mission and mission analysis brief. Part of the commander's planning guidance is directly related to collection activities—the initial CCIRs and information collection guidance. The guidance for planning should contain sufficient information for the operations officer to complete a draft information collection plan. As a minimum, the commander's planning guidance includes—

- Current CCIRs.
- Focus and tempo.
- Engagement criteria.
- Acceptable risk to assets.

2-17. The commander issues the initial commander's intent with the commander's planning guidance. The staff verifies the draft information collection plan is synchronized with the commander's intent assesses any ongoing information collection activities, and recommends changes to support the commander's intent, CCIRs, and concept of operations.

FINAL PLANNING GUIDANCE

2-18. After the decision briefing, the commander determines a COA the unit follows and issues final planning guidance. Final planning guidance includes—

- Any new CCIRs, including the LTIOV.
- Rehearsals.

ROLE OF THE STAFF

2-19. The staff must function as a single, cohesive unit—a professional team. Effective staff members know their respective responsibilities and duties. They are also familiar with the responsibilities and duties of other staff members. (ATTP 5-0.1 details staff duties and responsibilities.) The information collection responsibilities of other coordinating staff members include assisting in the development of the information collection plan and annexes.

2-20. The chief of staff or executive officer directs the efforts of coordinating and special staff officers, integrates and synchronizes plans and orders, and supervises management of the CCIRs.

2-21. The G-2 (S-2) must work in concert with the entire staff to identify collection requirements and implement the information collection plan. The intelligence staff determines collection requirements, (based upon inputs from the commander and other staff sections) develops the information collection matrix with input from the staff representatives, and continues to work with the staff planners to develop the information collection plan. The G-2 (S-2) also identifies those intelligence assets and resources—human intelligence, geospatial intelligence, measurement and signature intelligence, or signals intelligence—which can provide answers to the CCIRs.

2-22. The G-2X (S-2X) (hereafter referred to as the 2X) is the doctrinal term used to refer to the counterintelligence and human intelligence operations manager who works directly for the G-2 (S-2). The term also refers to the staff section led by the 2X. The 2X manages counterintelligence and human intelligence operations in support of the overall unit operation. The 2X section works with the G-2 (S-2) in information collection planning and assessing, taking developed counterintelligence and human intelligence requirements and identifying the proper assets to answer the requirements. This information is used to develop requirement planning tools and the overall collection plan.

2-23. The G-3 (S-3) is the primary information collection tasking and directing staff officer within the unit, tasking the organic and assigned assets for execution. The G-3 (S-3) collaboratively develops the information collection plan and ensures its synchronization with the operation plan.

2-24. The other members of the staff support the operations process. Through the conduct of the planning process, staffs develop requirements that are considered for inclusion as CCIRs and into the information collection plan. Staffs also monitor the situation and progress of the operation towards the commander's desired goal. Staffs also prepare running estimates. A *running estimate* is the continuous assessment of the current situation used to determine if the current operation is proceeding according to the commander's intent and if planned future operations are supportable (FM 5-0). Staffs continuously assess how new information might impact conducting operations. They update running estimates and determine if adjustments to the operation are required. Through this process, the staffs ensure that the information collection plan remains updated as the situation changes and requirements are answered or new requirements developed.

2-25. Staff members consider the following when supporting the information collection planning and execution:

- **Nature of the mission**. Offensive, defensive, and stability or defense support of civil authorities (DSCA) operations have different requirements, time frames, rules of engagement, and other differences. These differences influence information staffs require to provide recommendations or decisions. Unit movements before an operation begins may require a route reconnaissance.
- **Terrain and weather**. Specific environments (urban, mountain, jungle, and desert), the size of the operational area, trafficability, and severe weather conditions affect when and how assets are deployed and may degrade sensor capabilities. Additionally terrain management for asset locations is a staff responsibility in the creation of the information collection plan.
- **Higher commander's intent and guidance**. The commander's intent and guidance may specify the initiation of collection activities or they may leave wide leeway for subordinate commanders and staffs. Staffs determine how information collection activities support the commander's visualization expressed in the commander's intent.
- **What is known and not known about the enemy and the environment**. The commander determines the criticality of the information identified through CCIRs, which include the

LTIOV. When the information is required drives the collection timeframe. The staff recommends requirements as part of the CCIR development process, ensuring that requirements remain current with the situation and on-going operations.

- **Risk to collection assets**. Using the composite risk management process, commanders include acceptable risk to collection assets in their guidance. This may preclude the use or early use of some types of assets. For example, a long-range surveillance company may be available, but the nature of the terrain and the enemy may dictate the use of a less vulnerable asset.
- **Rules of engagement that affect information collection activities**. These may include limitations on where or when aircraft may fly, the use of tracked vehicles in urban areas, protection measures, surveillance of U.S. citizens (in DSCA), and other restrictions that affect information collection activities.
- **Need for operations security**. Staffs balance the need for information with the need to avoid revealing intentions by conducting information collection activities. This may dictate selection of assets, such as an airborne asset instead of ground reconnaissance asset, or the use of deception.
- **Support for friendly deception operations**. Information collection activities can support friendly deception operations by causing the enemy to wrongly predict friendly intentions based upon the reconnaissance and surveillance efforts they observe.
- **Available assets.** The availability, capabilities, and limitations of assets impact decisions on when and how to deploy them.
- **Enemy counterreconnaissance**. Staffs need to be cognizant of the nature of the enemy's counterreconnaissance intentions and capabilities, and plan to defeat or avoid them.

WORKING GROUP INPUT TO INFORMATION COLLECTION

2-26. *Battle rhythm* is a deliberate daily cycle of command, staff, and unit activities intended to synchronize current and future operations (JP 3-33). A headquarters' battle rhythm consists of a series of meetings, briefings, and other activities synchronized by time and purpose. The chief of staff or executive officer oversees the battle rhythm. Each meeting, to include working groups and boards, should be logically sequenced so that one meeting's outputs are available as another meeting's inputs (to include higher headquarters meetings).

2-27. A working group is a grouping of predetermined staff representatives who meet to provide analysis, coordinate, and provide recommendations for a particular purpose or function. Working groups are cross functional by design to synchronize the contributions of multiple command posts cells and staff sections.

2-28. A board is a grouping of predetermined staff representatives with delegated decision authority for a particular purpose or function. Boards are similar to working groups. However, commanders appoint boards with the purpose to arrive at a decision. When the process or activity being synchronized requires command approval, a board is the appropriate forum.

OPERATIONS AND INTELLIGENCE WORKING GROUP

2-29. At division and higher echelons, there are dedicated cells responsible for information collection planning. At battalion and brigade, there are no designated cells for information collection planning, this function is provided by the operations and intelligence staffs. Depending on the availability of personnel, the commander may choose to designate an ad hoc group referred to as an operations and intelligence working group. Because the primary staff officers' responsibilities cannot be delegated, the staff—chief of staff or executive officer—should direct and manage the efforts of this working group to achieve a fully synchronized and integrated information collection plan.

2-30. Unit standard operating procedures and battle rhythms determine how frequently an operations and intelligence working group meets. This working group should be closely aligned with both the current operations and future operations (or plans) cells to ensure requirements planning tools are properly integrated into the overall operation plan. These planning tools should also be nested in the concepts for plans.

2-31. The operations and intelligence working group is a temporary grouping of designated staff representatives who coordinate and integrate information collection activity and provide recommendations to the commander. This group ensures maximum efficiency in information collection by carefully employing all the collection tasks or missions together in the information collection plan. This helps satisfy as many different requirements as possible while ensuring that the operations and intelligence work group does not favor or become too reliant on one particular unit, discipline, or system. The working group usually includes, at a minimum, the following representatives:

- Chief of staff or executive officer.
- G-3 (S-3) (alternate chair) or representative.
- Engineer coordinator representative.
- Air defense airspace management or brigade aviation element representative.
- G-2 (S-2) or representative.
- G-2X (S-2X) or representative.
- Military intelligence company commander or representative.
- Reconnaissance squadron S-3, S-2, the S-3 and S-2, or a representative.
- G-2X (S-2X) or representative.
- Fire support officer or representative.
- G-7 (S-7) or representative.
- Signal officer or representative.
- Electronic warfare officer.
- G-9 (S-9) or representative.
- Chemical, biological, radiological, and nuclear officer.
- Sustainment cell representative.
- Subordinate unit representatives (if available).
- Special operations forces representative (if available).
- Legal representative (if available).

2-32. The working group aims to bring together the staff sections to validate requirements and deconflict the missions and taskings of organic and attached collection assets. Input is required from each member of the working group. The output of the working group is validation of outputs. This includes the following:

- An understanding of how the enemy is going to fight.
- A refined list of requirements.
- Confirmation of the final disposition of all collection assets.
- Review of friendly force information requirements, priority intelligence requirements (PIRs), and EEFI.
- Validation of outputs of other working groups (for example, fusion and targeting working groups).
- Review and establish critical NAIs and targeted areas of interest (TAIs).

2-33. The working group meeting is a critical event. Staffs must integrate it effectively into the unit battle rhythm to ensure the collection effort provides focus to operations rather than disrupting them. Preparation and focus are essential to a successful working group. All representatives, at a minimum, must come to the meeting prepared to discuss available assets, capabilities, limitations, and requirements related to their functions. Planning the working group's battle rhythm is paramount to conducting effective information collection operations. Staffs schedule the working group cycle to complement the higher headquarters' battle rhythm and its subsequent requirements and timelines.

2-34. The G-3 (S-3) (or representative) comes prepared to provide the following:

- The current friendly situation.
- Current CCIRs.
- The availability of collection assets.
- Requirements from higher headquarters (including recent fragmentary orders or taskings).
- Changes to the commander's intent.

- Changes to the task organization.
- Planned operations.

2-35. The G-2 (S-2) (or representative) comes prepared to provide the following:

- The current enemy situation.
- The current information collection priorities and strategies.
- Current requirements planning tools.
- The situational template tailored to the time discussed.
- Support from resources the G-2 (S-2) must request from higher headquarters.
- Weather and effects of weather on intelligence collection, reconnaissance, and surveillance.

2-36. Figure 2-1 describes a method for the operations and intelligence working group.

Purpose: To synchronize information collection with operations, determine current requirements, and make full use of all available assets to meet the commander's intent and requirements. **Frequency:** Twice weekly. **Duration:** 30 to 45 minutes. **Location:** To be determined.	**Staff Proponent:** G-2 (S-2) **Chair:** Deputy commander **Attendees:** Primary staff sections, fires officer, G-2X (S-2X), brigade or battalion liaison officers, Air Force liaison officer.
Inputs: • Command group guidance. • Area of operations update. • CCIRs update. • Future operations requirements. • Subordinate unit requirements • Targeting requirements. • Air tasking order nomination. **Outputs:** • Priorities and recommendations for latest information collection plan. • Latest scrub of the CCIRs. • FRAGO input.	**Agenda:** • Command group guidance review. • Area of operations review. • Past information collection plan review. • Weather. • Future operations requirements. • Subordinate unit requirements. • Targeting requirements. • Allocation of collection resources and assets availability. • Review issues. • Summary. • Closing comments.
CCIR commander's critical information requirement	FRAGO fragmentary order

Figure 2-1. Example of the operations and intelligence working group

FUSION WORKING GROUP

2-37. Typically, brigade and above form a fusion working group. This working group aims to refine and fuse the intelligence between the command and its subordinate units. The output of this working group provides the intelligence staff with refinements to the situation template and the event template. The working group also refines existing PIRs and recommends new PIRs to the operations and intelligence working group. Additionally the working group reviews requirements to ensure currency.

TARGETING WORKING GROUP

2-38. The purpose of the targeting working group is to synchronize the unit's targeting assets and priorities. For the staff, supporting the planning for the decide, detect, and assess (known as D3A) activities of the targeting process requires continuous updating of IPB products (such as situation templates and COA matrixes). The targeting working group considers targeting related collection and exploitation requirements. It also recommends additional requirements to the operations and intelligence working group. Staffs articulate these requirements as early in the targeting process as possible to support target development and other assessments.

2-39. Information collection support to target development takes the decide, detect, deliver, and assess methodology and applies this to the development of targets. Units using other targeting techniques—like find, fix, finish, exploit, assess, disseminate (known as F3EAD) or find, fix, track, target, engage, and assess (known as F2T2EA)—require no adaptation to the information collection support to targeting process. Nominations for request to current and future tasking orders as well as refinements to the high-value target lists are outputs of this working group.

2-40. The results of these working groups form the basis of the requests for information collection as well as products used by the intelligence staff in the creation of requirements planning tools. The operations staff integrates these tools in the creation of the information collection plan.

Chapter 3

Planning Requirements for and Assessing Information Collection

This chapter describes planning requirements for and assessing information collection for information collection activities. It discusses considerations for commanders for information collection planning. Then it discusses the support information collections provides to personnel recovery. It then covers the military decisionmaking process and information collection planning. Lastly, this chapter discusses assessing information collection activities.

THE OPERATIONS PROCESS AND INFORMATION COLLECTION

3-1. Commanders direct information collection activities by approving commander's critical information requirements (CCIRs) and through driving the operations process. The success of information collection is measured by its contribution to the commander's understanding, visualization, and decisionmaking. The operations process and information collection activities are mutually dependent. Commanders provide the guidance and focus that drive both by issuing their commander's intent and approving CCIRs. The activities of information collection occur during all parts of the operation providing continuous information to the operations process.

3-2. Throughout the operations process, commanders and staffs use integrating processes to synchronize the warfighting functions to accomplish missions. Information collection activities, as well as intelligence preparation of the battlefield (IPB) are among these integrating processes. *Synchronization* is the arrangement of action in time, space, and purpose to produce maximum relative combat power at a decisive place and time (JP 1-02). This collaborative effort by the staff, with the commander's involvement, is essential for synchronizing information collection with the overall operation. Planning, preparing, executing, and assessing information collection activities is a continuous cycle whose time frame depends on the echelon, assets engaged, and the type of operation. For example, offensive operations have a significantly shorter time frame for gathering information and expecting to see changes in the situation than stability operations.

3-3. Conducting information collection activities consists of various staff functions; planning, collection, processing and exploitation; analysis and production; dissemination and integration; and evaluation and feedback. It should focus on the commander's requirements. The purpose of these staff functions is to place all collection assets and resources into a single plan in order to capitalize on the different capabilities. The plan synchronizes and coordinates collection activities within the overall scheme of maneuver. A good information collection plan (refer to example in appendix B) fits into and supports the overall operations plan or order. It positions and tasks collection assets so they can collect the right information, sustain or reconstitute for branches or sequels, or shift priorities as the situation develops. Effective information collection focuses on answering the commander's requirements through collection tasks translated into orders.

INFORMATION COLLECTION PLANNING CONSIDERATIONS

3-4. The information collection plan synchronizes activities of the information collection assets to provide intelligence to the commander required to confirm course of action selection and targeting requirements. The intelligence staff, in coordination with the operations staff, ensures all available collection assets provide the required information. They also recommend adjustments to asset locations, if required.

3-5. To be effective, the information collection plan must be based on the initial threat assessment and modified as the intelligence running estimate changes. Other staff sections' running estimates may contain requirements for inclusion into the information collection plan. Additionally, the plan must be synchronized with the scheme of maneuver and updated as that scheme of maneuver changes. Properly synchronized information collection planning begins with the development and updating of IPB (threat characteristics, enemy templates, enemy course of action statements, and, most importantly, an enemy event template or matrix). Properly synchronized information collection planning ends with well-defined CCIRs and collection strategies based on the situation and commander's intent.

SUPPORT TO PERSONNEL RECOVERY

3-6. Support to personnel recovery consists of the staff activities and unit capabilities focused on collecting information to recover and return own personnel—whether Soldier, Army civilian, selected Department of Defense contractors, or other personnel as determined by the Secretary of Defense—who are isolated, missing, detained, or captured in an area of operations. This support also includes developing detailed analysis, detailed products, and estimates to support operations undertaken to recover isolated, missing, detained, or captured personnel.

THE MDMP AND INFORMATION COLLECTION PLANNING

3-7. Information collection planning is embedded in the military decisionmaking process (MDMP) and depends extensively on all staff members thoroughly completing the IPB process. Information collection planning starts with receipt of the mission (which could be a warning order). Information collection directly supports the development of intelligence and operations products used throughout the decision-making process. At each step in the MDMP, the staff must prepare certain products used in the plan and prepare phases of the operations process as described below.

3-8. Information collection activities are continuous, collaborative, and interactive. Several of the outputs from the various MDMP steps require the collaboration of the staff, especially the intelligence and operations staffs. The information collection plan cannot be developed without constant coordination among the entire staff. At every step in the MDMP, the intelligence staff must rely on input from the entire staff and cooperation with the operations staff to develop information collection products that support the commander's intent and maximize collection efficiency for each course of action under consideration. Paragraphs 3-9 through 3-59 highlight information collection planning inputs and outputs during the MDMP. Additional information on the conduct of the MDMP is contained in ATTP 5-0.1.

RECEIPT OF MISSION

3-9. Before receipt of the mission, the intelligence staff generates intelligence knowledge in anticipation of the mission. In addition to the knowledge already available, the intelligence staff uses intelligence reach and requests for additional information to higher headquarters to fill in the information gaps in the initial intelligence estimate. The intelligence staff should identify and tap into any ongoing or existing information collection activities or joint intelligence, surveillance, and reconnaissance (ISR) collection that may offer relevant information to fill gaps.

3-10. When a mission is received, the commander and staff shift their efforts to describing the operational environment using mission variables and begin preparations for the MDMP. Commanders provide their initial guidance to the staff. The staff uses it to generate the initial information collection tasks to units and transmits it as part of the first warning order. In their guidance, commanders state the critical information required for the area of operations. Expressed in later steps of the MDMP, these requirements identify the critical pieces of information that the commander must know to successfully plan, prepare, execute, and assess operations.

3-11. During the receipt of mission step, the staff gathers tools needed for the MDMP, begins the intelligence estimate, updates running estimates, and performs an initial assessment of the time available to subordinate units for planning, preparation, and execution. Since information collection assets are required early, the staff needs sufficient preparation time to begin sending information that the commander needs.

3-12. The information collection outputs from this step are—

- The commander's initial information collection guidance.
- Intelligence reach tasks.
- Requests for information to higher headquarters.
- Directions for accessing on-going or existing information collection activities or joint ISR.
- The first warning order (WARNO) with initial information collection tasks.

MISSION ANALYSIS

3-13. When mission analysis begins, the staff should have the higher headquarters plan or order and all available products. The staff adds their updated running estimates to the process. The initial information collection tasks issued with the first WARNO may yield information to be analyzed and evaluated for relevance to mission analysis. The commander provides initial guidance that the staff uses to capture the commander's intent and develop the restated mission.

Analyze the Higher Headquarters Order

3-14. During mission analysis, the staff analyzes the higher headquarters order to extract information collection tasks and constraints such as limits of reconnaissance. The order also contains details on the availability of information collection assets from higher echelons and any allocation of those assets to the unit.

Perform Intelligence Preparation of the Battlefield

3-15. IPB is one of the most important prerequisites to information collection planning. During IPB, staffs develop several key products that aid information collection planning. Those products include—

- Threat characteristics.
- Terrain overlays.
- The weather effects matrix.
- Enemy situational templates and course of action statements.
- The enemy event template and matrix.
- The high-payoff target list.
- An updated intelligence estimate including identified information gaps.

3-16. These products aid the staff in identifying—

- Information gaps that can be answered by existing collection activities, intelligence reach, and requests for information to higher echelons. The remaining information gaps are used to develop requirements for information collection.
- Threat considerations that may affect planning.
- Terrain effects that may benefit, constrain, or limit the capabilities of collection assets.
- Weather effects that may benefit, constrain, or negatively influence the capabilities of collection assets.
- Civil considerations that might affect information collection planning.

Note: When considering terrain effects, planners can use the geospatial information team to develop line-of-sight products.

3-17. The most useful product for information collection planning for the intelligence officer is the threat event template. Once developed, the threat event template is a key product in the development of the information collection plan. Likely threat locations, avenues of approach, infiltration routes, support areas, and areas of activity become named areas of interest (NAIs) or targeted areas of interest (TAIs) on which collection assets focus their collection efforts. Indicators, coupled with specific information requirements and essential elements of information (EEFI), provide collection assets with the required information on which units identify and report. FM 2-01.3 contains additional information on the IPB process and products.

3-18. As the staff completes mission analysis, the intelligence staff completes development of initial collection requirements. These collection requirements form the basis of the initial information collection plan, requests for collection support, and requests for information to higher and lateral units. When the mission analysis is complete, staffs have identified intelligence gaps, and planners have an initial plan on how to fill those gaps. Additionally, the operations officer and the remainder of the staff thoroughly understand the unit missions, tasks, and purposes.

Determine Specified, Implied, and Essential Tasks

3-19. The staff also identifies specified, implied, and essential information collection tasks. Specified tasks are directed toward subordinate units, systems, sensors, and Soldiers. Implied tasks determine how a system or sensor is initialized for collection. Essential information collection tasks are derived from specified and implied tasks. They are the focus of the information collection effort.

Review Available Assets

3-20. The staff must review all available collection assets, effectively creating an inventory of capabilities to be applied against collection requirements. Building the inventory of assets and resources begins with annex A of the higher headquarters order. The staff takes those assets attached or under operational control of the unit and adds those resources available from higher echelons and those belonging to adjacent units that might be of assistance. The higher headquarters order should specify temporary or permanent operating locations and the air tasking order details for aerial assets.

3-21. While reviewing the available collection assets, the staff evaluates the collection assets according to their capability and availability. First, the staff measures the capabilities of the collection assets. They must know and address the practical capabilities and limitations of all unit organic assets. Capability includes—

- Range.
- Day and night effectiveness.
- Technical characteristics.
- Reporting timeliness.
- Geolocation accuracy.
- Durability.
- Threat activity.
- Sustainability.
- Vulnerability.
- Performance history.

3-22. Range deals with the collector's ability to provide target coverage. It is important to not only consider mission range (duration and distance), but also how close the collection asset must be to the target. In addition, intelligence staffs consider the communications requirements from the asset to the controlling headquarters. What is the asset's effective range to observe target activity? What is the asset's ability to move and maneuver including travel and support times? If the best asset is an unmanned aircraft system, what it the range of the aircraft? What is the flight time duration? How far is the preplanned coverage area from the aircraft launch locations?

3-23. Day and night effectiveness discusses the collector's ability to collect information in varying degrees of light. Some collection sensors were exclusively designed for nighttime or limited visibility conditions, while some sensors cannot operate at night or with limited visibility. Is the asset capable of conducting collection during the hours of darkness and low visibility? How does thermal crossover effect the asset's capabilities?

3-24. Technical characteristics address the capabilities and limitations of the collector's resources. Urban environments degrade some capabilities of collection sensors. Weather effects on sensors must be considered. Collectors take into account the time factors each asset requires for task performance. Can the sensor see through fog or smoke? What are the effects of the environment (including such factors as urban

or rural terrain and soil composition) on the collection asset? Can it continue despite hostile electronic attack? Can the aircraft launch in high winds or limited visibility? Can the prime mover cross-restricted terrain?

3-25. Reporting timeliness deals with the collector's promptness for reporting. Some collection assets require additional processing time to convert data into a useable format. What are the established reporting criteria for each collection asset? How long does it take a collector to disseminate collected information to the requestor?

3-26. Geolocation accuracy discusses the collector's ability to identify exact locations. Targeting requirements and rules of engagement may require greater geolocational accuracy. Accuracy implies reliability and precision. How accurate is the locational data provided by the asset? Is the asset capable of providing locational accuracy required for precision guided munitions?

3-27. Durability addresses the stability and endurance of the materials used by collectors. Can the aircraft launch in high winds or limited visibility? Can the prime mover cross-restricted terrain?

3-28. Threat activity deals with amount of enemy activity the collector can identify. Is the threat conducting activities that can be obtained and reported by the collection system?

3-29. Sustainability addresses the length of time a collector can use an asset without additional resources. Each collection asset has unique sustainment requirements; therefore, the staff must consider the collection asset's sustainability for long duration operations. The longer the collection period, the harder it will be to find assets for continuous activity. Weather can significantly affect sustainability of certain collection assets.

3-30. Vulnerability discusses the collector's vulnerability to threat forces, not only in the target area but also along the entire route of travel. Collectors evaluate their vulnerability to threat forces. Collectors consider the threat's ability to locate, identify, and destroy the collectors anywhere their collection mission might take them. What is the threat's ability to locate, identify, and destroy the collection asset? Is the collection asset or sensor vulnerable to threat denial and deception?

3-31. Performance history covers the known reliability of collection assets. Experienced staffs know which collection assets they can rely on to meet the commander's requirements. Readiness rates, responsiveness, and accuracy over time may raise one collector's reliability factor. Certain sensors require confirmation, especially if targeting is an issue.

3-32. The second criteria staffs evaluate is the availability of collection assets. Staffs must know the collectors and processors available at their own echelon and at echelons above and below it. They also know how to access those assets and resources. Theater and joint echelons apportion joint ISR assets to subordinate echelons. Corps and divisions allocate support from the apportioned amount they receive to brigade combat teams and below. Staffs understand the system of apportionment and allocation so they can determine what is available and what they can request by analyzing the higher headquarters order and reviewing the various scheduling or tracking mechanisms.

Note: Military source operations take time to establish and cultivate. Human intelligence collection availability and responsiveness is linked to geographic access, support relationships, protection restrictions, and workload. For more information on military source and human intelligence, refer to FM 2-22.3 and TC 2-22.303.

Signals intelligence assets are also valuable collection assets in stability operations when properly focused and supported through all-source intelligence analysis. Staffs employ signals intelligence collection with another collection asset. This mix of coverage allows signals intelligence collectors to cue and be cued by other collection assets.

3-33. Certain capabilities require confirmation, especially if targeting is an issue. For example, target selection standards may require the staff to rely on systems capable of providing targeting accuracy. If experience shows that a particular system is often unavailable because of local weather patterns, the staff considers this in evaluating the system's performance history perhaps leading to the selection of an alternate system.

Determine Constraints

3-34. When determining constraints, the staff considers legal, political, operational, and rules of engagement constraints that might constrain reconnaissance, security, intelligence operations, and surveillance. The staff must consider planning constraints such as limits of reconnaissance, earliest time information is of value, and not earlier than times. In some cases, the commander may impose constraints on the use of certain collection assets. In other cases, system specific constraints—such as the weather, crew rest, or maintenance cycle limitations—may impose limits the staff must consider.

Identify Critical Facts and Assumptions

3-35. When staffs identify critical facts and assumptions, they identify critical facts and assumptions pertinent to information collection planning that they will use later in course of action (COA) development. For example, a critical fact might be that imagery requests may take 72 to 96 hours to fulfill or that the human intelligence effort requires significant time before a good source network is fully developed.

3-36. Developing assumptions for planning include the availability and responsiveness of organic assets and resources from higher echelons. For example, the staff might use a certain percentage (representing hours) of unmanned aircraft system support available on a daily basis, weather and maintenance permitting.

Perform Risk Assessment

3-37. When performing a risk assessment, the staff considers the asset's effectiveness versus the protection requirements and risk to the asset. For example, placing a sensor forward enough on the battlefield that it can return valuable data and information may put the asset at high risk of being compromised, captured, or destroyed. The calculus of payoff versus loss will always be determined by mission variables and the commander's decision.

3-38. In some cases, friendly forces may reveal a collection capability by taking certain actions. If it is important to keep a collection capability concealed, then the staff carefully considers every lethal or nonlethal action based on current intelligence.

Determine Initial CCIRs and EEFI

3-39. Determining initial CCIRs and EEFI is the most important prerequisite for information collection planning. The staff refines the list of requirements they derive from the initial analysis of information available and from intelligence gaps identified during IPB. They base this list on higher headquarters tasks, commander's guidance, staff assessments, and subordinate and adjacent unit requests for information.

3-40. The staff then nominates these requirements to the commander to be CCIRs and EEFI. Commanders alone decide what information is critical based on their experience, the mission, the higher commander's intent, and input from the staff. The CCIRs are the primary focus for information collection activities.

Develop the Initial Information Collection Plan

3-41. The initial information plan is crucial to begin or adjust the collection effort to help answer requirements necessary in developing effective plans. The initial information collection plan sets information collection in motion. Staffs may issue it as part of a WARNO, a fragmentary order, or an operation order. As more information becomes available, staffs incorporate it into a complete information plan to the operation order.

3-42. At this point in the MDMP, the initial information plan has to be generic because the staffs have yet to develop friendly COAs. The basis for the plan is the commander's initial information collection guidance, the primary information gaps identified by the staff during mission analysis, and the enemy situational template developed during IPB. (Chapter 4 contains additional information on tasking and directing collection assets.)

3-43. The intelligence staff creates the requirements management tools for the information collection plan. The operations staff is responsible for the information collection plan. During this step, the operations and intelligence staff work closely to ensure they fully synchronize and integrate information collection activities into the overall plan.

3-44. The operations officer considers several factors when developing the initial information collection plan, including—

- Requirements for collection assets in follow-on missions.
- The time available to develop and refine the initial information collection plan.
- The risk the commander is willing to accept if information collection missions are begun before the information collection plan is fully integrated into the scheme of maneuver.
- Insertion and extraction methods for reconnaissance, security, surveillance, and intelligence units.
- Contingencies for inclement weather to ensure coverage of key NAIs or TAIs.
- The communications plan for transmission of reports from assets to tactical operations centers.
- The inclusion of collection asset locations and movements into the fire support plan.
- The reconnaissance handover with higher or subordinate echelons.
- The sustainment support.
- Legal support requirements.

Develop Requests for Information and Requests for Collection or Support

3-45. Submitting a request for information to the next higher or lateral echelon is a method for obtaining information not available with organic information collection assets. Units enter requests for information into a request for information management system where all units can see them. Hence, analysts several echelons above the actual requester become aware of the request and may be able to answer it.

3-46. When the unit cannot satisfy a collection requirement with its own assets, the intelligence staff composes and submits a request for information to the next higher echelon (or lateral units) for integration within its own information collection plan. At each echelon, the requirement is validated and a determination made as to whether or not that echelon can satisfy the requirement. If that echelon cannot satisfy the requirement, it is passed to the next higher echelon.

Note: This process continues until the requirement is satisfied, the information or intelligence is no longer needed, or it is determined that the requirement cannot be satisfied.

3-47. Throughout the request for information process, units must apprise the submitting organization of the status of their request for information as either accepted for action, passed to another organization for action, returned without action (invalid or impracticable request), or closed (satisfied). For PIR, the intelligence staff tracks all production requirements, particularly those transmitted to higher echelons. When a requirement is satisfied or determined to be overcome by events, intelligence officers must notify the higher headquarters that the requirement is closed.

Develop and Synchronize Production Requirements

3-48. Intelligence staffs develop and synchronize production requirements to provide timely and relevant intelligence analysis and products to commanders, staff, and subordinate forces. Staffs use the unit's battle rhythm as a basis for determining the daily, weekly, and monthly analytical products. The intelligence staff then designs an analytical and production effort to answer the CCIRs and meet the commander's need for situational understanding and the staff's need for situational awareness.

3-49. Intelligence production includes analyzing information and intelligence. It also includes presenting intelligence products, assessments, conclusions, or projections regarding the area of operations and threat forces in a format that aids the commander in achieving situational understanding. Staffs devote the remainder of the analytical effort to processing, analyzing, and disseminating data and information.

3-50. Commanders and staffs measure the success of the analytical and production effort by the products provided and their ability to answer or satisfy the CCIRs, intelligence requirements, and information requirements. For the purposes of the intelligence warfighting function an intelligence requirement is a type of information requirement developed by subordinate commanders and staff (including subordinate staffs) that requires dedicated collection.

COURSE OF ACTION DEVELOPMENT

3-51. Using the continually updated IPB products and the enemy situation template, the intelligence staff must integrate information collection considerations to develop friendly COAs. In many cases, the information collection considerations for each COA are similar depending on the characteristics of the friendly COA.

3-52. The operations and intelligence staffs must collaborate on information collection considerations to support each COA developed. The staff works to integrate its available resources into an integrated plan. Intelligence and operations staffs focus on the relationship of collection assets to other friendly forces, the terrain and weather, and the enemy.

3-53. The development of NAIs and TAIs based upon suspected enemy locations drive the employment of collection assets. The staff considers how to use asset mix, asset redundancy, and asset cueing to offset the capabilities of the various collection assets.

3-54. During COA development, the staff refines and tailors the initial CCIRs for each COA. Technically, these are initial requirements for each course of action. Later in the MDMP, once a COA is approved, the commander approves the final CCIR, and the staff publishes it.

COURSE OF ACTION ANALYSIS (WAR-GAMING)

3-55. The intelligence staff records the results of COA analysis and uses that information to develop the requirements planning tools. The entire staff uses the action-reaction-counteraction process to move logically through the war-gaming process. These events have a bearing on the assets recommended for tasking to the operations staff.

ORDERS PRODUCTION

3-56. Orders production is putting the plan into effect and directing units to conduct specific information collection tasks. The staff prepares the order by turning the selected COA into a clear, concise concept of operations and supporting information. The order provides all the information subordinate commands need to plan and execute their operations. However, this is not the first time subordinate commanders and their staffs have seen this data. Within the parallel and collaborative planning process, planners at all echelons have been involved in the orders process.

ASSESS INFORMATION COLLECTION ACTIVITIES

3-57. Assessment guides every operations process activity. Assessment is the continuous monitoring and evaluation of the current situation, particularly the enemy, and progress of an operation. Assessing information collection activities enables the operations and intelligence staffs to monitor and evaluate the current situation and progress of the operation. The desired result is to ensure all collection tasks are completely satisfied in a timely manner.

3-58. Staffs begin assessing information collection task execution with monitoring and reporting by collection assets as they execute their missions. Staffs track reporting to determine how well the information collection assets satisfy their collection tasks. The desired result is relevant information delivered to the commander before the latest time information is of value.

3-59. The running estimate informs the staff of the status of collection on all requirements. A running estimate is even more effective when staffs compare previous ones that refer to the same time. This comparison grades accuracy and relevancy of the prediction to what actually occurred enabling the staff to develop COAs that avoid repeating mistakes.

3-60. After each phase of the operation, staffs conduct an assessment. They examine the audit trail to determine which requirements were answered and which ones were not answered. Then the operation and intelligence staffs assess the accuracy and effectiveness of the collection assets and analytic elements. (Refer to FM 5-0, chapter 6, for further information on assessment.)

Chapter 4

Tasking and Directing Information Collection

Commanders direct information collection activities by approving requirements and through mission command in driving the operations process. This chapter describes the tasking and directing of information collection assets. It discusses how the staff finalizes the information collection plan and develops the information collection overlay. It then discusses the development of the information collection scheme of support. Lastly it discusses re-tasking assets.

TASK AND DIRECT INFORMATION COLLECTION

4-1. The operations staff integrates collection assets through a deliberate and coordinated effort across all warfighting functions. Tasking and directing information collection is vital to control limited collection assets. During task and direct information collection, the staff recommends redundancy, mix, and cue, as appropriate. The process of planning information collection activities begins once requirements are established, validated, and prioritized. Staffs accomplish tasking information collection by issuing warning orders, fragmentary orders, and operation orders. They accomplish directing information collection assets by continuously monitoring the operation. Staffs conduct re-tasking to refine, update, or create new requirements.

FINALIZE THE INFORMATION COLLECTION PLAN

4-2. To finalize the information collection plan, the staff must complete several important activities and review several considerations to achieve a fully synchronized, efficient, and effective plan. The information collection plan also applies to the rapid decisionmaking and synchronization process. Updating information collection activities during the execution and assessment phases of the operations process is crucial to the successful execution and subsequent adjustments of the information collection plan. The information collection plan is implemented through execution of asset tasking. The tasking process provides the selected collection assets with specific, prioritized requirements. When collection tasks or requests are passed to units, the staff provides specific details that clearly define the collection requirements. These requirements identify—

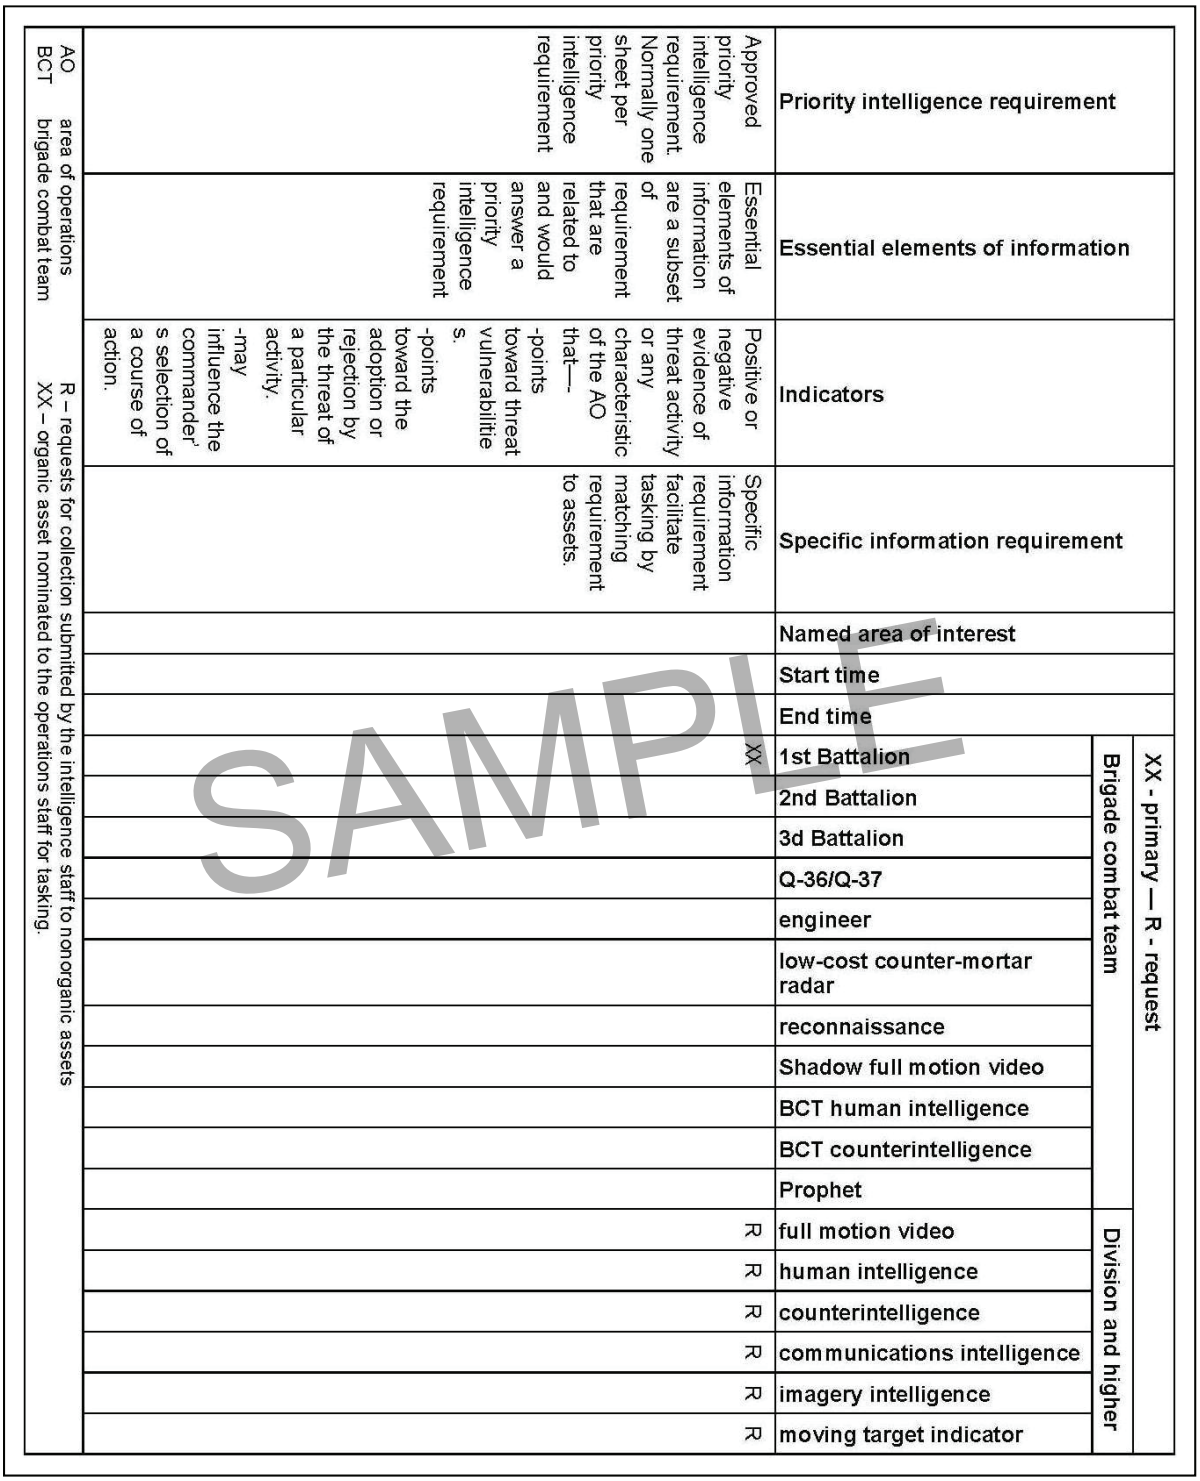
- What to collect—specific information requirements and essential elements of information.
- Where to collect it—named areas of interest and targeted areas of interest.
- When and how long to collect.
- Why to collect—answer commander's critical information requirements.

4-3. The information collection plan is an execution order and should be published in the five-paragraph operation order (OPORD) format as a warning order (WARNO), an OPORD, or a fragmentary order (FRAGO). Staffs use the information collection plan for tasking, directing, and managing of collection assets (both assigned and attached assets) to collect against the requirements. The operations officer tasks and directs information collection activities. The intelligence staff assists the staff in the development of the information collection plan by providing the requirement planning tools. (Refer to TC 2-01 and ATTP 2-01 on how the requirement planning tools are developed.) Staffs—

- Integrate the information collection plan into the scheme of maneuver.
- Publish annex L (information collection) to the OPORD that tasks assets to begin the collection effort.

- Ensure that the information collection plan addresses all of the commander's requirements, that assigned and attached assets have been evaluated and recommended for information collection tasks within their capabilities, and that collection tasks outside the capabilities of assigned and attached assets have been prepared as requests for information to appropriate higher or lateral headquarters.
- Publish any FRAGOs and WARNOs associated with information collection.

4-4. Appendix B contains examples of the annex L and an information collection WARNO. Figure 4-1 is a sample information collection matrix format which can be used as an appendix to annex L. ATTP 2-01 contains additional information and techniques on completing the information collection matrix.



Priority intelligence requirement	Essential elements of information	Indicators	Specific information requirement	Named area of interest	Start time	End time	XX - primary — R - request	
							Brigade combat team	Division and higher
Approved priority intelligence requirement. Normally one sheet per priority intelligence requirement	Essential elements of information are a subset of requirement that are related to and would answer a priority intelligence requirement	Positive or negative evidence of threat activity or any characteristic of the AO that— -points toward threat vulnerabilities. -points toward the adoption or rejection by the threat of a particular activity. -may influence the commander's selection of a course of action.	Specific information requirement tasking by matching requirement to assets.				1st Battalion	XX
							2nd Battalion	
							3d Battalion	
							Q-36/Q-37	
							engineer	
							low-cost counter-mortar radar	
							reconnaissance

R – requests for collection submitted by the intelligence staff to nonorganic assets
XX – organic asset nominated to the operations staff for tasking.

SAMPLE

Figure 4-1. Sample information collection matrix

4-5. The primary means of tasking assets is through an information collection plan. Staffs can issue this plan as part of the completed OPORD; however, the tactical situation may impose a limited time constraint. In such cases, staffs can issue the information collection plan as early as the initial WARNO. This gives collection assets time to prepare for information collection activities. Staffs use FRAGOs to re-task assets that are already conducting operations and to adjust execution as requirements and priorities change.

DEVELOP THE INFORMATION COLLECTION OVERLAY

4-6. The staff may issue an information collection overlay depicting the information collection plan in graphic form as an appendix or annex L to the OPORD. Typical items on the overlay include the following:

- Friendly boundaries and phase lines.
- Reconnaissance handover lines.
- Named areas of interest and targeted areas of interest.
- Limits of advance and limits of reconnaissance. Limits of reconnaissance are constraints derived from higher headquarters orders that may designate a limit of advance impacting reconnaissance units.
- Counterreconnaissance areas.
- Fire support control measures.
- Graphics depicting zone, area, or route reconnaissance.
- Routes start points, release points, infiltration lanes, and checkpoints.
- Primary and alternate observation post locations.
- Ambulance exchange points and logistics release points.
- Planned or existing obstacles.
- Scan sectors for sensors.
- Unmanned aircraft system flight paths.
- Retransmission locations.

4-7. Figure 4-2 on page 4-4 displays an example of an information collection overlay.

DEVELOP THE INFORMATION COLLECTION SCHEME OF SUPPORT

4-8. The information collection scheme of support includes the planning and execution of operations and resources to support the Soldiers and units who perform information collection. This support includes fires, movement, protection, and sustainment (logistics, personnel services, health services support, and other sustainment related functions). The staff prepares the initial scheme of support. The operations officer approves the plan and tasks units.

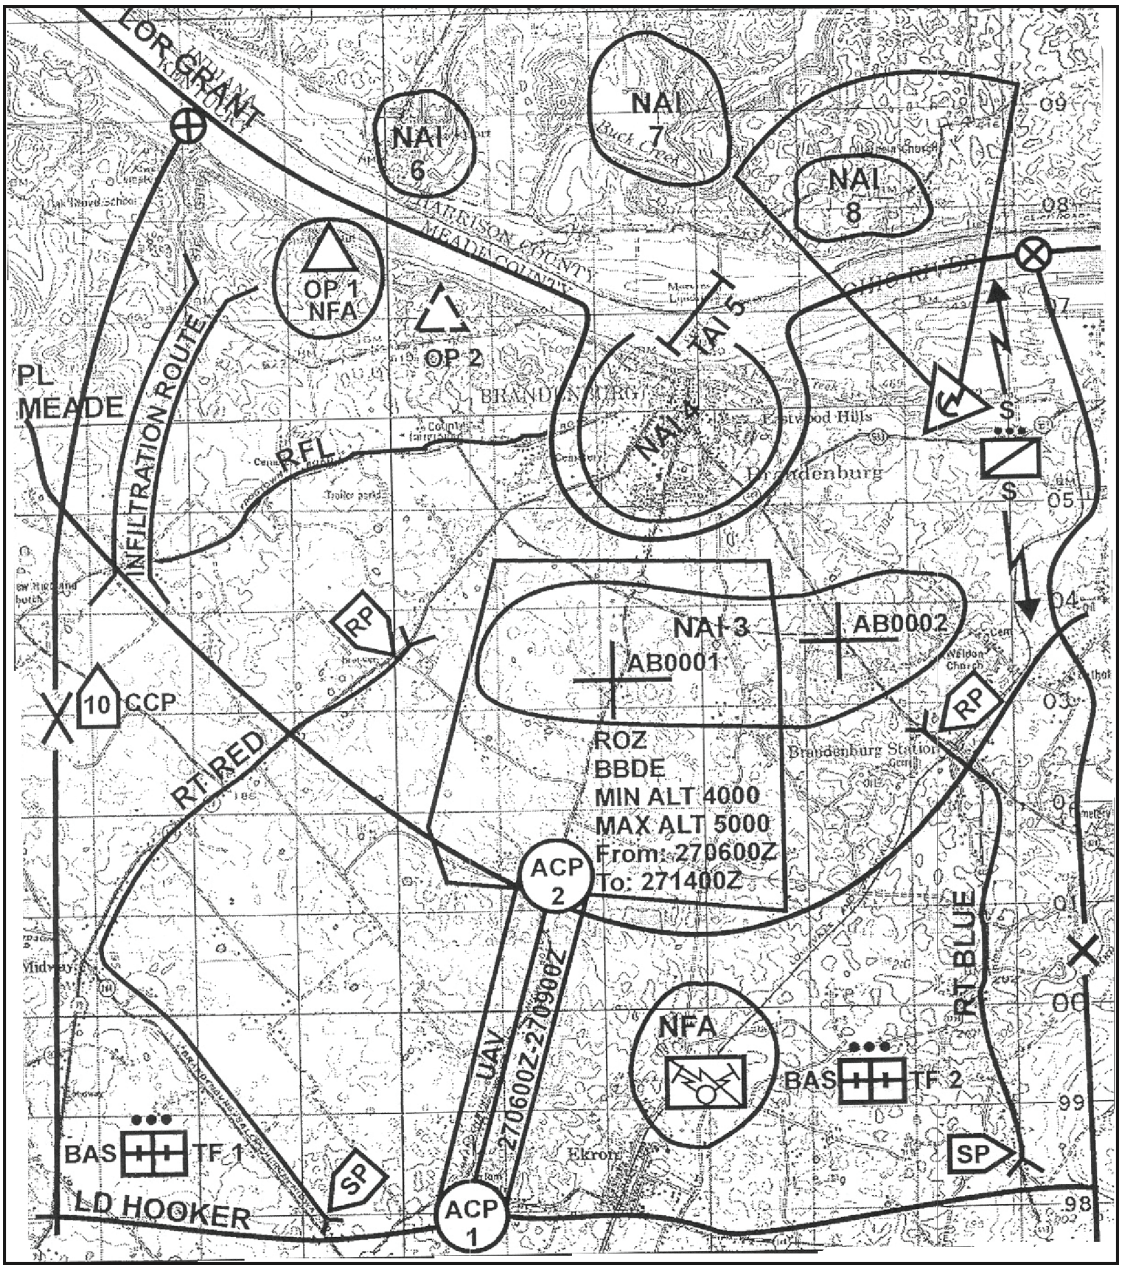

Figure 4-2. Example of an information collection overlay

4-9. The staff publishes the scheme of support in annex L. It addresses as a minimum those items shown in table 4-1.

Table 4-1. Scheme of support

Warfighting Functions	*Items Addressed*
Movement and maneuver	• Provide asset movement routes to and from mission execution location.
Fires	• Call for fire. • Request immediate attack helicopter support. • Request immediate close air support.
Protection	• Air defense.
Sustainment	• Medical evacuation request. • Casualty evacuation request. • Landing zone and pickup zone procedures for rotary-wing aircraft to perform air-ground integration, casualty evacuation, or aerial resupply. • Casualty reporting. • Reconstitution. • Postal and administrative support. • Religious support. • Resupply of classes I, III, and V. • Field maintenance support, recovery, and evacuation of unserviceable equipment including vehicles, collection platforms, and systems.

PROVIDE SUPPORT TO SITE EXPLOITATION

4-10. *Site exploitation* is systematically searching for and collecting information, material, and persons from a designated location and analyzing them to answer information requirements, facilitate subsequent operations, or support criminal prosecution (ATTP 3-90.15). Refer to ATTP 3-90.15 for additional information on site exploitation.

4-11. Site exploitation consists of a related series of activities to exploit personnel, documents, electronic data, and material captured, while neutralizing any threat posed by the items or contents. Units conduct site exploitation using one of two techniques: hasty and deliberate. Commanders chose the technique based on time available and the unit's collection capabilities.

MONITOR OPERATIONS

4-12. Staffs track the progress of the operation against the requirements and the information collection plan. The operation seldom progresses on the timelines assumed during planning and staff war-gaming. The staff watches for changes in tempo that require changes in reporting times, such as latest time information is of value (LTIOV). The intelligence and operations staffs coordinate any changes with all parties concerned, including commanders and appropriate staff sections. Sometimes the staff's assumptions about enemy courses of action (COAs) will not prove entirely correct. Usually this results in a change in requirements as well as adjustments to the timelines. Staffs may initiate abbreviated versions of the intelligence preparation of the battlefield (IPB) and decisionmaking processes to accommodate changes in their assumptions.

CORRELATE REPORTS TO REQUIREMENTS

4-13. Correlating information reporting to the original requirement and evaluating reports is key to effective requirements management. This quality control effort helps the staff ensure timely satisfaction of requirements. Requirements management includes dissemination of reporting and related information to original requesters and other users.

4-14. To correlate reports, the staff tracks which specific collection task originates from which requirement to ensure the original requester and all who need the collected information actually receive it. For

efficiency and timeliness, the staff ensures production tasks are linked to requirements. This allows the staff to determine which requirements have been satisfied and which require additional collection.

4-15. The staff address the following potential challenges:

- Large volumes of information that could inundate the intelligence analysis section. The intelligence staff may have trouble finding the time to correlate each report to a requirement.
- Reports that partially satisfy a number of collection tasks. Other reports may have nothing to do with the collection task.
- Reported information that fails to refer to the original task that drove collection.
- Circular reporting and spam or unnecessary message traffic that causes consternation and wastes valuable time.

SCREEN REPORTS

4-16. The staff screens reports to determine whether the collection task has been satisfied. In addition, the staff screens each report for the following criteria:

- **Relevance.** Does the information actually address the tasked collection task? If not, can the staff use this information to satisfy other requirements?
- **Completeness.** Is essential information missing? (Refer to the original collection task.)
- **Timeliness.** Was the asset reported by the LTIOV established in the original task?
- **Opportunities for cueing.** Can this asset or another asset take advantage of new information to increase the effectiveness and efficiency of the overall information collection effort? If the report suggests an opportunity to cue other assets, intelligence and operations staffs immediately cue them and record any new requirements in the information collection plan.

4-17. Information collection assets do not submit reports that simply state *nothing significant to report*. These reports may convey that collection occurred, but no activity satisfying the information collection task was observed, which may be a significant indicator. *Nothing significant to report* is by no means a reliable indicator of the absence of activity.

PROVIDE FEEDBACK

4-18. The staff provides feedback to all collection assets on their mission effectiveness and to analytic sections on their production. Normally the mission command element of that unit provides this feedback. Feedback reinforces whether collection or production satisfies the original task or request and provides guidance if it does not. Feedback is essential to maintaining information collection effectiveness and alerting leaders of deficiencies to be corrected.

4-19. As the operation continues, the intelligence and operations staffs track the status of each collection task, analyze reporting, and ultimately satisfy requirements. They pay particular attention to assets not producing required results, which may trigger adjustments to the information collection plan. During execution, the staff assesses the value of the information from collection assets as well as develops and refines requirements to satisfy information gaps.

4-20. When reporting satisfies a requirement, the staff relieves the collection assets of further responsibility to collect against information collection tasks related to the satisfied requirement. The operations officer, in coordination with the intelligence staff, provides additional tasks to satisfy emerging requirements. The operations staff notifies—

- Collection assets and their leadership of partially satisfied requirements to continue collection against, of those collection tasks that remain outstanding, and what remains to be done.
- Collection assets of new tasks designed to exploit cueing and other opportunities.

4-21. By monitoring operations, correlating reports to requirements, screening reports, and providing feedback, the staff ensures the most effective employment of collection assets.

UPDATE THE INFORMATION COLLECTION PLAN

4-22. Evaluation of reporting, production, and dissemination identifies updates for the information collection plan. As the current tactical situation changes, staffs adjust the overall information collection plan to synchronize collection tasks, optimizing collection and exploitation capabilities. They constantly update requirements to ensure that information gathering efforts are synchronized with current operations while also supporting future operations planning. As collected information answers requirements, the staff updates the information collection plan.

4-23. The steps in updating the information collection plan are—

- Maintain information collection activities synchronized to operations.
- Cue assets to other collection requirements.
- Eliminate satisfied requirements.
- Develop and add new requirements.
- Re-task assets.
- Transition to the next operation.

4-24. The steps in updating information collection taskings are collaborative efforts by the intelligence and operations staff. Some steps predominately engage the intelligence staff, others the operations staff. Some steps may require coordination with other staff sections, and others may engage the entire operations and intelligence working group.

Maintain Information Collection Activities Synchronized to Operations

4-25. As execution of the commander's plan progresses, the staff refines decision point timeline estimates used when the information is required. The staff stays alert to the need for recommending changes in the information collection plan because of these refinements. As the need for changes arises, the intelligence staff coordinates with the appropriate staff sections to update products required to refine the information collection plan. This may be as simple as updating timelines, or it may require that these products be completely redone.

Cue Assets to Other Collection Requirements

4-26. The intelligence and operations staffs track the status of collection assets, cueing and teaming assets together as appropriate to minimize the chance of casualties. For example, if a Soldier reports the absence of normal activity in a normally active market area, the staff could recommend redirecting an unmanned aircraft system or other surveillance means to monitor the area for a potential threat.

Eliminate Satisfied Requirements

4-27. During its evaluation of the information collection plan, the staff identifies requirements that were satisfied. The staff eliminates satisfied requirements and requirements that are no longer relevant, even if unsatisfied. When a requirement is satisfied or no longer relevant, the intelligence staff eliminates it from the information collection plan and updates any other logs or records.

RE-TASK ASSETS

4-28. The staff may issue orders to re-task assets. This is normally in consultation with the intelligence officer and other staff sections. Re-tasking is assigning an information collection asset with a new task and purpose. It occurs—

- Upon completion of the staff's initial requirement.
- On order, after the LTIOV and having not satisfied the original requirement. (Adjusting the LTIOV may be required.)
- As planned to support a branch or sequel.
- In response to a variance.

DEVELOP AND ADD NEW REQUIREMENTS

4-29. As the operation progresses and the situation develop, commanders generate new requirements. Intelligence staff begins updating the requirements planning tools. The intelligence staff prioritizes new requirements against remaining requirements. The intelligence staff consolidates the new requirements with the existing requirements, reprioritizes the requirements, evaluates resources based upon the consolidated listing and priorities, and makes appropriate recommendations to the commander and operations officer.

TRANSITIONS

4-30. A transition occurs when the commander decides to change focus from one type of military operation to another. Updating information collection tasking may result in a change of focus for several collection assets. As with any other unit, collection assets may require rest and refit—or lead time for employment—to transition from one mission or operation to another effectively.

This page intentionally left blank.

Appendix A

Information Collection Assets

This appendix discusses information collection assets available to Army commanders for the planning and execution of collection activities. This appendix discusses those assets by level, phase, and echelon. Lastly, this chapter discusses the network-enabled information collection.

BACKGROUND

A-1. An information collection capability is any human or automated sensor, asset, or processing, exploitation, and dissemination system that can be directed to collect information that enables better decisionmaking, expands understanding of the operational environment, and supports warfighting functions in decisive action. Factors—a unit's primary mission, typical size area of operations (AO), number of personnel, and communications and network limitations—significantly impact what sensors, platforms, and systems are fielded.

A-2. When a unit requires more robust collection assets to meet its mission, it may request resources and products from higher echelons and adjacent units. During prolonged conflict or joint and multinational operations, the conduct of routine or protracted reconnaissance, security, surveillance, and intelligence operations also impact joint intelligence, surveillance, and reconnaissance (ISR) resource allocation and formalized information collection tasking and requesting procedures.

MONITOR THE TACTICAL PLAN

A-3. Staffs ensure the collection activities remain focused on the commander's critical information requirements (CCIRs). They continuously update staff products and incorporate those products into the running estimates and common operational picture (COP). Lastly, they quickly identify and report threats and decisive points in the AO.

A-4. Paragraphs A-5 through A-8 illustrate collection activities at different levels during different phases of an operation. Strategic, operational, and tactical levels have different tasks to perform during the phases of an operation, but all levels work together to provide commanders the intelligence they need to successfully complete each phase of an operation. Table A-1 provides some examples of information collection assets.

Table A-1. Sample information collection assets

Levels	*Examples of information collection assets*
Strategic	• Defense Human Intelligence Service agents. • Central Intelligence Agency. • Federal Bureau of Investigation. • Defense Intelligence Agency. • National Security Agency.
Operational	• Regionally focused joint information centers. • Theater army's military intelligence brigades. • Army aerial exploitation battalions. • Joint aerial assets.

Table A-1. Sample information collection assets (continued)

Levels	*Examples of information collection assets*
Tactical	• A battlefield surveillance brigade. • Target acquisition radars. • Reconnaissance and cavalry squadrons and troops. • Attack reconnaissance aviation units. • Unmanned aircraft system. • Any Soldier with information to report.

STRATEGIC

A-5. National and theater-level collection assets provide tactical forces updates before and during deployment. Theater-level shaping operations require actionable intelligence including adversary centers of gravity and decision points, as well as the prediction of adversary anti-access measures. Space-based resources are key to supporting situational awareness during deployment and entry phases because they—

- Monitor protection indicators.
- Provide warning of ballistic missile launches threatening aerial and sea ports of debarkation and other threats to arriving forces.
- Provide the communications links to forces en route.
- Provide meteorological information that could affect operations.

OPERATIONAL

A-6. The intelligence staff requests collection support with theater, joint, and national assets. Respective collection managers employ organic means to cover the seams and gaps between units. These means provide the deploying tactical force the most complete portrayal possible of the enemy and potential adversaries, the populace, and the environmental situation upon entry. The operational-level intelligence assets operate from a regional focus center. This regional focus center (located in the crisis area) assumes primary analytical overwatch for the alerted tactical maneuver elements. The theater army's military intelligence brigade (MIB) provides overwatch and functions as both a command post and a research node. The MIB intelligence staff must completely understand the deploying tactical force commanders' intent. The MIB must understand the deploying forces' situation and current mission statuses. In additrion, the MIB requires access to all relevant data and knowledge about what is being planned at higher headquarters and national levels.

TACTICAL

A-7. The entire information collection and analysis effort shifts to provide tailored support to deploying forces in response to their CCIRs. Priority within the brigade combat team (BCT) shifts to planning to deploy and conduct offensive operations to secure a lodgment in the objective areas. The BCT prepares to conduct combat operations upon arrival. The BCT commander understands the situation sufficiently to employ the combat power of the BCT effectively. The BCT's intelligence element collaborates with higher echelons to satisfy CCIRs and provide the context and focus to the information gathered.

A-8. As the unit prepares to fight upon arrival, it synchronizes its information collection activities with division and higher echelon headquarters. Operational-, theater-, and national-level intelligence collection reports are used to develop and continually update the COP.

INFORMATION COLLECTION ASSETS BY PHASE

A-9. Paragraphs A-10 through A-17 illustrate collection activities at different phases of an operation. Units perform different tasks during deployment, entry, and transition. Commanders require certain information assets to complete each phase of an operation successfully.

DEPLOYMENT

A-10. Prior to issuing the execution order, higher tactical echelons and joint, interagency, intergovernmental, and multinational information collection assets support situation development and shaping operations in the objective area. Upon receipt of the execution order and approval of the course of action, the geographic combatant command expands the size and scope of information collection activities. The geographic combatant command is in the area of responsibility with significant collection assets to detect, identify, and track adversary decision points and centers of gravity. Information collected by the geographic combatant command is immediately available to the tactical echelon, through the network, to continuously update the COP and intelligence running estimate. Combat assessments of lethal and nonlethal effects drive decisions regarding the deployment timing, locations, and actions on arrival.

ENTRY

A-11. During the entry phase, deploying units are particularly vulnerable to enemy actions. Effective intelligence reduces that vulnerability. Tactical forces use the information that their higher headquarters, and theater- and national-level assets provide to maintain situational awareness and refine plans. The intelligence running estimate provides the commander predictive intelligence to anticipate adversary actions. Updates en route provide continuing information about the situation, the threat, and the environment. They allow the commander to adjust the plan prior to arrival in response to changes in the AO or threat actions.

A-12. Forces conduct tactical assault upon arrival as necessary. They conduct continuous reconnaissance, intelligence, and security operations. As the buildup of forces continues, the tactical forces strives to reduce dependence on higher echelon resources while becoming more reliant upon organic assets. As organic and supporting assets arrive into the theater, commanders immediately employ them to support tactical-level situational awareness. In addition, operational and strategic resources still contribute to the COP. Arriving units and staffs establish liaisons with units already in the AO.

A-13. As the BCT enters the AO, it continues to rely primarily on national-, theater-, and higher-tactical echelon information collectors until its organic assets become fully available. The intelligence overwatch support section provides context and focus to information gathered by theater and national collectors. Appropriate to echelon, the S-2 and military intelligence elements focus and put into context the information collected, analyzed, and disseminated by higher echelons. The different echelons integrate raw and analyzed information to answer their commander's priority intelligence requirements and tailor reports to specific mission requirements. In the early phases of entry operations, focused, detailed collection and analysis of the BCT's operational environment remains a primary responsibility of its higher headquarters. The BCT becomes responsible for providing its own situational awareness of the operational environment when assigned its operational area.

A-14. Once on the ground, the BCT immediately begins to deploy its information collection reconnaissance units, sensors, and collection systems. The tactical echelon expands its sensing and collecting capabilities until the entire force is on the ground and achieves maximum situational awareness. During entry operations, echelons above brigade continue to provide collection support and serve to complement the BCT's organic reconnaissance units and assets. Once the BCT deploys, strategic and operational echelons continue to complement the BCT's organic assets and focus on those areas outside the sensing range and capability of the maneuver elements. Sensors covering the noncontiguous AO provide early warning and cueing of the BCT's reconnaissance squadron and sensors.

TRANSITION

A-15. Information collection requirements during the transition phase shift from one operation to another. regardless, the combatant commander remains aware that major combat operations and stability operations may occur simultaneously.

A-16. Commanders may reprioritize strategic and operational echelon information collection assets. The BCT's collection assets become a resource for division headquarters and higher echelon units for their information needs. The AO generally involves other nations. Often, multinational information collection focus increases along with the involvement of nongovernmental organizations. There may be multinational collection entities operating in each brigade's AO with no formal command relationship. Commanders

must effectively integrate these capabilities into collection plans and processes to prevent unnecessary redundancy and maximize information sharing.

A-17. During this phase, the combatant commander and all subordinate echelons redefine adversary centers of gravity and focus information collection activities on political, social, economic, information, and criminal activities that pose a threat to friendly forces and the stability of the AO. Collaboration and interaction with all friendly elements in the AO is essential. Predictive assessments for the remaining threat forces or illicit factions contribute to future operational planning and force disposition.

INFORMATION COLLECTION ASSETS BY ECHELON

A-18. Paragraphs A-19 through A-41 illustrate collection activities in different echelons of an operation. Different units perform different tasks at each echelon. Commanders at different echolons require certain information assets to complete each phase of an operation successfully.

SPECIAL OPERATIONS FORCES

A-19. Special operations forces may possess a high degree of cultural awareness due to their extensive training, experience, and regional orientation. Some members of every unit will communicate in the local language. Civil affairs units are also sources of useful information; however, commanders recognize that the legitimacy of civil affairs activities often hinges on whether the local population perceives those forces are collecting information. Civil affairs personnel may be tasked to collect information en route to or returning from a meeting with host-nation personnel but may not be tasked to collect information during the meeting. Some special operations forces make ideal collection assets during stability operations because they can interact with the local population.

A-20. Historically, special operations forces have operated independently from conventional forces, although both plan and execute operations within a synchronized framework to support the joint force commander's overall plan. Recent operations have produced situations in which conventional forces and special operations forces operated in the same operational area simultaneously, requiring close coordination. Conventional forces and special operations forces can complement one another in a number of areas, including information collection activities. Special operations forces can provide conventional forces with special reconnaissance capabilities, positive identification of specific targets, target marking and terminal guidance, battle damage assessment, information on indigenous forces, and combat weather support. Conventional forces can provide special operations forces with robust fire support, multiple attack resource options, lethal and nonlethal fires, and other resources available to heavier forces.

A-21. Key lessons for successfully integrating conventional forces with special operations forces include the following:

- Establish personal relationships (rapport).
- Train integrated forces early and often, before conducting tactical operations.
- Clearly define and articulate command relationships.
- Fully integrate planning and intelligence efforts to alleviate misunderstandings.
- Understand the strengths and limitations of each force, and use this knowledge to advantage.

MILITARY INTELLIGENCE BRIGADE

A-22. The theater army's MIB provides intelligence support, including support for information collection activities. The MIB supports the theater army, other Army operational-level commands in the area of responsibility, and combatant, joint, or multinational commands.

A-23. The MIB consists of the—

- Operations battalion.
- Forward collection battalion (counterintelligence and human intelligence).
- Forward collection battalion (signals intelligence).
- Strategic signals intelligence battalion.
- Theater support battalion.

A-24. The MIB performs intelligence operations, all-source intelligence analysis, intelligence production, intelligence collection management, and intelligence dissemination in support of the theater army. It provides dedicated long-term, continuous support to the geographic combatant commander or subunified commander for that commander's theater security cooperation plan and small-scale contingencies. It also provides in-theater intelligence support during major combat operations.

A-25. The MIB provides the theater army commander with dedicated intelligence capabilities for all intelligence disciplines. It has robust counterintelligence and human intelligence capabilities with interrogation and exploitation potential. Each MIB also has dedicated imagery intelligence analysts, and most have imagery intelligence collection capabilities. The MIB also has measurement and signature intelligence capabilities.

BATTLEFIELD SURVEILLANCE BRIGADE

A-26. The battlefield surveillance brigade (BFSB) conducts reconnaissance and security to collect information to support operations at echelons-above-brigade level. It helps develop the COP, and it enhances commanders' decisionmaking. Table A-2 identifies BFSB collection assets. The BFSB fills two roles in division-level and higher operations. It augments BCTs and supporting brigades to enhance their abilities to accomplish their missions. It also executes their portion of the information collection plan—

- In that portion of the AO not assigned to a subordinate unit (unassigned area).
- In an AO assigned to it by the supported unit.
- In an area that has characteristics of both types (unassigned area and assigned AO).

Table A-2. Battlefield surveillance brigade information collection assets

Warfighting Function	*Organization*	*Capability*
Movement and Maneuver	Reconnaissance Squadron	Conduct area, zone, or route reconnaissance.
Intelligence	Military Intelligence Battalion Intelligence Operations	Provide signals intercept and signal emitter location data that use 12–person multifunction teams that combine signals intelligence, human intelligence, and counterintelligence capabilities and supporting operational management teams.
		Provide counterintelligence and human intelligence teams and supporting operational management teams that provide general support to division or corps collection requirements.
		Provide counterintelligence and human intelligence teams that provide general support to augment capabilities of a maneuver brigade.
		Provide counterintelligence or human intelligence capability to a functional brigade.
		Provide aerial reconnaissance and surveillance capability. Provide battle damage assessment capability.
	Headquarters and Headquarters Company	Support development of brigade common operational picture, targeting, intelligence preparation of the battlefield, and analysis of reporting across all the warfighting functions and development of intelligence products.
		Provide geospatial intelligence.
		Receive, process, and display near-real time information from nonorganic airborne sensors, including Joint Surveillance Target Attack Radar System.
		Provide additional information collected during conduct of primary missions.

Table A-2. Battlefield surveillance brigade information collection assets (continued)

Warfighting Function	*Organization*	*Capability*
Sustainment	Brigade Support Company	Provide information and intelligence developed and disseminated through mission command systems (such as command post of the future).
Mission Command	Brigade Headquarters and Headquarters Company	Provide additional information collected during conduct of primary missions.
		Provide signal retransmission teams that can provide additional observation posts.

A-27. Although assets above division level can fulfill many intelligence requirements, they may not answer all of them. Often, higher-level operational needs take precedence and cause assets at these levels to focus on the next higher echelon's CCIRs. In some cases, higher-level assets may not provide the level of detail or timeliness the BFSB's supported command requires. The BFSB bridges the gap between the tactical reconnaissance and security executed at brigade level and the operational and strategic reconnaissance executed at levels above the division.

A-28. In its other role, the BFSB augments other brigades by providing counterintelligence, human intelligence, signals intelligence, and unmanned aircraft system. In some situations, augmentation includes elements of the reconnaissance squadron. The BFSB provides a means for the supported commander to weight the decisive operation or the main effort and to provide other brigades with assets, capabilities, or the increased capacity required for a specific mission or operation. Refer to FM 3-55.1 for additional information on BFSB operations.

COMBAT AVIATION BRIGADE

A-29. The combat aviation brigade (CAB) accomplishes reconnaissance and surveillance with its attack reconnaissance battalions and (when fielded) one unmanned aircraft system company. The heavy, medium, light, and expeditionary CABs have similar organization, varying only in the type and number of attack reconnaissance battalions. Heavy and medium CABS have more robust firepower capabilities than light and expeditionary CABs.

A-30. The CAB commander is the higher commander's senior advisor for employment of aviation assets. The CAB commander and staff are the primary integrators of manned aircraft and unmanned aircraft system operations.

A-31. The unmanned aircraft system company of the CAB, when fully fielded, deploys a one system ground control station (known as OSGCS) to the BFSB and fires brigade as required for mission planning and execution. Based on higher echelon requirements, the BFSB and fires brigade control the unmanned aircraft for reconnaissance and surveillance operations. Typically, the CAB launches the aircraft and turns control over to the one system ground control station operators. The one system ground control station locates where it can best control the aircraft and allows for the dissemination of collected information.

FIRES BRIGADE

A-32. Normally fires brigades are assigned, attached, or placed under the operational control of a division headquarters. However, they may be attached or placed operational control to a corps headquarters, a joint forces land component command, a joint task force (JTF), or another Service or functional component. Fire brigades are task organized to accomplish missions.

A-33. Fires brigades have the ability to reconnoiter, detect, and attack targets and confirm the effectiveness of fires. Fire brigades have robust communications and control systems that facilitate the efficient application of fires. They have the necessary fire support and targeting structure to effectively execute the entire decide, detect, deliver, and assess targeting process for their assigned tasks.

A-34. The fires brigade and each of its subordinate organizations can be augmented (task-organized) as required. For instance, executing a strike may require placing additional collection assets capabilities under operational control of the fires brigade headquarters. Alternatively, the BFSB can retain control of its organic assets and provide the information and desired effects to the fires brigade.

BRIGADE COMBAT TEAM

A-35. The BCT is the Army's largest defined combined arms organization and the Army's primary close combat force. For combat operations, the combatant commander builds the ground component of a JTF around the BCT. The BCT includes units and capabilities from every warfighting function; it is task-organized to meet specific mission requirements. Some capabilities, such as unmanned aircraft system platoons, are assets whose sole purpose is support to information collection activities. However, commanders consider some information collection assets that are not immediately obvious when planning reconnaissance and surveillance tasks and missions to answer CCIRs fully. Tables A-3, A-4, and A-5 show each BCT's information collection assets.

Table A-3. Infantry brigade combat team information collection assets

Warfighting Function	*Organization*	*Capability*
Movement and Maneuver	Reconnaissance Squadron	Conduct Soldier sensor missions, as needed, to satisfy requirements.
		Conduct security operations and surveillance tasks as required.
		Conduct area, zone, or route reconnaissance.
	Infantry Battalion	Conduct Soldier sensor missions, as needed, to satisfy requirements, including tactical questioning.
		Provide scout platoon capability for real-time detection, recognition, and identification of distant target locations.
Intelligence	Brigade Special Troops Battalion Military Intelligence Company	Conduct intelligence operations military source operations, document exploitation, interrogation and debriefing, and counterintelligence operations (such as preliminary investigations).
		Support development of brigade common operational picture, targeting, intelligence preparation of the battlefield, analysis, reconnaissance and surveillance reporting across all the warfighting functions, and intelligence products.
		Provide organic aerial reconnaissance and surveillance and battle damage assessment capability.
Fires	Fires Battalion	Conduct Soldier sensor missions, as needed, to satisfy information requirements.
		Detect artillery and mortar fires, establish long-duration observation posts.
Sustainment	Brigade Support Battalion	Provide additional information collected during conduct of primary missions.
		Provide information on types of wounds or injuries, diseases, and health and welfare of population that refines understanding of operational environment or enemy capabilities.

Table A-3. Infantry brigade combat team information collection assets (continued)

Warfighting Function	*Organization*	*Capability*
Protection	Brigade Special Troops Battalion	Provide information collected during internment and resettlement, area security, and maneuver mobility support operations.
	Engineer Company	Conduct Soldier sensor missions, as needed, to satisfy information requirements.
		Provide terrain teams and reconnaissance teams that identify key terrain, obstacle intelligence, and infrastructure information.
Mission Command	Brigade Special Troops Battalion	Provide information and intelligence developed and disseminated through mission command systems.
		Conduct route, area, and zone CBRN reconnaissance to detect, identify, mark, report, and sample for presence of CBRN hazards.

CBRN chemical, biological, radiological, and nuclear

Table A-4. Heavy brigade combat team information collection assets

Warfighting function	*Organization*	*Capability*
Movement and Maneuver	Reconnaissance Squadron	Conduct security operations and surveillance tasks to include Soldier sensor missions, as needed, to satisfy information requirements.
		Conduct area, zone, or route reconnaissance.
	Combined Arms Battalion	Conduct Soldier sensor missions, as needed, to satisfy information requirements, including tactical questioning.
		Provide scout platoon capability for real-time detection, recognition, and identification of distant target locations.
Intelligence	Brigade Special Troops Battalion Military Intelligence Company	Conduct intelligence operations source operations, document exploitation, interrogation and debriefing, and counterintelligence operations (such as preliminary investigations).
		Provide organic aerial reconnaissance and surveillance, and battle damage assessment capability.
		Receive, process, and display near real-time information from non-organic airborne sensors.
Fires	Fires Battalion	Conduct Soldier sensor missions, as needed, to satisfy information requirements.
		Detect artillery and mortar fires.
		Establish long-duration observation posts.

Table A-4. Heavy brigade combat team information collection assets (continued)

Warfighting function	*Organization*	*Capability*
Sustainment	Brigade Support Battalion	Provide additional information collected during conduct of primary missions.
		Provide information on types of wounds or injuries, diseases, and health and welfare of population that refines understanding of operational environment or enemy capabilities.
		Provide additional information collected during conduct of primary missions.
Protection	Brigade Special Troops Battalion	Provide information collected during internment and resettlement, area security, and maneuver mobility support operations.
		Conduct Soldier sensor missions, as needed, to satisfy information requirements.
		Provide terrain teams and reconnaissance teams identify key terrain, obstacle intelligence, and infrastructure information.
		Conduct route, area, and zone CBRN reconnaissance to detect, identify, mark, report, and sample for presence of CBRN hazards.
Mission Command	Brigade Special Troops Battalion	Provide additional information collected during conduct of primary missions.
		Provide signal retransmission teams that can provide additional observation post capability.

CBRN chemical, biological, radiological, and nuclear

Table A-5. Stryker brigade combat team information collection assets

Warfighting function	*Organization*	*Capability*
Movement and Maneuver	Reconnaissance Squadron	Conduct security operations, surveillance tasks, and tactical questioning to include Soldier sensor missions, as needed, to satisfy information requirements.
		Conduct area, zone, or route reconnaissance.
		Provide organic unmanned aircraft system platoon to conduct aerial reconnaissance and surveillance and battle damage assessment.
		Provide Prophet Signal Intercept System to provide signals intercept and signal emitter location data.
		Provide CBRN platoon to conduct route, area, and zone CBRN reconnaissance to detect, identify, mark, report, and sample for presence of CBRN hazards.
		Provide unattended ground sensors platoon for increased unmanned monitoring of terrain.
	Stryker Battalions	Conduct Soldier sensor missions, as needed, to satisfy information requirements, including tactical questioning.

Table A-5. Stryker brigade combat team information collection assets (continued)

Warfighting function	*Organization*	*Capability*
Intelligence	Military Intelligence Company	Conduct intelligence operations military source operations, document exploitation, interrogation and debriefing, and counterintelligence operations (such as preliminary investigations).
		Support development of brigade common operational picture, targeting, IPB, analysis of reporting across all the warfighting functions and development of intelligence products.
		Receive, process, display near real time information from non-organic airborne sensors.
Fires	Fires Battalion	Conduct Soldier sensor missions, as needed, to satisfy information collection requirements.
		Detect artillery and mortar fires, establish long duration observation posts.
Sustainment	Brigade Support Battalion	Provide additional information collected during conduct of primary missions.
		Provide information on types of wounds or injuries, diseases, health and welfare of population that refines understanding of operational environment or enemy capabilities.
Protection	Military Police Platoon	Provide information collected during internment and resettlement, area security, and maneuver mobility support operations
		Conduct route, area, and zone CBRN reconnaissance to detect, identify, mark, report, and sample for presence of CBRN hazards.
	Engineer Company	Conduct Soldier sensor missions, as needed, to satisfy information requirements.
		Provide terrain teams and reconnaissance teams identify key terrain, obstacle Intelligence, and infrastructure information.
Mission Command	Brigade Support Battalion	Provide combat information and intelligence developed and disseminated through mission command systems (such as command post of the future).
		Provide additional information collected during conduct of primary missions.
		Provide signal retransmission teams that can provide additional observation post capabilities.

CBRN chemical, biological, radiological, and nuclear

A-36. The BCT conducts reconnaissance, security, and intelligence operations. The BCT commander gains situational understanding by conducting integrated reconnaissance and security operations that answer the CCIRs. Typically the BCT assigns short-term reconnaissance, intelligence, and security tasks to its reconnaissance squadron; sustained missions usually require participation from the entire BCT. When the BCT assigns reconnaissance or security tasks to a subordinate element, the BCT task-organizes the subordinate element and allocates to it the resources necessary to meet its mission requirements. The BCT may allocate tank and mechanized infantry units, reconnaissance units, engineer elements, attack helicopter units, close air support priority, and intelligence systems to perform reconnaissance or security tasks. (Refer to FM 3-90.6, for additional information.)

A-37. The BCT operations section—

- Is responsible for development of the information collection plan.
- Tasks subordinate units.
- Ensures the information collection plan supports the overall scheme of maneuver.

A-38. The BCT intelligence section—

- Assesses information received to derive intelligence.
- Performs requirements planning and assessment of information collection.

BRIGADE COMBAT TEAM RECONNAISSANCE SQUADRON

A-39. The reconnaissance squadrons of the heavy brigade combat team, infantry brigade combat team, and Stryker brigade combat team are organized to accomplish reconnaissance and security missions throughout the BCT's AO. By leveraging information technology with air and ground reconnaissance capabilities in complex terrain, the reconnaissance squadron helps develop the situation by focusing on all categories of threats in a designated AO. This allows the BCT commander to maintain battlefield mobility and agility while choosing the time, place, and method to confront the enemy. The squadron commander has various tools to conduct reconnaissance and security missions across the spectrum of conflict. The squadron commander can task-organize to optimize complementary effects while maximizing support throughout the BCT's AO. (Refer to FM 3-20.96, for additional information.)

A-40. Most Army information collection assets have been assigned at the brigade level to ensure intelligence and information is readily available to commanders in increasingly decentralized AOs. Corps, division, and BCTs often require information from the same assets. The requirement for layering information collection capabilities—some with theater-level applications—and the often long or personnel-intensive logistics, processing, exploitation, and dissemination of those assets require management at echelons above brigade.

A-41. Information collection capabilities are rapidly evolving to meet new challenges of the current and future area of operations and provide the flexibility required to provide information across the spectrum of operations. To act decisively, commanders and staffs identify, understand, and integrate (sometimes creatively) the multitude of information collection capabilities found at every echelon across the warfighting functions.

NETWORK-ENABLED INFORMATION COLLECTION

A-42. The networking of all joint force elements creates capabilities for unparalleled information sharing and collaboration and a greater unity of effort via synchronization and integration of force elements at the lowest echelons. Distributed Common Ground System (Army) (DCGS-A) provides a network-centric, enterprise intelligence, weather, geospatial engineering, and space operations capabilities to maneuver, maneuver support, and sustainment organizations at all echelons from battalion to joint task forces. The DCGS-A is being implemented to integrate intelligence tasking, collection, processing, and dissemination capabilities across the Army and joint community. The purpose of DCGS-A is to unite the different systems across the global information network. DCGS-A is the Army's primary system for—

- Receipt of and processing select information collection asset data.
- Control of select Army sensor systems.
- Fusion of sensor data and information
- Direction and distribution of relevant threat, terrain, weather, and civil considerations products and information.
- Facilitation of friendly information and reporting.

This page intentionally left blank.

Appendix B

The Information Collection Annex to the Operation Order

This appendix provides instructions for preparing Annex L (Information Collection) in Army plans and orders. It provides a format for the annex that can be modified to meet the requirements of the base order and operations, and an example information collection plan. Refer to ATTP 5-0.1 for additional guidance on formatting and procedures.

ANNEX L (INFORMATION COLLECTION)

B-1. The information collection annex clearly describes how information collection activities support the offensive, defensive, and stability or defense support of civil authorities operations throughout the conduct of the operations described in the base order. See figure B-1. It synchronizes activities in time, space, and purpose to achieve objectives and accomplish the commander's intent for reconnaissance, surveillance, and intelligence operations (including military intelligence disciplines).

[CLASSIFICATION]

Place the classification at the top and bottom of every page of the Information Collection Annex. Place the classification marking (TS), (S), I, or (U) at the front of each paragraph and subparagraph in parentheses. Refer to AR 380-5 for classification and release marking instructions.

ANNEX L (Information Collection) TO OPERATION ORDER # [number] [(code name)]—[issuing headquarters] [(classification of title)]

1. (U) Situation.

a. (U) Area of Interest. *No change to Annex B (Intelligence) or appendix 1 to annex C (Operations).*

b. (U) Area of Operations. *No change to Appendix 2 (Operation Overlay) to Annex C (Operations).*

(1) (U) Terrain. *Describe the aspects of terrain that impact operations. Refer to Annex B (Intelligence) as required.*

(2) (U) Weather. *Describe the aspects of weather that impact operations. Refer to Annex B (Intelligence) as required.*

c. (U) Enemy Forces. *No change to Annex B (Intelligence).*

d. (U) Friendly Forces. *No change to base order, Annex A (Task Organization) and Annex C (Operations).*

[page number]

[CLASSIFICATION]

Figure B-1. Example Annex L (Information Collection) annotated format

[CLASSIFICATION]

ANNEX L (INFORMATION COLLECTION) TO OPERATION ORDER # [number] [(code name)]—[issuing headquarters] [(classification of title)]

e. (U) Interagency, Intergovernmental, and Nongovernmental Organizations. *Identify and describe other organizations in the area of operations that may impact the conduct of operations or implementation of information collection-specific equipment and tactics. Refer to Annex V (Interagency Coordination) as required.*

f. (U) Civil Considerations. *Describe the critical aspects of the civil situation that impact information collection activities. Refer to Appendix 1 (Intelligence Estimate) to Annex B (Intelligence) and Annex K (Civil Affairs Operations) as required.*

g. (U) Attachments and Detachments. *If pertinent, list units or assets attached to or detached from the issuing headquarters. State when each attachment or detachment is effective (for example, on order, on commitment of the reserve) if different from the effective time of the base order. Do not repeat information already listed in Annex A (Task Organization).*

h. (U) Assumptions. *List any information collection-specific assumptions that support the annex development.*

2. (U) Mission. *State the mission in support of the operation—a short description of the who, what (task), when, where, and why (purpose) that clearly indicates the action to be taken and the reason for doing so.*

3. (U) Execution.

a. (U) Concept of Operations. *This is a statement of the overall information collection objective. Describe how the tasks or missions of reconnaissance, surveillance, security, intelligence operations, and so forth support the commander's intent and the maneuver plan. Direct the manner in which each element of the force cooperates to accomplish the key information collection tasks and ties that to support of the operation with task and purpose statement. Must describe, at minimum, the overall scheme of maneuver and concept of fires. It should refer to Appendix 1 (Information Collection Plan) to Annex L (Information Collection).The following subparagraphs are examples. Omit what is unnecessary for brevity.*

(1) (U) Movement and Maneuver. *Provide the scheme of movement and maneuver for collection assets and any other unit given a key information collection task, in accordance with the concept of operations in the base order (paragraph 3b) and Annex C (Operations). Describe the employment of information collection assets in relation to the rest of the force and state the method forces will enter the area of operations (AO).*

(2) (U) Intelligence. *Describe the intelligence concept for supporting information collection. Refer to Annex B (Intelligence) as required.*

(3) (U) Fires. *Describe the concept of fires in support of information collection. Identify which information collection assets have priority of fires and the coordinating purpose of, priorities for, allocation of, and restrictions on fire support and fire support coordinating measures. Refer to Annex D (Fires) as required.*

(4) (U) Protection. *Describe protection support to information collection. Refer to Annex F (Protection) as required.*

[page number]

[CLASSIFICATION]

Figure B-1. Example Annex L (Information Collection) annotated format (continued)

[CLASSIFICATION]

ANNEX L (INFORMATION COLLECTION) TO OPERATION ORDER # [number] [(code name)]—[issuing headquarters] [(classification of title)]

(5) (U) Engineer. *Describe engineer support, if applicable, to information collection. Identify priority of mobility and survivability assets. Refer to Annex G (Engineer) as required.*

(6) (U) Sustainment. *Describe sustainment support to information collection as required. Refer to Annex F (Sustainment).*

(7) (U) Signal. *Describe signal support to information collection as required. Refer to Annex H (Signal).*

(8) (U) Inform and influence. *State overall concept for synchronizing information collection with inform and influence operations. Refer to Annex J (Inform and Influence Activities).*

(9) (U) Assessment. *If required, describe the priorities for assessment for the information collection plan and identify the measures of effectiveness used to assess end state conditions and objectives. Refer to Annex M (Assessment) as required.*

b. (U) Tasks to Subordinate Units. *State the information collection task assigned to each unit not identified in the base order. (Refer to Appendix 1 (Information Collection Plan) to Annex L (Information Collection) as needed.)*

(1) (U) Information Collection Support Tasks for Maneuver Units.

(a) (U) Tasks to Maneuver Unit 1.

(b) (U) Tasks to Maneuver Unit 2.

(c) (U) Tasks to Maneuver Unit 3.

(2) (U) Information Collection Support Tasks for Support Units. *Direct units to observe and report in accordance with Appendix 1 (Information Collection Plan) to Annex L (Information Collection). Consider all options such as Naval gunfire support.*

(a) (U) Military Intelligence. *Refer to Annex B (Intelligence).*

(b) (U) Engineer. *Refer to Annex G (Engineer).*

(c) (U) Fires. *Refer to Annex D (Fires).*

(d) (U) Signal. *Refer to Annex H (Signal).*

(e) (U) Sustainment. *Refer to Annex F (Sustainment).*

(f) (U) Protection. *Refer to Annex E (Protection).*

[CLASSIFICATION]

ANNEX L (INFORMATION COLLECTION) TO OPERATION ORDER # [number] [(code name)]—[issuing headquarters] [(classification of title)]

(g) (U) Public Affairs. *Refer to Appendix 1 (Public Affairs) to Annex J (Inform and Influence Activities).*

(h) (U) Civil Affairs. *Refer to Annex K (Civil Affairs Activities).*

c. (U) Coordinating Instructions. *List only instructions applicable or not covered in unit standard operating procedures (SOPs).*

(1) (U) Time or Condition When the Plan Becomes Effective.

(2) (U) Priority Intelligence Requirements. *List priority intelligence requirements (PIRs) here, the information collection tasks associated with them, and the latest time information is of value for each PIR.*

(3) (U) Essential Elements of Friendly Information. *List essential elements of friendly information (EEFI) here.*

(4) (U) Fire Support Coordinating Measures. *List fire support coordinating or control measures. Establish no fire areas.*

(5) (U) Intelligence Handover Lines with Adjacent Units. *Identify handover guidance and parameters; refer to necessary graphics or attachments as required.*

(6) (U) Limits of Advance, Limits of Reconnaissance, and Quick Reaction Force Response Instructions. *Identify as required, referencing graphical depictions in attachments or instructions as needed.*

(7) (U) Airspace Coordinating Measures. *List airspace control measures.*

(8) (U) Intelligence Coordination Measures. *List information such as restrictions on international borders or other limitations and the coordination or special instructions that apply. Identify what unit is responsible for coordinating information collection activities in relation to the AO.*

(9) (U) Rules of Engagement. *Refer to Appendix 11 (Rules of Engagement) to Annex C (Operations) as required.*

(10) (U) Risk Reduction Control Measures. *State any reconnaissance, surveillance, and security-specific guidance such as fratricide prevention measures not included in SOPs, referring to annex F (Protection) as required.*

(11) (U) Environmental Considerations. *Refer to Appendix 5 (Environmental Considerations) to Annex G (Engineer) as required.*

(12) (U) Other Coordinating Instructions. *List only instructions applicable to two or more subordinate units not covered in the base plan or order.*

4. (U) Sustainment. *Describe any sustainment requirements, subparagraphs may include:*

a. (U) Logistics. *Refer to Appendix 1 (Logistics) to Annex F (Sustainment) as required.*

b. (U) Personnel. *Refer to Appendix 2 (Personnel Services Support) to Annex F (Sustainment) as required.*

THE INFORMATION COLLECTION PLAN

B-2. Figure B-2 (page B-6) is an example of an ~~i~~nformation collection plan. This plan can also be accompanied by a graphical depiction of the plan, called the ~~i~~nformation collection overlay. Units may develop and adjust the format of their information collection plan to meet the requirements of the mission and clearly depict information collection in terms of time and space for execution. The information collection plan must contain—

- Information about the area of operations for the collection assets.
- Reporting guidance.
- Identified named area of interest or targeted area of interest.
- The task for each asset.
- The time the asset is to collect or that information is relevant.
- References to any passage of lines or fire support and airspace control measures that are not standard operating procedures.

Unit: **INFORMATION COLLECTION PLAN** Period Covered From: To:

Appendix C

Joint Intelligence, Surveillance, and Reconnaissance

The Army conducts operations as part of a joint force. This appendix examines joint intelligence, surveillance, and reconnaissance activities as part of unified action. It discusses the joint intelligence, surveillance, and reconnaissance doctrine, resources, planning systems, considerations, and organizations.

UNIFIED ACTION

C-1. *Unified action* is the synchronization, coordination, and/or integration of the activities of governmental and nongovernmental entities with military operations to achieve unity of effort (JP 1). It involves the application of all instruments of national power, including actions of other government agencies and multinational military and nonmilitary organizations. Combatant as well as subordinate commanders use unified action to integrate and synchronize their operations directly with the activities and operations of other military forces and nonmilitary organizations in their area of operations.

C-2. Army forces operating in an operational area are exposed to many non-U.S. Army participants. Multinational formations, host-nation forces, other government agencies, contractors, and nongovernmental organizations are all found in the operational area. Each participant has distinct characteristics, vocabulary, and culture, and all can contribute to situational understanding. Commanders, Soldiers, and all who seek to gather information have much to gain by being able to work with and leverage the capabilities of these entities. The Army expands the joint intelligence, surveillance, and reconnaissance (ISR) doctrine (contained in JP 2-01) by defining information collection as an activity that focuses on answering the commander's critical information requirements (see paragraph 1-3).

CONCEPTS OF JOINT INTELLIGENCE, SURVEILLANCE, AND RECONNAISSANCE

C-3. Joint ISR is an intelligence function, and its collections systems are intelligence assets and resources under the control of the J-2. This is different from Army information collection. Joint ISR does not include reconnaissance and surveillance units. Joint usage of reconnaissance and surveillance refers to the missions conducted by predominately airborne assets. Two key concepts impact how Army conducts joint ISR in the joint operations area: integration and interdependence.

INTEGRATION

C-4. The Army uses integration to extend the principle of combined arms to operations conducted by two or more Service components. The combination of diverse joint force capabilities generates combat power more potent than the sum of its parts. This integration does not require joint command at all echelons; however, it does require joint interoperability at all echelons.

INTERDEPENDENCE

C-5. The Army uses interdependence to govern joint operations and impact joint ISR activities. This interdependence is the purposeful reliance by one Service's forces on another Service's capabilities to maximize the complementary and reinforcing effects of both. Army forces operate as part of an interdependent joint force. Areas of interdependence that directly enhance Army information collection activities include—

- **Joint command and control**. Integrated capabilities that—
  - Gain information superiority through improved, fully synchronized, integrated ISR, knowledge management, and information management.
  - Share a common operational picture.
  - Improve the ability of joint force and Service component commanders to conduct operations.
- **Joint intelligence**. Integrated processes that—
  - Reduce unnecessary redundancies in collection asset tasking through integrated ISR.
  - Increase processing and analytic capability.
  - Facilitate collaborative analysis.
  - Provide global intelligence production and dissemination.
  - Provide intelligence products that enhance situational understanding by describing and assessing the operational environment.

C-6. Other Services also rely on Army forces to complement their capabilities, including intelligence support, detainee and prisoner of war operations, and others.

JOINT INTELLIGENCE, SURVEILLANCE, AND RECONNAISSANCE DOCTRINE

C-7. JP 2-01 governs joint ISR doctrine. The joint force headquarters in the theater of operations govern operational policies and procedures specific to that theater. Army personnel serving in joint commands must be knowledgeable of joint doctrine for ISR. Army personnel involved in joint operations must understand the joint operation planning process. The joint operation planning process focuses on the interaction between an organization's commander and staff and the commanders and staffs of the next higher and lower commands. The joint operation planning process continues throughout an operation.

C-8. Army and joint doctrine share many of the same terms and definitions; however, commanders and staffs must understand their use and differences. Examples include joint use of ISR and the Army's use of information collection, joint operations area instead of area of operations, and the joint operation planning process instead of the military decisionmaking process.

JOINT INTELLIGENCE, SURVEILLANCE, AND RECONNAISSANCE RESOURCES

C-9. When organic collection assets or other Army resources are not sufficient, the intelligence officer and operations officer need to understand how to access joint resources. The exact procedures vary in each operational theater. The joint force collection manager reviews all requests for joint ISR resources based on validated needs as established by the command's formal intelligence requirements.

C-10. One type of resource is a request for information. Subordinate Army commanders submit their requests for information through echelon channels. If the intermediate echelons cannot answer them, they are passed to the joint task force's (JTF's) request for information section for research and response. Once a request for information is returned without an answer, subordinate commanders can submit a request for joint ISR support to the joint intelligence operations center. The joint intelligence operations center apportions its assets or other resources from higher echelons against the requests it receives, in order of priority, as defined by the JTF commander. Requests that cannot be satisfied by assets controlled or apportioned by the JTF are translated into the national intelligence system for collection.

C-11. Another resource is air support. At echelons below Army Service component command, requests for joint ISR air support go through an air support operations center or similar organization. Units requesting joint ISR support must accurately write air support requests, and they must request the desired capability or effect, not the specific airframe. Air Force air liaison officers at that headquarters may assist in training Army personnel how to prepare air support requests; however, their primary duty is to advise the commander and staff.

C-12. Some resources are outside the theater. The mission may require joint ISR resources not organic to the theater or to the components of the subordinate joint force. Joint ISR resources are typically in high demand and requirements usually exceed platform capabilities or inventory. The joint force collection manager must ensure that all requests for additional joint ISR resources are based on validated needs as established by the command's formal intelligence requirements.

JOINT INTELLIGENCE, SURVEILLANCE, AND RECONNAISSANCE PLANNING SYSTEMS

C-13. Two joint ISR planning systems— the collection management mission application and the Planning Tool for Resource, Integration, Synchronization, and Management (PRISM)—help facilitate access to joint resources. In joint collection management operations, the collection manager, in coordination with the operations directorate, forwards collection requirements to the component commander exercising tactical control over the theater reconnaissance and surveillance assets. A mission tasking order goes to the unit selected to be responsible for the collection operation. At the selected unit, the mission manager makes the final choice of specific platforms, equipment, and personnel required for the collection operations based on operational considerations such as maintenance, schedules, training, and experience. The collection management mission application is used by the Air Force. It is a web-centric information systems architecture that incorporates existing programs sponsored by several commands, Services, and agencies. It also provides tools for recording, gathering, organizing, and tracking intelligence collection requirements for all disciplines. PRISM, a subsystem of collection management mission application, is a Web-based management and synchronization tool used to maximize the efficiency and effectiveness of theater operations. PRISM creates a collaborative environment for resource managers, collection managers, exploitation managers, and customers.

JOINT AIR PLANNING PROCESS

C-14. Any joint ISR plan involving airborne assets or resources must consider the joint air planning process. The combatant commander's air component's air and space operations center controls the airspace in the area of responsibility and all air activity above the coordinating altitude determined by that commander. The air and space operations center must be informed of everything that is going to fly above the coordinating altitude. The air and space operations center also prioritizes joint ISR requirements for the assets that the Air Force component command controls and apportions. In a multinational headquarters, the air and space operations center is the combined air and space operations center.

C-15. Recent operations have demonstrated the value of having joint ISR liaison officers at Army organizational headquarters to help tactical commanders integrate theater ISR assets into their operations. These officers come from the air and space operations center, combined air and space operations center, or the Combined Forces Air Component Command. These liaison elements provide joint expertise and direct liaison with the combined air and space operations center. They also provide insight to the combined air and space operations center and related organizations into the operations they support.

JOINT INTELLIGENCE, SURVEILLANCE, AND RECONNAISSANCE CONCEPT OF OPERATIONS

C-16. The counterpart to the joint ISR plan is the joint ISR concept of operations, which is developed in conjunction with operational planning. The joint ISR concept of operations is based on the collection strategy and ISR execution planning, and is developed jointly by the joint force J-2 and J-3. The joint ISR concept of operations addresses how all available ISR assets and associated tasking, processing, exploitation, and dissemination infrastructure, to include multinational or coalition and commercial assets, are used to answer the joint force's intelligence requirements. It identifies asset shortfalls relative to the joint force's validated priority intelligence requirements (PIRs). It requires periodic evaluation of the capabilities and contributions of all available ISR assets in order to maximize their efficient utilization, and to ensure the timely release of allocated ISR resources when no longer needed by the joint force. JP 2-01 chapter 2 discusses the concept of operations in detail.

NATIONAL INTELLIGENCE, SURVEILLANCE, AND RECONNAISSANCE RESOURCES AND GUIDELINES

C-17. Within the context of the National Intelligence Priorities Framework, the concept of ISR operations may be used to justifying requests for additional national ISR resources. National collection resources are leveraged against national priorities. Intelligence officers must remember that these assets are scarce and have a multitude of high-priority requirements.

NATIONAL INTELLIGENCE SUPPORT TEAMS

C-18. National intelligence support teams (NISTs) are formed at the request of a deployed joint or combined task force commander. NISTs are comprised of intelligence and communications experts from Defense Intelligence Agency, Central Intelligence Agency, National Geospatial-Intelligence Agency, National Security Agency, and other agencies as required to support the specific needs of the joint force commander. Defense Intelligence Agency is the executive agent for all NIST operations. Once on station, the NIST supplies a steady stream of agency intelligence on local conditions and potential threats. The needs of the mission dictate size and composition of NISTs.

C-19. Depending on the situation, NIST personnel are most often sent to support corps- or division-level organizations. However, during recent operations in Operation Iraqi Freedom and Operation Enduring Freedom, national agencies placed personnel at the brigade combat team level in some cases.

PLANNING AND REQUESTS FOR INFORMATION SYSTEMS

C-20. Several national databases and Intelink Web sites contain information applicable to the intelligence preparation to the battlefield process and national ISR planning. Commanders and their staff should review and evaluate those sites to determine the availability of current data, information, and intelligence products that might answer intelligence or information requirements.

- **Modernized integrated database** (known as MIDB) is accessible via Intelink and contains current, worldwide order-of-battle data organized by country, unit, facility, and equipment.
- **National Geospatial-Intelligence Agency's National Exploitation System** (known as NES) is accessible via Intelink. This site permits users to research the availability of imagery coverage over targets of interest and to access historical national imagery archives and imagery intelligence reports.
- **Country knowledge bases** and **crisis home pages** are maintained by many combatant command and joint force commands as Intelink Web sites containing the best and most up-to-date intelligence products available from the intelligence community.
- **Signals Intelligence On-Line Information System** (known as SOLIS) database contains current and historical finished signals intelligence products.
- **Secure analyst file environment** (known as SAFE) structured data files provide access to the following databases:
  - **Intelligence Report Index Summary File** (known as IRISA) contains index records and the full text of current and historical intelligence information reports.
  - **All-Source Document Index** (known as ASDIA) contains index records and abstracts for hardcopy all-source intelligence documents produced by Defense Intelligence Agency.
- **Human intelligence collection requirements** is a registry of all validated human intelligence requirements and tasking.
- **Modernized Defense Intelligence Threat Data System** (known as MDITDS) is a collection of analytic tools that support the retrieval and analysis of information and intelligence related to counterintelligence, indications and warning, and counterterrorism.
- **Community on-line intelligence system for end users and managers** (known as COLISEUM) is a database application which allows the user to identify and track the status of all validated crisis and noncrisis intelligence production requirements.

REQUIREMENTS MANAGEMENT SYSTEM

C-21. The requirements management system provides the national and Department of Defense imagery communities with a uniform automated collection management system. The requirements management system manages intelligence requirements for the national and Department of Defense user community in support of the United States' imagery and geospatial information system. This system—managed by National Geospatial-Intelligence Agency—provides end-to-end management of national and strategic imagery collection, exploitation, and dissemination. It enables creation, review, and approval of imagery requests. It tasks requirements for collection, production, and exploitation of imagery to appropriate locations. The requirements management system determines satisfaction of imagery requests, can modify imagery requests based on input from other sources of intelligence, and provides analytical tools for users to exploit.

C-22. The generated messages of the requirements management system are dispatched for approval and subsequent collection and exploitation tasking. The system is central to current and future integrated imagery and geospatial information management architectures supporting national, military, and civil customers.

C-23. Nominations management services provide the coordination necessary to accept user requirements for new information. These services aggregate, assign, and prioritize these user requirements. Nominations management services also track requirement satisfaction from the users.

NATIONAL SIGNALS INTELLIGENCE REQUIREMENTS PROCESS

C-24. The national signals intelligence requirements process (NSRP) is an integrated and responsive system of the policies, procedures, and technology used by the intelligence community to manage requests for national-level signals intelligence products and services. The NSRP replaced the previous system called the national signals intelligence requirement system.

C-25. The NSRP establishes an end-to-end crypto-logic mission management tracking system using information needs. Collectors of signals intelligence satisfy tactical through national-level consumer information needs based on NSRP guidance. The NSRP improves the consumer's ability to communicate with the collector by adding focus and creating a mechanism for accountability and feedback.

C-26. Information needs are used in NSRP to relay the collection requirements to signals intelligence collectors and systems. Users prioritize and classify information needs according to standardized time categories. Priorities for research information needs involve limited efforts and only exist for a set time using existing data (no new collection is required). Limited duration information needs require collection and production over a period of up to 90 days. Standing information needs require sustained collection over periods exceeding 90 days and up to 2 years.

C-27. Information needs are further prioritized based on how quickly the signals intelligence community must react to the request for collection by identifying—

- Routine information needs that require action in 30 or more days.
- Time sensitive information needs that require actions within 4 to 29 days after submission.
- Time critical information needs that require actions within the first three days after submission.

C-28. Requests for national signals intelligence collection must be sponsored at the national level, validated by the intelligence community, and prioritized among all the other competing requirements.

GUIDELINES FOR ACCESSING NATIONAL RESOURCES FOR INFORMATION

C-29. Depending upon local procedures and systems available, the Army intelligence officer may use various means to submit a request for information. The guidelines below assist in accessing national-level resources to answer the request for information—

- Know the PIRs and identify gaps that exist in the intelligence database and products.
- Know what collection assets are available from supporting and supported forces.
- Understand the timeline for preplanned and dynamic collection requests for particular assets.

- Identify collection assets and dissemination systems that may help answer the commander's PIRs.
- Ensure liaison and coordination elements are aware of PIRs and timelines for satisfaction. Ensure PIRs are tied to specific operational decisions.
- During planning, identify collection requirements and any trained analyst augmentation required to support post-strike battle damage assessment or other analysis requirements.
- Plan for cueing to exploit collection platforms.

JOINT INTELLIGENCE, SURVEILLANCE, AND RECONNAISSANCE CONSIDERATIONS

C-30. Communication and cooperation with other agencies and organizations in the joint operations area can enhance ISR collection efforts, creating sources of information with insights not otherwise available. Commanders must understand the respective roles and capabilities of the civilian organizations in the joint operations area to coordinate most effectively. Civilian organizations have different organizational cultures and norms. Some organizations may work willingly with Army forces while others may not. Some organizations are particularly sensitive about being perceived as involved in intelligence operations with the military. Some considerations in obtaining the valuable information these organizations may have access to are—

- **Building a relationship**—this takes time, effort, and a willingness to schedule time to meet with individuals.
- **Patience**—it is best not to expect results quickly and to avoid the appearance of tasking other agencies to provide information.
- **Reciprocity**—U.S. forces often can provide assistance or support that facilitate cooperation.
- **Mutual interests**—other organizations may have the same interests as U.S. forces (such as increased security).
- **Trust**—it should be mutual. At a minimum, organizations trust U.S. forces will not abuse the relationship and that the information is provided in good faith.

C-31. Commanders cannot task civilian organizations to collect information. However, U.S. government intelligence or law enforcement agencies normally collect or have access to information as part of their operations. These organizations may benefit by mutual sharing of information, and can be an excellent resource. Provincial reconstruction teams, for example, work in cooperation with military efforts and can provide information that is important to the commander's lines of effort such as infrastructure, governance, economic development, and health care.

JOINT INTELLIGENCE, SURVEILLANCE, AND RECONNAISSANCE ORGANIZATION

C-32. The JTF is the primary organization for joint operations. If other nations are included, it is a combined JTF. The JTF is designed to perform missions of short duration with specific, limited objectives. The JTF draws units from theater components and may receive augmentation—units, intelligence capabilities, and communications—from outside the theater.

C-33. When Army forces operate under a JTF or combined JTF for unified action, several organizations in the joint intelligence architecture can assist lower echelons with their joint ISR and information collection plans. The J-2 headquarters of a typical JTF has a joint intelligence operations center. Within this center, the collection management and the request for information sections are useful to Army intelligence officers as they plan joint ISR operations. In some cases, the collection management and dissemination sections are combined by the J-2 into one section: collection management and dissemination. Chapter 2 of JP 3-33 discusses the organization of the typical joint task force staff.

C-34. Key joint organizations for joint ISR include—

- Joint intelligence support element.
- Air and space operations center or combined air and space operations center.

- Intergovernmental and nongovernmental organizations.
- Multinational operations.

JOINT INTELLIGENCE SUPPORT ELEMENT

C-35. The joint intelligence support element may also be created to augment the J-2 element of the JTF. The collection management operations branch section within the joint intelligence support element is the interface where subordinate Army commanders receive support from the JTF. The collection management operations branch oversees the JTF's ISR activities. Dynamic re-tasking of joint resources must be coordinated with the joint intelligence support element collection management operations branch.

AIR AND SPACE OPERATIONS CENTER OR COMBINED AIR AND SPACE OPERATIONS CENTER

C-36. Joint air planning products produced by the air and space operations center include the air tasking order, airspace control order, and special instructions. The air tasking order, airspace control order, and special instructions provide operational and tactical direction at the appropriate levels of detail. For aerial assets, these products are important for intelligence staffs as well as mission managers and operators (for example, unmanned aircraft system operators and aircraft pilots).

C-37. Army intelligence staffs coordinate with the air and space operations center through an Army unit called a battlefield coordination detachment. The battlefield coordination detachment is the Army Service component command's liaison at the air and space operations center. This detachment communicates the land component commander's issues to the air component commander. Aerial collection requests flow through the battlefield coordination detachment to the air and space operations center for consideration. (See ATTP 3-09.13 for more information on battlefield coordination detachment duties and responsibilities.)

C-38. The air and space operations center sends a liaison element to the air component command element to communicate the air component commander's issues to the land component commander.

INTERGOVERNMENTAL AND NONGOVERNMENTAL ORGANIZATIONS

C-39. In addition to working with U.S. government agencies, unified action involves synchronizing joint or multinational military operations with activities of other government agencies, intergovernmental organizations, nongovernmental organizations, and contractors. These organizations may have significant access, specialized knowledge, or insight and understanding of the local situation because of the nature of what they do. These organizations vary widely in their purposes, interests, and ability or willingness to cooperate with the information-gathering activities of U.S. forces. It is often preferable to simply cultivate a relationship that enables the exchange of information without revealing specific requirements.

MULTINATIONAL OPERATIONS

C-40. The Army uses the joint definition of *multinational operations*—a collective term to describe military actions conducted by forces of two or more nations, usually undertaken within the structure of a coalition or alliance (JP 3-16). Intensive coordination, training, and extensive liaison are important to effective multinational ISR operations.

C-41. In multinational operations, the JTF must share intelligence, as necessary, for mission accomplishment with foreign military forces and coordinate the exchange of intelligence liaisons with those forces. Command and control of ISR resources may remain essentially national or may be integrated into a combined command and control structure. There is no single intelligence doctrine for multinational operations. Each coalition or alliance must develop its own unique procedures. Refer to JP 2-01 for more information on the intelligence considerations for multinational operations.

C-42. Multinational force commanders establish a system that optimizes each nation's contributions. Managing assets from multinational partners requires close coordination and at times, maintenance support. U.S. forces often also provide technical assistance to share information and intelligence.

C-43. Early, concurrent planning is critical to the success of joint and multinational operations. Multinational ISR planning activities include, but are not limited to—

- **Developing requirements**—information regarding the threat and the environment that needs to be collected and processed to meet the intelligence requirements of the commander.
- **Developing indicators**—activity or lack of activity that confirms or denies the action or event specified in an intelligence requirement. Intelligence analysts develop indicators.
- **Developing the ISR plan**—which involves coordination between the collection manager and operations directorate.

C-44. U.S. personnel assigned to a multinational organization should be aware of, and remain sensitive to, cultural and religious differences among its members. In some instances, these differences may result in periods of increased vulnerability for the joint force or require scheduling changes for meetings or briefings.

C-45. In most multinational operations, U.S. forces share intelligence with foreign military forces and receive intelligence from those forces. Unique intelligence policy and criteria are tailored to each multinational operation. In some multinational operations or campaigns, existing international standardization agreements may provide a basis for establishing rules and policies for conducting joint intelligence operations. Since each multinational operation is unique, such agreements may have to be modified or amended based on the situation. Policy and procedures are tailored based on theater guidance and national policy as contained in DODD 5230.11. Staffs never disclose classified information automatically. Any disclosure must be consistent with U.S. national policy and U.S. military objectives, be done with security assurances in place, present a clearly defined U.S. advantage, and be limited to only necessary information.

Glossary

The glossary lists acronyms and terms with Army, multi-Service, or joint definitions, and other selected terms. Where Army and joint definitions are different, (Army) follows the term. Terms for which FM 3-55 is the proponent (authority) manual are marked with an asterisk (*). The proponent manual for other terms is listed in parentheses after the definition.

SECTION I – ACRONYMS AND ABBREVIATIONS

AO	area of operations
ATTP	Army tactics, techniques, and procedures
BCT	brigade combat team
BFSB	battlefield surveillance brigade
CAB	combat aviation brigade
CBRN	chemical, biological, radiological, and nuclear
CCIR	commander's critical information requirement
COA	course of action
COP	common operational picture
DA	Department of the Army
DCGS-A	Distributed Common Ground System (Army)
DODD	Department of Defense directive
DSCA	defense support of civil authorities
EEFI	essential elements of friendly information
FM	field manual
FRAGO	fragmentary order
G-2	assistant chief of staff, intelligence
G-2X	assistant chief of staff, counterintelligence and human intelligence
G-3	assistant chief of staff, operations
G-7	assistant chief of staff, information operations
G-9	assistant chief of staff, civil affairs operations
IPB	intelligence preparation of the battlefield
ISR	intelligence, surveillance, and reconnaissance
J-2	intelligence directorate of a joint staff
JP	joint publication
JTF	joint task force
LTIOV	latest time information is of value
MDMP	military decisionmaking process
MIB	military intelligence brigade
NAI	named area of interest
NIST	national intelligence support team
NSRP	national signals intelligence requirements process
OPORD	operation order

PIO	public information officer
PIR	priority intelligence requirement
PRISM	Planning Tool for Resource, Integration, Synchronization, and Management
S-2	intelligence staff officer
S-2X	intelligence staff executive officer
S-3	operations staff officer
S-7	information operations staff officer
S-9	civil affairs operations staff officer
SOP	standard operating procedure
TAI	target area of interest
TC	training circular
U.S.	United States
UAS	unmanned aircraft system
WARNO	warning order

SECTION II – TERMS

battle rhythm

A deliberate daily cycle of command, staff, and unit activities intended to synchronize current and future operations. (JP 3-33)

geospatial intelligence

The exploitation and analysis of imagery and geospatial information to describe, assess, and visually depict physical features and geographically referenced activities on the Earth. Geospatial intelligence consists of imagery, imagery intelligence, and geospatial information. (JP 2-03)

human intelligence

A category of intelligence derived from information collected and provided by human sources. (JP 2-0)

***information collection**

An activity that synchronizes and integrates the planning and employment of sensors and assets as well as the processing, exploitation, and dissemination of systems in direct support of current and future operations.

intelligence

The product resulting from the collection, processing, integration, evaluation, analysis, and interpretation of available information concerning foreign nations, hostile or potentially hostile forces or elements, or areas of actual or potential operations. The term is also applied to the activity which results in the product and to the organizations engaged in such activity. (JP 2-0)

multinational operations

A collective term to describe military actions conducted by forces of two or more nations, usually undertaken within the structure of a coalition or alliance. (JP 3-16)

reconnaissance

Those operations undertaken to obtain, by visual observation or other detection methods, information about the activities and resources of an enemy or adversary, or to secure data concerning the meteorological, hydrographical or geographical characteristics and the indigenous population of a particular area. (FM 3-90)

running estimate

The continuous assessment of the current situation used to determine if the current operation is proceeding according to the commander's intent and if planned future operations are supportable. (FM 5-0)

site exploitation

Systematically searching for and collecting information, material, and persons from a designated location and analyzing them to answer information requirements, facilitate subsequent operations, or support criminal prosecution. (ATTP 3-90.15)

surveillance

The systematic observation of aerospace, surface, or subsurface areas, places, persons, or things, by visual, aural, electronic, photographic, or other means. (JP 3-0)

synchronization

The arrangement of action in time, space, and purpose to produce maximum relative combat power at a decisive place and time. (JP 1-02)

unified action

The synchronization, coordination, and/or integration of the activities of governmental and nongovernmental entities with military operations to achieve unity of effort. (JP 1)

Preface

ATP 2-33.4 provides fundamental information to a broad audience, including commanders, staffs, and leaders, on how intelligence personnel conduct analysis to support Army operations. It describes the intelligence analysis process and specific analytic techniques and information on the conduct of intelligence analysis performed by intelligence personnel, especially all-source analysts, across all intelligence disciplines. Additionally, ATP 2-33.4 describes how intelligence analysis facilitates the commander's decision making and understanding of complex environments.

The principal audience for ATP 2-33.4 is junior to midgrade intelligence analysts conducting intelligence analysis. This publication provides basic information on intelligence analysis for commanders, staffs, and other senior military members.

ATP 2-33.4 readers must have an understanding of the following:

- Intelligence doctrine described in ADP 2-0 and FM 2-0.
- Collection management described in ATP 2-01.
- Intelligence preparation of the battlefield (IPB) described in ATP 2-01.3.
- Operational doctrine described in ADP 3-0 and FM 3-0.
- Joint targeting described in JP 3-60.

Commanders, staffs, and subordinates ensure their decisions and actions comply with applicable United States (U.S.), international, and, in some cases, host-nation laws and regulations. Commanders at all levels ensure their Soldiers operate in accordance with the law of war and the rules of engagement. (See FM 6-27.)

This publication contains copyrighted material.

ATP 2-33.4 uses joint terms where applicable. Selected joint and Army terms and definitions appear in both the glossary and the text. For definitions shown in the text, the term is italicized, and the number of the proponent publication follows the definition. This publication is not the proponent for any Army terms.

ATP 2-33.4 applies to the Active Army, Army National Guard/Army National Guard of the United States, and U.S. Army Reserve unless otherwise stated.

The proponent of ATP 2-33.4 is the U.S. Army Intelligence Center of Excellence. The preparing agency is the Directorate of Doctrine and Intelligence Systems Training, U.S. Army Intelligence Center of Excellence, Fort Huachuca, AZ. Send comments and recommendations on a DA Form 2028 (*Recommended Changes to Publications and Blank Forms*) to Commander, U.S. Army Intelligence Center of Excellence, ATTN: ATZS-DST-D (ATP 2-33.4), 550 Cibeque Street, Fort Huachuca, AZ 85613-7017; by email to usarmy.huachuca.icoe.mbx.doctrine@mail.mil; or submit an electronic DA Form 2028.

Introduction

ATP 2-33.4 discusses doctrinal techniques—descriptive methods for performing missions, functions, or tasks as they apply to intelligence analysis. ATP 2-33.4—

- Describes the intelligence analysis process.
- Discusses structured analytic techniques and the methods for implementing them.
- Describes unique considerations related to intelligence analysis.

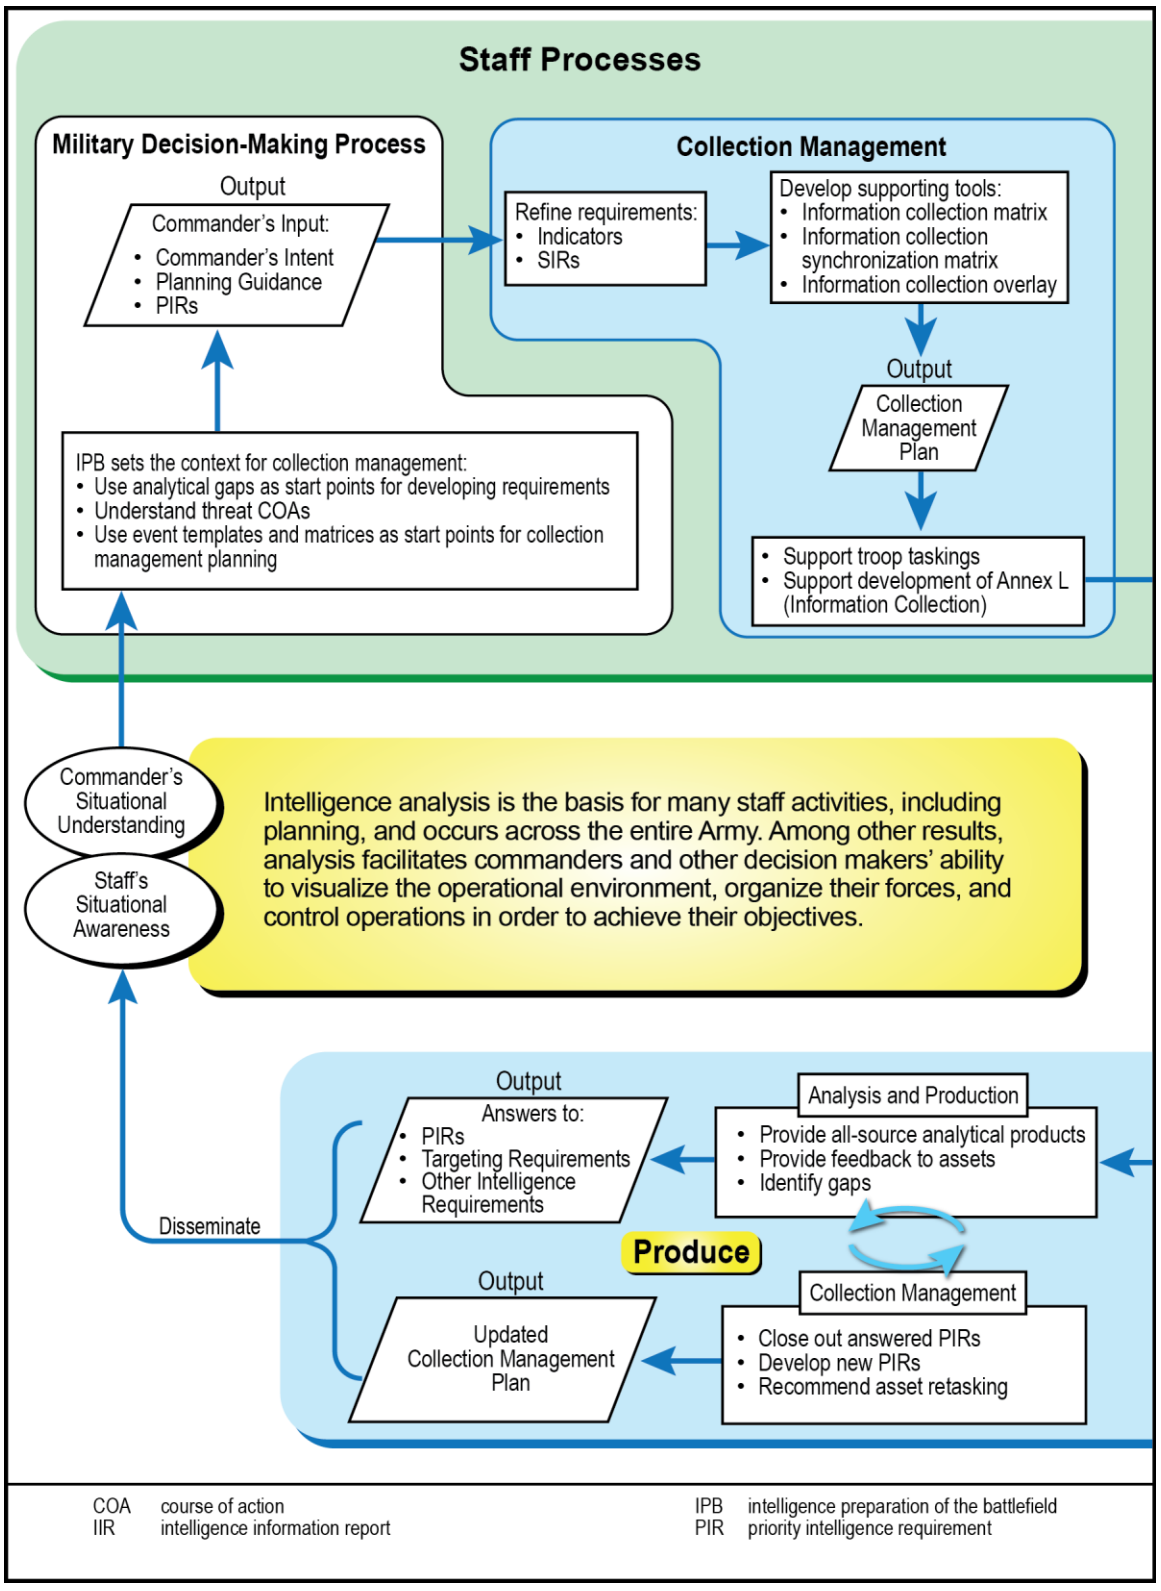
ATP 2-33.4 does not discuss—

- The Army's intelligence fundamentals and the intelligence warfighting function. See ADP 2-0 and FM 2-0 for the fundamentals.
- Techniques used to perform IPB and collection management. See ATP 2-01.3 and ATP 2-01, respectively.
- Information on how individual intelligence disciplines conduct specific tasks. See the appropriate intelligence discipline Army techniques publications.
- Specific organizational structures and manning information and specific techniques at echelons above corps, corps and divisions, and/or brigade combat teams. See classified ATP 2-19.1, ATP 2-19.3, and/or ATP 2-19.4, respectively.

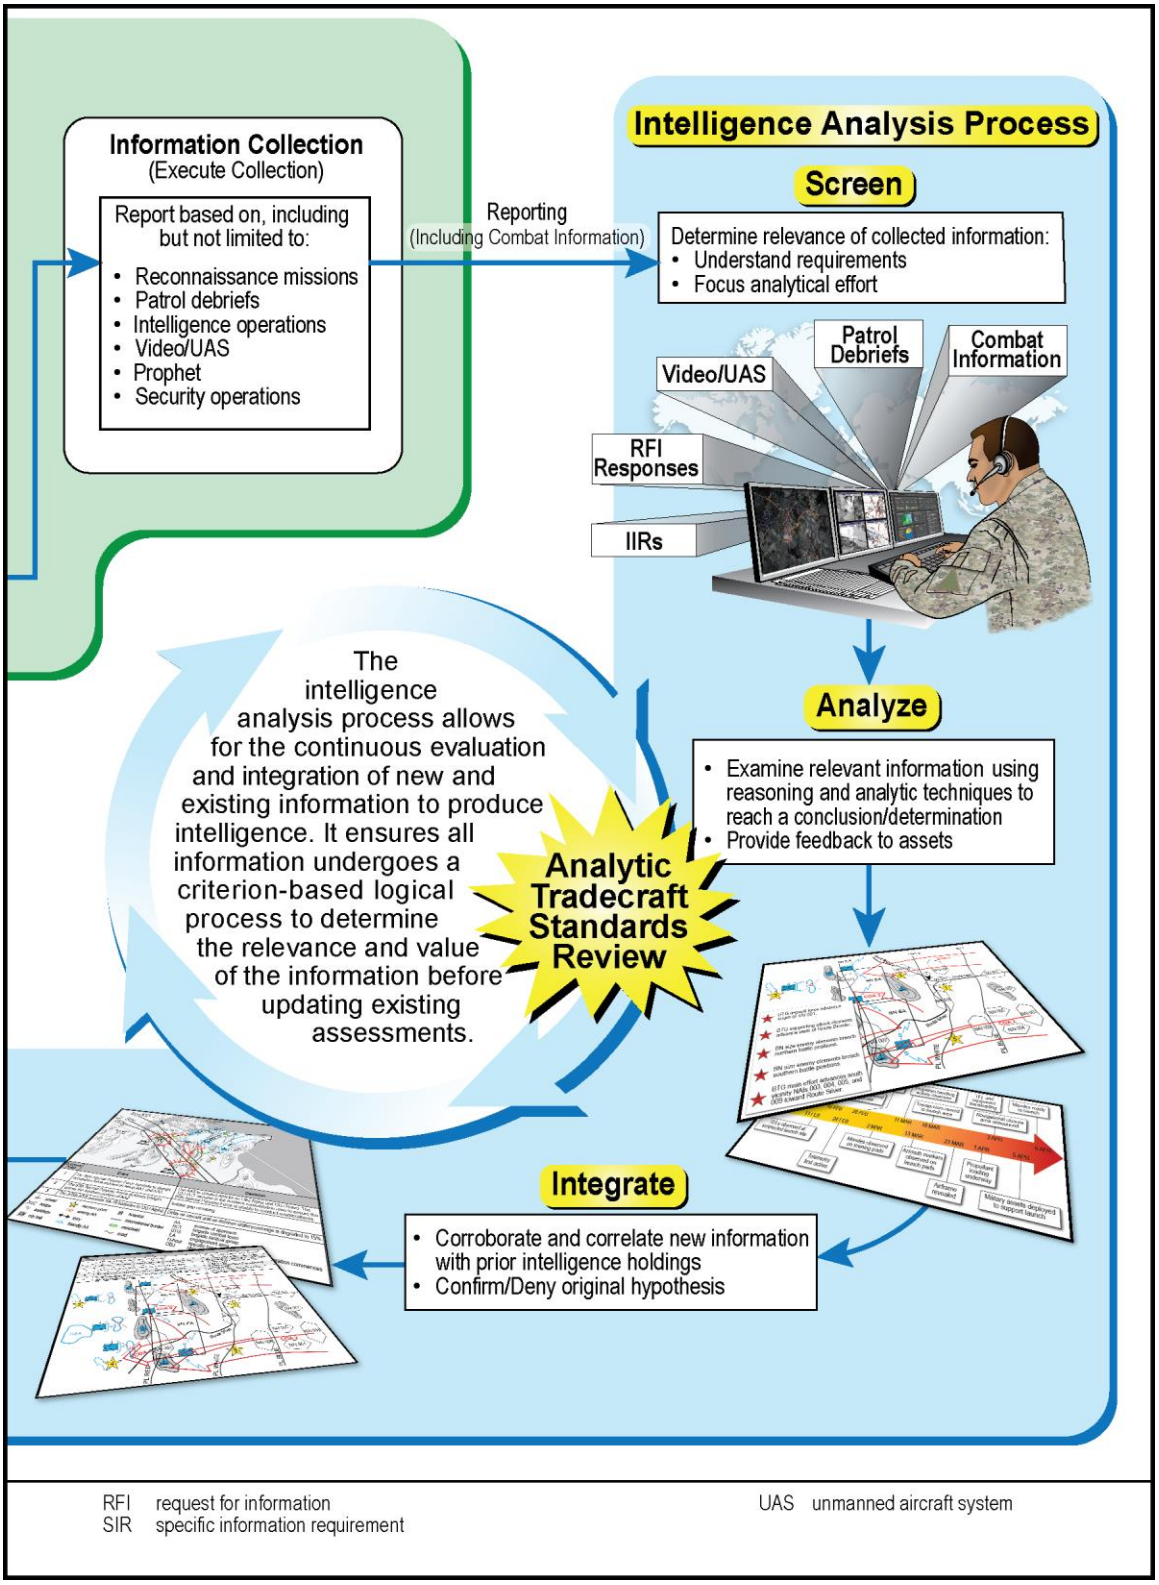
Intelligence analysis is central to intelligence. It is the basis for many staff activities, including planning, and occurs across the entire Army. Among other results, analysis facilitates commanders and other decision makers' ability to visualize the operational environment (OE), organize their forces, and control operations to achieve their objectives. To understand the role of intelligence analysis, intelligence professionals must understand how intelligence analysis corresponds with other staff processes, especially the military decision-making process and information collection (including collection management).

The introductory figure on pages xii and xiii displays the intelligence analysis process and shows how intelligence analysis fits with the other staff processes to facilitate the commander's understanding:

- The commander's initial intent, planning guidance, and priority intelligence requirements (PIRs) drive the collection management plan.
- The entire staff, led by the intelligence and operations staffs, develops the information collection plan that results in reporting.
- All-source intelligence is based on information from all intelligence disciplines, complementary intelligence capabilities, and other available sources, such as reconnaissance missions, patrol debriefs, and security operations.
- Information collected from multiple sources moves through the intelligence analysis process, resulting in intelligence.
- The intelligence staff conducts all-source analysis and produces timely, accurate, relevant, predictive, and tailored intelligence that satisfies the commander's requirements and facilitates the commander's situational understanding and the staff's situational awareness.



Introductory figure. Intelligence analysis at a glance



Introductory figure. Intelligence analysis at a glance (*continued*)

ATP 2-33.4 updates and describes the fundamentals of intelligence analysis. ATP 2-33.4 has nine chapters and six appendixes:

- **Chapter 1** provides an overview of intelligence analysis based on the Army's mission, providing intelligence professionals with the fundamentals they must understand to conduct intelligence analysis. The overview also includes the role of intelligence analysis in the Army's mission to fight for intelligence as peer threats counter information collection efforts and during large-scale ground combat operations.
- **Chapter 2** describes the intelligence analysis process (screen, analyze, integrate, and produce) and how it will be executed to answer the commander's PIRs.
- **Chapter 3** identifies and defines the all-source analytical tasks and how their application facilitates commanders and other decision makers' visualization.
- **Chapter 4** discusses intelligence analysts' use of analytic techniques and tools to solve intelligence problems and to limit analytical errors. This chapter introduces those structured analytic techniques discussed further in chapters 5 and 6.
- **Chapter 5** describes the basic and diagnostic structured analytic techniques, which improve the assessment and presentation of a finished intelligence product.
- **Chapter 6** describes those advanced structured analytic techniques required by analytic teams to prove or disapprove current or sometimes opposing analytical assessments. These techniques allow for greater absorption of alternative perspectives through cognitive processes.
- **Chapter 7** discusses how the tasks performed by intelligence analysts differ significantly based on the echelon, the supported functional element, the Army's strategic roles, and the specific mission.
- **Chapter 8** presents three tactical to operational examples that illustrate the situation a unit might encounter along the forward edge of the battle area with friendly and threat forces poised to engage in large-scale ground combat.
- **Chapter 9** discusses managing long-term analytical assessments, also referred to as analytic design, to ensure the analytical effort is properly focused and carefully planned and executed, and analytical results are communicated effectively to the requestor.
- **Appendix A** briefly describes the role of automation in enabling intelligence analysis to facilitate real-time collaboration, detailed operational planning, and support to collection management.
- **Appendix B** provides cognitive considerations for intelligence analysts, detailing basic thinking abilities, critical and creative thinking, and how to avoid analytical pitfalls—all of which when applied ensure accurate, timely, and reliable intelligence to the commander. These considerations are essential for anyone conducting analysis, but not necessarily through the intelligence analysis process.
- **Appendix C** details the Intelligence Community Analytic Standards established by Intelligence Community Directive 203, as well as the integration of the standards into Army intelligence analysis in action.
- **Appendix D** describes the threat and provides threat considerations based on threat doctrine, capabilities, and equipment that may assist intelligence analysts during large-scale ground combat operations in identifying likely threat requirements.
- **Appendix E** discusses intelligence production, specifically those reports and presentations required to support operations.
- **Appendix F** discusses how intelligence analysts support the overall targeting effort.

This publication—

- Introduces acronyms at their first use in the front matter of this publication (preface and introduction), and again in the body of the publication (chapters and appendixes).
- Uses *U.S.* as a modifier (for example, *U.S. forces*) and *United States* as a noun (for example, the *United States, a country in North America*).
- Uses *G-2/S-2* and *G-3/S-3* to denote the *division or corps/battalion or brigade intelligence staff officer* and *division or corps/battalion or brigade operations staff officer*, respectively.
- Uses the term *threat*, which includes all enemies and adversaries that are part of the OE.

PART ONE

Fundamentals

Chapter 1

Understanding Intelligence Analysis

INTELLIGENCE ANALYSIS OVERVIEW

1-1. *Analysis* is the compilation, filtering, and detailed evaluation of information to focus and understand that information better and to develop knowledge or conclusions. In accordance with ADP 6-0, *information* is, in the context of decision making, data that has been organized and processed in order to provide context for further analysis (ADP 6-0). Information generally provides some of the answers to the *who*, *what*, *where*, *when*, *why*, and *how* questions. *Knowledge* is, in the context of decision making, information that has been analyzed and evaluated for operational implications (ADP 6-0). Knowledge assists in ascribing meaning and value to the conditions or events within an operation. Analysis performed by intelligence personnel assists in building the commander's knowledge and understanding. ADP 6-0 provides an in-depth discussion on how commanders and staffs process data to progressively develop their knowledge to build and maintain their situational awareness and understanding. (See figure 1-1.)

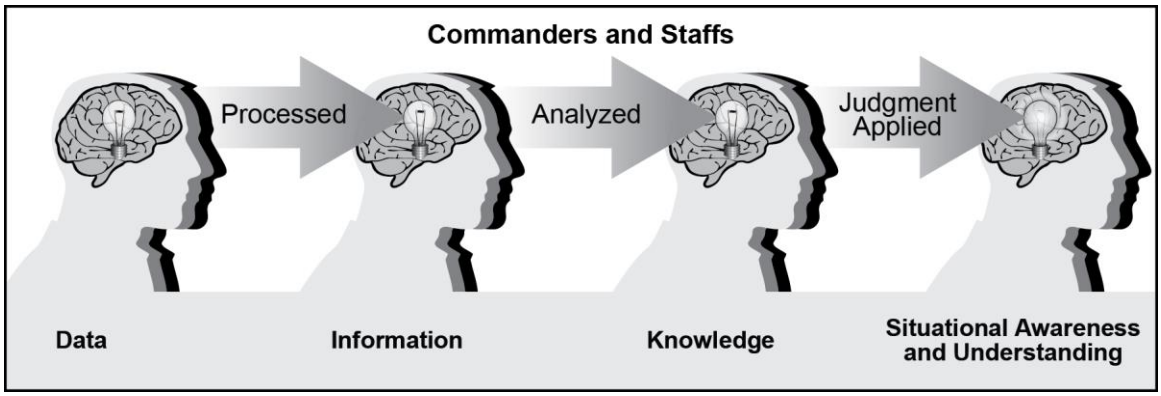


Figure 1-1. Achieving situational awareness and understanding

1-2. Analysis is the basis for many staff activities, including planning, and occurs across the entire Army. Among other results, analysis facilitates commanders and other decision makers' ability to visualize the operational environment (OE), organize their forces, and control operations in order to achieve their objectives.

1-3. Intelligence analysis is a form of analysis specific to the intelligence warfighting function. It is continuous and occurs throughout the intelligence and operations processes. *Intelligence analysis* is the process by which collected information is evaluated and integrated with existing information to facilitate intelligence production (ADP 2-0). Analysts conduct intelligence analysis to produce timely, accurate, relevant, and predictive intelligence for dissemination to the commander and staff. The purpose of intelligence analysis is to describe past, current, and attempt to predict future threat capabilities, activities, and tactics; terrain and weather conditions; and civil considerations.

1-4. Army forces compete with an adaptive enemy; therefore, perfect information collection, intelligence planning, intelligence production, and staff planning seldom occur. Information collection is not easy, and a single collection capability is not persistent and accurate enough to provide all of the answers. Intelligence analysts will be challenged to identify erroneous information and enemy deception, and commanders and staffs will sometimes have to accept the risk associated with incomplete analysis based on time and information collection constraints.

1-5. Some unique aspects of intelligence analysis include—

- The significant demand on analysts to compile and filter vast amounts of information in order to identify information relevant to the operation.
- The need for analysts to clearly separate confirmed facts from analytical determinations and assessments.
- Insight into how the physical environment (terrain, weather, and civil considerations) may affect operations.
- The ability to assess complex situations across all domains and the information environment.

1-6. Although ATP 2-33.4 is the primary publication for the intelligence analyst, it is designed to be used with ADP 2-0, *Intelligence*, and FM 2-0, *Intelligence*. ADP 2-0 discusses various aspects of intelligence analysis within a few different doctrinal constructs (see figure 1-2):

- As one of the four intelligence core competencies in chapter 2.
- As an inherent part of the steps and continuous activities of the intelligence process in chapter 3.
- As a part of or closely related to all-source intelligence, single-source intelligence capabilities, and intelligence processing, exploitation, and dissemination capabilities in chapter 4.

1-7. Intelligence analysis comprises single-source analysis and all-source analysis. ADP 2-0 discusses both single-source and all-source intelligence capabilities. As shown in figure 1-2, single-source intelligence capabilities comprise the intelligence disciplines, complementary intelligence capabilities, and multifunction intelligence units. Single-source and all-source intelligence capabilities include but are not limited to—

- Single-source analytical elements:
  - Brigade combat team (BCT) human intelligence (HUMINT) analysis cell.
  - Division signals intelligence cell.
  - Corps counterintelligence analysis cell.
  - Brigade through corps geospatial intelligence cells.
- All-source analytical elements:
  - Battalion intelligence cell.
  - Brigade intelligence support element (also known as BISE).
  - Division analysis and control element (ACE).
  - Corps ACE.
  - Theater army ACE.
  - National Ground Intelligence Center (NGIC).

Note. In this publication, all-source analytical elements include the intelligence staff for each unit as well as its supporting analytical element when applicable.

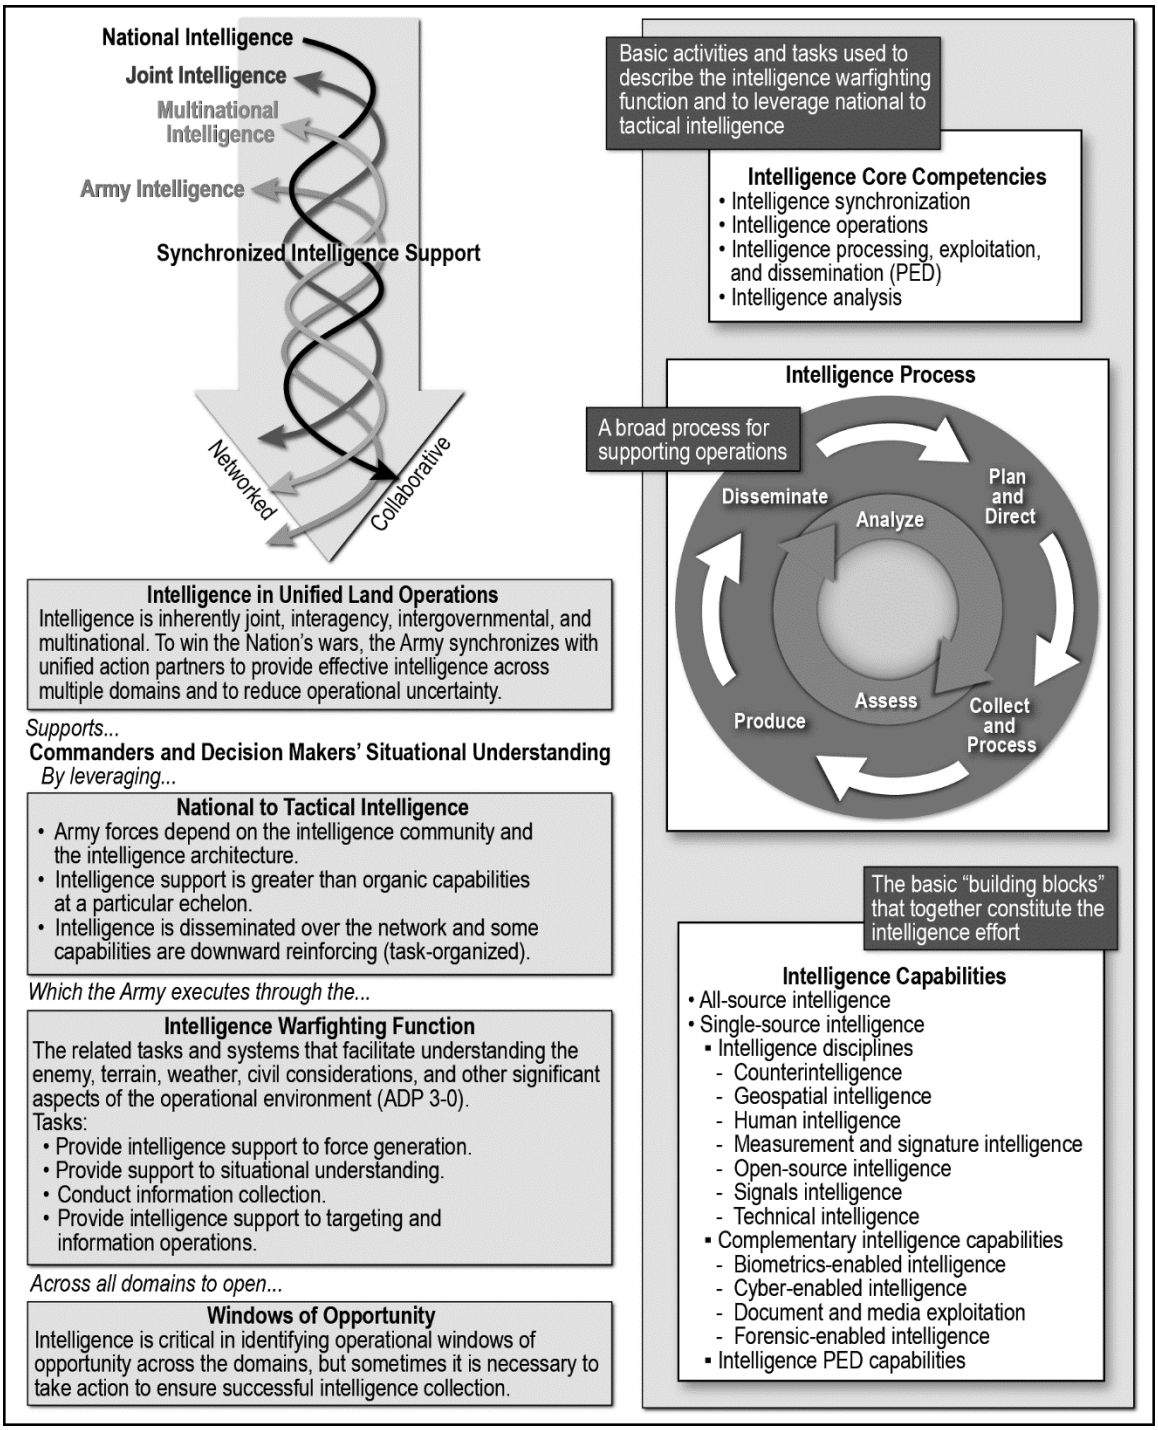

Figure 1-2. Intelligence analysis within doctrinal constructs

SINGLE-SOURCE ANALYSIS

1-8. Single-source collection is reported to single-source analytical elements. Single-source analytical elements conduct continuous analysis of the information provided by single-source operations. Following single-source analysis, analytical results are disseminated to all-source analytical elements for corroboration, to update the common operational picture, and to refine all-source intelligence products. A continuous analytical feedback loop occurs between all-source analytical elements, single-source analytical elements, and collectors to ensure effective intelligence analysis. Figure 1-3 provides a simplified example of this single-source to all-source information flow for HUMINT reporting and analysis at the BCT level.

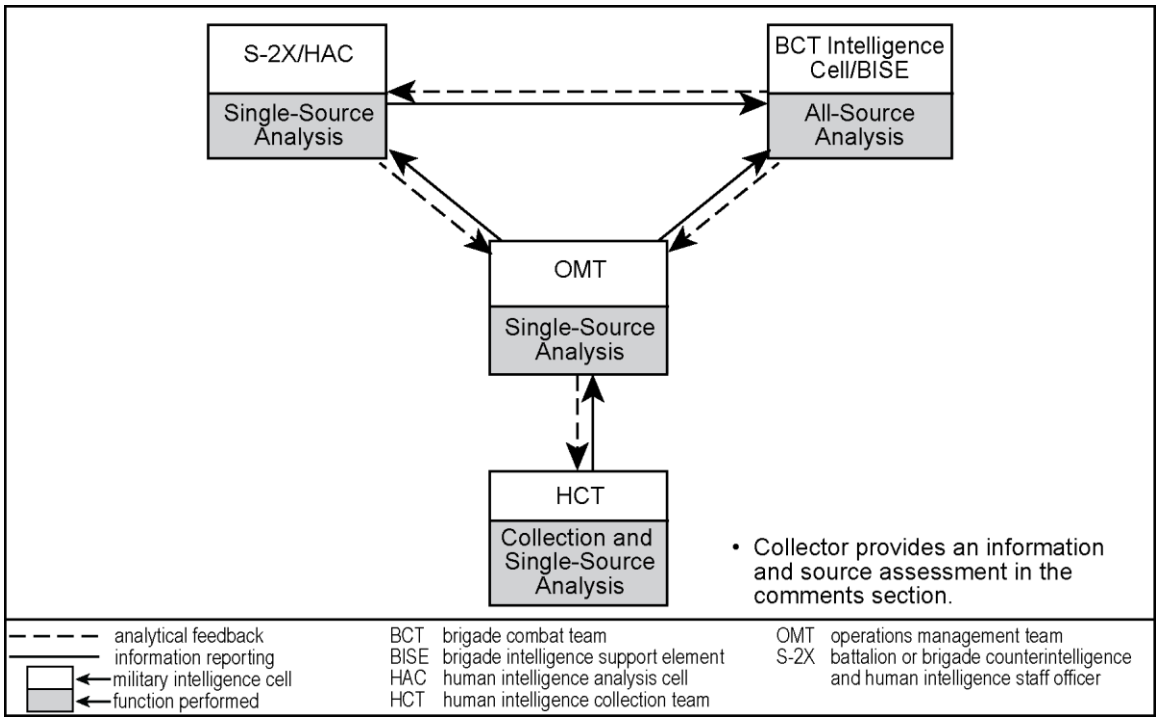

Figure 1-3. Information and intelligence reporting example

1-9. Several portions of this publication apply to single-source analysis, especially the intelligence analysis process in chapter 2 and the analytic techniques in chapters 4 through 6. Specific doctrine on single-source analysis is contained in the following publications:

- Intelligence disciplines:
  - For counterintelligence analysis, see ATP 2-22.2-1, *Counterintelligence Volume I: Investigations, Analysis and Production, and Technical Services and Support Activities*, chapter 4.
  - For HUMINT analysis, see FM 2-22.3, *Human Intelligence Collector Operations*, chapter 12.
  - For open-source intelligence analysis, see ATP 2-22.9, *Open-Source Intelligence*, chapters 1, 2, and 3.
  - For signals intelligence analysis, see ATP 2-22.6-2, *Signals Intelligence Volume II: Reference Guide*, appendix G.
- Complementary intelligence capabilities:
  - For biometrics-enabled intelligence analysis (the foundation of identity intelligence), see ATP 2-22.82, *Biometrics-Enabled Intelligence*, chapter 7.
  - For document and media exploitation (DOMEX) analysis, see ATP 2-91.8, *Techniques for Document and Media Exploitation*, chapter 9.

ALL-SOURCE ANALYSIS AND PRODUCTION

1-10. Various all-source analytical elements integrate intelligence and information from all relevant sources (both single-source and other information collection sources) to provide the most timely, accurate, relevant, and comprehensive intelligence possible and to overcome threat camouflage, counterreconnaissance, and deception. All-source analytical elements, such as the brigade intelligence support element or ACE, are functionally aligned to support the commander and the intelligence staff. The intelligence staff is integrated with the rest of the staff to ensure they have a thorough understanding of the overall operation, the current situation, and future operations. Additionally, all-source analytical elements often corroborate their analytical determinations and intelligence products through access to and collaboration with higher, lower, and adjacent all-source analytical elements.

1-11. All-source intelligence analysts use an array of automation and other systems to perform their mission. (See appendix A.) From a technical perspective, all-source analysis is accomplished through the fusion of single-source information with existing intelligence in order to produce intelligence. For Army purposes, *fusion* is consolidating, combining, and correlating information together (ADP 2-0). Fusion occurs as an iterative activity to refine information as an integral part of all-source analysis and production.

1-12. With the vast amounts of information and broad array of all-source intelligence capabilities, the G-2/S-2 provides the commander and staff with all-source intelligence. All-source intelligence products inform the commander and staff by facilitating situational understanding, supporting the development of plans and orders, and answering priority intelligence requirements (PIRs), high-payoff targets (HPTs), and other information requirements.

1-13. The G-2/S-2 can use single-source intelligence to support the commander and staff. In those instances, it is best to first send that single-source intelligence to the all-source analytical element to attempt to quickly corroborate the information. Corroboration reduces the risk associated with using that single-source intelligence by comparing it to other information reporting and existing intelligence products. Following corroboration and dissemination of the intelligence to the commander and staff, the all-source analytical element incorporates the single-source intelligence into the various all-source intelligence products and the threat portion of the common operational picture.

1-14. In certain situations and specific organizations, especially at echelons above corps, a single-source analytical element can produce single-source intelligence products for dissemination to the commander and staff without all-source corroboration. However, there is significant risk in using uncorroborated single-source intelligence at the tactical level. For example, a BCT commander may choose to make decisions based on a single HUMINT report. This is similar to the commander using combat information to make decisions during an operation. In those situations, the commander and G-2/S-2 should be aware of and try to mitigate the risk associated with using uncorroborated single-source reporting and intelligence.

Note. *Combat information* is unevaluated data, gathered by or provided directly to the tactical commander which, due to its highly perishable nature or the criticality of the situation, cannot be processed into tactical intelligence in time to satisfy the user's tactical intelligence requirements (JP 2-01).

CONDUCTING INTELLIGENCE ANALYSIS

1-15. The goal of intelligence analysis is to provide timely and relevant intelligence to commanders and leaders to support their decision making. Intelligence analysis requires the continuous examination of information and intelligence about the threat and significant aspects of the OE. To be effective, an intelligence analyst must—

- Understand and keep abreast of intelligence doctrine.
- Maintain complete familiarity on all aspects of the threat, including threat capabilities, doctrine, and operations.

- Have knowledge on how to account for the effects of the mission variables (mission, enemy, terrain and weather, troops and support available, time available, and civil considerations [METT-TC]) and operational variables (political, military, economic, social, information, infrastructure, physical environment, and time [PMESII-PT]) on operations.
- Thoroughly understand operational doctrine (especially FM 3-0, *Operations*), operational and targeting terminology, and operational symbology.

1-16. Analysts conduct intelligence analysis to ultimately develop effective intelligence. They do this by applying the basic thinking abilities (information ordering, pattern recognition, and reasoning) and critical and creative thinking, all described in appendix B. FM 2-0 describes the characteristics of effective intelligence as accurate, timely, usable, complete, precise, reliable, relevant, predictive, and tailored. Beyond those characteristics, intelligence analysts must also understand the six aspects of effective analysis:

- Embracing ambiguity.
- Understanding intelligence analysis is imperfect.
- Meeting analytical deadlines with the best intelligence possible.
- Thinking critically.
- Striving to collaborate closely with other analysts.
- Adhering to analytic standards as much as possible.

EMBRACING AMBIGUITY

1-17. Intelligence personnel must accept and embrace ambiguity in conducting analysis as they will never have all the information necessary to make certain analytical determinations. Intelligence analysts will be challenged due to the constantly changing nature of the OE and the threat and to the fog of war—all imposed during large-scale ground combat operations, creating complex, chaotic, and uncertain conditions. Intelligence analysts must understand the OE is complex; embrace ambiguity; and recognize and mitigate their own or others' biases, challenge their assumptions, and continually learn while conducting analysis across the breadth of operations.

1-18. Analysts operate within a time-constrained environment and with limited information. Therefore, they may sometimes produce intelligence that is not as accurate and detailed as they would prefer. Having both an adequate amount of information and extensive subject matter expertise does not guarantee the development of logical or accurate determinations. To be effective, analysts must have—

- A detailed awareness of their commander's requirements and priorities.
- An understanding of the limitations in information collection and intelligence analysis.
- A thorough knowledge of the OE and all aspects of the threat.
- Expertise in applying the intelligence analysis process and analytic techniques.

1-19. The effective combination of the aforementioned bullets provides intelligence analysts with the best chance to produce accurate and predictive intelligence and also to detect threat denial and deception efforts. To adequately account for complexity and ambiguity, intelligence analysts should continually identify gaps in their understanding of the OE and the threat, and factor in those gaps when conducting intelligence analysis.

ANALYTICAL IMPERFECTION

1-20. Given the ambiguity, fog of war, and time-constraints, intelligence analysts must accept imperfection. As much as possible, analysts should attempt to use validated facts, advanced analytic techniques, and objective analytical means. However, using them and providing completely objective and detailed analytical determinations may be challenging, especially during tactical operations. Analysts should also consider that logical determinations are not necessarily facts.

1-21. When presenting analytical determinations to the commander and staff, intelligence personnel must ensure they can answer the *so what* question from the commander's perspective. Additionally, they should clearly differentiate between what is relatively certain, what are reasonable assumptions, and what is unknown, and then provide the degree of confidence they have in their determination as well as any significant issues associated with their analysis. This confidence level is normally subjective and based on—

- The collection asset's capability (reliability and accuracy).
- Evaluation criteria.
- The confidence in the collected data.
- The analyst's expertise and experience.
- Intelligence gaps.
- The possibility of threat deception.

1-22. Intelligence analysts should be prepared to explain and justify their conclusions to the commander and staff. Over time, the all-source analytical element should learn the most effective way to present analytical determinations to the commander and staff. A deliberate and honest statement of what is relatively certain and what is unknown assists the commander and staff in weighing some of the risks inherent in the operation and in creating mitigation measures.

MEETING ANALYTICAL DEADLINES

1-23. Analysts must gear their efforts to the time available and provide the best possible intelligence within the deadline. Operational planning and execution deadlines often impose challenging time constraints that analysts must meet. Analysts must often produce intelligence without all of the information that would result in a more thorough or certain analytical determination. Analysts must meet the deadline because a quick analytical assessment in time to affect staff planning and friendly courses of action (COAs) is far better than a perfect analytical assessment that is received too late to affect staff planning.

CRITICAL THINKING

1-24. Intelligence analysts must know how to arrive at logical, well-reasoned, and unbiased conclusions as a part of their analysis. Analysts strive to reach determinations based on facts and reasonable assumptions. Therefore, critical thinking is essential to analysis. Using critical thinking, which is disciplined and self-reflective, provides more holistic, logical, ethical, and unbiased analyses and determinations. Applying critical thinking assists analysts in fully accounting for the elements of thought, the intellectual standards, and the traits of a critical thinker. (See appendix B for information on critical and creative thinking.)

COLLABORATION

1-25. Commanders, intelligence and other staffs, and intelligence analysts must collaborate. They should actively share and question information, perceptions, and ideas to better understand situations and produce intelligence. Collaboration is essential to analysis; it ensures analysts work together to achieve a common goal effectively and efficiently. Analysts can leverage national to tactical intelligence, using Department of Defense (DOD) intelligence capabilities, to enable analytical collaboration and assist them in producing intelligence.

1-26. Through collaboration, analysts develop and enhance professional relationships, access each other's expertise, enhance their understanding of the issues, and expand their perspectives on critical analytical issues. Collaboration is another means, besides critical thinking, by which intelligence analysts avoid potential pitfalls, such as mindsets and biases, and detect threat denial and deception efforts. (For information on analytical pitfalls, see appendix B.)

ADHERING TO ANALYTIC STANDARDS

1-27. As much as possible, the conclusions reached during intelligence analysis should adhere to analytic standards, such as those established by the Director of National Intelligence in Intelligence Community Directive (ICD) 203, to determine the relevance and value of the information before updating existing assessments. (See figure 1-4 on page 1-8.) These standards govern the production and evaluation of national intelligence analysis to meet the highest standards of integrity and rigorous analytic thinking. Although created for national-level intelligence agencies, these analytic standards are also valid at the operational and tactical levels. (See appendix C for a detailed discussion of the analytic standards.)

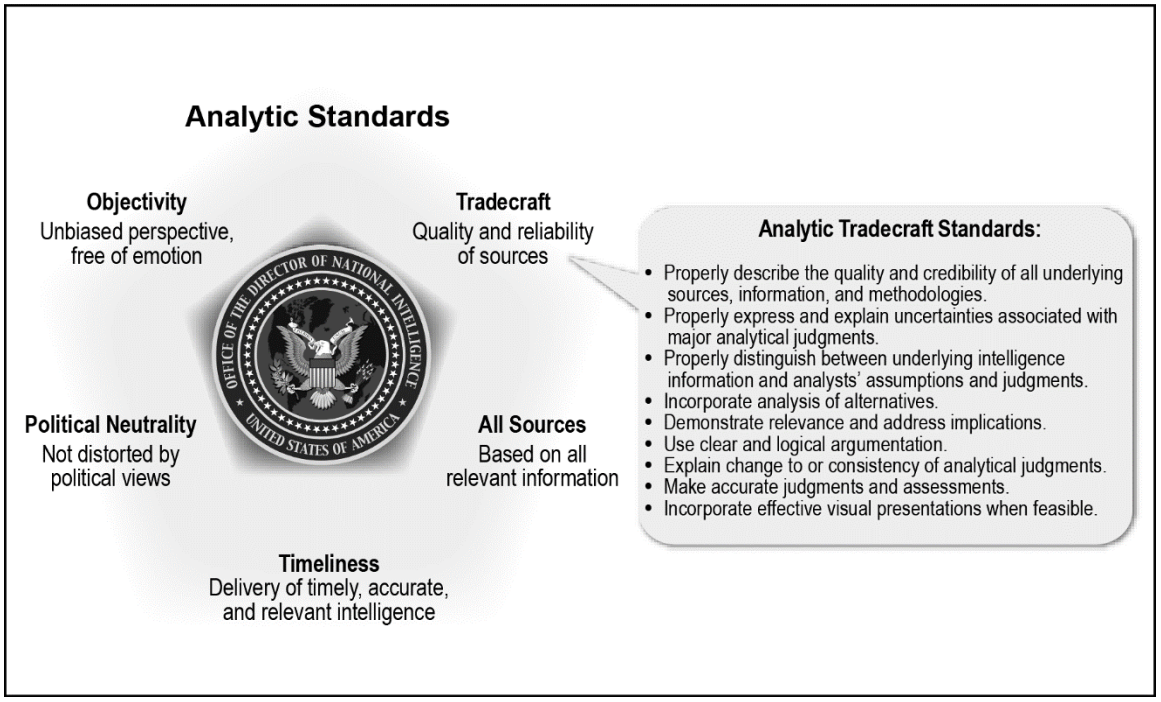

Figure 1-4. Analytic standards

INTELLIGENCE ANALYSIS AND COLLECTION MANAGEMENT

1-28. While collection management is not part of intelligence analysis, it is closely related. Analysis occurs inherently throughout collection management, and intelligence analysts must understand the information collection plan.

1-29. Collection management is a part of the larger information collection effort. Information collection is an integrated intelligence and operations function. ATP 2-01 discusses collection management in detail. The intelligence staff performs the collection management process in collaboration with the operations staff. The collection management process comprises the following tasks:

- Develop requirements.
- Develop the collection management plan.
- Support tasking and directing.
- Assess collection.
- Update the collection management plan.

Note. *Plan requirements and assess collection*, as an information collection task, has been replaced with the term *collection management*.

1-30. The intelligence warfighting function focuses on answering commander and staff requirements, especially PIRs, which are part of the commander's critical information requirements. Intelligence analysis for a particular mission begins with information collected based on commander and staff requirements (which are part of collection management); those requirements are usually developed within the context of existing intelligence analysis. Together, these two activities form a continuous cycle—intelligence analysis supports collection management and collection management supports intelligence analysis. The G-2/S-2 must synchronize these two activities, and analysts and personnel within both activities must cooperate and collaborate closely to enable effective intelligence support.

1-31. Intelligence analysis and collection management overlap or intersect in several areas. While not all inclusive, the following includes some of these areas:

- The all-source intelligence architecture and analysis across the echelons are important aspects of planning effective information collection. To answer the PIR and present the commander and staff with a tailored intelligence product, there must be adequate time. Collection management personnel must understand the all-source intelligence architecture and analysis across the echelons and consider those timelines.
- Collection management personnel depend on the intelligence analysis of threats, terrain and weather, and civil considerations in order to perform the collection management process. Intelligence preparation of the battlefield (IPB) often sets the context for collection management:
  - Intelligence analytical gaps are the start points for developing requirements.
  - All-source analysts and collection management personnel must understand the threat COAs and how to execute those COAs as reflected in the situation templates.
  - Event templates and event matrices are the start points for developing subsequent collection management tools.
- All-source analysts and collection management personnel—
  - Use and refine threat indicators during the course of an operation.
  - Mutually support and track threat activities relative to the *decide*, *detect*, *deliver*, and *assess* (also called D3A) functions of the targeting methodology.
  - Must confer before answering and closing a PIR.
- The effectiveness of intelligence analysis is an integral part of assessing the effectiveness of the information collection plan during collection management.

1-32. A disconnect between intelligence analysis and collection management can cause significant issues, including a degradation in the overall effectiveness of intelligence support to the commander and staff. Therefore, intelligence analysts and collection management personnel must collaborate closely to ensure they understand PIRs, targeting and information operations requirements (when not expressed as PIRs), threat COAs and other IPB outputs, the current situation, and the context/determinations surrounding current threat activities.

THE ALL-SOURCE INTELLIGENCE ARCHITECTURE AND ANALYSIS ACROSS THE ECHELONS

1-33. All-source analysis, collaboration, and intelligence production occur both within and between echelons. Intelligence analysts not only integrate the broad array of information collected and intelligence produced at their echelon, but they also collaborate across the various echelons and the intelligence community to benefit from the different knowledge, judgments, experience, expertise, and perceptions—all invaluable to the analytical effort. Intelligence analysis is facilitated by an all-source push (deliberately sending) and pull (accessing from a different unit) of information and intelligence. Figure 1-5 on page 1-10 depicts single-source collection and analysis as a layer of the all-source intelligence architecture across the echelons. Chapter 7 details intelligence analysis across the echelons.

1-34. At the different echelons, based on a number of factors, the intelligence staff and supporting all-source analytical element are divided into teams to support the various command posts and to perform the various all-source analytical tasks. There is no standard template on how best to structure the all-source analytical effort. The G-2/S-2 decides on an all-source structure that is optimized to support command and control and is requirements-driven based on ongoing operations.

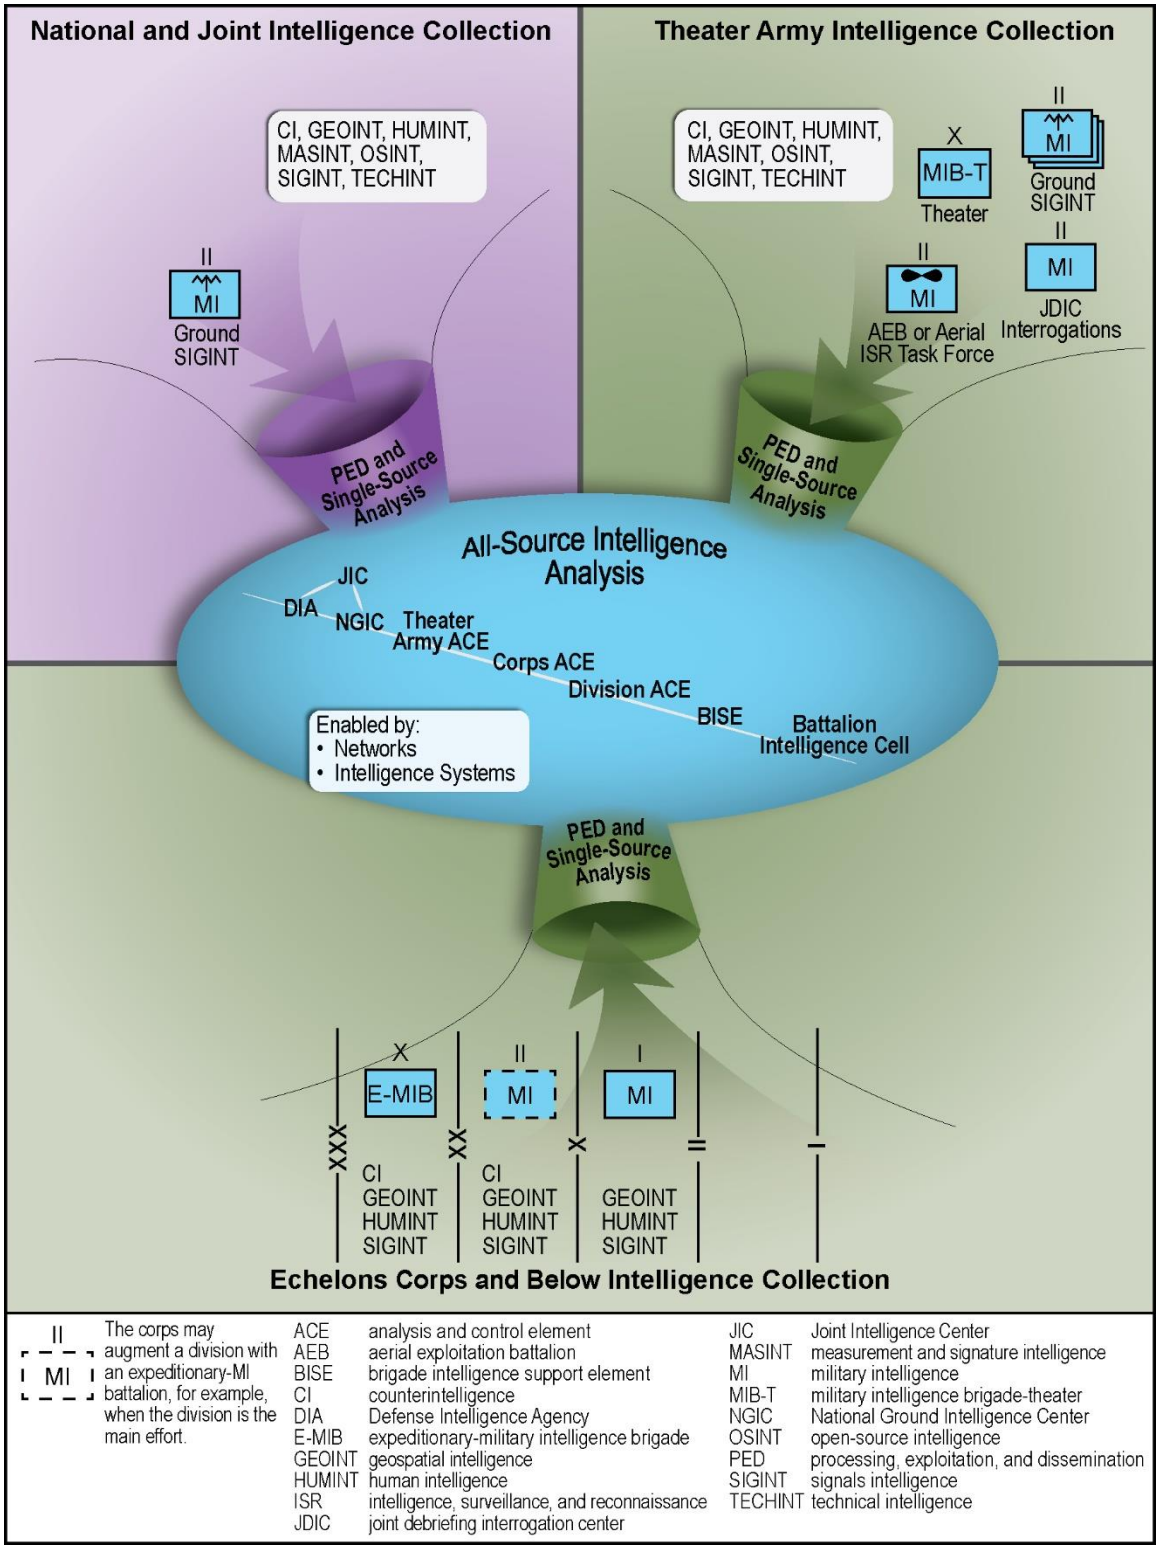

Figure 1-5. All-source analysis across the echelons

INTELLIGENCE ANALYSIS DURING LARGE-SCALE GROUND COMBAT OPERATIONS

1-35. FM 3-0, published in October 2017, provided a new operational focus for the Army and introduced the Army's strategic roles (shape OEs, prevent conflict, prevail in large-scale ground combat, and consolidate gains). FM 3-0 clearly states that while Army forces cannot focus solely on large-scale ground combat operations at the expense of other missions, Army forces cannot afford to be unprepared for large-scale combat operations in an increasingly unstable world. ADP 2-0, published in July 2019, and FM 2-0, published in July 2018, reinforce this focus, providing extensive discussions on intelligence within large-scale ground combat operations.

1-36. ADP 3-0, *Operations*, published in July 2019, provided a definition for large-scale combat operations and created a new term, large-scale ground combat operations. *Large-scale combat operations* are extensive joint combat operations in terms of scope and size of forces committed, conducted as a campaign aimed at achieving operational and strategic objectives (ADP 3-0). *Large-scale ground combat operations* are sustained combat operations involving multiple corps and divisions (ADP 3-0).

1-37. While the fundamentals of intelligence analysis remain constant across the Army's strategic roles, large-scale ground combat operations create some unique challenges for the intelligence analyst. (See table 1-1.) The fluid and chaotic nature of large-scale ground combat operations will cause the greatest degree of fog, friction, uncertainty, and stress on the intelligence analysis effort. Army forces will have to fight for intelligence as peer threats will counter information collection efforts, forcing commanders to make decisions with incomplete and imperfect intelligence. These realities will strain all-source analysis.

Table 1-1. Intelligence analysis during large-scale ground combat operations

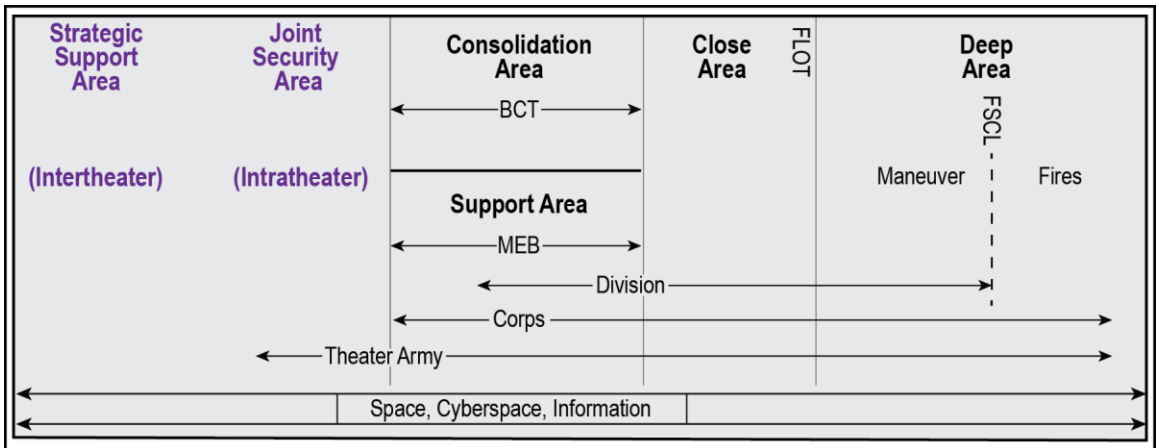
Army strategic role	*Intelligence analysis support*
Prevail in large-scale ground combat	Analysts— • Perform intelligence preparation of the battlefield as part of the military decision-making process to support deployment into a theater of operations. • While collecting and screening information, immediately report relevant combat information to the commander. • Ensure all analysis efforts support the unit commander's intent and guidance, established during the military decision-making process. • Continually update the running estimates and disseminate products to commanders and staffs. • Support current operations—integrate information by updating the common operational picture and continually communicating with other staff sections. • Support target development and detection by ensuring collection plans support the overall targeting plan.

1-38. Over the past 20 years, the Nation's peer threats have increased their capabilities and gained an understanding of United States (U.S.) and allied operations. According to ADP 3-0, a peer threat is an adversary or enemy able to effectively oppose U.S. forces worldwide while enjoying a position of relative advantage in a specific region. Peer threats—

- Can generate equal or temporarily superior combat power in geographical proximity to a conflict area with U.S. forces.
- May have a cultural affinity to specific regions, providing them relative advantages in terms of time, space, and sanctuary.
- Generate tactical, operational, and strategic challenges in order of magnitude more challenging militarily than other adversaries.
- Can employ resources across multiple domains to create lethal and nonlethal effects with operational significance throughout an OE.
- Seek to delay deployment of U.S. forces and inflict significant damage across multiple domains in a short period to achieve their goals before culminating.

1-39. During large-scale ground combat operations, intelligence analysts will have to predict and track rapidly evolving events across the various threat capabilities. (See appendix D.) For this reason, intelligence analysts must understand many of the operational concepts discussed in FM 3-0 and discussed from an intelligence perspective in FM 2-0. These doctrinal concepts include—

- **Multi-domain operations**, including **windows of opportunity**, discussed in FM 3-0, chapter 1, and FM 2-0, chapter 1.
- **Positions of relative advantage**, discussed in FM 3-0, chapter 1.
- **Operational art**, discussed in ADP 3-0, chapter 2, and FM 3-0, chapter 1.
- The new **operational framework**, discussed in FM 3-0, chapter 1, and FM 2-0, chapter 1.
- The new **key physical aspects of the operational framework**, discussed in FM 2-0, chapter 1. (See figure 1-6.)
- **Fighting for intelligence**, discussed in FM 3-0, chapter 2, and FM 2-0, chapter 6.



The strategic support area describes the area extending from a theater of operations to a continental United States base, or another combatant commander's area of responsibility, that contains those organizations, LOCs, and other agencies required in the field. It includes the air and seaports supporting the flow of forces and sustainment into the theater.	The joint security area is a specific surface area, designated by the joint force commander, to facilitate protection of joint bases and their connecting LOCs that support joint operations.	The consolidation area is the portion of the commander's AO that is designated to facilitate the security and stability tasks necessary for freedom of action in the close area and to support the continuous consolidation of gains. The support area is the portion of the commander's AO that is designated to facilitate the positioning, employment, and protection of the base sustainment assets required to sustain, enable, and control operations.	The close area is the portion of a commander's AO assigned to subordinate maneuver forces.	The deep area is the portion of the commander's AO that is not assigned to subordinate units. The deep area is divided into — • Deep area (maneuver): The zone between the FLOT and the FSCL is typically the area over which friendly ground forces intend to maneuver in the near future and is also the area where joint air interdiction operations are normally executed through the air support operations center/direct air support center. • Deep area (fires): Interdiction best describes how Army and joint fires are typically employed in the deep area. *Interdiction* is an action to divert, disrupt, delay, or destroy the enemy's military surface capability before it can be used effectively against friendly forces, or to otherwise achieve objectives (JP 3-03).

AO	area of operations	FLOT	forward line of own troops	LOC	line of communications
BCT	brigade combat team	FSCL	fire support coordination line	MEB	maneuver enhancement brigade

Figure 1-6. Key aspects of the operational framework

1-40. As in all operations, intelligence drives operations and operations support intelligence; this relationship is continuous. The commander and staff need effective intelligence in order to understand threat centers of gravity, goals and objectives, and COAs. Precise intelligence is also critical to target threat capabilities at the right time and place and to open windows of opportunity across domains. Commanders and staffs must have detailed knowledge of threat strengths, weaknesses, equipment, and tactics to plan for and execute friendly operations.

1-41. Commanders and staffs accept some risks and operational uncertainty in all operations, especially during large-scale ground combat operations. The commander must allocate adequate time for information collection and intelligence analysis or determine the balance between time allotted to collection and analysis and to operational necessity. When there is not enough time for adequate information collection and intelligence analysis, the all-source analytical element must inform the G-2/S-2 of the gaps, issues, and risks, so the G-2/S-2 can inform the commander. In those cases, that unit must depend on the higher echelon all-source analytical element for additional support and overwatch.

1-42. One of the ultimate goals of intelligence analysis is to assist the unit in identifying and opening an operational window of opportunity to eventually achieve a position of relative advantage. Opening a window of opportunity often requires a significant amount of intelligence analysis in order to achieve a high degree of situational understanding. This will be difficult as friendly forces are often at a disadvantage in conducting information collection against the threat. Therefore, opening an operational window of opportunity may have to start with operations that support intelligence. In a sense, this is opening an information collection window of opportunity as part of the effort to fight for intelligence.

1-43. The staff must thoroughly plan, find creative solutions, and collaborate across echelons to overcome information collection challenges. Once friendly forces have an open window of opportunity to execute information collection, intelligence analysts will receive more information and should be able to provide timely and accurate intelligence products, updates, and predictive assessments. This timely and accurate intelligence can then assist friendly forces in opening subsequent windows of opportunity to reach positions of relative advantage.

1-44. Facilitating the commander and staff's situational understanding of the various significant aspects of the OE is challenging. Intelligence analysis must address important considerations across all domains and the information environment as well as support multi-domain operations. Intelligence analysis must include all significant operational aspects of the interrelationship of the air, land, maritime, space, and cyberspace domains; the information environment; and the electromagnetic spectrum. Intelligence analysts use information and intelligence from the joint force, U.S. Government, the intelligence community, and allies to better understand and analyze the various domains and peer threat capabilities.

INTELLIGENCE ANALYSIS DURING THE ARMY'S OTHER STRATEGIC ROLES

1-45. As part of a joint force, the Army operates across the strategic roles (shape OEs, prevent conflict, prevail in large-scale ground combat, and consolidate gains) to accomplish its mission to organize, equip, and train its forces to conduct sustained land combat to defeat enemy ground forces and to seize, occupy, and defend land areas. The unique aspects of large-scale ground combat operations were discussed in paragraphs 1-35 through 1-44. Each strategic role presents unique challenges and is often characterized by different analytical tasks, products, product timelines, and specific requirements. (See table 1-2 on page 1-14.)

Table 1-2. Intelligence analysis during the other Army strategic roles

Army strategic role	*Intelligence analysis support*
Shape operational environments	Analysts— • During periods of peace, identify peer threats or hostile element actions in regionally significant areas. This includes supporting contingency planning. • Develop regional expertise and generate intelligence knowledge for possible contingencies. • Provide warning intelligence at echelons above corps. • Identify second and third order effects of all friendly actions based on the operational variables (political, military, economic, social, information, infrastructure, physical environment, and time). • Assist with security force assistance and theater engagement efforts and, when possible, in building an initial allied intelligence analysis architecture. • Support realistic training to improve regional awareness of potential peer threat capabilities and hybrid scenarios. • Conduct focused analysis as regional tensions increase and update operation plans as required.
Prevent conflict	
Consolidate gains	Analysts— • Assess the operational environment and identify how the local population reacts to stability operations. • Use diagnostic structured analytic techniques (see chapter 4) to compare their original estimates of the operational environment and identify changes that may affect stability operations. • Assess operational considerations for improvements to transition control to legitimate civil authorities.

Chapter 2

The Intelligence Analysis Process

OVERVIEW

2-1. Both all-source and single-source intelligence analysts use the intelligence analysis process. The process supports the continuous examination of information, intelligence, and knowledge about the OE and the threat to generate intelligence and reach one or more conclusions. Appendix B provides an overview of three analytic skills: basic thinking abilities, critical and creative thinking, and avoiding analytical pitfalls. Chapters 4 through 6 provide analytic techniques for conducting qualitative analysis. The application of the analytic skills and techniques assist analysts in evaluating specific situations, conditions, entities, areas, devices, or problems.

2-2. The intelligence analysis process includes the continuous evaluation and integration of new and existing information to produce intelligence. It ensures all information undergoes a criterion-based logical process, such as the analytic tradecraft standards established by ICD 203, to determine the relevance and value of the information before updating existing assessments. (See appendix C for a detailed discussion on the analytic tradecraft standards.)

2-3. The intelligence analysis process is flexible and applies to any intelligence discipline. Analysts may execute the intelligence analysis process meticulously by thoroughly screening information and applying analytic techniques, or they may truncate the process by quickly screening collected information using only basic structured analytic techniques. The process becomes intuitive as analysts become more proficient at analysis and understanding their assigned OE. The intelligence analyst uses collected information to formulate reliable and accurate assessments.

THE PHASES OF THE INTELLIGENCE ANALYSIS PROCESS

2-4. The phases of the intelligence analysis process are interdependent. (See figure 2-1 on page 2-2.) Through time and experience, analysts become more aware of this interdependence. The phases of the intelligence analysis process are—

- **Screen (collected information):** Determining the relevance of the information collected.
- **Analyze:** Examining relevant information.
- **Integrate:** Combining new information with current intelligence holdings to begin the effort of developing a conclusion or assessment.
- **Produce:** Making a determination or assessment that can be disseminated to consumers.

Note. *Relevant information* is all information of importance to the commander and staff in the exercise of command and control (ADP 6-0).

2-5. To successfully execute the intelligence analysis process, it is critical for analysts to understand the PIRs and other requirements related to the current OE and mission. This understanding assists analysts in framing the analytic problem and enables them to separate facts and analytical judgments. Analytical judgments form by generating hypotheses—preliminary explanations meant to be tested to gain insight and find the best answer to a question of judgment. (See chapter 6 for more on generating hypotheses.)

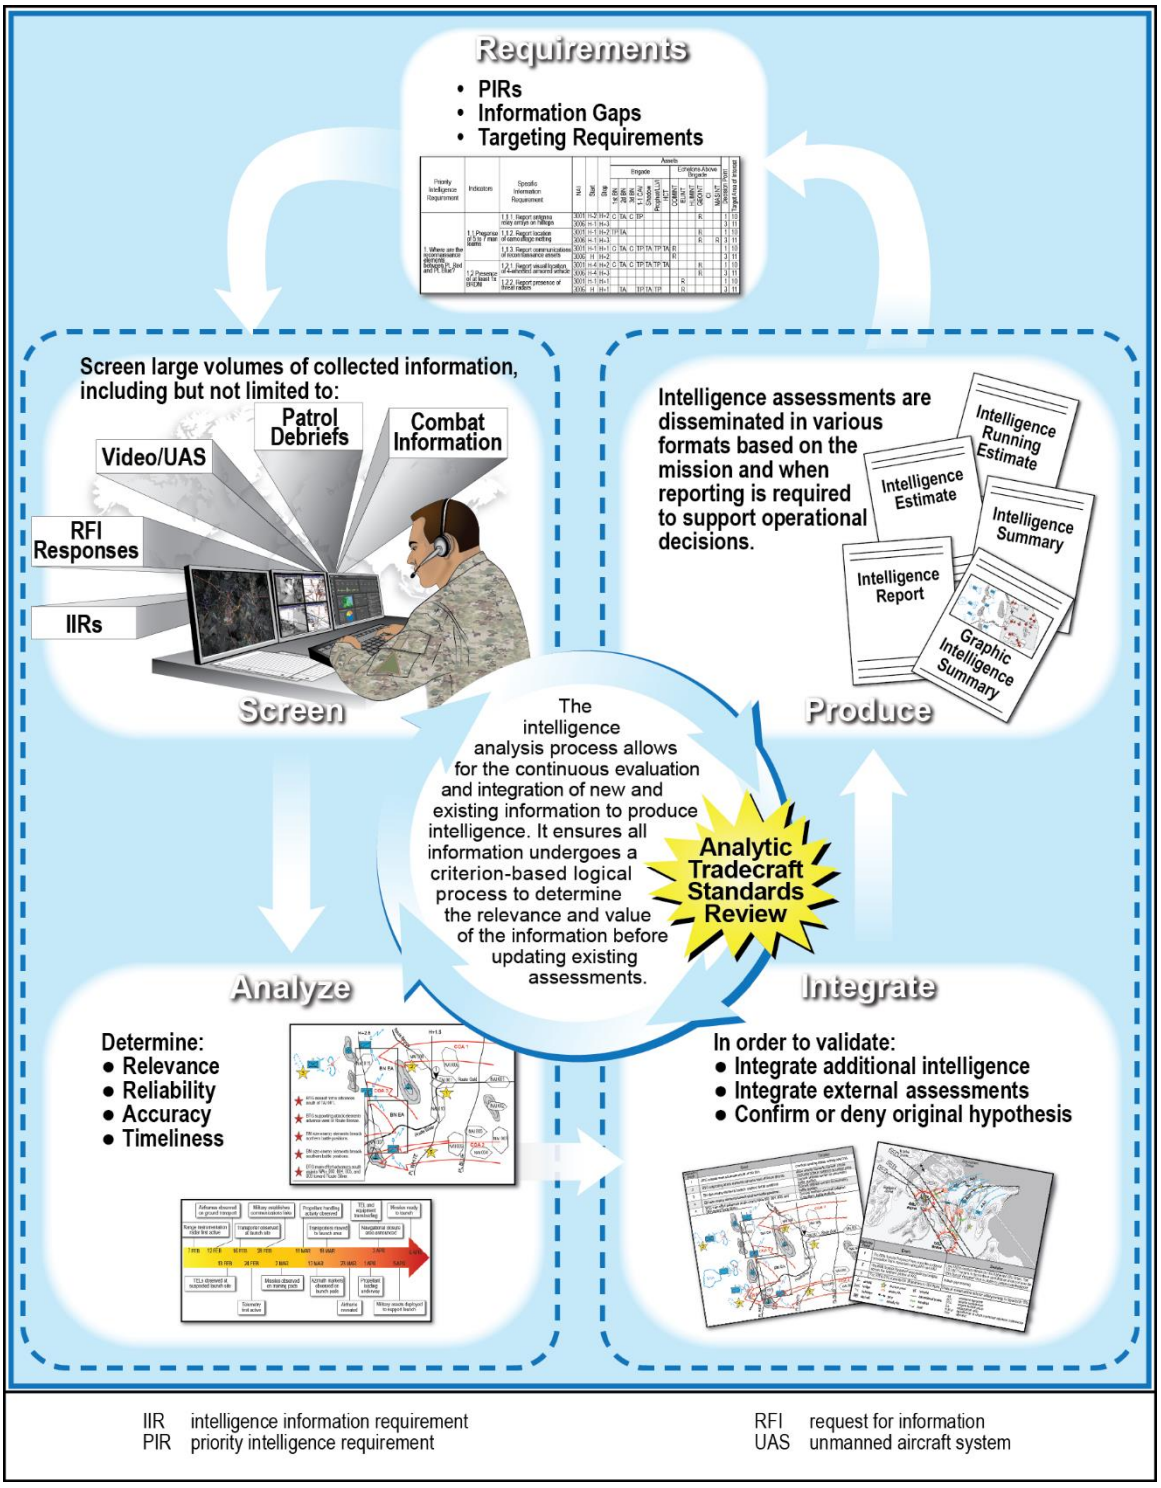


Figure 2-1. The intelligence analysis process

2-6. The following begins a series of examples that walk the reader through the intelligence analysis process from the reporting of requirements to the production and dissemination of intelligence to the commander and staff.

Example: Division Commander's PIRs

PIR 1: Will the motorized rifle division use the tank brigade as a southward exploitation force?

PIR 2: Where is the motorized rifle division's multiple launch rocket system (MLRS) battalion?

PIR 3: Where will displaced civilians impede U.S. combat forces' movement north?

Collection in the past hour provided six pieces of information for analysts to process and answer the commander's PIRs:

- Possible identification of two threat MLRSs as well as support equipment traveling west to east at 20 kilometers per hour along a road 15 kilometers north of the 1 BCT forward locations.
- Threat motorized rifle battalion in company strength engaging adjacent 2 BCT forward positions attempting to seize a hilltop out of sector at a (PK1234) general four-digit grid.
- The 1 BCT reports harassing small arms engagements along forward battalion locations.
- Approximately 28 or 30 threat tanks detected in convoy formations 40 kilometers north of the 1 BCT forward locations.
- Threat air defense elements active near possible headquarters and artillery locations detected.
- Multiple-source reporting that a threat tank brigade is preparing to advance south, seeking to exploit lead division penetration of 1 BCT forward positions.

SCREEN COLLECTED INFORMATION

2-7. During the execution of single-source intelligence or all-source analysis, analysts continuously filter the volume of information or intelligence received through the continuous push and pull of information. It is during the *screen* phase that analysts sort information based on relevancy and how it ties to the analytical questions or hypotheses they developed to fill information gaps. They do this by conducting research and accessing only the information that is relevant to their PIRs, mission, or time. Analysts also screen the volume of information based on the information source's reliability and the information accuracy, as explained in paragraphs 2-12 through 2-15.

2-8. Time permitting, analysts research by accessing information and intelligence from databases, the internet (attributed to open-source information), collaborative tools, broadcast services, and other sources such as automated systems. This screening enables analysts to focus their analytical efforts on only the information that is pertinent to their specific analytic problem. (See ATP 2-22.9 for more information on open-source information; see appendix A for more information on automated systems.)

Note. The relevancy of the information may change as the situation changes. For example, analysts may want to focus their analysis on information not older than 45 days about an armored division in garrison; however, this information may quickly become irrelevant as time elapses and the tactical situation changes.

Example: Screen

Upon screening the six pieces of information in response to collection requirements supporting PIRs 1 and 2, intelligence analysts focused on tank and MLRS/artillery activities. They kept four and discarded two of the pieces of information:

- **Keep for further analysis:** Possible identification of two threat MLRSs as well as support equipment traveling west to east at 20 kilometers per hour along a road 15 kilometers north of the 1 BCT forward locations.
- **Discard:** Threat motorized rifle battalion in company strength engaging adjacent 2 BCT forward positions attempting to seize a hilltop out of sector at a general four-digit grid.
- **Discard:** The 1 BCT reports harassing small arm engagements along forward battalion locations. (It does not relate to the PIRs.)
- **Keep for further analysis:** Approximately 28 or 30 threat tanks detected in convoy formations 40 kilometers north of the 1 BCT forward locations.
- **Keep for further analysis:** Threat air defense artillery elements active near possible headquarters and artillery locations detected.
- **Keep for further analysis:** Multiple-source reporting that a threat tank brigade is preparing to advance south, seeking to exploit lead division penetration of 1 BCT forward positions.

ANALYZE

2-9. Analysts examine relevant information or intelligence using reasoning and analytic techniques, which enable them to see information in different ways and to reveal something new or unexpected. It may be necessary to gain more information or apply a different technique, time permitting, until a conclusion is reached or a determination is made.

2-10. Analysts also analyze the volume of information based on the information source's reliability and the information accuracy, as screening information is continuous. This occurs when analysts receive information they immediately recognize as untrue or inaccurate based on their knowledge or familiarity with the analytic problem. Analysts should not proceed with the analysis when there is a high likelihood that the information is false or part of a deception, as this may lead to inaccurate conclusions. False information and deception are more prevalent today with the proliferation of misinformation commonly found in social media readily available on the internet.

2-11. Analysts may decide to retain or exclude information based on results from the *screen* phase. While the excluded information may not be pertinent to the current analytical question, the information is maintained in a unit repository as it may answer a follow-on question from a new analytical question.

2-12. During operations, intelligence analysts must consider information relevancy, reliability, and accuracy to perform analysis:

- **Relevancy:** Analysts examine the information to determine its pertinence about the threat or OE. Once the information is assessed as relevant, analysts continue with the analysis process.
- **Reliability:** The source of the information is scrutinized for reliability. If the source of the information is unknown, the level of reliability decreases significantly.
- **Accuracy:** Unlike reliability, accuracy is based on other information that can corroborate (or not) the available information. When possible, analysts should obtain information that confirms or denies a conclusion in order to detect deception, misconstrued information, or bad data or information. Additionally, when possible, analysts should characterize their level of confidence in that conclusion.

Note. **Exception:** Combat information, as defined in paragraph 1-14. (See FM 3-13 and FM 3-55.)

2-13. There are marked differences in evaluating the accuracy of information between higher and lower echelons. Higher (strategic) echelons have more sources of information and intelligence than lower (tactical) echelons, giving higher echelons more opportunities to confirm, corroborate, or refute the accuracy of the reported data. The role of higher echelons in evaluating the credibility (or probable truth) of information differs from its role in evaluating the reliability of the source (usually performed best by the echelon closest to the source).

2-14. Information is evaluated for source reliability and accuracy based on a standard system of evaluation ratings for each piece of information, as indicated in table 2-1; *reliability* is represented by a letter and *accuracy* by a number. Single-source intelligence personnel assign the rating, and it is essential for all-source personnel to understand the evaluation of validated intelligence sources.

Table 2-1. Evaluation ratings for source reliability and information accuracy

	Reliability
A	**Completely reliable:** Clearly a known source or reliable information.
B	**Usually reliable:** A known source that provides reliable information.
C	**Fairly reliable:** A source that has reported on information with a degree of reliability.
D	**Not usually reliable:** Typically, a source who provides information with a heavy bias, or past data was not validated.
E	**Unreliable:** Information provided is not reliable; typically, information cannot be confirmed by any means possible with any degree of certainty.
F	**Reliability cannot be judged:** There is no basis for estimating the reliability.
	Accuracy
1	**Confirmed by other sources:** One can state with certainty there is corroborating information.
2	**Probably true:** There is no actual proof, but no reason exits to assess; the source of the information is already available.
3	**Possibly true:** Information may not at present be available to refute the accuracy.
4	**Doubtfully true:** There is information that contradicts the accuracy.
5	**Improbable:** No confirmation, and the information contradicts other reliable/accurate sources.
6	**Truth cannot be judged:** Information does not meet the criteria above.

2-15. Reliable and accurate information is integrated into the analytical production. Data that is less reliable or accurate is not discarded; it is retained for possible additional screening with other established information or if new requirements arise that are relevant to existing data. Analysts are encouraged to read information rated as *F6* (reliability = F; accuracy = 6) to determine if it has relevancy although the source cannot be confirmed and the information accuracy is questionable. As friendly forces collect more information and that information is included in all-source or single-source intelligence analysis, the information originally rated as F6 may subsequently be rated as more reliable and accurate.

Example: Analyze

From the screened information, analysts analyze the retained information (bolded):

- **Possible identification of two MLRSs as well as support equipment traveling west to east at 20 kilometers per hour along a road 15 kilometers north of the 1 BCT forward locations.** Key elements of information include (1) the location of MLRSs maneuvering north, parallel to the division area of operations (AO), which would enable elements to stop and fire, as needed, and (2) the possible identification of two MLRSs with trailing support equipment. Requests for information include (1) the identification of the types of MLRSs and support equipment, (2) the location of the MLRSs if they have stopped, and (3) the observed activity if the location of the MLRSs has been detected.
- **Approximately 28 to 30 threat tanks detected in convoy formations 40 kilometers north of the 1 BCT forward locations.** Analysts determine that the tanks detected are 40 kilometers outside of the 1 BCT AO. However, the predictive analytical assessment identifies this as possible reinforcements likely to enter the AO within the next 24 to 48 hours.
- **Threat air defense elements active near possible headquarters and artillery locations detected.** Key elements of information include the headquarters and artillery locations. The presence of air defense artillery indicates a protected site. The 1 BCT forward positions are in range of threat artillery.
- **Multiple-source reporting that a threat tank brigade is preparing to advance south, seeking to exploit lead division penetration of 1 BCT forward positions**. Key elements of information include a tank brigade preparing to advance in the direction of 1 BCT forward positions. The tank brigade is identified as an exploitation element to penetrate friendly positions.

Note. The information of threat action outside of the immediate division area of interest was passed to the corps; it did not confirm or deny any threat COAs although the report came from a reliable source. The various reports caused some further refinements to the information collection plan.

INTEGRATE

2-16. As analysts reach new conclusions about the threat activities during the *analyze* phase, they should corroborate and correlate this information with prior intelligence holdings using reasoning and analytic techniques. Analysts determine how new information relates to previous analytical conclusions. New information may require analysts to alter or validate initial conclusions. Analysts must continue to evaluate and integrate reliable and accurate information relevant to their mission.

2-17. Analysts resume the analysis based on questions (hypotheses) they established during the *screen* and *analyze* phases. At this point, analysts begin to draw conclusions that translate into an initial determination that is likely to require additional analysis and, in certain instances, additional collection. They employ the analytic tradecraft standards to assess probabilities and confidence levels; they employ the action-metrics associated with analytical rigor to draw accurate conclusions. However, some of these conclusions may present alternative COAs not previously considered during IPB. These COAs must be presented to the commander and staff because they might have operational implications. (Appendix C discusses the analytic tradecraft standards and the action-metrics associated with analytical rigor.)

2-18. Hypotheses are tested and often validated during the *integrate* phase and become the basis for analytical production. To properly validate the hypotheses, analysts must demonstrate analytical rigor to determine the analytical sufficiency of their conclusions and be willing to present those points that prove the accuracy of their assessment.

Example: Integrate

From the four pieces of information, analysts tentatively determine the intent of the tank brigade (likely the motorized rifle division identified during the military decision-making process [MDMP] effort). Analysts conclude the tank brigade will most likely advance south against 1 BCT forward positions within 12 hours if the threat assesses there is a window of opportunity. Additionally, analysis indicates an artillery grouping is repositioning in the range of friendly forces to support the exploitation effort.

Corps, adjacent division, and multinational reporting and confirmation that MLRSs and support equipment are traveling west to east compels the division to collaborate with the adjacent division to confirm the intent and objective of the threat elements.

Note. Analysts must request additional collection on tank, headquarters, and artillery locations to verify current conclusions and initiate the targeting process.

PRODUCE

2-19. Intelligence and operational products are mutually supportive and enhance the commander and staff's situational understanding. Intelligence products are generally categorized by the purpose for which the intelligence was produced. The categories can and do overlap, and the same intelligence and information can be used in each of the categories. JP 2-0 provides an explanation for each of the categories:

- Warning intelligence.
- Current intelligence.
- General military intelligence.
- Target intelligence.
- Scientific and technical intelligence.
- Counterintelligence.
- Estimative intelligence.
- Identity intelligence.

2-20. Intelligence analysis results in the production and dissemination of intelligence to the commander and staff. Intelligence analysts produce and maintain a variety of products tailored to the commander and staff and dictated by the current situation, standard operating procedures (SOPs), and battle rhythms. (See appendix E for a detailed discussion on intelligence production.)

Note. When disseminating intelligence products, intelligence analysts must recognize when intelligence information at a higher classification is essential for the commander's awareness. Intelligence analysts and the intelligence staff must adhere to all appropriate U.S. laws, DOD regulations, classification guidelines, and security protocols. (See AR 380-28.)

The classification of U.S. intelligence presents a challenge in releasing information during multinational operations although sharing information and intelligence as much as possible improves interoperability and trust. Commanders and staffs should understand U.S. and other nations' policies about information sharing, since the early sharing of information (during planning) ensures effective multinational operations.

2-21. An analyst's ultimate goal is finding threat vulnerabilities and assisting the commander and staff in exploiting those vulnerabilities—despite having answered the commander's PIR. If the intelligence analysis does not answer the commander's PIR, the analyst should reexamine the guidance, consider recommending different collection strategies, and review information previously discarded as nonessential. Sometimes, the cause for not answering the requirement is the analyst's misunderstanding of the commander's PIR or guidance, thus the analyst must return to the original question posed by the commander and reevaluate the initial hypothesis.

2-22. In tactical units, analysts must understand that their adjacent and especially their subordinate units may have degraded communications. In those cases, analysts at each echelon must develop their own conclusions and assessments and should use their unit's primary, alternate, contingency, and emergency (known as PACE) plan to facilitate continuous dissemination of their products and assessments (see FM 3-0).

Example: Produce

Following additional collection at specific points of interest, analysts confirm the tank brigade's role as the exploitation force and MLRS battalion locations. Refined collection improves the data and information necessary to target those units and answer PIRs 1 and 2.

Chapter 3
All-Source Analytical Tasks

OVERVIEW

3-1. Through the application of the all-source analytical tasks, intelligence analysis facilitates commanders and other decision makers' ability to visualize the OE, organize their forces, and control operations to achieve their objectives. The all-source analytical tasks are—

- Generate intelligence knowledge.
- Perform IPB.
- Provide warnings.
- Perform situation development.
- Provide intelligence support to targeting and information operations.

3-2. In any operation, both friendly and threat forces will endeavor to set conditions to develop a position of relative advantage. Setting these conditions begins with generate intelligence knowledge, which provides relevant knowledge about the OE that is incorporated into the Army design methodology and used later during other analytical tasks. During the MDMP, the intelligence staff leads IPB and conducts continuous intelligence analysis to understand the OE and the options it presents to friendly and threat forces. The commander and staff continuously assess information, operations, and changes in the OE. Warning intelligence, situation development, and intelligence support to targeting assist them in further shaping the OE to facilitate mission success. These all-source analytical tasks are included within the intelligence warfighting function tasks of the Army Universal Task List (also called AUTL), captured in FM 2-0, appendix B. Each specific task is identified with an Army tactical task (ART) number, such as ART 2.1.4 for the generate intelligence knowledge task. (See figure 3-1.)

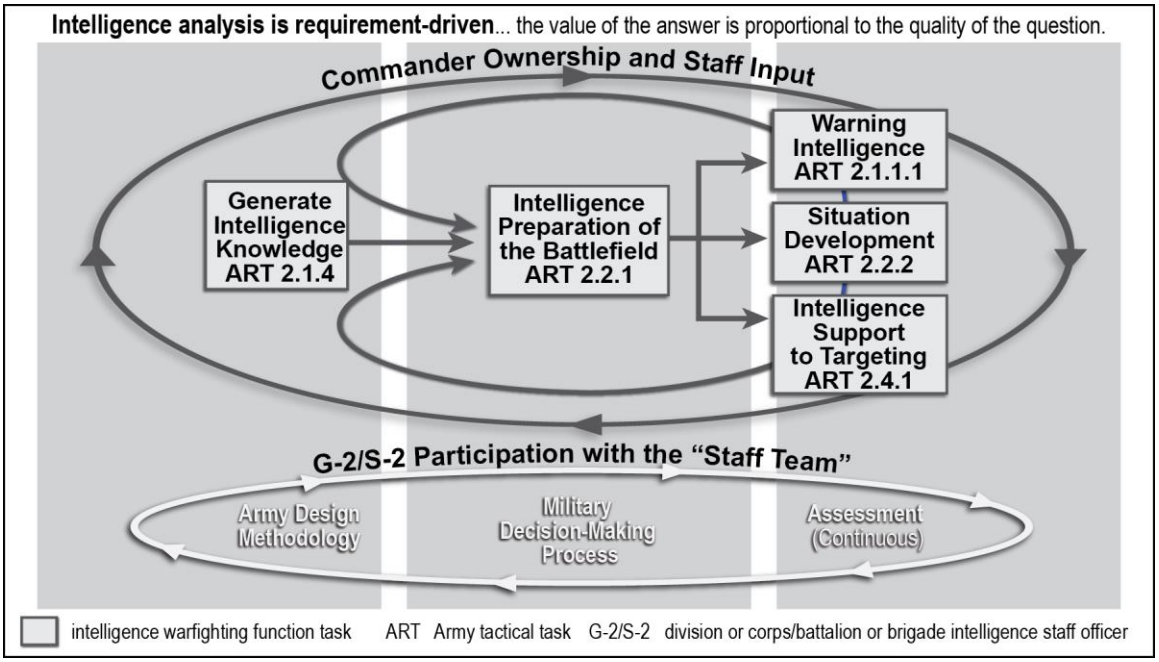

Figure 3-1. The all-source analytical tasks

3-3. The continuous assessment of collected information also mitigates risk to friendly forces while identifying opportunities to leverage friendly capabilities to open a window of opportunity. Analysis presents the commander with options for employing multiple capabilities and gaining a position of relative advantage over the threat.

3-4. For each all-source analytical task, the challenge for the intelligence analyst is understanding the unique requirements and considerations based on the situation, operational echelon, and specific mission. For example, targeting requirements at the brigade level narrowly focus on targets within that brigade's AO. Whereas theater army-level targeting synchronizes and uses operations conducted by one or more corps to reach operational objectives. Another example includes long-term analytical assessments, which are usually produced at the strategic and operational levels of warfare (see chapter 9).

3-5. There are many forms of analysis associated with unique operational activities. One important example of these types of activities is identity activities, which result in identity intelligence. *Identity intelligence* is the intelligence resulting from the processing of identity attributes concerning individuals, groups, networks, or populations of interest (JP 2-0). Identity activities are described as a collection of functions and actions conducted by maneuver, intelligence, and law enforcement components. Identity activities recognize and differentiate one person from another to support decision making. Identity activities include—

- The collection of identity attributes and physical materials.
- The processing and exploitation of identity attributes and physical materials.
- All-source analytical efforts.
- The production of identity intelligence and DOD law enforcement criminal intelligence products.
- The dissemination of those intelligence products to inform policy and strategy development, operational planning and assessment, and the appropriate action at the point of encounter.

GENERATE INTELLIGENCE KNOWLEDGE (ART 2.1.4)

3-6. Generate intelligence knowledge is a continuous task driven by the commander. It begins before receipt of mission and enables the analyst to acquire as much relevant knowledge as possible about the OE for the conduct of operations. Information is obtained through intelligence reach, research, data mining, database access, academic studies, intelligence archives, publicly available information, and other information sources, such as biometrics, forensics, and DOMEX. The information and intelligence obtained can be refined into specific knowledge for use during mission analysis through functional analysis, which is discussed in chapter 6 of this publication.

3-7. Generate intelligence knowledge includes the following five tasks, which facilitate creating a foundation for performing IPB and mission analysis:

- **Develop the foundation to define threat characteristics:** Analysts create a database of known hostile threats and define their characteristics in a general location. Analysts can refine and highlight important threats through functional analysis that can be prioritized later during steps 3 and 4 of the IPB process.
- **Obtain detailed terrain information and intelligence:** Analysts describe the terrain of a general location and categorize it by environment type. For example, desert and jungle environments have distinguishing characteristics that can assist in analyzing terrain during step 2 of the IPB process.
- **Obtain detailed weather and weather effects information and intelligence:** Analysts describe the climatology of a general location and forecast how it would affect future operations. Analysts should rely on the Air Force staff weather officer of their respective echelons to assist in acquiring weather support products, information, and knowledge. If the staff weather officer is not readily available, analysts should use publicly available information and resources. Information regarding climatology characteristics can assist in analyzing weather effects during step 2 of the IPB process.
- **Obtain detailed civil considerations information and intelligence:** Analysts identify civil considerations (areas, structures, capabilities, organizations, people, and events [ASCOPE]) within a general location. Analysts can refine this information further when they receive a designated area of interest and can assist in determining how civil considerations will affect friendly and threat operations during step 2 of the IPB process.

- **Complete studies:** Although analysts do not have a specific operation, mission, or area of responsibility when generating intelligence knowledge, they can compile information into products based on the commander's guidance. This supports the commander's visualization and completes studies for dissemination. Completed studies or products include country briefs, written assessments, or graphics. These products inform the commander and staff on current and historic situations that may affect future operations when a mission is received.

PERFORM INTELLIGENCE PREPARATION OF THE BATTLEFIELD (ART 2.2.1)

3-8. Analytical support begins during the MDMP. The *military decision-making process* is an iterative planning methodology to understand the situation and mission, develop a course of action, and produce an operation plan or order (ADP 5-0). Commanders use the MDMP to visualize the OE and the threat, build plans and orders for extended operations, and develop orders for short-term operations within the framework of a long-range plan. During the mission analysis step of the MDMP, intelligence analysts lead the IPB effort; however, they cannot provide all of the information the commander requires for situational understanding. Other staff sections or supporting elements assist in producing and continuously refining intelligence products tailored to the commander's requirements and the operation. (See ATP 2-01.3 for IPB information.)

3-9. As analysts begin the IPB process, they should have a general understanding of their OE based on intelligence produced and acquired when generating intelligence knowledge. IPB is a four-step process:

- **Step 1—Define the OE.** The intelligence staff identifies those significant characteristics related to the mission variables of enemy, terrain and weather, and civil considerations that are relevant to the mission. The intelligence staff evaluates significant characteristics to identify gaps and initiate information collection. During step 1, the AO, area of interest, and area of influence must also be identified and established.
- **Step 2—Describe environmental effects on operations.** The intelligence staff describes how significant characteristics affect friendly operations. The intelligence staff also describes how terrain, weather, civil considerations, and friendly forces affect threat forces. The entire staff determines the effects of friendly and threat force actions on the population.
- **Step 3—Evaluate the threat.** Evaluating the threat is understanding how a threat can affect friendly operations. Step 3 determines threat force capabilities and the doctrinal principles and tactics, techniques, and procedures that threat forces prefer to employ.
- **Step 4—Determine threat COAs.** The intelligence staff identifies and develops possible threat COAs that can affect accomplishing the friendly mission. The staff uses the products associated with determining threat COAs to assist in developing and selecting friendly COAs during the COA steps of the MDMP. Identifying and developing all valid threat COAs minimize the potential of surprise to the commander by an unanticipated threat action.

PROVIDE WARNINGS (ART 2.1.1.1)

3-10. Across the range of military operations, various collection assets provide early warning of threat action. As analysts screen incoming information and message traffic, they provide the commander with advanced warning of threat activities or intentions that may change the basic nature of the operation. These warnings enable the commander and staff to quickly reorient the force to unexpected contingencies and to shape the OE.

3-11. Analysts can use analytic techniques and their current knowledge databases to project multiple scenarios and develop indicators as guidelines for providing warning intelligence. An *indicator* is, in intelligence usage, an item of information which reflects the intention or capability of an adversary to adopt or reject a course of action (JP 2-0). Analysts project future events and identify event characteristics that can be manipulated or affected. Characteristics that cannot be manipulated or affected should be incorporated into unit SOPs as warning intelligence criteria. (See ATP 2-01 and ATP 2-01.3 for more information on indicators.)

PERFORM SITUATION DEVELOPMENT (ART 2.2.2)

3-12. Intelligence analysis is central to situation development, as it is a process for analyzing information and producing current intelligence concerning the relevant aspects of the OE within the AO before and during operations. Analysts continually produce current intelligence to answer the commander's requirements, update and refine IPB products, and support transitions to the next phase of an operation. (For more information on situation development, see FM 2-0.)

Note. In addition to the AO, intelligence analysts should also consider and include relevant aspects of the OE within the area of influence and area of intelligence responsibility that impact the commander's AO.

3-13. Analysts continually analyze the current situation and information to predict the threat's next objective or intention. During step 3 of the IPB process, analysts compare the current situation with their threat evaluations to project multiple scenarios and develop indicators. Understanding how the threat will react supports the planning of branches and sequels, affording the commander multiple COAs and flexibility on the battlefield during current operations. For example, observing a threat unit in a defensive posture may indicate an offensive operation within a matter of hours. Providing this information to the commander enables the staff to pursue a different COA that can place friendly units in a better position of relative advantage. The commander may use a flanking maneuver on the threat since it is in a relatively stationary position, hindering the future offensive operation.

PROVIDE INTELLIGENCE SUPPORT TO TARGETING AND INFORMATION OPERATIONS (ART 2.4)

3-14. *Targeting* is the process of selecting and prioritizing targets and matching the appropriate response to them, considering operational requirements and capabilities (JP 3-0). Across all echelons and intelligence disciplines, intelligence analysis provides relevant and timely intelligence to support targeting (both lethal and nonlethal). The staff uses this intelligence during the targeting process, which uses the *decide*, *detect*, *deliver*, and *assess* methodology. (See appendix F for more on intelligence support to targeting.)

3-15. Intelligence analysis, starting with the IPB effort, supports target development and target detection:

- **Intelligence analysis support to target development:** Target development involves the systematic analysis of threat forces and operations to determine high-value targets (HVTs) (people, organizations, or military units the threat commander requires for successful completion of the mission), HPTs (equipment, military units, organizations, groups, or specific individuals whose loss to the threat contributes significantly to the success of the friendly COA), and systems and system components for potential engagement through maneuver, fires, electronic warfare, or information operations.
- **Intelligence analysis support to target detection:** Intelligence analysts establish procedures for disseminating targeting information. The targeting team develops the sensor and attack guidance matrix to determine the sensors required to detect and locate targets. Intelligence analysts incorporate these requirements into the collection management tools, which assist the operations staff in developing the information collection plan.

3-16. *Information operations* is the integrated employment, during military operations, of information-related capabilities in concert with other lines of operation to influence, disrupt, corrupt, or usurp the decision-making of adversaries and potential adversaries while protecting our own (JP 3-13). Intelligence support to military information operations pertains to the collection of information essential to define the information environment, understand the threat's information capabilities, and assess or adjust information-related effects. Continuous and timely intelligence is required to accurately identify the information environment across the physical, informational, and cognitive dimensions, including the operational variables (PMESII-PT). Intelligence support to military information operations focuses on the following:

- Aspects of the information environment that influence, or are influenced by, the threat.
- Understanding threat information capabilities.

- Understanding the methods by which messages are transmitted and received in order to assess the cognitive reception and processing of information within the target audience.
- Assessing information-related effects (target audience motivation and behavior, measure of effectiveness, and information indicators of success or failure).

This page intentionally left blank.

PART TWO

Task Techniques

Chapter 4

Analytic Techniques

OVERVIEW

4-1. Intelligence analysts use cognitive processes and analytic techniques and tools to solve intelligence problems and limit analytical errors. The specific number of techniques and tools applied depends on the mission and situation. The basic thinking abilities for intelligence analysis and critical and creative thinking, all described in appendix B, facilitate analysis and improve the probability of accurate conclusions. Intelligence analysts must be as accurate as possible to assist in ensuring mission success.

4-2. The following distinguishes between a technique, tool, and method:

- **Technique** is a way of doing something by using a special knowledge or skill. An analytic technique is a way of looking at a problem, which results in a conclusion, assessment, or both. A technique usually guides analysts in thinking about a problem instead of providing them with a definitive answer as typically expected from a method.
- **Tool** is a component of an analytic technique that facilitates the execution of the technique but does not provide a conclusion or assessment in and of itself. Tools facilitate techniques by allowing analysts to display or arrange information in a way that enables analysis of the information. An example of a tool is a link diagram or a matrix. Not all techniques have an associated tool.
- **Method** is a set of principles and procedures for conducting qualitative analysis.

APPLYING STRUCTURED ANALYTIC TECHNIQUES

4-3. Structured analysis assists analysts in ensuring their analytic framework—the foundation upon which they form their analytical judgments—is as solid as possible. It entails separating and organizing the elements of a problem and reviewing the information systematically. Structured analytic techniques provide ways for analysts to separate the information into subsets and assess it until they generate a hypothesis found to be either feasible or untrue. Structured analytic techniques—

- Assist analysts in making sense of complex problems.
- Allow analysts to compare and weigh pieces of information against each other.
- Ensure analysts focus on the issue under study.
- Force analysts to consider one element at a time systematically.
- Assist analysts in overcoming their logic fallacies and biases.
- Ensure analysts see the elements of information. This enhances their ability to identify correlations and patterns that would not appear if not depicted outside the mind.
- Enhance analysts' ability to collect and review data. This facilitates thinking with a better base to derive alternatives and solutions.

4-4. Applying the appropriate structured analytic technique assists commanders in better understanding and shaping the OE. One technique may not be sufficient to assist in answering PIRs; therefore, analysts should use multiple techniques, time permitting. For example, determining the disposition and composition of the threat in the OE is like attempting to put the pieces of a puzzle together. Employing multiple analytic techniques facilitates the piecing of the puzzle, thus creating a clearer picture. (See figure 4-1.) Structured analytic techniques are categorized as the following and summarized in figure 4-2:

- Basic—provide insight that supports problem solving. (See chapter 5.)
- Diagnostic—make analysis more transparent. (See chapter 5.)
- Advanced:
  - Contrarian—challenge current thinking. (See chapter 6.)
  - Imaginative—develop new insights. (See chapter 6.)

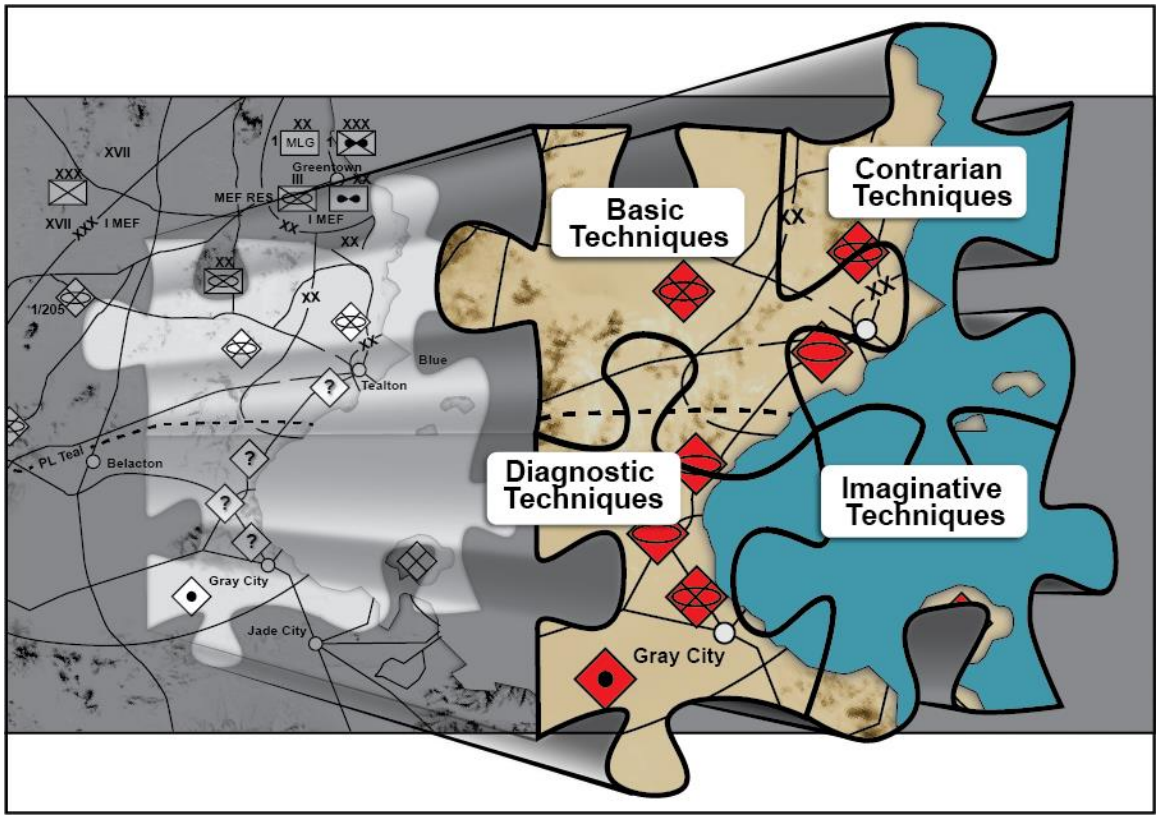

Figure 4-1. Applying analytic techniques to understand the operational environment

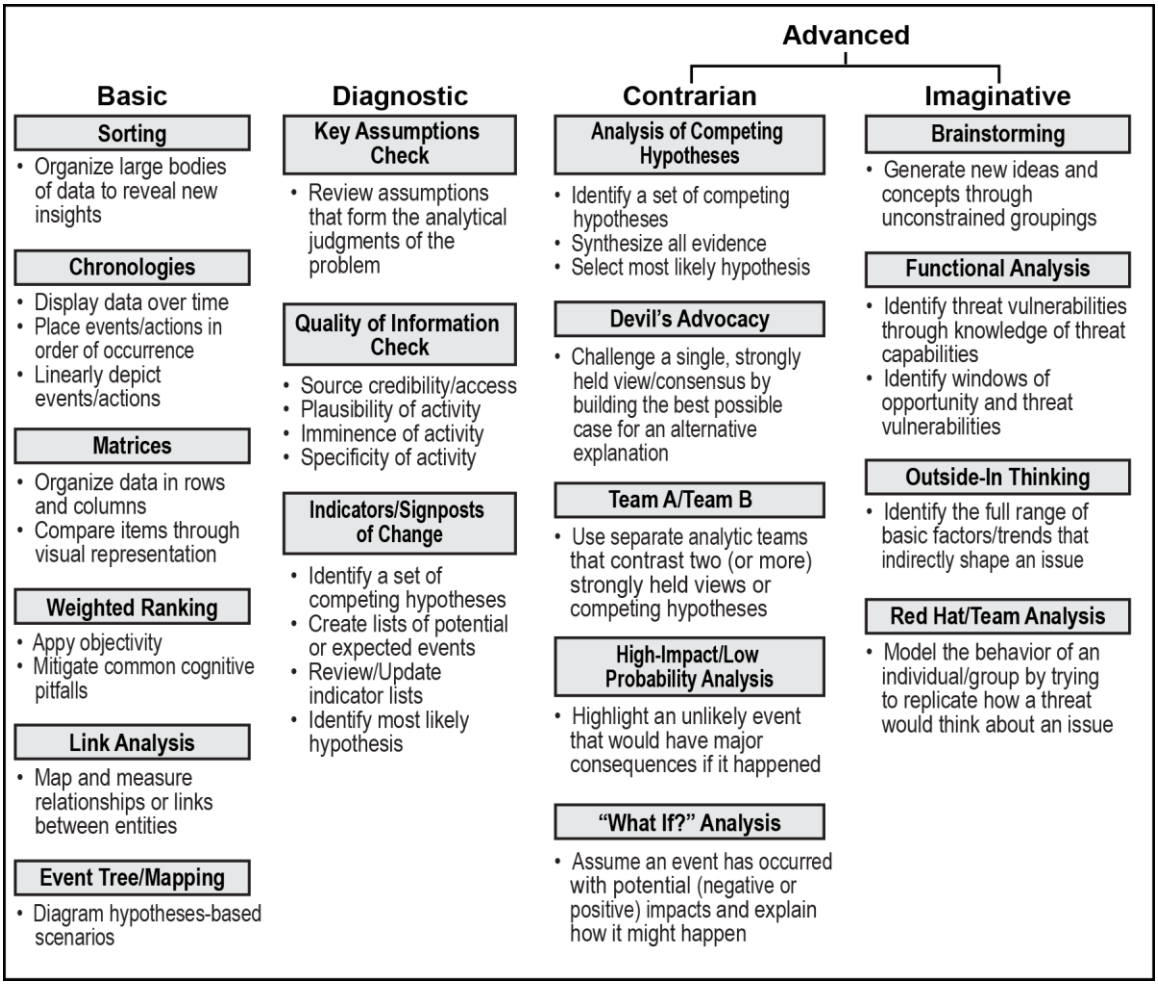

Figure 4-2. Structured analytic techniques summarized

4-5. For thorough analysis, analysts should incorporate as many appropriate techniques as possible into their workflow. Although this may be more time consuming, analysts become more proficient at using these techniques, ultimately reducing the amount of time required to conduct analysis. The exact techniques and tools incorporated, as well as the order in which to execute them, are mission- and situation-dependent. There is no one correct way to apply these techniques as each analyst's experience, preference, and situation are influencing factors.

4-6. Analysts can apply structured analytic techniques in the *analyze* and *integrate* phases of the intelligence analysis process to assist them in solving analytic problems. The analytic problem can vary depending on the echelon or mission. For example, an analytic problem could be forecasting the future stability of a specific country, while another could be trying to identify an HVT. The results of structured analytic techniques and tools, such as link diagrams or quad-charts, are not always incorporated into intelligence products such as intelligence estimates or intelligence running estimates (see FM 2-0). However, analysts may use these results to inform their analytical products; they should maintain these results in a repository for future reference.

4-7. The vast amount of information that analysts must process can negatively affect their ability to complete intelligence assessments timely and accurately; therefore, analysts should be proficient at using both manual and automated methods to conduct structured analysis. Additionally, analysts conduct analysis from varying environments and echelons in which the availability of automation and network connectivity may not be fully mission capable.

Applying Analytic Techniques Throughout the Intelligence Analysis Process

UNDERSTAND THE REQUIREMENTS: A human intelligence analysis cell (HAC) is tasked to help find the composition and disposition of the threat's integrated air defense system (IADS) on the battlefield. This task supports one of the division commander's PIRs. The division's HUMINT elements have been attempting to collect information from captured detainees, defectors, and internally displaced persons. Additionally, HUMINT sources are sensitized to look for radar dishes and missiles.

SCREEN THE COLLECTED INFORMATION: The HAC receives multiple HUMINT reports on various topics, but it focuses on those reports that support the PIR related to IADSs.

The HAC assesses the value of the reports by determining the *relevance* of the information to the PIR, the *reliability* of the source of the information, and the *accuracy* of the information itself:

- **Relevance:** The HAC searches HUMINT databases for all HUMINT reporting in theater related to IADSs and tailors its query to receive reports not older than 120 days (date) and within the boundaries of its AO (location). The HAC discovers that there are 20 reports on hand possibly related to IADSs within the specified date and geographic location. **(Overall relevance is estimated as high.)**
- **Reliability:** The HAC looks for duplication in the reporting, which can occur when one HUMINT source provides multiple HUMINT collection teams the same information. The HAC finds one duplicate report and eliminates it, leaving 19 reports on hand to analyze. The HAC also determines that one of the sources lacks credibility and eliminates the one report associated with that source, reducing the number to 18 reports. **(Overall reliability of sources is estimated as moderate.)**
- **Accuracy:** The HAC examines the 18 reports and determines that most of them have marginally accurate information because they lack grids for any locations. Despite this, the HAC does not eliminate these reports. **(Overall accuracy is estimated as moderate.)**

Screening results: The HAC compiles first-hand information from multiple credible sources about missiles on the backs of large trucks within the division's AO, and from another credible source who reported an increase in the number of trucks with missiles in the last 30 days.

ANALYZE: The HAC considers the information against its current knowledge level and uses sorting, a basic structured analytic technique, to categorize the information and determine what it now reveals or what gaps still exist. The HAC uses the Distributed Common Ground System-Army (DCGS-A) and combatant command-specific databases to further examine the quality of the information to determine if there are any signs of a deception effort. The HAC then generates multiple hypotheses based on the information and determines that the reporting indicates the discovery of a threat supply point. The HAC challenges the hypothesis using contrarian techniques, such as devil's advocacy and team A/team B, to ensure the analysis is thorough (see chapter 6).

Initial analytical determination: Based on the reports and analytic techniques employed, the HAC determines that an unidentified truck with possible missiles will arrive at a general location every few days. The geographical area is a 1,500-meter location on the north side of a specific ridgeline. The HAC postulates that this general location may be a threat supply point for an unknown missile-type weapons system. The HAC reports a moderate level of confidence in its assessment. (See appendix C for more information on likelihoods and confidence levels.)

INTEGRATE: The HAC, requiring more information to further develop the analytic problem, expands the parameters of its previous database query by including the area of interest and HUMINT reporting not older than 150 days. This query returns the same reports as the previous query as well as additional reports from other HUMINT teams and other government agencies operating both inside and outside the division's AO. The reports are assessed as reliable and fairly accurate since the information about these items was preexisting.

Applying Analytic Techniques Throughout the Intelligence Analysis Process (*continued*)

INTEGRATE (*continued*): The following includes key findings in the HUMINT reports:

- The reports from other government agencies contain photographs of trucks with missiles, identified as logistics vehicles, transporting possible SA-17 missiles to and from unknown locations. The photographs were taken at a specific grid location showing the direction of travel towards the division's AO.
- An organic HUMINT report from inside the division's AO, not initially related to IADSs, now reveals links or indicators that, when combined with previous holdings, may provide information related to IADSs. In this report, the source reported loud military trucks travelling frequently near the source's home. Additionally, the source's description of the trucks matched those in the photographs of the other government agencies' reports. The source's residence is located along the main highway between where the photographs were taken and where the increase in trucks with missiles was reported. Furthermore, source reporting indicates that the trucks are loaded with missiles when heading towards the division's AO, but they are empty when heading away from the division's AO.

Note. Single-source analysts may be able to skip to the *produce* phase if no other information on the topic is available.

Final analytical determination: This new information, when integrated with the previous holdings and structured analytic techniques and tools, allows the HAC to refine its initial analytical determination. The HAC postulates that SA-17s are likely to arrive north of Ridgeline Borisenko within the grid square 38JCH1126 every few days. The HAC maintains a moderate level of confidence in its assessment. When the date of the postulated event elapses, the HAC will be able to further define the reliability of the sources and accuracy of the information.

PRODUCE: The HAC disseminates this newly produced intelligence in a summary that contains the determination that SA-17s will arrive north of Ridgeline Borisenko. The summary of HUMINT reporting is disseminated to the commander and shared with all other intelligence elements within the division.

This page intentionally left blank.

Chapter 5
Basic and Diagnostic Structured Analytic Techniques

SECTION I – BASIC STRUCTURED ANALYTIC TECHNIQUES

5-1. Basic structured analytic techniques are the building blocks upon which further analysis is performed. They are typically executed early in the intelligence effort to obtain an initial diagnosis of the intelligence problem through revealing patterns. The basic structured analytic techniques described in this publication are—

- **Sorting technique:** Organizing large bodies of data to reveal new insights.
- **Chronologies technique:**
  - Displaying data over time.
  - Placing events or actions in order of occurrence.
  - Linearly depicting events or actions.
- **Matrices technique:**
  - Organizing data in rows and columns.
  - Comparing items through visual representation.
- **Weighted ranking technique:**
  - Facilitating the application of objectivity.
  - Mitigating common cognitive pitfalls.
- **Link analysis technique:** Mapping and measuring relationships or links between entities.
- **Event tree and event mapping techniques:** Diagramming hypotheses-based scenarios.

5-2. These techniques—

- Improve assessments by making them more rigorous.
- Improve the presentation of the finished intelligence in a persuasive manner.
- Provide ways to measure progress.
- Identify information gaps.
- Provide information and intelligence.

SORTING

5-3. Sorting is a basic structured analytic technique used for grouping information in order to develop insights and facilitate analysis. This technique is useful for reviewing massive data stores pertaining to an intelligence challenge. Sorting vast amounts of data can provide insights into trends or abnormalities that warrant further analysis and that otherwise would go unnoticed. Sorting also assists in reviewing multiple categories of information that when divided into components presents possible trends, similarities, differences, or other insights not readily identifiable. Table 5-1 on page 5-2 briefly describes when to use the sorting technique, as well as the value added and potential pitfalls associated with using this technique.

Table 5-1. Sorting technique

Sorting: *A basic structured analytic technique for organizing a large amount of data in a manner that often yields new insights.*		
When to use	**Value added**	**Potential pitfalls**
Sorting data early in the analysis process is advantageous. It is most effective when information elements can be arranged into categories and subcategories to gain insights not readily identifiable. Sorting is particularly effective during initial data collection and hypotheses generation.	Sorting vast amounts of data can provide insights into trends or anomalies that warrant further analysis. This technique can highlight new or additional analytic insights into an old or new intelligence problem.	Improper sorting can hide valuable insights as easily as it can illuminate them. This occurs more frequently if data is not standardized.

5-4. **Method.** The following steps outline the process of sorting:

- **Step 1:** Arrange the information into categories to determine which categories or combination of categories might show trends or abnormalities that would provide insight into the problem being studied.
- **Step 2:** Review the listed facts, information, or hypotheses in the database to identify key fields that may assist in uncovering possible patterns or groupings.
- **Step 3:** Group those items according to the schema of the categories defined in step 1.
- **Step 4:** Choose a category and sort the information within that category. Look for any insights, trends, or oddities.
- **Step 5:** Review (and re-review) the sorted facts, information, or hypotheses to determine alternative ways to sort them. List any alternative sorting schema for the problem. One of the most useful applications of this technique is sorting according to multiple schemas and examining results for correlations between data and categories. For example, analysts identify from the sorted information that most attacks occurring on the main supply route also occur at a specific time.

5-5. A pattern analysis plot sheet is a common analysis tool for sorting information. (See figure 5-1.) It can be configured to determine threat activity as it occurs within a specified time. The pattern analysis plot sheet is a circular matrix and calendar. Each concentric circle represents one day and each wedge in the circle is one hour of the day. In figure 5-1, the information categories pertain to tactical surface-to-surface missile (also called SSM) launches arranged according to the days of the week and the times of day. For example, four Surface-to-Surface Missile B launches occurred during the last week of the month on alternate weekdays, mainly in the early hours of the day. The threat could be conducting launches during the early morning hours when people are just waking up and at their most vulnerable.

5-6. This method of sorting allows analysts to determine various aspects of an event, such as the type and timing of a particular event, and assists collection managers in allocating collection assets in space and time. Although the pattern analysis plot sheet is a sorting tool, it can also overlap with chronologies since analysts commonly use it to capture and display data over time.

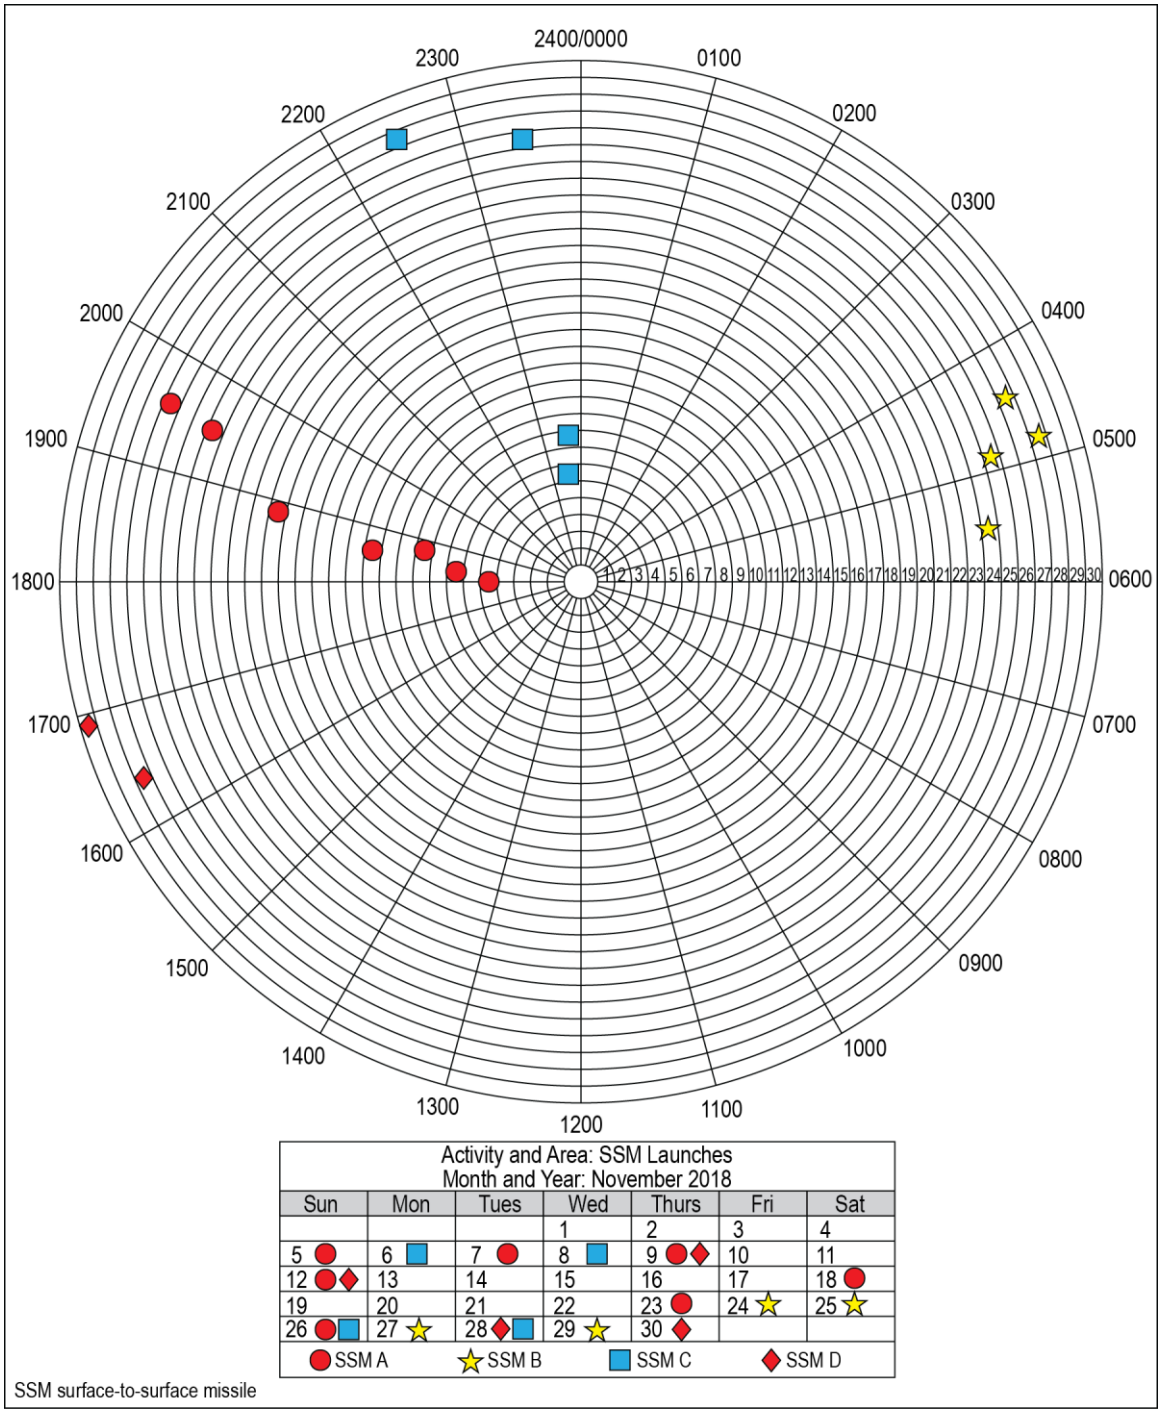

Figure 5-1. Sorting data using a pattern analysis plot sheet example

CHRONOLOGIES

5-7. A chronology is a list that places events or actions in the order they occurred; a timeline is a graphical depiction of those events. Analysts must consider factors that may influence the timing of events. For example, the chronological time of events may be correlated to the lunar cycle (moonset), religious events, or friendly patrol patterns. Timelines assist analysts in making these types of determinations. Table 5-2 briefly describes when to use the chronologies technique, as well as the value added and potential pitfalls associated with using this technique.

Table 5-2. Chronologies technique

Chronologies: *Technique for displaying data over time.*		
When to use	**Value added**	**Potential pitfalls**
The chronologies technique assists in organizing events or actions. It is useful for understanding the timing and sequence of relevant events as well as identifying significant events and gaps. The events may have a cause-and-effect relationship, or they may not. While timelines may be developed at the onset of an analytical task to ascertain the context of the activity being analyzed, they are also used in reviewing intelligence studies to discover causes for intelligence failures as they highlight significant events.	Chronologies assist in identifying patterns and correlations between events. This technique enables analysts to relate seemingly random events to the overarching situation and highlight or identify significant changes. It also assists in discovering trends, issues, or anomalies. Timelines depict information in a format easily understood in a briefing.	Analysts must be careful not to assume that events following earlier events are caused by the earlier events; there may be no causal relationship. The validity of this technique may be minimized if analysts fail to find contextual events that relate to the information in the chronology or timeline.

5-8. **Method.** Creating a chronology or timeline involves three steps:

- **Step 1:** List relevant events by the date or in order each occurred. Analysts should ensure they properly reference the data.
- **Step 2:** Review the chronology or timeline by asking the following questions:
  - What are the temporal distances between key events? If lengthy, what caused the delay? Are there missing pieces of data that may fill those gaps that should be collected?
  - Did analysts overlook pieces of intelligence information that may have had an impact on the events?
  - Conversely, if events seem to happen more rapidly than expected, is it possible that analysts have information related to multiple-event timelines?
  - Are all critical events necessary and shown for the outcome to occur?
  - What are the intelligence gaps?
  - What are indicators for those intelligence gaps?
  - What are the vulnerabilities in the timeline for collection activities?
  - What events outside the timeline could have influenced the activities?
- **Step 3:** Summarize the data along the line. Sort each side of the line by distinguishing between types of data. For example, depict intelligence reports above the timeline and depict significant activities below the timeline. Multiple timelines may be used and should depict how and where they converge.

5-9. Timelines are depicted linearly and typically relate to a single situation or COA. (See figure 5-2.) Multilevel timelines allow analysts to track concurrent COAs that may affect each other. Analysts use timelines to postulate about events that may have occurred between known events. They become sensitized to search for indicators, so the missing events are found and charted. Timelines may be used in conjunction with other structured analytic techniques, such as the event tree technique (see paragraph 5-22), to analyze complex networks and associations.

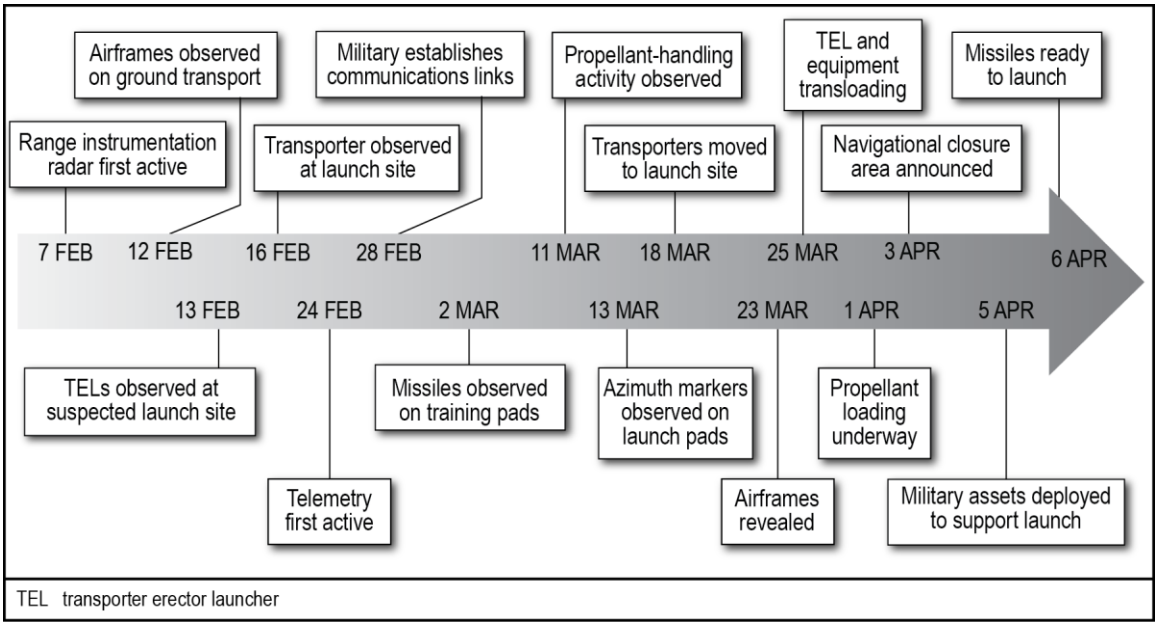

Figure 5-2. Timeline example

5-10. Figure 5-3 illustrates a time event chart, which is a variation of a timeline using symbols to represent events, dates, and the flow of time. While there is great latitude in creating time event charts, the following should be considered when creating them:

- Depict the first event as a triangle.
- Depict successive events as rectangles.
- Mark noteworthy events with an X across the rectangles.
- Display the date on the symbol.
- Display a description below the symbol.
- If using multiple rows, begin each row from left to right.

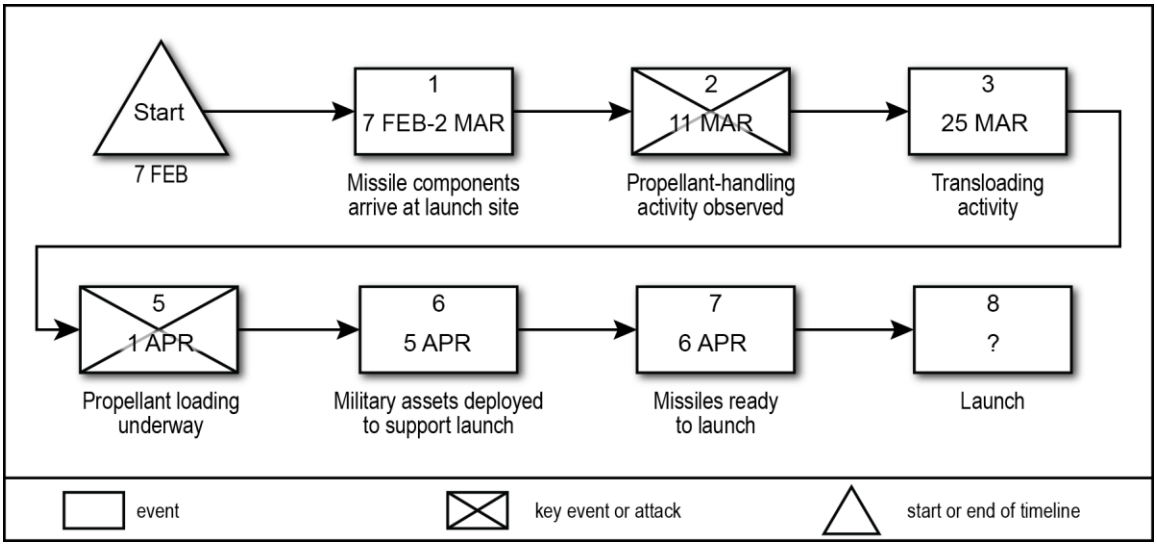

Figure 5-3. Time event chart example

MATRICES

5-11. A matrix is a grid with as many cells as required to sort data and gain insight. Whenever information can be incorporated into a matrix, it can provide analytic insight. A matrix can be rectangular, square, or triangular; it depends on the number of rows and columns required to enter the data. Three commonly used matrices are the—

- **Threat intentions matrix—**assists in efficiently analyzing information from the threat's point of view based on the threat's motivation, goals, and objectives. (See paragraph 5-14.)
- **Association matrix—**identifies the existence and type of relationships between individuals as determined by direct contact.
- **Activities matrix—**determines connections between individuals and any organization, event, entity, address, activity, or anything other than persons.

Note. Since the association and activity matrices closely relate to link analysis, they are described under the link analysis technique. (See paragraph 5-21.)

5-12. A key feature of the matrices analytic technique is the formulation of ideas of what may occur when one element of a row interacts with the corresponding element of a column. This differs from other matrices, such as the event matrix (described in ATP 2-01.3), in which the elements of the columns and rows do not interact to formulate outcomes; the matrix is primarily used to organize information. Table 5-3 briefly describes when to use the matrices technique, as well as the value added and potential pitfalls associated with using this technique. comparison

Table 5-3. Matrices technique

Matrices: *Technique that uses analytic tools for sorting and organizing data to facilitate comparison and analysis.*		
When to use	**Value added**	**Potential pitfalls**
A matrix is useful when there are more options or intricate data to conceptualize at one time without the aid of visual representations.	A matrix is useful for isolating critical data when there are vast amounts of information relevant to an issue, such as collected open-source information for a country study to generate intelligence knowledge; it facilitates comparing the options. When used to review data related to options, such as in a threat intentions matrix, this technique enables the analytical focus on each option, thus improving comparisons.	A matrix's two-dimensional design limits its use for collating data on complex issues; leaving out pertinent data can oversimplify an issue.

5-13. **Method.** The following steps outline the process for constructing a matrix (see figure 5-4):

- **Step 1:** Draw a matrix with enough columns and rows to enter the two sets of data being compared.
- **Step 2:** Enter the range of data or criteria along the uppermost horizontal row and the farthest left vertical column leaving a space in the upper left corner of the matrix.
- **Step 3:** In the grid squares in between, annotate the relationships, or lack thereof, in the cell at the intersection between two associated data points.
- **Step 4:** Review the hypotheses developed about the issue considering the relationships shown in the matrix; if appropriate, develop new hypotheses based on the insight gained from the matrix.

5-14. The following steps pertain to the threat intentions matrix technique (see figure 5-4):

- **Step 1:** Enter the decision options believed to be reasonable from the threat's viewpoint along the farthest left vertical column.
- **Step 2:** Enter the objectives for each option from the threat's viewpoint in the *objectives* column.
- **Step 3:** Enter the benefits for each option from the threat's viewpoint in the *benefits* column.
- **Step 4:** Enter the risks for each option from the threat's viewpoint in the *risks* column.

- **Step 5:** Fill in the *implications* column, which transitions the analyst from the threat's viewpoint to the analyst's viewpoint. Enter the implications from the threat's viewpoint and then add a slash (/) and enter the implications from the analyst's viewpoint.
- **Step 6:** Enter the indicators from the analyst's viewpoint in the *indications* column. This provides a basis for generating collection to determine as early as possible which option the threat selected.

	Objectives	***Benefits***	***Risks***	***Implications***	***Indications***
White House	Destroy most important United States (U.S.) symbol	Ultimate show of power	Miss target or shot down	Threat gains in stature/U.S. drawn into war, bled economically	• Unusual interest in White House air defenses • Extremists taking pilot training
Terrorist Attack	• Mass casualties • Instill fear	• Show of power • Media attention	• Adequate training • Maintain secrecy	Threat gains in stature/mass casualties can damage economy	• Unusual surveillance • Pilot training • Familiarizing with the area
Wall Street	Hurt the U.S. economy	• Aid recruitment • Show of power	• Adequate training • Maintain secrecy	Threat gains in stature/difficult to determine attacker	• Unusual surveillance • Pilot training • Familiarizing with the area

Figure 5-4. Threat intentions matrix example

WEIGHTED RANKING

5-15. The weighted ranking technique is a systematic approach that provides transparency in the derivation and logic of an assessment. This facilitates the application of objectivity to an analytic problem. To simplify the weighted ranking technique, this publication introduces subjective judgments instead of dealing strictly with hard numbers; however, objectivity is still realized. This technique requires analysts to select and give each criterion a weighted importance from the threat's viewpoint. Analysts use the criticality, accessibility, recuperability, vulnerability, effect, and recognizability (also called CARVER) matrix tool to employ this technique to support targeting prioritization. (See ATP 3-60.) The insight gained from how each criterion affects the outcome allows for a clear and persuasive presentation and argumentation of the assessment.

5-16. Weighted ranking assists in mitigating common cognitive pitfalls by converting the intelligence problem into a type of mathematical solution. The validity of weighting criteria is enhanced through group discussions, as group members share insights into the threat's purpose and viewpoint; red hat/team analysis can augment this technique. Weighted ranking uses matrices to compute and organize information. Table 5-4 briefly describes when to use the weighted ranking technique, as well as the value added and potential pitfalls associated with using this technique.

Table 5-4. Weighted ranking technique

Weighted ranking: *Technique that provides clarity among many alternatives by applying weighting to criteria to provide an overall score for each alternative.*		
When to use	**Value added**	**Potential pitfalls**
Analysts should use weighted ranking when there is a need for transparency in the reasoning used to derive an assessment. The targeting selection process is an example of when this technique is advantageous.	Weighted ranking adds validity to an assessment of alternatives, options, and hypotheses by mitigating biases and mindsets, which may result in the unsystematic and therefore inconsistent use of criteria.	Weighted ranking takes more time than many other basic structured analytic techniques and relies on a fair number of mathematical computations. This may cause analysts to avoid the technique.

5-17. **Method.** The following steps describe how to accomplish a simplified weighted ranking review of alternative options:

- **Step 1:** Create a matrix and develop all options and criteria related to the analytical issue. Figure 5-5 depicts the *options* as types of operations and the *criteria* as the five military aspects of terrain (observation and fields of fire, avenues of approach, key terrain, obstacles, and cover and concealment [OAKOC]).
- **Step 2:** Label the left, uppermost column/row of the matrix as options and fill the column with the types of operations generated in step 1.
- **Step 3:** List the criteria (OAKOC) generated in step 1 in the top row with one criterion per column.
- **Step 4:** Assign weights and list them in parentheses next to each criterion. Depending on the number of criteria, use either 10 or 100 points and divide them based on the analyst's judgment of each criterion's relative importance. Figure 5-5 shows how the analyst assigned the weights from the threat's perspective to the OAKOC factors using 10 points.
- **Step 5:** Work across the matrix one option (type of operation) at a time to evaluate the relative ability of the option to satisfy the corresponding criterion from the threat's perspective. Using the 10-point rating scale, assign 1 as low and 10 as high to rate each option separately. (See figure 5-5 for steps 1 through 5.)
- **Step 6:** Work across the matrix again, one option at a time, and multiply the criterion weight by the option rating and record this number in each cell. (See figure 5-6.)

Options	***Criteria***					
	Observation and fields of fire (2)	Avenues of approach (1)	Key terrain (1)	Obstacles (3)	Cover and concealment (3)	Total
Integrated attack	**7**	**8**	**6**	**3**	**6**	
Limited objective attack	**5**	**6**	**8**	**2**	**4**	
Spoiling attack	**7**	**3**	**2**	**5**	**8**	
Counterattack	**4**	**3**	**2**	**5**	**4**	
Maneuver defense	**7**	**3**	**2**	**2**	**8**	
Area defense	**5**	**2**	**4**	**7**	**8**	

Figure 5-5. Weighted ranking (steps 1–5) to determine the threat's most likely COA

Options	***Criteria***					
	Observation and fields of fire (2)	Avenues of approach (1)	Key terrain (1)	Obstacles (3)	Cover and concealment (3)	Total
Integrated attack	**7(2) = 14**	**8(1) = 8**	**6(1) = 6**	**3(3) = 9**	**6(3) = 18**	**55**
Limited objective attack	**5(2) = 10**	**6(1) = 6**	**8(1) = 8**	**2(3) = 6**	**4(3) = 12**	**42**
Spoiling attack	**7(2) = 14**	**3(1) = 3**	**2(1) = 2**	**5(3) = 15**	**8(3) = 24**	**58**
Counterattack	**4(2) = 8**	**3(1) = 3**	**2(1) = 2**	**5(3) = 15**	**4(3) = 12**	**40**
Maneuver defense	**7(2) = 14**	**3(1) = 3**	**2(1) = 2**	**2(3) = 6**	**8(3) = 24**	**49**
Area defense	**5(2) = 10**	**2(1) = 2**	**4(1) = 4**	**7(3) = 21**	**8(3) = 24**	**61**

Figure 5-6. Weighted ranking (step 6) to determine the threat's most likely COA

LINK ANALYSIS

5-18. Link analysis, often known as network analysis, is a technique used to evaluate the relationships between several types of entities such as organizations, individuals, objects, or activities. Visualization tools augment this technique by organizing and displaying data and assisting in identifying associations within complex networks. Although analysts can perform link analysis manually, they often use software to aid this technique. Link analysis programs are standard components in the Army's intelligence systems, from theater to company levels.

Performing Link Analysis Manually

A manual approach to link analysis is using small sticky notes of paper on a whiteboard. The analyst labels the notes to represent different entities and nodes and places them on the whiteboard. Using markers, the analyst links the entities and nodes. This method has several benefits:

- A larger picture may be seen on a whiteboard than on a computer monitor; many automated systems present limited views.
- It allows movement of the entities, quick redrawing of links, and color-coding using different markers.
- It allows analysts to perform link analysis together in OEs with intermittent connectivity and limited bandwidth.

Note. Other manual practices include using a corkboard with thumbtacks, colored string or thread or incorporating a map to add geographic context.

5-19. Analysts may use link analysis to focus on leaders and other prominent individuals, who are sometimes critical factors in the AO. Analysts use personality files—often obtained from conducting identity activities using reporting and biometrics, forensics, and DOMEX data—to build organizational diagrams that assist them in determining relationships between critical personalities and their associations to various groups or activities. This analysis is critical in determining the roles and relationships of many different people and organizations and assessing their loyalties, political significance, and interests. (See ATP 2-01.3 for more information on assessing personalities and personality files.) Table 5-5 briefly describes when to use the link analysis technique, as well as the value added and potential pitfalls associated with using this technique.

Table 5-5. Link analysis technique

Link analysis: *Technique that maps and measures relationships or links among individuals, groups, or organizations.*		
When to use	**Value added**	**Potential pitfalls**
Analysts should use link analysis whenever individuals, groups, group activities, or process networks are being reviewed for insight. Analysts can use this technique to inform the targeting process and for assessing personalities, as accomplished during step 3 of the intelligence preparation of the battlefield process.	Link analysis can clarify what is known and what may be missing about the network being analyzed. Analysts can identify key nodes and hubs for social, organizational, and infrastructure networks, giving insight into relationships and potential vulnerabilities. Link analysis products are easily understood in briefings.	Analysts could assume (incorrectly) that a central figure in a network is the leader because of the number of connections to that figure. Analysts also might ignore the temporal aspect of the relationships and assume they are concurrent. Link analysis provides a freeze-frame look at an activity and seldom conveys change over time unless paired with a timeline or other multidimensional approach.

5-20. **Method.** The following steps describe how to construct a simple link analysis diagram:

- **Step 1:** Extract entities and the information about their relationships from intelligence holdings that include but are not limited to biometrics, forensics, and DOMEX information.
- **Step 2:** Place entity associations into a link chart using link analysis software or a spreadsheet or by drawing them manually:
  - Use separate shapes for different types of entities, for example, circles for people, rectangles for activities, and triangles for facilities. (See figure 5-7 on page 5-10.)
  - Use colored and varying types of lines to show different activities, for example, green solid lines for money transfers, blue dotted lines for communications, and solid black lines for activities. This differentiation typically requires a legend. (See figure 5-7 on page 5-10.)
- **Step 3:** Analyze the entities and links in the link chart.
- **Step 4:** Review the chart for gaps, significant relationships, and the meaning of the relationships based on the activity occurring. Ask critical questions of the data such as—
  - Which entity is central or key to the network?
  - Who or what is the initiator of interactions?
  - What role does each entity play in the network?

- Who or what forms a bridge or liaison between groups or subgroups?
- How have the interactions changed over time?
- Which nodes should be targeted for collection or defeat?

- **Step 5:** Summarize what is observed in the chart and draw interim hypotheses about the relationships.

5-21. The three types of visualization tools used in link analysis to record and visualize information are—

- Link diagram. (See figure 5-7.)
- Association matrix. (See figure 5-8.)
- Activities matrix. (See figure 5-9.)

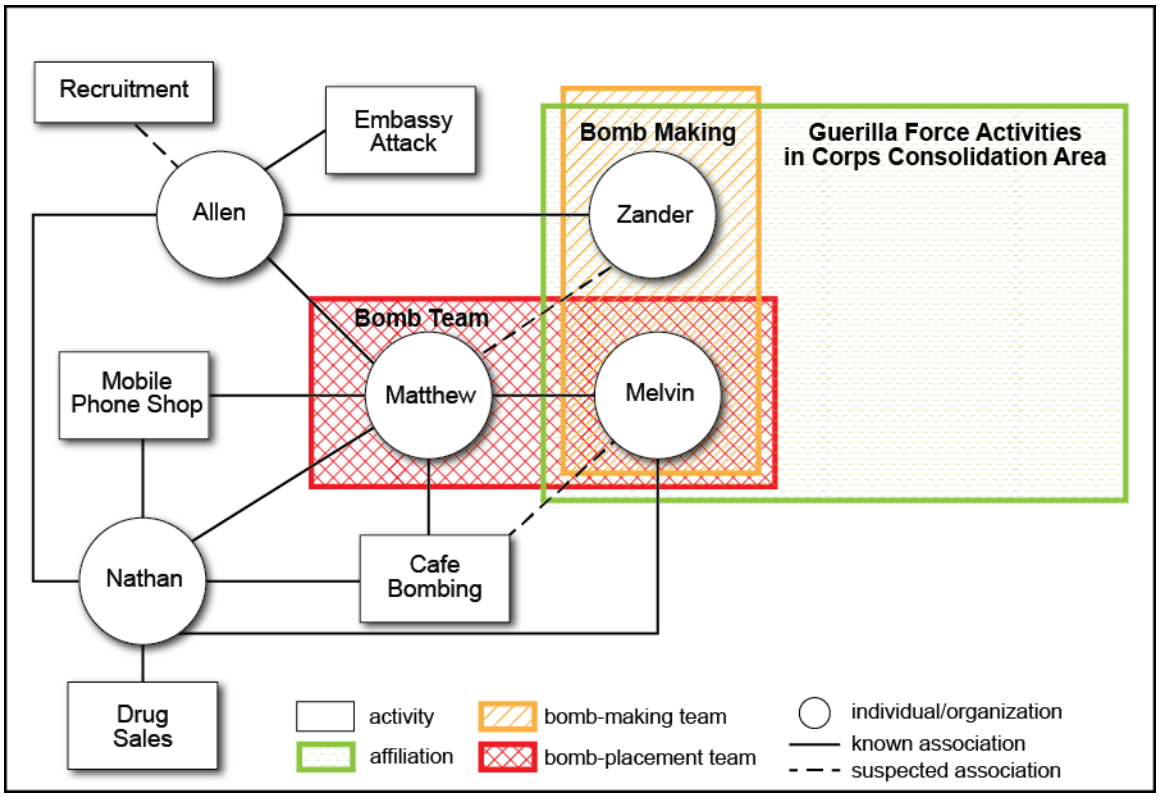

Figure 5-7. Link diagram example

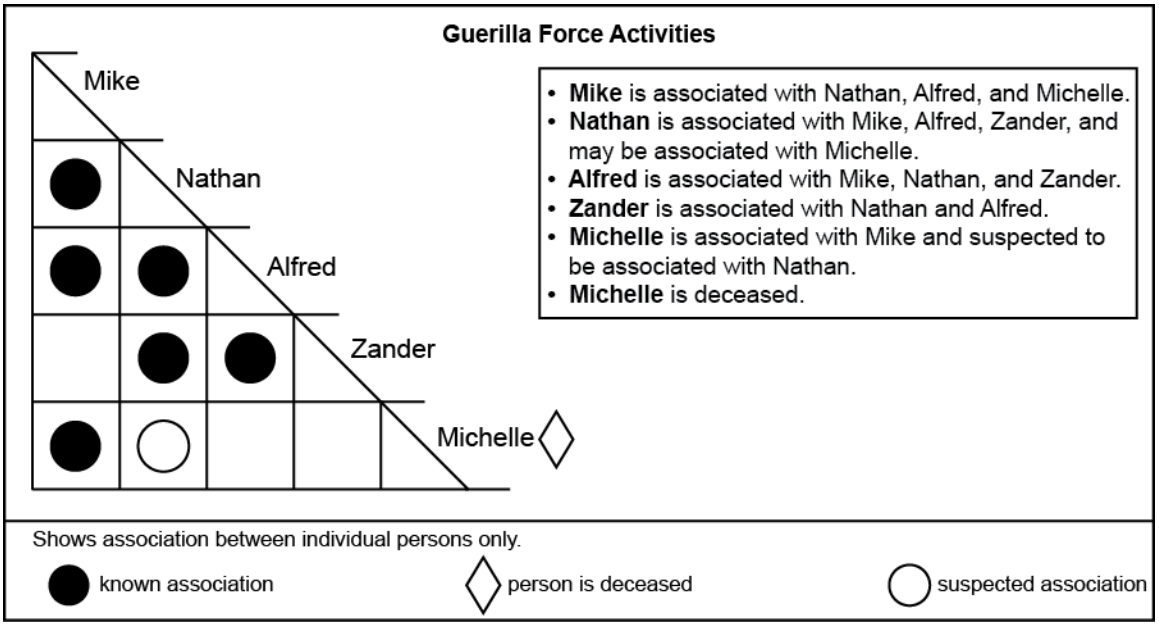

Figure 5-8. Association matrix example

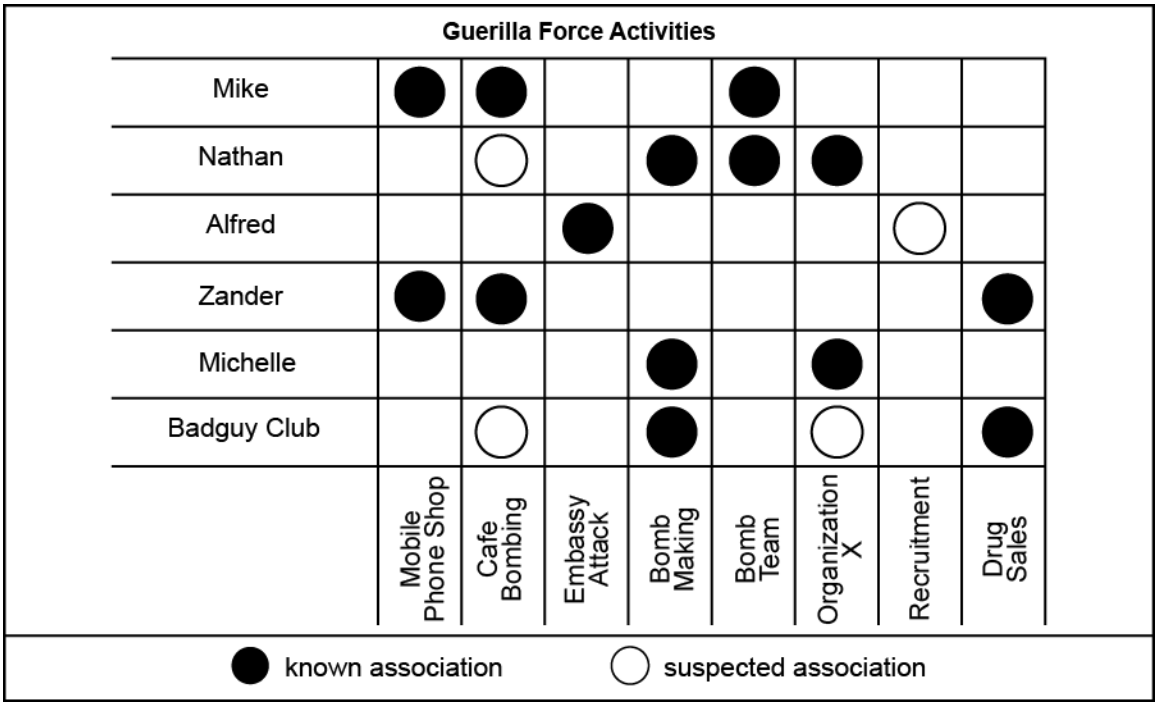

Figure 5-9. Activities matrix example

EVENT TREE

5-22. The event tree is a structured analytic technique that enables analysts to depict a possible sequence of events, including the potential branches of that sequence in a graphical format. An event tree works best when there are multiple, mutually exclusive options that cover the spectrum of reasonable alternatives. It clarifies the presumed sequence of events or decisions between an initiating event and an outcome. Table 5-6 briefly describes when to use the event tree technique, as well as the value added and potential pitfalls associated with this using technique. The following are pointers for analysts using the event tree technique:

- Use this technique in conjunction with weighted ranking, hypothesis-review techniques, and subjective probability to gain added insights.
- Leverage the expertise of a group of analysts during the construction of an event tree to ensure all events, factors, and decision options are considered.

Table 5-6. Event tree technique

Event tree: *A graphical depiction of a potential temporal sequence of events, including potential junctures within the event sequence.*		
When to use	**Value added**	**Potential pitfalls**
Analysts can use an event tree to clarify alternative event sequences with potential future outcomes or at least unknown outcomes related to an intelligence problem.	An event tree is a visual tool that analysts can use to depict a threat's options with decision points, which may provide insight into potential threat vulnerabilities. Event trees also provide an excellent method of determining collection requirements for indications that a decision has been made or events have unfolded in one of the alternative branches of the tree.	An intelligence failure can occur when the threat selects an unforeseen option arising from ignorance or when an unidentified event occurs.

5-23. **Method.** The following outlines the steps for creating event trees (see figure 5-10):

- **Step 1:** Identify the intelligence issue/problem (antigovernment protest in Egypt).
- **Step 2:** Identify the mutually exclusive and complete set of hypotheses that pertain to the intelligence issue/problem (Mubarak resigns or Mubarak stays).
- **Step 3:** Decide which events, factors, or decisions (such as variables) will have the greatest influence on the hypotheses identified in step 2.
- **Step 4:** Decide on the sequencing for when these factors are expected to occur or affect one another.
- **Step 5:** Determine the event options (Mubarak stays—hardline, reforms, some reforms) within each hypothesis and establish clear definitions for each event option to ensure collection strategies to monitor events are effective.
- **Step 6:** Construct the event tree from left to right. Each hypothesis is a separate main branch. Start with the first hypothesis and have one branch from this node for each realistic path the first event can take. Proceed down each event option node until the end state for that subbranch is reached. Then move to the next hypothesis and repeat the process.
- **Step 7:** Determine what would indicate a decision has been made at each decision point for each option to use in generating an integrated collection plan.
- **Step 8:** Assess the implications of each hypothesis on the intelligence problem.

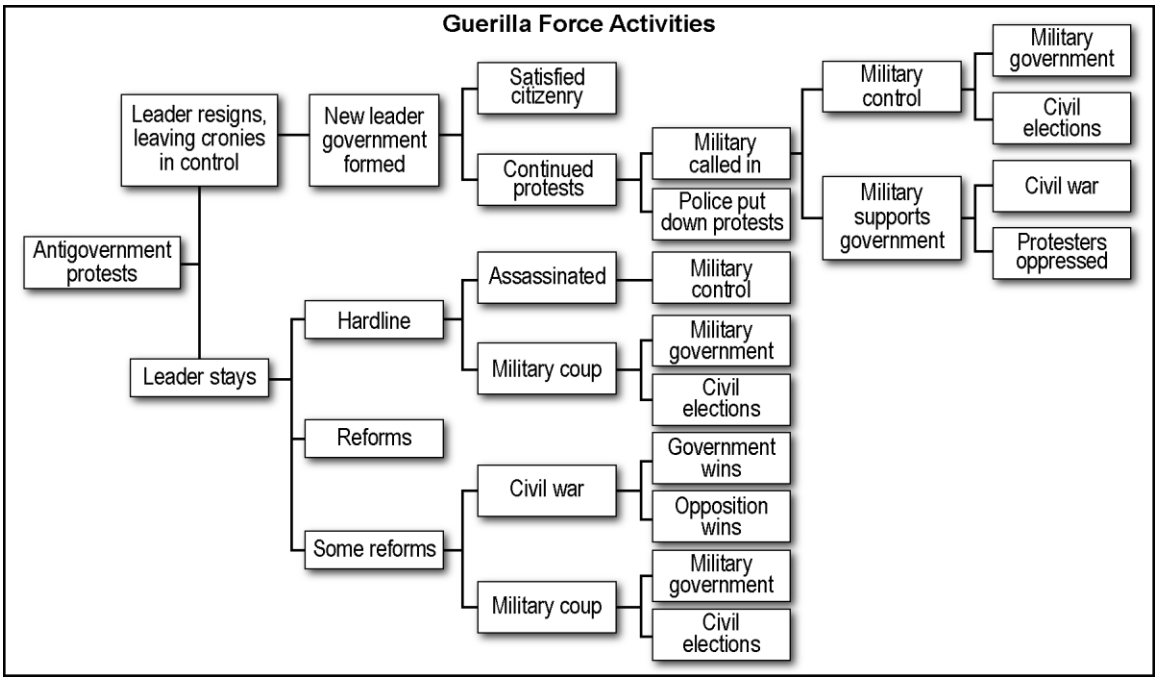

Figure 5-10. Event tree example

EVENT MAPPING

5-24. The event mapping technique uses brainstorming to assist in diagraming scenarios/elements stemming from analyst-derived hypotheses. Scenarios/Elements are linked around a central word or short phrase representing the issue/problem to be analyzed. (See paragraph 6-20 for more information on brainstorming.)

5-25. Event mapping scenarios/elements are arranged intuitively based on the importance of the concepts, and they are organized into groups, branches, or areas. Using the radial diagram format in event mapping assists in mitigating some bias, such as implied prioritization, anchoring, or other cognitive biases derived from hierarchy or sequential arrangements. Table 5-7 on page 5-14 briefly describes when to use the event mapping technique, as well as the value added and potential pitfalls associated with using this technique. The following includes event mapping general rules:

- Start with a blank medium such as paper or use a piece of stationery with adhesive on the back to make notes on a whiteboard.
- Think in terms of key words, phrases, or symbols that represent ideas and words.
- Annotate ideas as they occur, wherever they fit.
- Do not judge or hold back. Develop the map in the direction the topics flow—do not be limited by the map's appearance.
- As the map expands, strive to be more detailed.
- Use arrows or other visual aids to show the links between events in the scenario.
- Use color, as appropriate, to represent key players such as economics, military opposition groups, science, culture, and internal and external political pressures.

Table 5-7. Event mapping technique

Event mapping: *A mind-mapping diagram that represents the scenarios in hypotheses linked around a central issue.*		
When to use	**Value added**	**Potential pitfalls**
Analysts should use this technique when a nonlinear method is desired to generate, visualize, structure, and delineate the events in a scenario or hypotheses related to the intelligence issue/problem.	Event mapping uses a radial diagram that encourages a brainstorming approach. The many associations in event maps promote creativity in generating new ideas and associations not previously considered. This technique facilitates annotating indicators of change in developing collection plans.	Unconstrained event mapping can become overly detailed, lose focus, and include events and scenarios that lack relevance to the issue/problem analysts are studying.

5-26. **Method.** The following outlines the steps for applying event maps (see figure 5-11):

- **Step 1:** Place the word or symbol representing the issue/problem to be analyzed in the center of the medium from which the event map will be constructed.
- **Step 2:** Add symbols/words to represent possible actions/outcomes around the central issue/problem.
- **Step 3:** Link the possible actions/outcomes to the central issue or problem. If desired, use colors to indicate the major influence the link represents. For example, use green for economic links, red for opposition groups, or purple for military forces. Colors may also be used to differentiate paths for ease of reference.
- **Step 4:** Continue working outward, building the scenario of events into branches and subbranches for each hypothesis in detail.
- **Step 5:** If ideas end, move to another area or hypothesis.
- **Step 6:** When creativity wanes, stop and take a break. After the break, return and review the map and make additions and changes as desired.
- **Step 7:** As an option, number the links or decision points for each hypothesis. On a separate piece of paper, write down the evidence for each number to be collected that would disprove that link or decision. Use the lists for each number to develop an integrated collection strategy for the issue/problem.

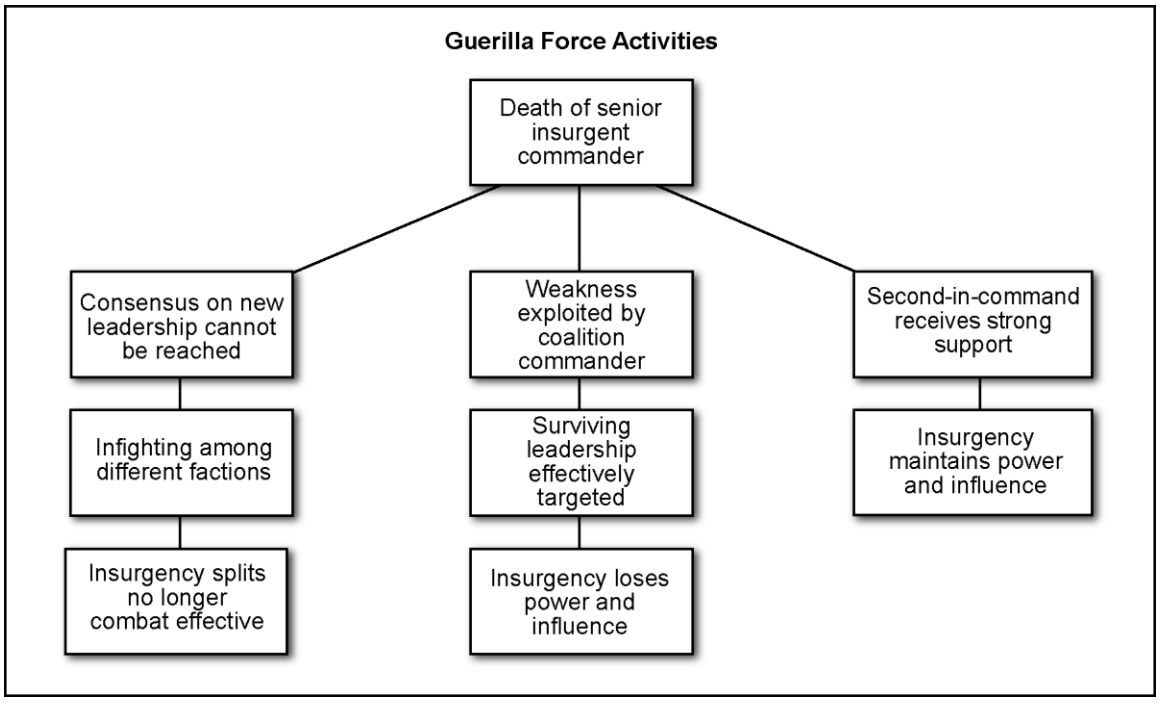

Figure 5-11. Event mapping example

SECTION II – DIAGNOSTIC STRUCTURED ANALYTIC TECHNIQUES

5-27. Diagnostic structured analytic techniques make analytical arguments, assumptions, and/or intelligence gaps more transparent. They are often used in association with most other analytic techniques to strengthen analytical assessments and conclusions. The most commonly used diagnostic techniques are—

- **Key assumptions check technique:** Reviewing assumptions that form the analytical judgments of the problem.
- **Quality of information check technique:**
  - Source credibility and access.
  - Plausibility of activity.
  - Imminence of activity.
  - Specificity of activity.
- **Indicators/Signposts of change technique:**
  - Identifying a set of competing hypotheses.
  - Creating lists of potential or expected events.
  - Reviewing/Updating indicator lists.
  - Identifying most likely hypotheses.

KEY ASSUMPTIONS CHECK

5-28. A key assumption is any hypothesis that analysts have accepted to be true and forms the basis of an assessment. For example, analysts may focus exclusively on analyzing key technical military variables of a military force and assume that a force will operate in a particular environment such as a desert, open plain, or arctic setting. The goal of this technique is not to undermine or abandon key assumptions; rather, it is to make them explicit and identify what information or developments would demand rethinking them.

5-29. Rechecking assumptions is valuable at any time before finalizing judgments. Key assumptions checks should be collaborative because an analyst cannot effectively self-check. Table 5-8 describes when to use this technique, as well as the value added and potential pitfalls associated with using this technique.

Table 5-8. Key assumptions check technique

Key assumptions check: *An exercise in explicitly listing and challenging key working assumptions that underlie the basic analysis.*		
When to use	**Value added**	**Potential pitfalls**
A key assumptions check is most beneficial at the beginning of an analytic project. Analysts typically identify key assumptions during step 2 of the military decision-making process.	Explicitly identifying working assumptions during an analytic project assists analysts in— • Explaining the logic of the analytical argument and exposing faulty logic. • Understanding key factors that shape an issue. • Stimulating thinking about an issue. • Uncovering hidden relationships and links between key factors. • Identifying developments that would cause them to abandon an assumption. • Preparing for changed circumstances that could surprise them.	Identifying hidden assumptions is difficult because they are ideas believed to be true, albeit often subconsciously. Therefore, the assumptions are seldom examined and almost never challenged.

5-30. **Method.** Checking for key assumptions requires analysts to consider how their analysis depends on the validity of certain evidence. The following four-step process assists analysts in checking key assumptions:

- **Step 1:** Review what the current analytic line of thinking on the issue appears to be:
  - What do analysts think they know?
  - What key details assist analysts in accepting that the assumption is true?
- **Step 2:** Articulate the evidence, both stated and implied in finished intelligence, accepted as true.

- **Step 3:** Challenge the assumption by asking why it must be true and is it valid under all conditions. What is the degree of confidence in those initial answers?
- **Step 4:** Refine the list of key assumptions to contain only those that must be true in order to sustain the analytic line of thinking. Consider under what circumstances or based on what information these assumptions might not be true.

5-31. Analysts should ask the following questions during this process:

- What is the degree of confidence that this assumption is true?
- What explains the degree of confidence in the assumption?
- What circumstances or information might undermine this assumption?
- Is a key assumption more likely a key uncertainty or key factor?
- If the assumption proves to be wrong, would it significantly alter the analytic line of thinking? How?
- Has this process identified new factors that require further analysis?

QUALITY OF INFORMATION CHECK

5-32. Weighing the validity of sources is a key feature of any analytical assessment. Establishing how much confidence analysts have in their analytical judgments should be based on the information's reliability and accuracy. Analysts should perform periodic checks of the information for their analytical judgments; otherwise, important analytical judgments may become anchored to poor-quality information.

5-33. Determining the quality of information independent of the source of the information is important in ensuring that neither duly influences the other. Not understanding the context in which critical information has been provided makes it difficult for analysts to assess the information's validity and establish a confidence level in the intelligence assessment. A typically reliable source can knowingly report inaccurate information, and a typically unreliable source can sometimes report high-quality information. Therefore, it is important to keep the two reviews—source and information—separate. Table 5-9 briefly describes when to use the quality of information check technique, as well as the value added and potential pitfalls associated with using this technique. This technique—

- Provides the foundation for determining the confidence level of an assessment and clarity to an analyst's confidence level in the assessment.
- Provides an opportunity to catch interpretation errors and mitigate assimilation or confirmation bias based on the source:
  - **Assimilation bias** is the modification and elaboration of new information to fit prior conceptions or hypotheses. The bias is toward confirming a preconceived answer.
  - **Confirmation bias** is the conditions that cause analysts to undervalue or ignore evidence that contradicts an early judgment and value evidence that tends to confirm already held assessments.
- Identifies intelligence gaps and potential denial and deception efforts.

Table 5-9. Quality of information check technique

Quality of information check: *A way to evaluate the completeness and validity of available information separately from the source.*		
When to use	**Value added**	**Potential pitfalls**
This technique should be initially applied during the screen phase of the analysis process. Periodic reviews of the quality of information should be conducted to prevent assumptions or weak judgments from becoming facts over time. Checking the quality of information is an ongoing, continuous process.	A thorough quality of information check provides analysts with an accurate assessment of "what we know" and "what we do not know." Additionally, this technique provides validity to analysts' confidence levels in assessments.	Analysts can become susceptible to circular reporting and source-based bias when reviewing the quality of information. Analysts may not consider that critical information may sometimes be found in reports from sources judged to have a low level of access or a poor record.

5-34. **Method.** For an information review to be fully effective, analysts need as much background information on sources as is possible. At a minimum, analysts should perform the following steps:

- **Step 1:** Review all sources of information for accuracy; identify any of the more critical or compelling sources. (For example, a human source with direct knowledge is compelling.)
- **Step 2:** Determine if analysts have sufficient and/or strong collaboration between the information sources.
- **Step 3:** Reexamine previously dismissed information considering new facts or circumstances.
- **Step 4:** Ensure any circular reporting is identified and properly flagged for other analysts; analysis based on circular reporting should also be reviewed to determine if the reporting was essential to the judgments made. (For example, a human source's purpose for providing information may be to deceive.)
- **Step 5:** Consider whether ambiguous information has been interpreted and qualified properly. (For example, a signals intelligence transcript may be incomplete.)
- **Step 6:** Indicate a level of confidence analysts can place on sources that may likely figure into future analytical assessments.

5-35. Analysts can use table 5-10 as a questioning guideline. Table 5-10 is not an all-inclusive list of questions, as it does not include every intelligence discipline. It is a start point for analysts to check the quality of the information; analysts can expand the list of questions to include other intelligence disciplines.

Table 5-10. Questioning guideline for checking information quality

Counterintelligence/Human intelligence
• Who wrote the report, and to what organization does the report writer belong? • What changes have been made to the data since the original collection? • What is the collector's evaluation of the information in the report? • Can the source's purpose be ascertained? • Was the information first-, second-, or third-hand? • Is there information from a different intelligence discipline that corroborates this report? • Is the information consistent or inconsistent with previous information? • Does the analyst have any concerns that denial and deception may be in the information? Why?
Geospatial intelligence
• What is the frequency of collection? When does it occur (time/day)? Have there been any recent changes to the frequency of collection or exploitation? • Are additional images being taken at different times? • Is the target aware of overhead imagery capabilities? • Are geospatial intelligence-based indicators being used to assess the site or the activity? • Is there a geospatial aspect to the information?
Signals intelligence
• Communications intelligence: ▪ Is this a complete transcript (verbatim) or a processed (analyzed) summary of the traffic? ▪ Was this report a snippet of a much longer conversation? ▪ Did the collection shortfall preclude capturing all the traffic? • Electronic intelligence: ▪ Is the signal correlated to any events or activities? ▪ What was the duration of the collection? ▪ What is the frequency of the collection? When does it occur (time/day)? ▪ Are additional signals being collected at different times? ▪ Is there additional intelligence that correlates with this emitter activity? ▪ Has the activity been corroborated by another form of intelligence?

Note. Analysts should consciously avoid relating the source to the information until the quality of information check is complete. If relating the source to the quality of information changes the opinion of the information, analysts must ensure they can articulate why. Analysts should develop and employ a spreadsheet to track the information and record their confidence levels in the quality of information as a constant reminder of the findings.

INDICATORS/SIGNPOSTS OF CHANGE

5-36. The indicators/signposts of change technique is primarily a diagnostic tool that assists analysts in identifying persons, activities, developments, or trends of interest. Indicators/Signposts of change are often tied to specific scenarios created by analysts to help them identify which scenario is unfolding. Indicators/Signposts of change are a preestablished set of observable phenomena periodically reviewed to help track events, spot emerging trends, and warn of unanticipated change. These observable phenomena are events expected to occur if a postulated situation is developing. For example, some of the observable events of a potential protest include—

- The massive gathering of people at a specific location.
- People's rallying cries posted as messages on social media.
- An adjacent country's aggressive national training and mobilization drills outside of normal patterns.

5-37. Analysts and other staff members create a list of these observable events and the detection and confirmation of these indicators enable analysts to answer specific information requirements that answer PIRs. Collection managers often use these lists to help create an intelligence collection plan. A list of indicators allows analysts to track developments and build a more concrete case for analytical judgments.

5-38. This technique aids other structured analytic techniques that require hypotheses generation as analysts create indicators that can confirm or deny these hypotheses. Analysts may use indicators/signposts of change to support analysis during all operations of the Army's strategic roles and to assist them in identifying a change in the operations. Table 5-11 briefly describes when to use the indicators/signposts of change technique, as well as the value added and potential pitfalls associated with using this technique.

Table 5-11. Indicators/Signposts of change technique

Indicators/Signposts of change: *A preestablished set of observable phenomena periodically reviewed to help track events, spot emerging trends, and warn of unanticipated change.*		
When to use	**Value added**	**Potential pitfalls**
The technique can be used whenever analysts need to track an event over time to monitor and evaluate changes. It can also amplify other structured analytic techniques and support collection management and current operations.	By providing an objective baseline for tracking events or targets, indicators/signposts of change instill rigor into the analysis process and enhance the credibility of analytical judgments.	Poor indicators can lead to analytic failures. This technique requires analysts to continually check the validity of the indicators as their original assumptions may be outdated or too narrow in focus.

5-39. **Method.** Whether used alone or in combination with other structured analysis, the process is the same. When developing indicators, analysts start from the event, work backwards, and include as many indicators as possible. The following outlines the steps to the indicators/signposts of change technique:

- **Step 1:** Identify a set of competing hypotheses or scenarios.
- **Step 2:** Create separate lists of potential activities, statements, or events expected for each hypothesis or scenario.
- **Step 3:** Regularly review and update the indicator lists to see which are changing.
- **Step 4:** Identify the most likely or most correct hypothesis or scenario based on the number of changed indicators observed.

Note. Analysts should avoid making an assessment based on a single indicator. Integrating multiple indicators is essential for analysts to obtain the clearest picture and assists in mitigating threat deception efforts.

Chapter 6

Advanced Structured Analytic Techniques

SECTION I – CONTRARIAN STRUCTURED ANALYTIC TECHNIQUES

6-1. Contrarian structured analytic techniques challenge ongoing assumptions and broaden possible outcomes. They assist analysts in understanding threat intentions, especially when not clearly stated or known. Contrarian techniques explore the problem from different (often multiple) perspectives. This allows analysts to better accept analytic critique and grant greater avenues to explore and challenge analytical arguments and mindsets. Proper technique application assists analysts in ensuring preconceptions and assumptions are thoroughly examined and tested for relevance, implication, and consequence.

6-2. The contrarian structured analytic techniques described in this publication are—

- **Analysis of competing hypotheses (ACH) technique:** Evaluating multiple hypotheses through a competitive process in order to reach unbiased conclusions and attempting to corroborate results.
- **Devil's advocacy technique:** Challenging a single, strongly held view or consensus by building the best possible case for an alternative explanation.
- **Team A/Team B technique:** Using separate analytic teams that contrast two (or more) strongly held views or competing hypotheses.
- **High-impact/Low-probability analysis technique:** Highlighting an unlikely event that would have major consequences if it happened.
- **What if? analysis technique:** Assuming an event has occurred with potential (negative or positive) impacts and explaining how it might happen.

ANALYSIS OF COMPETING HYPOTHESES

6-3. Analysts use ACH to evaluate multiple competing hypotheses in order to foster unbiased conclusions. Analysts identify alternative explanations (hypotheses) and evaluate all evidence that will disconfirm rather than confirm hypotheses. While a single analyst can use ACH, it is most effective with a small team of analysts who can challenge each other's evaluation of the evidence.

6-4. ACH requires analysts to explicitly identify all reasonable alternatives and evaluate them against each other rather than evaluate their plausibility one at a time. ACH involves seeking evidence to refute hypotheses. The most probable hypothesis is usually the one with the least evidence against it, not the one with the most evidence for it. Conventional analysis generally entails looking for evidence to confirm a favored hypothesis. Analysts sometimes integrate the weighted ranking technique with ACH; this can help elevate one hypothesis in favor of another. Table 6-1 on page 6-2 briefly describes when to use the ACH technique, as well as the value added and potential pitfalls associated with using this technique.

Table 6-1. Analysis of competing hypotheses technique

Analysis of competing hypotheses (ACH): *A technique that uses a matrix as a tool to aid judgment on issues requiring careful weighting of alternative explanations or conclusions.*		
When to use	**Value added**	**Potential pitfalls**
ACH is highly effective when there is a large amount of data to absorb and evaluate. It is particularly appropriate when analysts want to develop a clear record that shows what theories they have considered and how they arrived at their judgments. This technique is useful for generating predictive assessments, as required, during step 4 of the intelligence preparation of the battlefield process.	ACH helps analysts overcome the following common mistakes that can lead to inaccurate forecasts: • Susceptibility to being unduly influenced by a first impression based on incomplete data, an existing analytic line of thought, or a single explanation that seems to fit well enough. • Lack of generating a full set of explanations or hypotheses at the outset of a project. • Reliance on evidence to support their preferred hypothesis, but that is also consistent with other explanations.	There are occasions when there is not enough evidence to arrive at a conclusion using ACH, or when the evidence is unbalanced enough—such as when using intelligence primarily from a single source—to lead to an inaccurate conclusion.

6-5. **Method.** Simultaneous evaluation of multiple competing hypotheses is difficult to accomplish without using tools. Retaining these hypotheses in working memory and then assessing how each piece of evidence interacts with each hypothesis is beyond the mental capabilities of most individuals. To manage the volume of information, analysts use a matrix as a tool to complete ACH. (See figure 6-1.) The following outlines the steps used to complete ACH:

- **Step 1:** Identify the intelligence problem.
- **Step 2:** Identify all possible hypotheses related to the intelligence problem.
- **Step 3:** Gather and make a list of all information related to the intelligence problem.
- **Step 4:** Prepare a matrix with each hypothesis across the top and each piece of information down the left side.
- **Step 5:** Determine if each piece of information is consistent or inconsistent with each hypothesis.
- **Step 6:** Refine the matrix. Reconsider the hypotheses and remove information that has no diagnostic value.
- **Step 7:** Draw tentative conclusions about the relative likelihood of each hypothesis.
- **Step 8:** Analyze if conclusions rely primarily on a few critical pieces of information.
- **Step 9:** Report conclusions.
- **Step 10:** Identify milestones for future observation that may indicate events are taking a different course than expected.

Guerilla Force Activities

Figure 6-1. Analysis of competing hypotheses used during step 4 of the IPB process

DEVIL'S ADVOCACY

6-6. Analysts use the devil's advocacy technique for reviewing proposed analytical conclusions. They are usually not involved in the deliberations that led to the proposed analytical conclusion. Devil's advocacy is most effective when used to challenge an analytic consensus or a key assumption about a critically important intelligence question. In some cases, analysts can review a key assumption and present a product that depicts the arguments and data that support a contrary assessment. Devil's advocacy can provide further confidence that the current analytic line of thought will endure close scrutiny. Table 6-2 briefly describes when to use the devil's advocacy technique, as well as the value added and potential pitfalls associated with using this technique. Devil's advocacy can lead analysts to draw one of three conclusions:

- Analysts ignored data or key lines of argument that undermine their analysis and should restart the analysis process.
- The analysis is sound, but more research is warranted in select areas.
- Key judgments are valid, but a higher level of confidence in the bottom-line judgments is warranted.

Table 6-2. Devil's advocacy technique

Devil's advocacy: *The process of challenging a single, strongly held view or consensus by building the best possible case for an alternative explanation.*		
When to use	**Value added**	**Potential pitfalls**
This technique is useful when there is concern about seemingly widespread unanimity amongst analysts on a critical issue. Analysts should assume the role of the devil's advocate if they have some doubts about a widely held view, or a leader might designate that analysts challenge the prevailing wisdom in order to reaffirm the group's confidence in those assessments.	Devil's advocacy challenges the current consensus to ensure analysts do not overlook alternate possibilities. It highlights the weaknesses in a current analytical judgment or assists in reaffirming analysts' confidence in the conclusion by— • Explicitly challenging key assumptions. • Identifying any faulty logic or information. • Presenting alternative hypotheses.	Those who strongly advocate an analytical judgment will resist a devil's advocacy approach. This technique challenges assumptions, but it can turn into an analytical argument with analysts taking sides rather than exploring the issue at hand.

6-7. **Method.** The following outlines the steps for the devil's advocacy technique:

- **Step 1:** Present the main analytical conclusion.
- **Step 2:** Outline the main points and key assumptions and characterize the evidence supporting the current analytical view.
- **Step 3:** Select one or more assumptions that appear the most susceptible to challenge.
- **Step 4:** Review the data used to determine questionable validity, possible deception, and the existence of gaps.
- **Step 5:** Highlight evidence that supports an alternative hypothesis or contradicts current thinking.
- **Step 6:** Present findings that demonstrate flawed assumptions, poor evidence, or possible deception.

6-8. Analysts should consider the following when conducting the devil's advocacy technique:

- Sources of uncertainty.
- Diagnosticity of evidence.
- Anomalous evidence.
- Changes in the broad environment.
- Alternative decision models.
- Availability of cultural expertise.
- Indicators of possible deception.
- Information gaps.

TEAM A/TEAM B

6-9. Team A/Team B is a process for comparing, contrasting, and clarifying two (or more) equally valid analytical assessments. Multiple teams of analysts perform this process, each working along different lines of analysis. Team A/Team B involves separate analytic teams that analyze two (or more) views or competing hypotheses. Team A/Team B is different from devil's advocacy, which challenges a single dominant mindset instead of comparing two (or more) strongly held views. Team A/Team B recognizes that there may be competing, and possibly equally strong, mindsets on an issue that needs to be clarified. A key requirement to ensure technique success is equally experienced competing mindsets. This mitigates unbalanced arguments. Table 6-3 briefly describes when to use the team A/team B technique, as well as the value added and potential pitfalls associated with using this technique.

Note. If opposing positions are well established, it can be useful to place analysts on teams that advocate positions they normally do not support; forcing analysts to argue the other side can make them more aware of their own mindsets.

Table 6-3. Team A/Team B technique

Team A/Team B: *Use of independent teams to contrast two (or more) strongly held views or competing hypotheses.*		
When to use	**Value added**	**Potential pitfalls**
If there are at least two competing views on a key issue, then team A/team B may be the appropriate technique to apply. Use when there are equally strong mindsets held on an issue that needs to be clarified.	This technique may help opposing groups see merit in each other's perspective. This reduces friction and differences by allowing those holding opposing views to feel their hypotheses have been given equal attention.	If the two teams are unequally matched, then the two views may receive an unequal amount of support.

6-10. **Method.** The following steps outlines the steps of the team A/team B technique (see figure 6-2):

- **Step 1:** Identify the two (or more) competing hypotheses.
- **Step 2:** Form teams and designate individuals to develop the best case for each hypothesis.
- **Step 3:** Review information that supports each respective position.
- **Step 4:** Identify missing information that would support or bolster the hypotheses.
- **Step 5:** Prepare a structured argument with an explicit discussion of—
  - Key assumptions.
  - Key evidence.
  - The logic behind the argument.
- **Step 6:** Set aside the time for a formal debate or an informal brainstorming session.

- **Step 7:** Have an independent jury of peers listen to the oral presentation and be prepared to question the teams about their assumptions, evidence, and/or logic.
- **Step 8:** Allow each team to present its case, challenge the other team's argument, and rebut the opponent's critique of its case.
- **Step 9:** The jury considers the strength of each presentation and recommends possible next steps for further research and collection efforts.

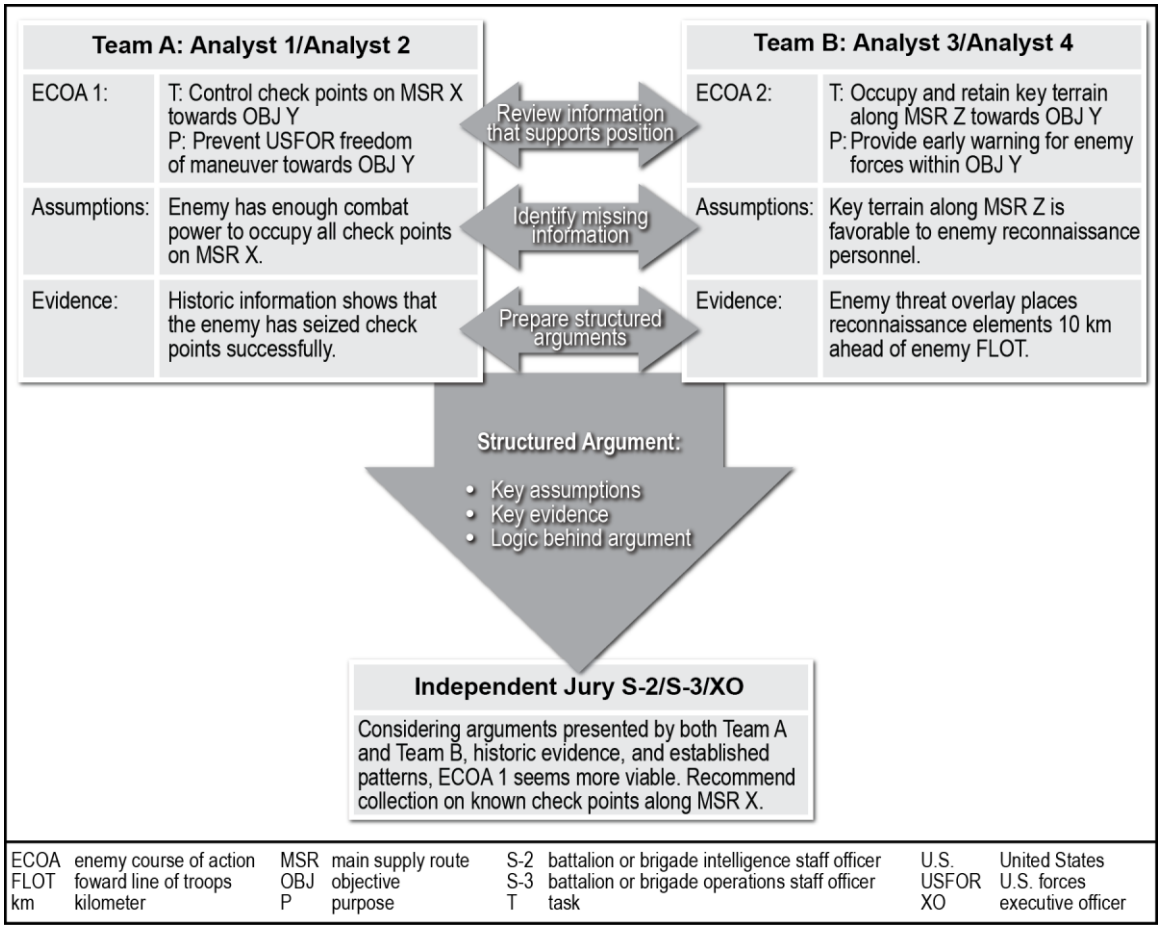

Figure 6-2. Team A/Team B used during step 4 of the IPB process

HIGH-IMPACT/LOW-PROBABILITY ANALYSIS

6-11. The high-impact/low-probability analysis technique sensitizes analysts to the potential impact that seemingly low-probability events could have on U.S. forces. New and often fragmentary data suggesting that a previously unanticipated event might occur is a trigger for applying this technique.

6-12. Mapping out the course of an unlikely, yet plausible event may uncover hidden relationships between key factors and assumptions; it may also alert analysts to oversights in the analytic line of thought. This technique can augment hypotheses-generating analytic techniques.

6-13. The objective of high-impact/low-probability analysis is exploring whether an increasingly credible case can be made for an unlikely event occurring that could pose a major danger or open a window of opportunity. Examining the unlikely allows analysts to develop indicators that may provide early warnings of a shift in the situation. By periodically reviewing those indicators, analysts are likely to counter any prevailing mindset that such a development is highly unlikely. Table 6-4 on page 6-6 briefly describes when to use high-impact/low-probability analysis, as well as the value added and potential pitfalls associated with using this technique.

Table 6-4. High-impact/Low-probability analysis technique

High-impact/Low-probability analysis: *Provides decision makers with an early warning that a seemingly unlikely but impactful event might actually occur.*		
When to use	**Value added**	**Potential pitfalls**
Analysts should use high-impact/low-probability analysis to analyze a threat's worst-case scenario.	This technique allows analysts to explore the consequences of an event—particularly an event not deemed likely by conventional wisdom—without having to challenge the main-line judgment or argue about how likely an event is to occur.	Analysts that communicate the likelihood of low-probability events occurring may cause intelligence assessment consumers to disregard those events. Therefore, analysts should use caution when communicating likelihoods. Additionally, high-impact/low-probability analysis is sometimes confused with "what if" analysis.

6-14. **Method.** An effective high-impact/low-probability analysis involves the following steps:

- **Step 1:** Define the high-impact outcome clearly. This will justify examining what may be deemed a very unlikely development.
- **Step 2:** Devise one or more plausible pathways to the low-probability outcome. Be precise, as it may aid in developing indicators for later monitoring.
- **Step 3:** Insert possible triggers or changes in momentum if appropriate (such as natural disasters, sudden key leader health problems, or economic or political turmoil).
- **Step 4:** Brainstorm plausible but unpredictable triggers of sudden change.
- **Step 5:** Identify a set of indicators for each pathway that help anticipate how events are likely to develop and periodically review those indicators.
- **Step 6:** Identify factors that could deflect a bad outcome or encourage a positive one.

"WHAT IF?" ANALYSIS

6-15. "What if?" analysis is a technique for challenging a strong mindset that an event will not occur or that a confidently made forecast may not be entirely justified. "What if?" analysis is similar to high-impact/low-probability analysis; however, it does not focus on the consequences of an unlikely event. "What if" analysis attempts to explain how the unlikely event might transpire. It also creates an awareness that prepares analysts to recognize early signs of a significant change.

6-16. "What if" analysis can also shift focus from asking whether an event will occur to working from the premise that it has occurred. This allows analysts to determine how the event might have happened. This technique can augment hypotheses-generating analytic techniques using multiple scenario generation or ACH. "What if?" analysis shifts the question from "How likely is the event?" to the following:

- How could the event possibly occur?
- What would be the impact of the event?
- Has the possibility of the event happening increased?

6-17. Like other contrarian techniques, "what if?" analysis must begin by stating the conventional analytic line of thought and then stepping back to consider alternative outcomes that are too important to dismiss no matter how unlikely. Table 6-5 briefly describes when to use the "what if?" analysis, as well as the value added and potential pitfalls associated with using this technique.

Table 6-5. "What if?" analysis technique

"What if?" analysis: *Assumes that an event has occurred with a potential for a major or negative impact and then explains how it came about using hindsight.*		
When to use	**Value added**	**Potential pitfalls**
Using this technique is important when a judgment relies on limited information or unproven assumptions. "What if?" analysis is also a logical follow-up to a key assumptions check that identifies an assumption that is critical to an important estimate but about which there is some doubt.	This technique opens the mind to think differently and creatively. It also provides decision makers a better sense of what can be done to prevent a development from occurring. Additionally, the technique facilitates developing indicators for a potential event.	"What if?" analysis is sometimes confused with high-impact/low-probability analysis. Analysts may waste time if the event hypothesized is inconceivable.

6-18. **Method.** The "what if?" analysis steps are similar to the high-impact/low-probability analysis steps once analysts have established the event itself:

- **Step 1:** Assume the event has happened.
- **Step 2:** Select some triggering events that permitted the scenario to unfold to help make the "what if?" more plausible (for example, the death of key leader, a natural disaster, an economic or political event that might start a chain of other events).
- **Step 3:** Develop a chain of reasoning based on logic and evidence to explain how this outcome could have occurred.
- **Step 4:** Think backwards from the event in concrete ways, specifying what must occur at each stage of the scenario.
- **Step 5:** Identify one or more plausible pathways to the event; it is likely that more than one will appear possible.
- **Step 6:** Generate an indicators/signposts of change list to detect the beginnings of the event.
- **Step 7:** Consider the scope of positive and negative consequences and their relative impact.
- **Step 8:** Monitor the indicators developed periodically.

High-Impact/Low-Probability Analysis Versus "What If?" Analysis

- High-impact/Low-probability analysis primarily warns decision makers that recent, unanticipated developments suggest an event, previously deemed highly unlikely, might occur. It projects forward, extracting from recent evidence or information.
- Conversely, "what if?" analysis does not typically require new evidence or anomalous information as a trigger. It looks back, imagining a surprising outcome and then mapping several ways that outcome could occur.

SECTION II – IMAGINATIVE STRUCTURED ANALYTIC TECHNIQUES

6-19. Imaginative structured analytic techniques assist analysts in approaching an analytic problem from different and multiple perspectives. This technique also broadens analysts' selection of potential COAs, thus reducing the chance of missing unforeseen outcomes. Imaginative techniques facilitate analysts' ability to forecast events and generate ideas creatively. Additionally, the proper application of imaginative techniques can assist in identifying differences in perspectives and different assumptions among analytic team members. The most commonly used imaginative techniques are—

- **Brainstorming technique:** Generating new ideas and concepts through unconstrained groupings.
- **Functional analysis technique:**
  - Identifying threat vulnerabilities through knowledge of threat capabilities.
  - Identifying windows of opportunity and threat vulnerabilities.

- **Outside-in thinking technique:** Identifying the full range of basic factors and trends that indirectly shape an issue.
- **Red hat/team analysis technique:** Modeling the behavior of an individual or group by trying to replicate how a threat would think about an issue.

BRAINSTORMING

6-20. Brainstorming is a widely used technique for stimulating new thinking; it can be applied to most other structured analytic techniques as an aid to thinking. Brainstorming is most effective when analysts have a degree of subject matter expertise on the topic of focus.

6-21. Brainstorming should be a very structured process to be most productive. An unconstrained, informal discussion might produce some interesting ideas, but usually a more systematic process is the most effective way to break down mindsets and produce new insights. The process involves a **divergent thinking phase** to generate and collect new ideas and insights, followed by a **convergent thinking phase** for grouping and organizing ideas around key concepts. Table 6-6 briefly describes when to use the brainstorming technique, as well as the value added and potential pitfalls associated with using this technique.

Table 6-6. Brainstorming structured technique

Brainstorming: *A technique that involves a group process for generating new ideas and concepts.*		
When to use	**Value added**	**Potential pitfalls**
Typically, analysts apply structured brainstorming when they begin a project to help generate a range of hypotheses about an issue or when amplifying other analytic techniques.	This technique can maximize creativity in the thinking process. Structured brainstorming allows analysts to see a wider range of factors that might bear on the topic than they would otherwise consider. It can spark new ideas, ensure a comprehensive look at a problem, raise questions, and prevent premature consensus.	There may not be enough time to apply structured brainstorming correctly, to include establishing rules and generating ideas. Additionally, analysts may censor each other's ideas.

6-22. **Method.** As a two-phase process, brainstorming elicits the most information from brainstorming participants:

- **Phase 1—Divergent thinking phase:**
  - **Step 1:** Distribute a piece of stationery with adhesive and pens/markers to all participants. Typically, a group of 10 to 12 people works best.
  - **Step 2:** Pose the problem in terms of a focal question. Display it in one sentence on a large easel or whiteboard.
  - **Step 3:** Ask the group to write down responses to the question, using key words that will fit on the small piece of stationery.
  - **Step 4:** Stick all of the notes on a wall for all to see—treat all ideas the same.
  - **Step 5:** When a pause follows the initial flow of ideas, the group is reaching the end of its collective conventional thinking, and new divergent ideas are then likely to emerge. End phase 1 of the brainstorming after two or three pauses.
- **Phase 2—Convergent thinking phase:**
  - **Step 6:** Ask group participants to rearrange the notes on the wall according to their commonalities or similar concepts. Discourage talking. Some notes may be moved several times as they begin to cluster. Copying some notes is permitted to allow ideas to be included in more than one group.
  - **Step 7:** Select a word or phrase that characterizes each grouping or cluster once all of the notes have been arranged.
  - **Step 8:** Identify any notes that do not easily fit with others and consider them as either isolated thoughts or the beginning of an idea that deserves further attention.
  - **Step 9:** Assess what the group has accomplished in terms of new ideas or concepts identified or new areas that require more work or further brainstorming.

- **Step 10:** Instruct each participant to select one or two areas that deserve the most attention. Tabulate the votes.
- **Step 11:** Set the brainstorming group's priorities based on the voting and decide on the next steps for analysis.

FUNCTIONAL ANALYSIS USING CRITICAL FACTORS ANALYSIS

6-23. Critical factors analysis (CFA) is an overarching analytic framework that assists analysts in identifying threat critical capabilities, threat critical requirements, and threat critical vulnerabilities that they can integrate into other structured analytic techniques. This assists friendly forces in effectively identifying windows of opportunity and threat vulnerabilities. At echelons above corps, CFA assists in identifying threat centers of gravity that friendly forces can use for operational planning:

- *Critical capability* is a means that is considered a crucial enabler for a center of gravity to function as such and is essential to the accomplishment of the specified or assumed objective(s) (JP 5-0).
- *Critical requirement* is an essential condition, resource, or means for a critical capability to be fully operational (JP 5-0).
- *Critical vulnerability* is an aspect of a critical requirement which is deficient or vulnerable to direct or indirect attack that will create decisive or significant effects (JP 5-0).

Note. CFA is often presented as a stand-alone technique; however, it shares characteristics found in other imaginative techniques. For the purposes of this publication, CFA is categorized under imaginative techniques.

6-24. To conduct CFA successfully, identify threat critical capabilities. The more specific the threat critical capability, the more specificity analysts can apply to threat critical capabilities, requirements, and vulnerabilities. CFA is more effective when conducted by a team of experienced analysts. Additionally, structured brainstorming can amplify this technique. Analysts can determine windows of opportunity by identifying the common denominator or entity that encompasses those identified threat critical capabilities, requirements, and vulnerabilities. Identified threat critical vulnerabilities are used to develop the HVT list in IPB, step 3, and then later prioritized by the fires cells. (See figure 6-3 on page 6-10.) Table 6-7 briefly describes when to use the functional analysis technique using CFA, as well as the value added and potential pitfalls associated with using this technique.

Table 6-7. Functional analysis technique using critical factors analysis

Functional analysis using critical factors analysis (CFA): The application of the knowledge of common and necessary military functions to specific threat capabilities.		
When to use	**Value added**	**Potential pitfalls**
Analysts should conduct functional analysis using CFA when attempting to identify windows of opportunity and threat vulnerabilities. This is often completed when evaluating the threat during step 3 of the intelligence preparation of the battlefield process.	Functional analysis may also act as the catalyst for other analytic tools such as the criticality, accessibility, recuperability, vulnerability, effect, and recognizability (also called CARVER) matrix tool for prioritizing targets.	Units may not have enough experienced personnel to apply this technique effectively, as multiple analysts are optimal. There may not be enough time to conduct a thorough functional analysis.

6-25. **Method.** The following outlines those steps necessary to conduct CFA (see figure 6-3 on page 6-10):

- **Step 1:** Create a quad-chart. Identify a specific threat mission objective.
- **Step 2:** Identify all threat critical capabilities that are essential to achieve the threat mission objective and input in the top-right quadrant of the chart. (Threat must be able to achieve X.)
- **Step 3:** Identify all threat critical requirements—conditions or resources integral to critical capabilities developed in step 1—and input in the bottom-right quadrant of the chart. (To achieve X, the threat needs Y.)
- **Step 4:** Identify all threat critical vulnerabilities—elements related to threat critical requirements developed in step 2 that appear exposed or susceptible (at risk)—and input in the bottom-left quadrant of the chart. (The threat cannot lose Z.)

- **Step 5:** Analyze the chart to determine the windows of opportunity by identifying the common denominator (or entity) that encompasses those identified threat critical capabilities, requirements, and vulnerabilities and input in the top-left quadrant of the chart.
- **Step 6:** Identify all listed critical factors that friendly forces can directly affect to identify potential targets or topics for further collection.

Windows of Opportunity	**Threat Critical Capabilities**
Friendly force opportunities to attack: • Attack during threat movement because threat command and control limited during maneuver. • Attack at night because threat air limited to daytime.	• Maneuver in depth to disrupt friendly main effort. • Mass combat fire against friendly light reconnaissance force. • Speed presents two options against which to defend. • Capability to seize windows of opportunity.
Threat Critical Vulnerabilities	**Threat Critical Requirements**
• Command and control limited during maneuver. • Maneuver space and routes can be interdicted. • Supply elements vulnerable to attack. • Threat air limited to daytime and visual meteorological conditions. • Special operations forces insertion phase vulnerable to interdiction.	• Command and control. • Maneuver space and routes. • Long-range artillery and multiple launch rocket assets. • Available ammunition. • Available fuel. • Defensive counterair. • Available special operations forces support. • Available air transport to support insertion.

Figure 6-3. Functional analysis using critical factors analysis

OUTSIDE-IN THINKING

6-26. The outside-in thinking technique assists analysts in identifying the broad range of factors, forces, and trends that may indirectly shape an issue—such as global, political, environmental, technological, economic, or social forces—outside their area of expertise, but that may profoundly affect the issue of concern. This technique is useful for encouraging analysts to think critically because they tend to think from inside out, focusing on factors most familiar in their specific area of responsibility.

6-27. Outside-in thinking reduces the risk of missing important variables early in the analysis process; it should be the standard process for any project that analyzes potential future outcomes. This technique works well for a group of analysts responsible for a range of functional and/or regional issues. Table 6-8 briefly describes when to use the outside-in thinking technique, as well as the value added and potential pitfalls associated with using this technique.

Table 6-8. Outside-in thinking technique

Outside-in thinking: *A technique used to identify the range of systemic forces, factors, and trends that could shape an issue, allowing analysts to incorporate this broader conceptual framework into their analysis.*		
When to use	**Value added**	**Potential pitfalls**
Outside-in thinking is most useful in the early stages of an analytic project when the goal is to identify all critical, external factors that could influence how a particular situation will develop.	This technique encourages analysts to think about their issues in a wider conceptual and contextual framework. By recasting the problem in much broader and fundamental terms, analysts are more likely to uncover additional factors, an important dynamic, or a relevant alternative hypothesis.	Analysts tend to think from inside out, focusing on factors that are most familiar in their specific area of responsibility.

6-28. **Method.** The following outlines those steps of outside-in thinking (see figure 6-4):

- **Step 1:** Identify the topic of study.
- **Step 2:** Brainstorm all key factors (operational variables [PMESII-PT]) that could impact the topic.

- **Step 3:** Employ the mission variables (METT-TC) to trigger new ideas.
- **Step 4:** Focus on those key factors over which a commander can exert some influence.
- **Step 5:** Assess how each of those factors could affect the analytic problem.
- **Step 6:** Determine whether those factors can impact the issue based on the available evidence.

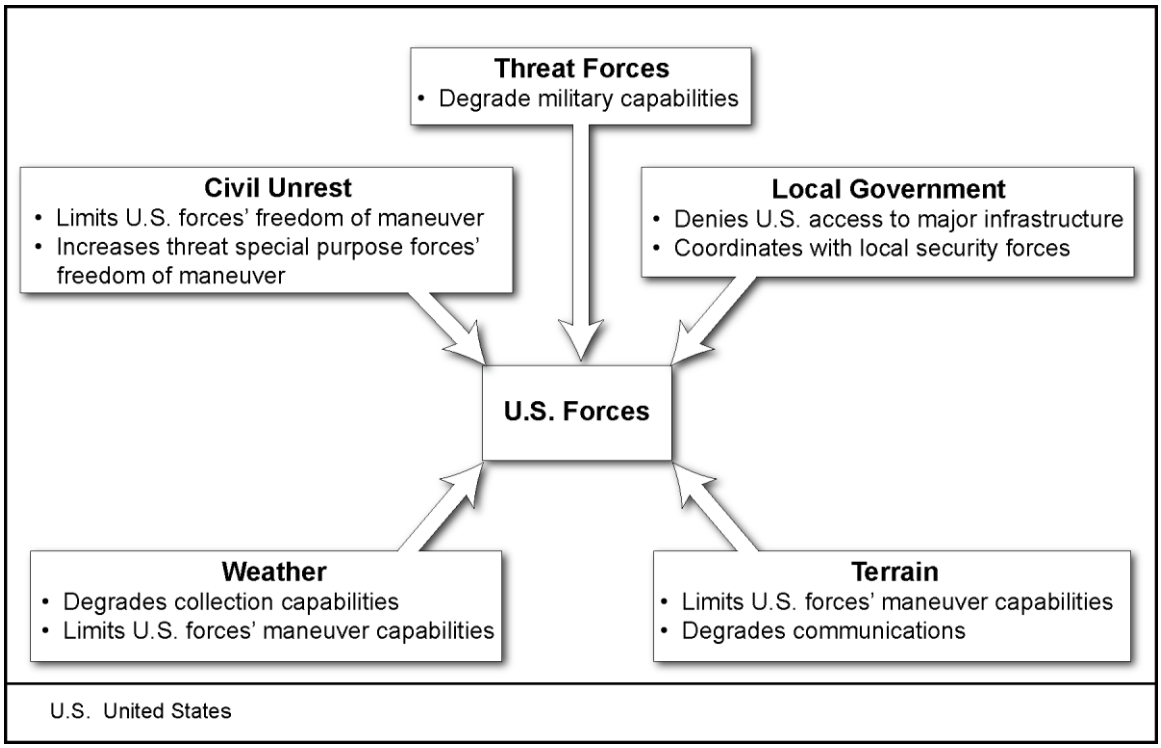

Figure 6-4. Outside-in thinking used during step 2 of the IPB process

RED HAT/TEAM ANALYSIS

6-29. The red hat/team analysis technique facilitates analysts' modeling of threat behavior by attempting to formulate ideas on how the threat would think about an issue. Red hat/team analysis is also a type of reframing technique performed by analysts attempting to solve an intelligence problem by using a different perspective. They attempt to perceive threats and opportunities as would the threat in order to categorize the threat. Categories include but are not limited—

- Command and control.
- Movement and maneuver.
- Intelligence.
- Fires.
- Sustainment.
- Protection.
- Cyberspace.

6-30. Red hat/team analysis is of limited value without a deep understanding of the threat—especially threat doctrine—and the threat's environment, which can affect the threat's decision making. Authoritarian leaders, military leaders, and small cohesive groups, such as terrorist cells, are candidates for this type of analysis. Analysts commonly use red hat/team analysis as a key input to step 2 of the MDMP. Table 6-9 on page 6-12 briefly describes when to use the red hat/team analysis technique, as well as the value added and potential pitfalls associated with using this technique.

Table 6-9. Red hat/team analysis technique

Red hat/team analysis: *A technique that aims to predict the behavior of a threat by trying to replicate how the threat thinks by way of analysts putting themselves "in the threat's shoes."*		
When to use	**Value added**	**Potential pitfalls**
Analysts should use this technique when attempting to forecast behaviors, especially threat behaviors. Analysts typically conduct this type of analysis during step 4 of the intelligence preparation of the battlefield process or when supporting war gaming during the military decision-making process.	The conscious effort to imagine the situation as the target perceives it assists analysts in gaining a different and usually more accurate perspective of the problem or issue.	Analysts challenged to forecast how a threat may behave risk falling into a "mirror-image" exercise. That is, analysts may incorrectly conduct red hat/team analysis from the perspective that the threat shares the same motives, values, or understanding of an issue as they do. Additionally, analysts may assume that the threat will behave according to the same assumptions, culture, and doctrine as analysts would if faced with the same threats or opportunities.

6-31. **Method.** The following outlines the steps to conduct red hat/team analysis:

- **Step 1:** Identify the situation and ask how the threat would respond to the situation.
- **Step 2:** Emphasize the need to avoid mirror imaging. Define the cultural and personal norms that would influence the threat's behavior (use operational variables [PMESII-PT]/civil considerations [ASCOPE] and threat characteristics, threat doctrine, and threat intentions matrices as aids).
- **Step 3:** Develop first-person questions that the threat would ask about the situation.
- **Step 4:** Present results and describe alternative COAs the threat would pursue.

Note. Some publications differentiate between red hat analysis and red team analysis, while others describe them as being the same. When differentiated, red team analysis is categorized as a contrarian technique. For this publication, the two techniques are synonymous.

PART THREE

Intelligence Analysis Considerations

Chapter 7

Analytic Support to Army Forces and Operations

OVERVIEW

7-1. Although the intelligence analysis process does not change, the tasks performed by intelligence analysts differ significantly based on the echelon, the supported functional element, the Army strategic role, and the specific mission. As with many tasks, the most significant factor affecting analysis is time. Time includes both the amount of time to analyze a problem and the timeliness of the final analytical assessment to the decision maker.

7-2. Operations, such as large-scale ground combat operations, are often especially time-constrained for decision makers and analysts. Therefore, care must be taken to provide timely, quality analytical assessments. For example, during large-scale offensive operations, the terrain designated to various echelons to seize, retain, and exploit the initiative dictates the friendly operating tempo within assigned boundaries. A battalion S-2 is assigned a very narrow frontage, while a brigade S-2 looks at a larger area that potentially encompasses a frontage based on assigned and attached maneuver elements according to the assigned mission. However, a brigade conducting consolidation area security might look for bypassed and irregular forces and terrorists within a large and complex area.

ANALYSIS ACROSS THE ECHELONS

7-3. Intelligence analysts conduct analysis during combat operations to support Army forces at all echelons. The commander's need for the continuous assessment of enemy forces focuses intelligence analysis. The analytical output of the intelligence warfighting function assists commanders in making sound and timely decisions. Analysts must understand at which points in an operation the commander needs specific PIRs answered in order to support upcoming decision points. This understanding assists analysts in creating a timeline for conducting analysis and identifying when information is no longer of value to the commander's decision making.

7-4. Analytical elements at NGIC and at echelons above corps focus primarily on strategic- to operational-level analytic problems, analytical elements at the corps level focus on both tactical- and operational-level analytic problems, and analytical elements at echelons below corps focus on tactical-level analytic problems. The strategic, operational, and tactical levels of warfare assist commanders—informed by the conditions of their OEs—in visualizing a logical arrangement of forces, allocating resources, and assigning tasks based on a strategic purpose:

- *Strategic level of warfare* is the level of warfare at which a nation, often as a member of a group of nations, determines national or multinational (alliance or coalition) strategic security objectives and guidance, then develops and uses national resources to achieve those objectives (JP 3-0). At the strategic level, leaders develop an idea or set of ideas for employing the instruments of national power (diplomatic, informational, military, and economic) in a synchronized and integrated fashion to achieve national objectives.
- *Operational level of warfare* is the level of warfare at which campaigns and major operations are planned, conducted, and sustained to achieve strategic objectives within theaters or other operational areas (JP 3-0). The operational level links the tactical employment of forces to national and military strategic objectives, focusing on the design, planning, and execution of operations using operational art. (See ADP 3-0 for a discussion of operational art.)
- *Tactical level of warfare* is the level of warfare at which battles and engagements are planned and executed to achieve military objectives assigned to tactical units or task forces (JP 3-0). The tactical level of warfare involves the employment and ordered arrangement of forces in relation to each other.

NATIONAL AND JOINT ANALYTIC SUPPORT

7-5. Intelligence analysis support to national organizations and the joint force focuses on threats, events, and other worldwide intelligence requirements. For the Army, the United States Army Intelligence and Security Command (INSCOM) is the lead organization to provide all-source and single-source intelligence capabilities to Army Service component commands. INSCOM includes functional brigades, units, and elements that provide general support, general support reinforcing, or direct support to theaters through intelligence reach, or they may be force-tailored for deployment to support the joint force. NGIC, which is under INSCOM, serves as the Army's Service Intelligence Center all-source analytical effort for general military intelligence, science and technology intelligence, and identity intelligence, all of which focus on the land domain. National and joint intelligence activities are continuous and reach across the range of military operations to provide continuous analytic support, including warning intelligence, to senior levels of the U.S. Government and DOD. (See JP 2-01 for more information on national and joint analytic support.)

THEATER ARMY

7-6. At the theater army level, intelligence analysis supports the combatant commander's operational mission requirements by enabling the theater command to apply capabilities to shape and prevent potential threat action. Theater army-level analytical activities include but are not limited to—

- Supporting theater campaign plans.
- Developing expertise to analyze threat characteristics within a region.
- Long-term analysis of a region and/or country that enables warning intelligence of imminent threat ground operations.
- Detailed analysis of multi-domain specific requirements.
- Serving as the Army's interface to national and joint support for operational and tactical forces.

7-7. Analysts assigned to the theater army-level all-source intelligence cell can expect to work with other Services as well as other nations. Analytical assessment support to future operations focuses on threat activities, intent, and capabilities beyond 168 hours within a designated global region assigned to the combatant commander.

CORPS

7-8. The corps G-2 and associated analytical elements, along with the ACE, further refine operational planning provided by the theater army, and they produce and update a broad range of intelligence products to support corps operations. These intelligence products, as well as constant collaboration between echelons, assist subordinate commands (division or brigade) in their planning. The corps ACE provides the most in-depth analysis at the tactical level to support the deep fight. Analytical assessment support to future operations focuses on threat activities, intent, and capabilities for the next 96 to 168 hours. (For more information on intelligence products, see appendix E.)

DIVISION

7-9. The division G-2, supported by the intelligence cell, advises the commander on how to leverage the intelligence warfighting function to support operations. The G-2 assists the commander in synchronizing intelligence operations; coordinates activities and systems that facilitate understanding the threat, terrain and weather, and other relevant aspects of the OE (such as key populations, groups, and organizations); and supervises the intelligence cell. The intelligence cell requests, receives, and analyzes information from multiple sources to produce and distribute intelligence products; it consists of most of the intelligence staff and an attached Air Force weather team.

BRIGADE COMBAT TEAM

7-10. The BCT S-2 is the principal intelligence advisor to the BCT commander. The S-2 coordinates activities and systems that facilitate understanding the threat, terrain and weather, and other relevant aspects of the area of interest (such as key populations, groups, and organizations). Additionally, the BCT S-2 supports security programs and oversees the BCT intelligence cell. The intelligence cell requests, receives, and analyzes information from multiple sources to produce and distribute intelligence products. The cell's geospatial engineer team manages the Standard Sharable Geospatial Foundation and geospatial information and services for the BCT, supporting the entire BCT with geospatial data and terrain analysis products.

BATTALION

7-11. Battalion-level intelligence analysis within the battalion intelligence section is rudimentary and focuses on a 12- to 24-hour period. Specifically, the battalion intelligence section focuses on IPB threat capabilities.

SUPPORT TO FUNCTIONAL ELEMENTS

7-12. The Army is committed to providing intelligence support across most unique functional elements. Although all of these elements perform IPB and collection management, the intelligence analysis requirements for these elements vary significantly based on the commander's designated mission; therefore, when assigned, intelligence analysts must learn the mission-specific intelligence analysis requirements for their functional element, identified in table 7-1.

Table 7-1. Intelligence analysis support to functional elements

Functional element	*Mission*	*Intelligence analysis considerations*	*Doctrinal references*
Air defense (AD) or air and missile defense	AD elements exist across all echelons. They establish AD plans to engage hostile ballistic missiles, aircraft, cruise missiles, and unmanned aircraft systems within the operational environment (OE).	Analysis focuses on air threats consisting of aircraft and missile technologies capable of controlling the air domain and influencing maneuverability within the land domain. Analysts must consider threat-to-friendly AD systems from threat air assets, as this is a United States (U.S.) or coalition Air Force mission.	JP 3-01 FM 3-01
Aviation	Aviation operations consist of aircraft (fixed- and rotary-wing) activities, airfield operations, and Army-level air traffic services.	Analysis support includes basic intelligence activities with additional knowledge of enemy aircraft and AD systems and capabilities. Army aviation operations require intelligence preparation of the battlefield (IPB) and collection support.	FM 3-04

Table 7-1. Intelligence analysis support to functional elements (*continued*)

Functional element	*Mission*	*Intelligence analysis considerations*	*Doctrinal references*
Chemical, biological, radiological, and nuclear (CBRN)	CBRN units support the Army across all echelons by identifying CBRN threats on the battlefield. This includes CBRN passive defense preventive measures to minimize friendly unit vulnerability to CBRN threat/hazard effects. CBRN reconnaissance and surveillance provide the command with detailed, timely, and accurate information to inform decision making or answer the commander's critical information requirements about CBRN threats or hazards.	Analysis support includes basic intelligence activities with additional knowledge of enemy capabilities to employ CBRN capabilities against friendly forces and toxic industrial material or dual-use facilities. Army CBRN operations require IPB and collection support to guide CBRN reconnaissance element collection efforts.	ATP 3-11.36 ATP 3-11.37 FM 3-11
Civil affairs (CA)	CA operations enhance awareness of and manage interactions with the OE civil component, identify and mitigate underlying causes of instability in the civil society, or apply functional specialty skills, which are normally the civil government's responsibility.	Analysis support focuses on IPB and threats to civil considerations (areas, structures, capabilities, organizations, people, and events [ASCOPE]).	FM 3-53 FM 3-57
Cyberspace	Cyberspace elements provide defensive cyberspace operations to the Army as well as to global commands.	Analysis support to cyberspace operations is a developing process and requires examination of current cyberspace operational concepts. Army cyberspace operations require unique cyberspace IPB and collection support.	FM 3-12
Engineer	Engineer activities include geospatial support, construction, real property maintenance activities, sustainment of lines of communications (LOCs), engineer logistics management, base camp development, mobility and countermobility functions, including river speeds, wet gap crossing bank slope, obstacle types and orientation, enemy engagement area development activities, and percentage of enemy survivability positions dug.	Basic analysis support to engineering activities is necessary to identify threats and enemy force activities. Army operational and tactical engineer operations require IPB and collection support. All staff sections rely on Army engineers to provide Standard Sharable Geospatial Foundation and geospatial and terrain analysis for mission planning, command and control/current operations, and geospatial intelligence products.	ATP 3-90.4 ATP 3-90.8 FM 3-34
Explosive ordnance disposal/ Counter-improvised explosive device/ Counter-explosive hazard	Large-scale ground combat operations support includes— • Targeting and remediating threat munitions production, storage, and employment. (Contingency) • Defeating explosive threats to the force. • Mitigating explosive hazards via training the force. • Neutralizing explosive hazards via attacking threat networks.	Analysis supports— • Characterizing threat capabilities in the context of conventional and unconventional munitions and explosive hazards, including CBRN threats. • Detecting, identifying, and targeting threat munition and explosive hazard production and storage capabilities, facilities, and networks. • Describing the threat's use of munitions and explosive hazards to support training.	JP 3-15.1 ATP 3-90.37 ATP 4-32 ATP 4-32.1
Medical	The complexities of the range of military operations require medical support to military and civilian considerations (ASCOPE).	Intelligence analysts advise the medical command on nuclear/chemical surety and CBRN operations. Reference the National Center for Medical Intelligence for all-source medical intelligence assessments.	FM 4-02

Table 7-1. Intelligence analysis support to functional elements (*continued*)

Functional element	*Mission*	*Intelligence analysis considerations*	*Doctrinal references*
Military police (MP)	MPs provide the Army's policing, investigations, and corrections capabilities to enable protection, preserve the force, and promote the rule of law. MPs execute these capabilities via the three MP disciplines: police operations, detention operations, and security and mobility support.	Analysis enables MP commanders' situational understanding, battlefield visualization, and force protection programs by providing relevant criminal threat and friendly information that impacts operational and tactical environments. Army MP operations and overall effects require IPB and collection support.	ATP 3-39.10 ATP 3-39.20 ATP 3-39.30 FM 3-39 FM 3-63
Psychological operations	Military information support operations support corps and divisions in providing tactical-level analysis and augmentation that include language and cultural expertise, regional analysis, and mass communications delivery capabilities.	Analysis support to military information support operations includes performing IPB, specifically threat and civil considerations (ASCOPE) analysis.	FM 3-53
Signal	The signal element supports all levels of Army commands and provides Army communications and communications security—Department of Defense information network (DODIN) operations.	Analysis support is wide-ranging, from global threat analysis to support of threat communications capabilities within a given OE. DODIN operations require IPB and collection support.	FM 6-02
Space	The Army space force is a multicomponent organization of space support elements that conduct theater space operations and planning, integrate and coordinate space capabilities, and support commanders in exercising command and control through space operations.	Analysis support to the Army Space and Missile Defense Command is unique; therefore, it provides new intelligence personnel upon arrival. Army space operations require unique space IPB and collection support.	FM 3-14
Special operations forces (SOF)	*Army special operations forces* are those Active and Reserve Component Army forces designated by the Secretary of Defense that are specifically organized, trained, and equipped to conduct and support special operations (JP 3-05). SOF include CA, psychological operations, Rangers, special forces, special mission units, and Army special operations aviation forces assigned to the U.S. Army Special Operations Command—all supported by the 528th Sustainment Brigade (Special Operations) (Airborne).	Analysis support includes efforts to defeat joint, transregional, all-domain, multifunctional threats and to facilitate Army special operations over a multi-domain extended battlefield in large-scale ground combat operations. Within the range of military operations, analysis assists commanders in developing the appropriate lines of effort and lines of operations to destroy threat networks, shape conditions, deter threats, and influence relevant actors. A common factor of special operations and associated activities is that special operations units conducting operations are either operating among populations or supporting others in permissive or uncertain environments. This factor requires nuanced information and intelligence products to ensure special operations units' consistent interactions with populations contribute to the success of the mission instead of being a detriment to the mission. Most importantly, operating among populations requires an understanding that the populations and subgroups within it are important, potential centers of gravity, sources of power, and often the basis to long-term stability.	ADP 3-05

Table 7-1. Intelligence analysis support to functional elements (*continued*)

Functional element	*Mission*	*Intelligence analysis considerations*	*Doctrinal references*
Sustainment	Sustainment doctrine focuses on the four elements of sustainment: logistics, personnel services, financial management, and health service support to unified land operations.	Analysis support includes basic intelligence activities with additional knowledge of logistics, LOCs, medical or health services, and, to some extent, personnel services and financial management. Army sustainment operations require IPB and collection support.	ADP 4-0

ANALYSIS ACROSS THE ARMY'S STRATEGIC ROLES

7-13. Intelligence analysts must consider all intelligence requirements for operations to shape, prevent, prevail in large-scale ground combat, and consolidate gains. However, the conduct of these operations is associated with the combatant command, as designated by the DOD, and with OE conditions.

SHAPE OPERATIONAL ENVIRONMENTS

7-14. Table 7-2 lists some of the unique considerations and intelligence requirements associated with operations to shape OEs. (For more information on shaping OEs, see FM 2-0's chapter 5.)

Table 7-2. Intelligence requirements associated with operations to shape

Unique considerations	*Intelligence requirements associated with shaping operational environments*
Key leaders	• Identify key leaders (politics, military, economic, social, information, infrastructure). • Evaluate the amount of influence of each leader. • Describe the local populace's opinion of each leader. • Perform link analysis for each leader's social and professional circles. • Research general biographical information.
Threat intent/critical capabilities	• Identify the critical resources the threat requires by capability. • Define the end state the threat is attempting to achieve. • Define decision points to reach the threat organization's end state. • Research open-source reporting on the threat. • Determine the threat's current phase of operations. • Project the threat's likely courses of action and potential crisis issues/flash points. (This should also develop indicators.)
Training activities	• Locate training locations. • Describe the threat training cycle. • Define threat capabilities by warfighting function. • Identify if new threat capabilities are being trained. • Describe how training is sustained.
Political activities	• Evaluate the effectiveness of the government. • Describe the local populace's opinion about the government. • Identify the government's critical requirements by capabilities. • Identify goals the government is attempting to achieve.

PREVENT CONFLICT

7-15. Table 7-3 lists some of the unique considerations and intelligence requirements associated with operations to prevent conflict. (For more information on preventing conflict, see FM 2-0's chapter 5.)

Table 7-3. Intelligence requirements associated with operations to prevent

Unique considerations	*Intelligence requirements associated with preventing conflict*
Mobilization actions	• Describe how the threat will conduct operations. • Evaluate if any windows of opportunity are present from the current situation and disposition. • Identify friendly risks based on the current situation and disposition. • Identify key terrain. • Identify areas that can limit friendly and threat freedom of movement.

PREVAIL IN LARGE-SCALE GROUND COMBAT

7-16. Table 7-4 lists some of the common considerations and intelligence requirements associated with large-scale ground combat operations.

Table 7-4. Intelligence requirements associated with large-scale ground combat operations

Considerations	*Intelligence requirements associated with large-scale ground combat*
Conventional forces and special operations forces	• Describe the threat using intelligence preparation of the battlefield (IPB). • Identify the threat's mission statement and intent. • Identify threat requirements that enable the threat to meet its end state. • Identify the threat commander's acceptable risk. • Identify the threat commander's decision points.
Irregular forces/Terrorists	• Identify irregular forces that friendly forces may encounter. • Describe irregular forces' capabilities by warfighting function. • Determine irregular forces' unique missions. • Identify when irregular forces will interdict/impede friendly force movement. • Locate where irregular forces will observe friendly forces. • Determine irregular forces' high-value targets. • Determine irregular forces' fire support.
Other adversaries (terrorist organizations, criminal organizations, individual relevant actors)	• Identify adversaries' purpose, intent, and motivations. • Identify adversaries' structure, organization, and networks. • Conduct human network analysis. • Identify adversaries' perspectives, intentions, strengths, vulnerabilities, susceptibilities, opportunities, issues, goals, and influence. • Identify nexuses between individual adversarial organizations. • Identify nexuses between adversarial organizations and conventional, special operations, and irregular forces.
Consolidation area	• **Bypassed enemy forces:** ▪ Identify the current disposition of potential stay-behind forces. ▪ Evaluate if the projected attrition of threat personnel is accurate. ▪ Describe how local nationals are reacting to stay-behind forces. ▪ Identify the goals of the stay-behind forces. • **Enemy special operations forces:** ▪ Identify potential safe havens. ▪ Identify potential civilian groups that may provide support. ▪ Identify the most likely tactics, techniques, and procedures that will be employed. ▪ Identify which friendly capabilities are most vulnerable to attack. • **Criminal organizations:** ▪ Identify activities that will impede friendly operations. ▪ Identify activities that will degrade public security. ▪ Determine which organizations can be levied as friendly proxies.

Table 7-4. Intelligence requirements associated with large-scale ground combat operations (*continued*)

Considerations	*Intelligence requirements associated with large-scale ground combat*
Consolidation area (*continued*)	• **Terrorist organizations:** ▪ Identify leaders in the area of operations that may be connected to terrorist activities. ▪ Describe successful terrorist activities that have occurred in the area of operations. ▪ Determine the most plausible, deadliest attack that may potentially occur. ▪ Identify resources terrorists require to conduct attacks. ▪ Describe the tactics, techniques, and procedures employed by terrorists. • **Irregular forces:** ▪ Place large emphasis/focus on civil considerations (ASCOPE). ▪ Identify resources the local populace requires. ▪ Determine if and describe how irregular forces are using those resources as leverage. ▪ Determine which populations are filling irregular force ranks. ▪ Determine which population areas are sympathetic to irregular force activities. ▪ Determine who has influence over irregular forces. • **Local population critical needs:** ▪ Identify the status of the basic infrastructure, including water, heating and cooling resources, electricity, medical, waste collection, roads, bridges, railways, seaports, airports, telecommunications, law enforcement, and emergency services. ▪ Identify key personnel required to manage the infrastructure. ▪ Coordinate analysis with attached or supporting civil affairs and psychological operations forces and organic staffs. ▪ Integrate infrastructure status into the common operational picture. • **Enemy reconsolidation and identification of capabilities.**
Support area	• Evaluate the infrastructure. • Determine refugee flow. • Identify obstacles to continuing activities.

ASCOPE areas, structures, capabilities, organizations, people, and events

OFFENSIVE AND DEFENSIVE OPERATIONS IN LARGE-SCALE GROUND COMBAT

7-17. Whether in offensive or defensive operations, the intelligence analysis process conducted does not differ drastically. In offensive and defensive operations during large-scale ground combat, the operating tempo is accelerated and therefore, intelligence analysis is accelerated. Regardless of the type of operation, all-source intelligence is the primary capability within the intelligence warfighting function that aids commanders' understanding of their OE. (See ADP 3-90 for a detailed discussion on offensive and defensive operations.)

Offensive Operations

7-18. An *offensive operation* is an operation to defeat or destroy enemy forces and gain control of terrain, resources, and population centers (ADP 3-0). The main differences between offensive and defensive operations are the focus and detail level of analysis required for determining the enemy's defensive framework and the effects of terrain on friendly maneuver. Additionally, the enemy often employs capabilities using different tactics and techniques, depending on the specific offensive or defensive operation. Offensive operations are either force-oriented or terrain-oriented. Force-oriented offensive operations focus on the enemy. Terrain-oriented offensive operations focus on seizing and retaining control of the terrain and facilities. Detailed IPB products, such as a modified combined obstacle overlay with intervisibility lines or an event template, must be developed to depict this information. (See ATP 2-01.3.) Table 7-5 lists some of the intelligence requirements associated with offensive operations.

Table 7-5. Intelligence requirements associated with the offense

Determine the enemy's likely purpose and type of defense: area defense, mobile defense, or retrograde.
Determine the enemy's likely end state, objectives, decision points, culmination point, strengths, vulnerabilities, and scheme of maneuver.
Identify military aspects of terrain (OAKOC) and weather effects that support enemy defensive operations: • Terrain that allows reconnaissance and security outposts to be arranged in depth along choke points and terrain features that canalize friendly forces to attrite U.S. forces and diminish U.S. combat power in depth. • Terrain, including subterranean, that allows the enemy to tie obstacles to existing terrain features to support enemy defensive positions. (See ATP 3-21.51 for more on subterranean terrain.) • Favorable air and ground avenues of approach for an enemy counterattack. • Terrain that canalizes friendly attacking forces. • Favorable weather effects (such as visibility, wind, precipitation, cloud cover/ceilings, temperature, thermal crossover, humidity, and atmospheric pressure) for enemy systems compared to friendly systems.
Identify military aspects of terrain (OAKOC) and weather effects that support friendly offensive operations: • Favorable ground and air mobility corridors. • Areas with significant concealment and/or cover. • Terrain that allows forces to bypass obstacles and enemy positions. • Infiltration routes. • Landing zones. • Favorable weather effects (such as visibility, wind, precipitation, cloud cover/ceilings, temperature, thermal crossover, humidity, and atmospheric pressure) for enemy systems compared to friendly systems. • Favorable weather for using obscuration or chemical weapons.
Identify the location and orientation of enemy counterreconnaissance and security units, obstacles, engagement areas, main battle areas, reserve units, and likely counterattack routes.
Within each enemy defensive area, identify specific primary, secondary, tertiary locations of enemy infantry, armored, antitank, mortar, and other units and systems, and the potential use of camouflage.
Determine the likely use and identify the location of enemy command and control nodes, reconnaissance and surveillance assets, long-range fires, artillery and rocket units, air defense systems, rotary aviation units, close air support, engineer units, ammunition and logistics nodes, CBRN units, electronic warfare assets, and special operations forces.
Determine the enemy's likely use of information warfare, cyberattacks, and denial and deception operations.
Determine the impact of significant civil considerations (ASCOPE) on friendly and enemy operations such as hindering movement on lines of communications, medical and health considerations, and the housing and feeding of a displaced population.
ASCOPE areas, structures, capabilities, organizations, people, and events CBRN chemical, biological, radiological, and nuclear OAKOC observation and fields of fire, avenues of approach, key terrain, obstacles, and cover and concealment U.S. United States

Defensive Operations

7-19. A *defensive operation* is an operation to defeat an enemy attack, gain time, economize forces, and develop conditions favorable for offensive or stability operations (ADP 3-0). Defensive operations retain decisive terrain or deny the enemy access to a vital area, attrite or fix the enemy as a prelude to offensive operations, counter a surprise action by the enemy, or increase the enemy's vulnerability by forcing the enemy to concentrate its forces.

7-20. The main differences between defensive operations and other decisive action are the focus and detail level of analysis required for determining the enemy's offensive framework and the effects of terrain on friendly defensive operations. Table 7-6 on page 7-10 lists some of the intelligence requirements associated with defensive operations.

Table 7-6. Intelligence requirements associated with the defense

Determine the enemy's likely purpose (for example, terrain- or force-oriented) and type of offense.
Determine the enemy's likely end state, objectives, decision points, culmination point, strengths, vulnerabilities, and scheme of maneuver.
Identify military aspects of terrain (OAKOC) and weather effects that support enemy offensive operations: • Favorable ground corridors and air avenues of approach. • Areas with significant concealment and/or cover. • Terrain, including subterranean, that allows forces to bypass obstacles and friendly positions. (See ATP 3-21.51 for more on subterranean terrain.) • Infiltration routes. • Landing zones. • Favorable weather effects (such as visibility, wind, precipitation, cloud cover/ceilings, temperature, thermal crossover, humidity, and atmospheric pressure) for enemy systems compared to friendly systems. • Favorable weather for using obscuration or chemical weapons.
Identify military aspects of terrain (OAKOC) and weather effects that support friendly defensive operations: • Terrain that allows friendly forces to tie obstacles to existing terrain features to supports friendly defensive positions. • Favorable air and ground avenues of approach for a counterattack. • Terrain that canalizes enemy attacking forces. • Favorable weather effects (such as visibility, wind, precipitation, cloud cover/ceilings, temperature, thermal crossover, humidity, and atmospheric pressure) for enemy systems compared to friendly systems.
Identify the location of enemy assembly areas, ammunition and logistics nodes, forward aviation locations, and likely movement routes into the friendly area of operations.
Template and track the composition, disposition, likely routes, and time phase lines of reconnaissance and surveillance, security, advanced engineering, infiltrating, and air assault units.
Template and track the composition, disposition, likely routes, and time phase lines of advance guard, main body, antitank, reserve, and second echelon units.
Template and track specific locations where the enemy will conduct key maneuver tasks, such as occupying support by fire positions and dismounting infantry, or where friendly units may be isolated in defensive positions due to the enemy's use of artillery scatterable mines.
Determine the likely use and template the location of enemy command and control nodes, long-range fires, artillery and rocket units, air defense systems, attack helicopter units, close air support, engineer units, CBRN units, electronic warfare assets, and special operations forces.
Determine the enemy's likely use of information warfare, cyberattacks, and denial and deception operations.
Determine the impact of significant civil considerations (ASCOPE) on friendly and enemy operations such as hindering movement on lines of communications, medical and health considerations, and the housing and feeding of a displaced population.
ASCOPE areas, structures, capabilities, organizations, people, and events CBRN chemical, biological, radiological, and nuclear OAKOC observation and fields of fire, avenues of approach, key terrain, obstacles, and cover and concealment

CONSOLIDATE GAINS

7-21. Commanders continually (through all phases of the operation) consider activities necessary to consolidate gains and achieve the end state. Operations to consolidate gains require a dynamic intelligence effort to conduct offensive and defensive operations that do not create secondary impacts to consolidating gains (for example, destroying key infrastructure) while also supporting the execution of area security and stability operations.

Consolidate Gains Concurrent with Large-Scale Ground Combat Operations

7-22. Table 7-7 lists some of the unique considerations and intelligence requirements associated with operations to consolidate gains during large-scale ground combat operations.

Table 7-7. Intelligence requirements associated with operations to consolidate gains

Unique considerations	*Intelligence requirements associated with consolidating gains*
Assessments	• Conduct battle damage assessments. • Evaluate the effectiveness of friendly operations. • Determine if there are any remaining stay-behind forces. • Describe the composition of any stay-behind forces (bypassed/isolated conventional forces, irregular/special purpose forces, terrorists or insurgents). • Evaluate how remaining threat forces are still able to operate. • Determine if there are any areas still sympathetic to threat forces. • Describe how remaining threat forces are able to sustain operations. • Identify the leadership that remaining forces are looking to for guidance. • Determine the security of hazardous materials and facilities that can be used in the production of weapons of mass destruction.
Transition	• Identify the recipient of the transfer of authority. • Determine if the organization is able to enforce and achieve its intent. • Determine if the organization has enough manpower to meet its intent. • Identify what resources the organization requires to meet its goals. • Determine if the organization can use all information networks to reach the populace effectively.

Consolidate Gains Through Stability Operations

7-23. A *stability operation* is an operation conducted outside the United States in coordination with other instruments of national power to establish or maintain a secure environment and provide essential governmental services, emergency infrastructure reconstruction, and humanitarian relief (ADP 3-0). In stability operations, success is measured differently from offensive and defensive operations. Time may be the ultimate arbiter of success: time to bring safety and security to an embattled populace; time to provide for the essential, immediate humanitarian needs of the people; time to restore basic public order and a semblance of normalcy to life; and time to rebuild the institutions of government and market economy that provide the foundations for enduring peace and stability. (See ADP 3-07 for information on stability operations.)

7-24. The main difference between stability operations and other decisive action is the focus and degree level of analysis required for the civil aspects of the environment. Unlike major combat—an environment dominated by offensive and defensive operations directed against an enemy force—stability operations encompass various military missions, tasks, and activities that are not enemy-centric.

7-25. Constant awareness and shared understanding of civil considerations (ASCOPE) about the environment are crucial to long-term operational success in stability operations. Analysts should classify civil considerations into logical groups (tribal, political, religious, ethnic, and governmental). Intelligence analysis during operations that focus on the civil population requires a different mindset and different techniques than an effort that focuses on defeating an adversary militarily.

7-26. Some situations (particularly crisis-response operations) may require analysts to focus primarily on the effects of terrain and weather, as in the case of natural disasters, including potential human-caused catastrophes resulting from natural disasters. Disasters (such as windstorms, hurricanes, typhoons, floods, tsunamis, wildfires, landslides, avalanches, earthquakes, and volcanic eruptions) may occur without warning. Human-caused catastrophes (such as civil conflict, acts of terrorism, sabotage, or industrial accidents) may develop over time. The speed at which an event occurs dictates how analysts will conduct their assessments and with whom they will share their intelligence.

Chapter 8
Analysis and Large-Scale Ground Combat Operations

OVERVIEW

8-1. In future operations, intelligence analysis considerations should include a combination of factors (or elements) that analysts must understand to support the commander. Multi-domain operation considerations differ by echelon. These considerations have their greatest impact on Army operations during large-scale ground combat. Despite the natural tendency to focus on the land domain during large-scale ground combat, analysts must look across the OE or AO to determine how the air, land, and maritime domains affect Army efforts and how those effects may open windows of opportunity for Army forces to create favorable conditions and positions of relative advantages for U.S. and coalition forces.

8-2. Situation development enables commanders to see and understand the battlefield in enough time and detail to make sound tactical decisions. Situation development assists in locating and identifying threat forces; determining threat forces' strength, capabilities, and significant activities; and predicting threat COAs. Situation development assists commanders in effectively employing available combat resources where and when decisive battles will be fought, preventing commanders from being surprised.

8-3. Commanders and staffs require timely, accurate, relevant, and predictive intelligence to successfully execute offensive and defensive operations in large-scale ground combat operations. The challenges of fighting for intelligence during large-scale ground operations emphasize a close interaction between the commander and staff, since the entire staff supports unit planning and preparation to achieve situational understanding against a peer threat. Since each echelon has a different situational understanding of the overarching intelligence picture, the analytical focus differs from one echelon to another. For example, updated intelligence analysis at the corps level could influence a commander's decisions at the BCT level because corps-level requirements differ from BCT-level requirements. Therefore, it is important for intelligence analysts to understand the missions, key tasks, and end state of higher and subordinate forces to ensure they maintain a holistic understanding of the OE. Although each echelon has a different analytical focus, the techniques, tools, and methods employed to conduct analysis do not change. (See FM 2-0 for more information on fighting for intelligence and all-source intelligence capabilities at each echelon.)

TACTICAL TO OPERATIONAL SITUATION: AN ENEMY ATTACK

8-4. The following three examples walk an intelligence analyst from the tactical to operational situation of an enemy attack, demonstrating the necessity for analysts to possess a broad understanding of the OE and the friendly forces' scheme of maneuver. The examples illustrate the situation a unit might encounter along the forward edge of the battle area (FEBA) with friendly and enemy forces poised to engage in large-scale ground combat. In this situation, many friendly and enemy units have deployed to gain a tactical advantage at the onset of combat.

TACTICAL-LEVEL EXAMPLE (BRIGADE COMBAT TEAM)

8-5. The BCT has already completed the MDMP and issued orders, and intelligence analysts have been providing periodic reports and products to support situation development as the situation unfolds. The battle noncommissioned officer receives a spot report that elements of a motorized rifle regiment have crossed the border/FEBA. (See figure 8-1 on page 8-2.) The commander wants to confirm the enemy's intent to cross the border before engaging the enemy.

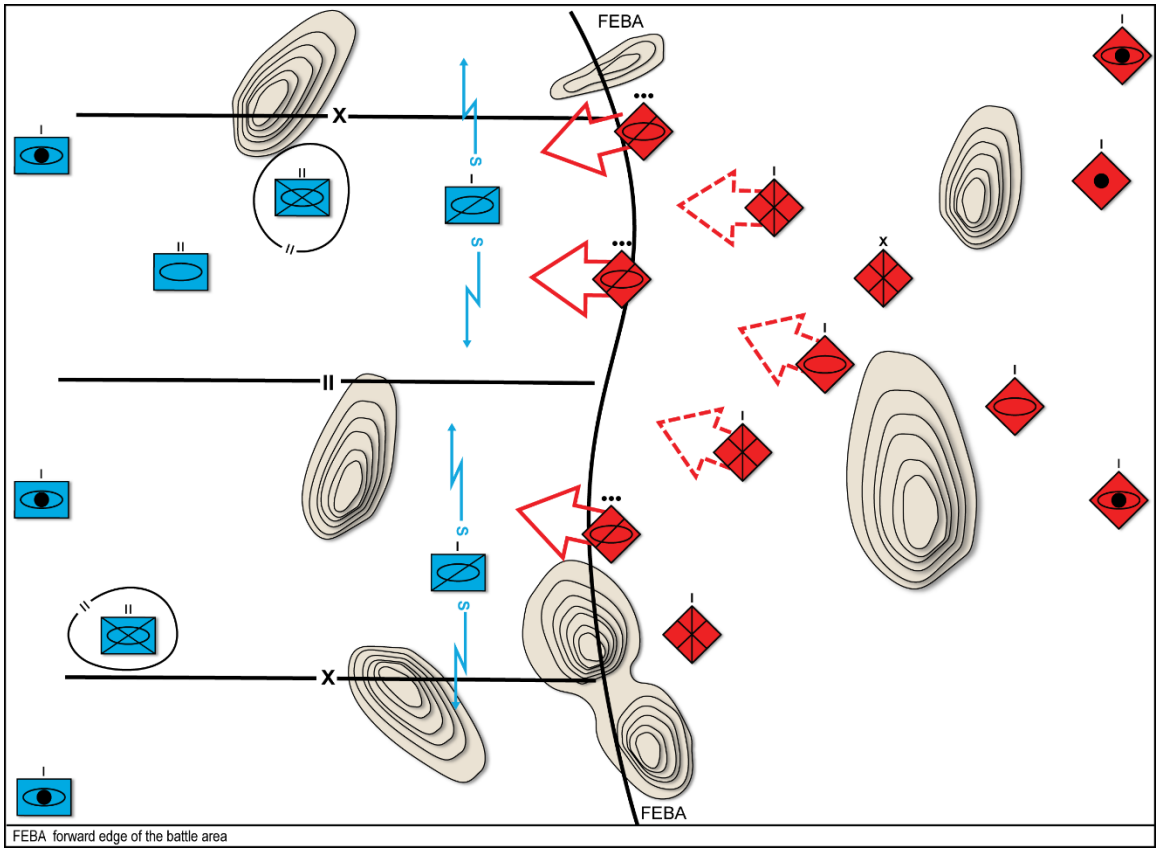

Figure 8-1. Brigade combat team situation example

8-6. Additional information received confirms reporting from forward reconnaissance elements. Intelligence reporting from single-source intelligence analysis indicates movement west of multiple company-sized tank and motorized rifle elements. The intelligence also reveals possible supporting artillery elements. (See table 8-1.)

Table 8-1. Intelligence analysis (brigade combat team) example

Brigade combat team intelligence analysis example			
Action taken			
Screen	***Analyze***	***Integrate***	***Produce***
• General items of relevancy to screen in a tactical sense: ▪ Indicators of threat activities for the next 24 to 48 hours. ▪ Changes in the operational environment that will affect operations. ▪ Enemy maneuvers within the area of operations. • Analysts initiate analysis based on a spot report that meets these criteria.	Analysts should form their initial hypothesis based on information assessed to be relevant in the *screen* phase.	Analysts should compare their new hypothesis to current intelligence holdings.	Analysts make their final assessment and produce a likely course of action (COA) for the commander to make a decision.

Table 8-1. Intelligence analysis (brigade combat team) example (*continued*)

Brigade combat team intelligence analysis example (continued)			
Action taken			
Screen	***Analyze***	***Integrate***	***Produce***
Based on the spot report, the commander provides the following specific requirement, which the intelligence section needs to address: Confirm the enemy's intent to cross the border.	Based on multiple reports indicating enemy forces maneuvering to the west, analysts must assess: • How this movement will support the enemy commander's intent and end state? • How much will the enemy commander commit to this movement? • Will the amount of force committed by the enemy commander drive friendly units to a decision point?	During step 3 of the intelligence preparation of the battlefield (IPB) process, step 3, analysts will have described the enemy to have the minimum products: • Written enemy description (Annex B [Intelligence]). • Situational order of battle. • Threat graphic template. • Threat capabilities matrix.	• Intelligence analysis assessment: At a minimum, battalion plus of motorized rifle supported with tank elements are crossing the border, and an enemy surprise attack by follow-on elements is likely. • Based on the assessment, the friendly commander confirms the enemy's intent to cross the border and provides guidance to assume attack positions to block the enemy advance.
Analysts screen the following based on the specific requirement and tactical guidelines: • Reporting from forward reconnaissance corroborates spot report. • Reporting from single-source analysis indicates movement, including the possible movement of additional elements.	Analysts may use the following analytic techniques: • Chronologies (*Basic*) to understand the enemy's intent and end state by examining historic operations the enemy has conducted. • Key assumptions check (*Diagnostic*) on the enemy's likely intent to enlighten how much the enemy will commit to the movement. • Analysis of competing hypothesis (*Diagnostic*) to project if the friendly commander will be faced with a decision point.	• Based on the enemy description and threat capabilities matrix: Analysts refine enemy movement to add the size of unit (as directed by the commander, but at least two levels down) and type (motorized rifle with tanks). • Based on the situational order of battle: Analysts assess the enemy commander will likely commit follow-on elements. • With a refined size and type of enemy units moving to the west, combined with the projected amount of force committed, the friendly commander must make a decision based on the enemy COA. • Analysts may use the team A/ team B (*Advanced*) analytic technique to war-game their assessed enemy COA, ensuring all variables are considered and their COA is viable. • Analysts may use the red hat/ analysis (*Advanced*) analytic technique in conjunction with their threat capabilities matrix to ensure the enemy intent in their initial hypothesis agrees with current intelligence holdings.	The intelligence analysis process is continuous, and analysts should now consider: • What information can be exploited by combat assessment from the block? • What single-source reporting generates post-mission? • Does the threat model derived in IPB, step 3, require changes? • What should be adjusted for information collection to fully answer the requirement?

TACTICAL-LEVEL EXAMPLE (DIVISION)

8-8. Figure 8-2 illustrates a similar enemy attack but with U.S. division graphics. The enemy's most likely COA is an attack orientated on at least two ground avenues of approach through canalizing terrain. At least one tank division with four brigade elements and two self-propelled artillery battalions will attack as the main effort. In addition to the tank and motorized rifle elements crossing the FEBA, there are elements of at least one tank brigade with self-propelled artillery advancing west.

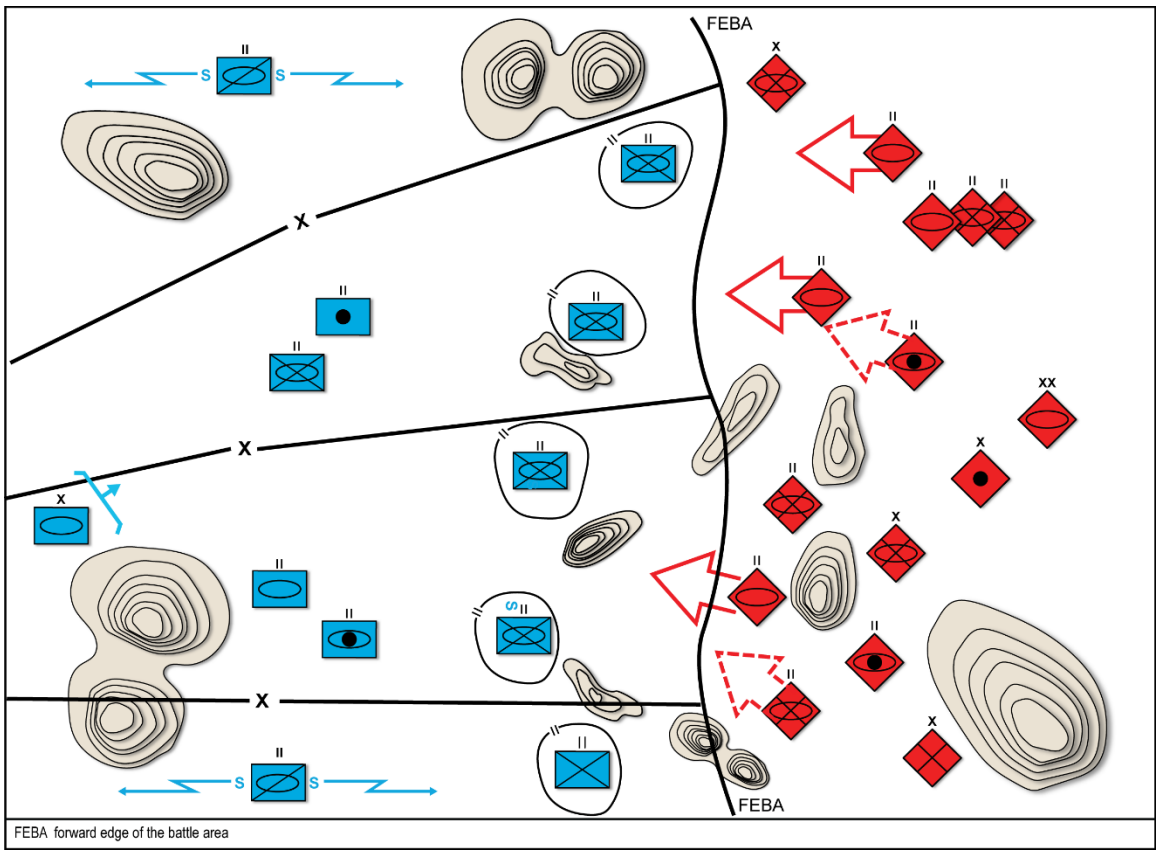

Figure 8-2. Division situation example

8-9. Division analysts assess that elements of the tank division are advancing west to engage friendly forces. The combat information and available intelligence seem to initially support an enemy division frontal attack with infantry and motorized rifle brigades penetrating the FEBA to destroy friendly defenses and allow follow-on units to secure primary and secondary objectives. (See table 8-2.)

Table 8-2. Intelligence analysis (division) example

Division intelligence analysis example			
Action taken			
Screen	***Analyze***	***Integrate***	***Produce***
• General items of relevancy to screen in an operational sense: ▪ Indicators of enemy activities for the next 48 to 168 hours. ▪ Changes in the operational environment that will affect subordinate commands. ▪ Enemy maneuvers that will affect subordinate unit's areas of responsibility (AORs). • Analysts initiate analysis based on reports of enemy orientation on two avenues of approach through canalizing terrain that meets these criteria.	Analysts should form their initial hypothesis based on information assessed to be relevant in the *screen* phase.	Analysts should compare their new hypothesis to current intelligence holdings.	Analysts make their final assessment and produce a likely course of action (COA) for the commander to make a decision.
Based on the orientation, the commander provides the following specific requirement, which the intelligence section needs to address: Project the enemy's future operations for the next 96 to168 hours and how they will affect subordinate units.	Based on the reports indicating enemy forces in attack position, analysts must assess: • What is the enemy commander's end state for this attack? • What resources would be a priority for the enemy commander to commit these forces to an attack? • Will the enemy attack force subordinate units to a decision point?	During intelligence preparation of the battlefield, analysts will have described the enemy and operational environment to have the minimum products: • Modified combined obstacle overlay (MCOO). • Threat model. • Situational order of battle.	• Intelligence analysis assessment: Two motorized rifle brigades are advancing west to engage friendly forces. The enemy is likely to conduct a division frontal attack with infantry and motorized rifle brigades in order to penetrate the forward edge of the battle area to destroy friendly defenses and allow follow-on units to secure primary or secondary objectives. • Based on the assessment, the friendly commander may plan for the enemy's future operations and dispatch orders to subordinate units.
Analysts screen the following based on the specific requirement and operational guidelines: • At least one tank division with four brigade elements in attack position. • Two self-propelled artillery battalions in attack position. • At least one artillery brigade advancing west.	Analysts may use the following analytic techniques: • Quality of information check (*Diagnostic*) to refine and validate the projected orientation and power of enemy forces in the area of operations. • Weighted ranking (*Diagnostic*) to prioritize enemy capabilities to identify critical actions that could greatly affect friendly forces.	• Based on the MCOO: Canalizing terrain will force the armored brigades to engage friendly forces east. • Based on the threat model: The enemy is likely to conduct a divisional attack to cross the border and employ follow-on units to secure the key terrain. • With a refined intent to seize key terrain and a defined method verified by reporting and intelligence analysis, the friendly commander can maneuver subordinate units into a block. • Analysts may use the high impact/low probability (*Advanced*) analytic technique to identify, for subordinate units, indicators of pending offensive operations within their AORs. • Analysts may use the functional analysis (*Advanced*) analytic technique to verify the center of gravity proposed in the initial hypothesis.	The intelligence analysis process is continuous, and analysts should now consider: • What information can be exploited by subordinate units from the block? • How will the enemy benefit from the seizure of the key terrain? • Is there favorable terrain to friendly forces that could mitigate the canalizing terrain in future operations?

Table 8-2. Intelligence analysis (division) example (*continued*)

Division intelligence analysis example (continued)			
Action taken			
Screen	***Analyze***	***Integrate***	***Produce***
	Based on the initial hypothesis, analysts should consider: • What domains can friendly forces leverage to gain an advantage on the enemy? • Are there any windows of opportunity across the domains? • What is the best way to allocate assets based on the windows of opportunity?	• Canalizing terrain can create areas of interest that can be targeted or collected on by air assets. • With an anticipated block, analysts should placement of obstacles for enemy forces. • Are there any elements within the situational order of battle that can apply cyberspace electromagnetic activities (CEMA)? • What effect will CEMA have on navigation and communications assets?	The analyst must disseminate the corresponding products with the applicable domain operator: • Share named and target area of interest overlays with joint force assets. • Share MCOOs and additional terrain analysis with engineer units to support subordinate commands. • Provide electronic warfare and signal units with enemy CEMA capabilities to mitigate system interruptions.

TACTICAL/OPERATIONAL-LEVEL EXAMPLE (CORPS)

8-10. Figure 8-3 provides information about the OE that assists in understanding, at a macro level, the enemy. Understanding that the enemy is conducting a large-scale attack contextualizes the situation for the tactical/operational commander and influences critical decisions. Knowing the enemy is conducting a general attack to likely seize the city of Sawburg influences the tactical and operational commanders' employment of forces, acceptance of risk, and determination to hold key terrain.

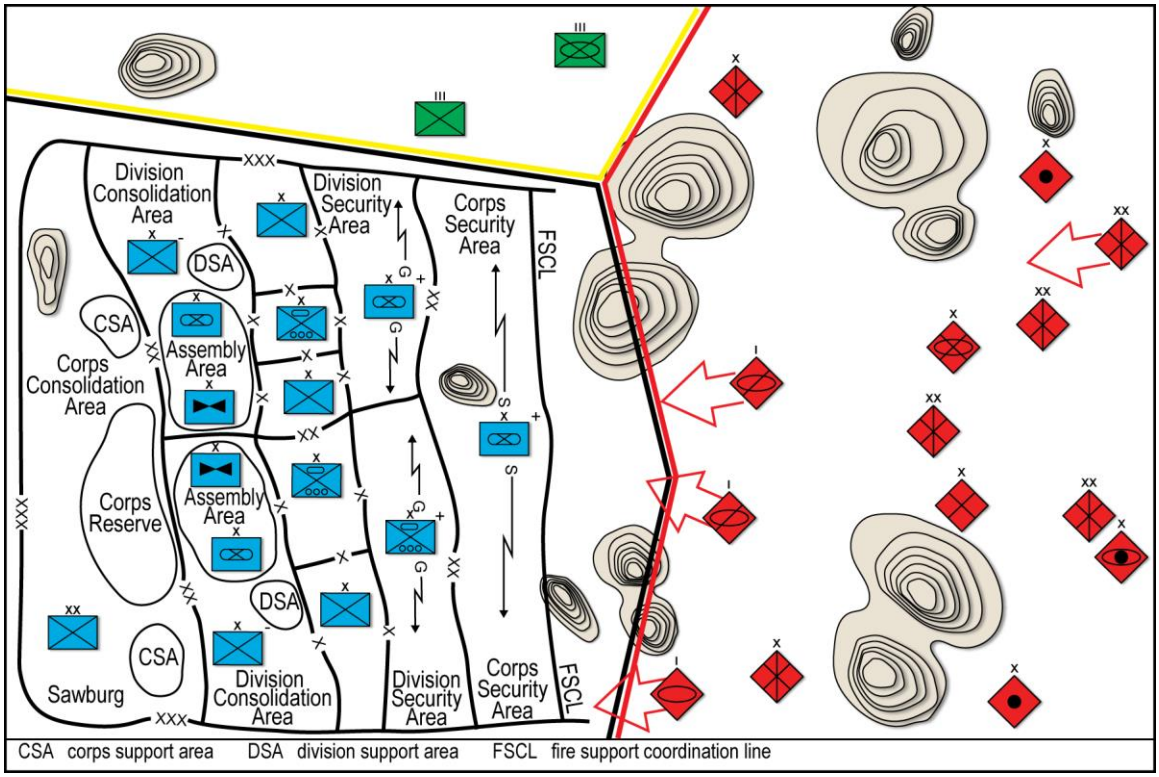

Figure 8-3. Tactical/Operational (corps) situation example

8-11. Based on reporting, the enemy has additional forces in the area, including a second tank division three to four days away in tactical-march formations. The friendly force commander is forced to commit ready forces to stop the enemy force advance since reserve elements are not available. (See table 8-3.)

Table 8-3. Intelligence analysis (tactical/operational [corps]) example

Corps intelligence analysis example			
Action taken			
Screen	***Analyze***	***Integrate***	***Produce***
• Based on the reports indicating enemy forces in attack position, analysts need to assess: ▪ Indicators of threat activities beyond 168 hours. ▪ Changes in the operational environment (OE) that will affect subordinate commands. ▪ Indicators that help shape and prevent potential threat action. • Analysts initiate analysis based on understanding why the enemy is attacking.	Analysts should form their initial hypothesis based on information assessed to be relevant in the *screen* phase.	Analysts should compare their new hypothesis to current intelligence holdings.	Analysts make their final assessment and produce a likely course of action (COA) for the commander to make a decision.
Based on this understanding, the commander provides the following specific requirement, which the intelligence section needs to address: Project the enemy's future operations for the next 96 to168 hours and establish the operational acceptance of risk.	Based on understanding the OE, analysts must assess: • What is the enemy commander's end state for seizing the key terrain? • How will the enemy commander use the key terrain if it is seized? • How much time will it take the enemy commander to maneuver forces to the border?	During mission analysis, analysts will have described the enemy and OE to have the minimum products: • Threat model. • Annex B (Intelligence) (to describe the enemy's likely intentions and end state). • Enemy COAs.	• Intelligence analysis assessment: The enemy conducts a general attack to likely seize Sawburg to influence the tactical and operational commanders' employment of forces, acceptance of risk, and determination to hold key terrain. • Based on the assessment, the friendly commander understands the enemy is attempting to push friendly units to a decision point and must plan to mitigate those operations.
Analysts screen the following based on the specific requirement and operational guidelines: • Location of key terrain is Sawburg. • Enemy composition and disposition in vicinity of friendly units.	Analysts may use the following analytic techniques: • Event trees (*Basic*) to develop initial scenarios of potential enemy actions. • Indicators/Signposts of change (*Diagnostic*) to establish a list of indicators to specific methods of offense being employed by the enemy. • Link analysis (*Basic*) to examine the relationship of resources, organizations, and other entities within the area of operations.	• Based on the threat model: Analysts assess the enemy commander to use armored divisions to conduct an attack. • Based on Annex B (Intelligence): It is likely the enemy will want to control Sawburg for resources. • Based on general enemy COAs: There is likely another tank division 3 to 4 days away from the projected battle zone. • Analysts could use the "what if?" (*Advanced*) analytic technique to generate the multiple outcomes of the operation, applying analytical rigor to their initial hypothesis. • Analysts could use the outside-in thinking (*Advanced*) analytic technique from other members or the staff or organization to gain insight on how favorable the key terrain would be for the enemy commander.	The intelligence analysis process is continuous, and analysts should now consider: • How will adjacent country (green) react to operations? • Are there any maneuvers that can mitigate the offensive enemy operation? • Can information collection refine enemy intentions?

Table 8-3. Intelligence analysis (tactical/operational [corps]) example (*continued*)

Corps intelligence analysis example			
Multi-domain considerations for intelligence analysis			
Screen	***Analyze***	***Integrate***	***Produce***
	Based on the initial hypothesis, analysts should consider: • What domains can friendly forces leverage to gain an advantage over the enemy? • What joint assets should be allocated to subordinate commands?	• Can the information environment develop indicators for enemy intentions? • Has the enemy leveraged information operations on Sawburg? • Reconnaissance in depth may have to be conducted by air assets on tank divisions 3 to 4 days away. • Are cyberspace electromagnetic activities (CEMA) vulnerable within the enemy's navigation and communications systems?	• Analysts must disseminate the corresponding products with the applicable domain operator: ▪ Provide named areas of interest (NAIs) for information collection to gain insight to Sawburg and their disposition to friendly and enemy forces. ▪ Share NAI and target area of interest overlays with joint force assets for reconnaissance in depth. • Analysts should synchronize with the CEMA cell to develop a better understanding of enemy intentions. • Analysts should use CEMA capabilities in conjunction with nonlethal targeting efforts.

Chapter 9
Managing Long-Term Analytical Assessments

OVERVIEW

9-1. Any echelon can conduct long-term intelligence analysis, which is simply analysis over a longer period of time (several months or longer). There are many forms of long-term analysis, such as long-term analytical assessments. Formal (authoritative or exploratory) long-term analytical assessments are usually associated with operational- and strategic-level intelligence units and organizations because these assessments are resource-intensive. Intelligence analysts at the tactical level can use some of the steps and substeps discussed in this appendix in order to improve their analysis, but they rarely apply all of the steps of the process.

9-2. Managing long-term analytical assessments, also referred to as analytic design in this appendix, ensures the analytical effort results in the best possible assessment. Analytic design ensures the analytical effort is properly focused, carefully planned and executed, and that the analytical results are effectively communicated to the requestor. The Defense Intelligence Agency published a helpful document, *Analytic Design: Analytic Tradecraft Guidance from the DI Research Director*, which served as the basis for this appendix.

9-3. Long-term analytical assessments are produced using a deliberate and specific execution of the intelligence analysis process over a longer period of time that closely complies with the Intelligence Community Analytic Standards (to include the analytic tradecraft standards) established in ICD 203. This form of analysis includes the careful management of the overall effort, dedicating significant resources to the effort (for example, analysis is conducted by an analytic team), executing various iterations of analysis, and applying advanced structured analytic techniques within the effort.

Note. Intelligence personnel should not use this appendix to develop criteria and standards for tactical-level intelligence analysis. This appendix covers the basics of analytic design but does not cover all the information needed to develop formal long-term analytical assessments. Specifically, some of the analytic techniques and the use of models and automated simulations are not discussed in this publication.

THE BASICS OF ANALYTIC DESIGN

9-4. Managing long-term analytical assessments is accomplished by performing seven analytic design steps, as shown in figure 9-1 on page 9-2:

- **Step 1:** Frame the question/issue.
- **Step 2:** Review and assess knowledge.
- **Step 3:** Review resources.
- **Step 4:** Select the analytic approach/methodology and plan project.
- **Step 5:** Develop knowledge.
- **Step 6:** Perform analysis.
- **Step 7:** Evaluate analysis.

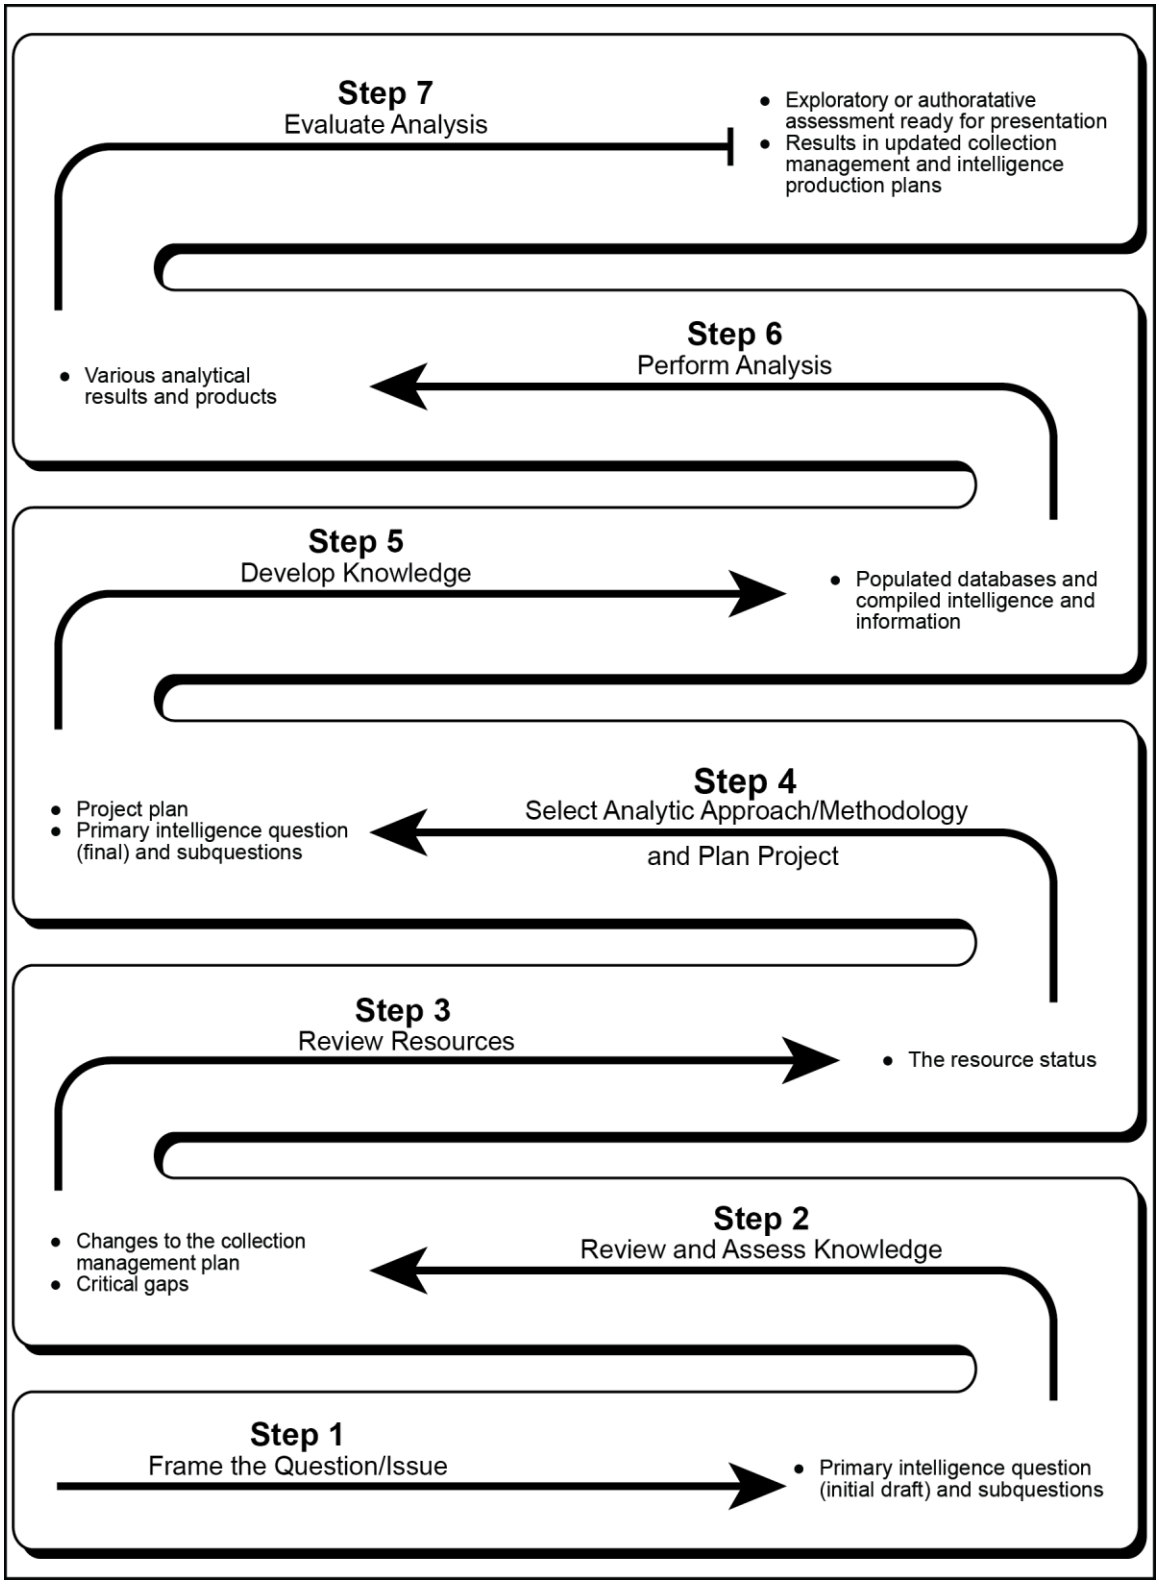

Figure 9-1. Analytic design steps

FRAME THE QUESTION/ISSUE

9-5. Properly framing the question greatly increases the chance of successful long-term analysis. The analytic team starts with understanding the requestor's requirement by identifying relevant topics and issues that break down into a primary question that can be analyzed. Framing the question includes refining and scoping the question to carefully capture the requestor's expectations, mitigate bias, craft an objective analytic question, and develop subquestions. This step results in an initial draft of the primary intelligence question and is followed by reviewing and assessing existing knowledge. (See figure 9-2.)

Note. Do not confuse the frame the question/issue step with the "frame" activities associated with the Army design methodology. (For information on the Army design methodology, see ATP 5-0.1)

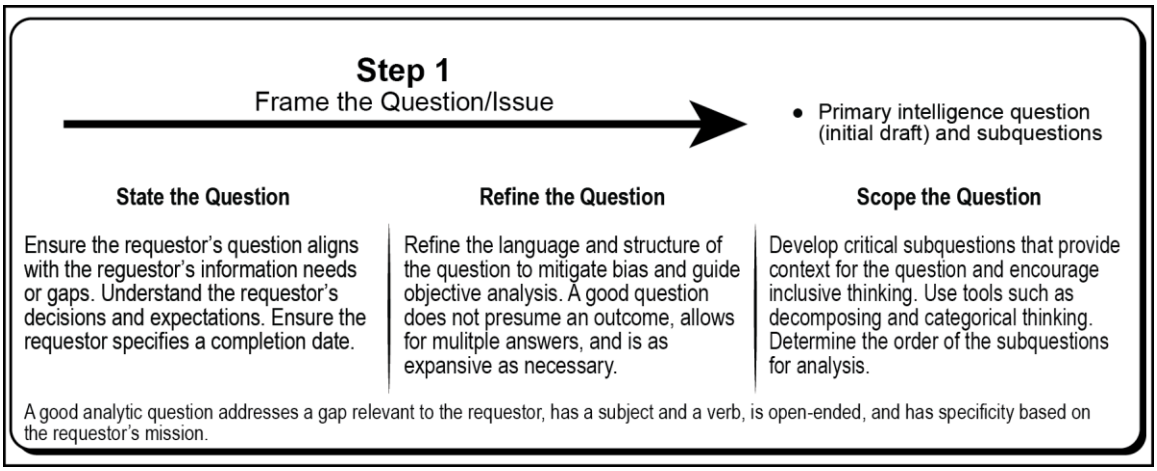

Figure 9-2. Frame the question/issue

REVIEW AND ASSESS KNOWLEDGE

9-6. Reviewing and assessing knowledge involves an overlap of the analytical effort with collection management. Step 2 includes reviewing available information and intelligence, the collection management plan, and results of on-going intelligence collection, as well as identifying information gaps. (See figure 9-3.)

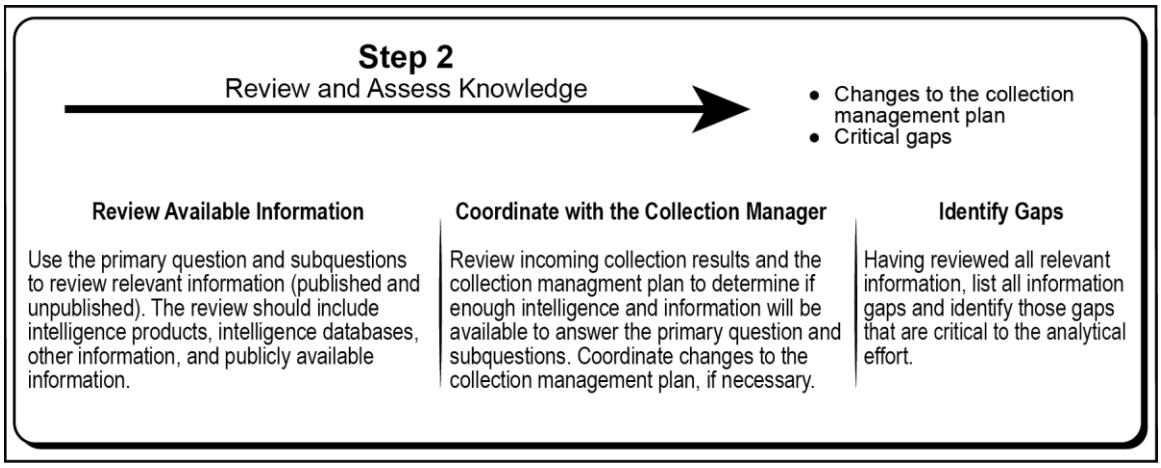

Figure 9-3. Review and assess knowledge

REVIEW RESOURCES

9-7. After understanding what knowledge is available and identifying information gaps, the next step is reviewing available resources, such as tools, personnel, and time. (See figure 9-4.)

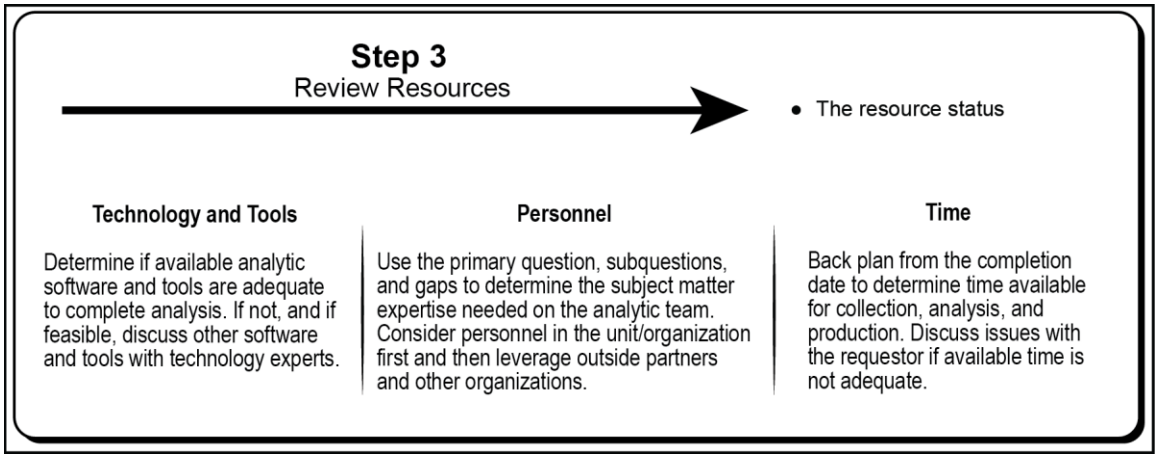

Figure 9-4. Review resources

SELECT THE ANALYTIC APPROACH/METHODOLOGY AND PLAN PROJECT

9-8. Using the results of steps 1 through 3, the analytic team finalizes the primary intelligence question and subquestions, selects the analytic approach/methodology, and develops a project plan. The analytic approach/methodology includes the specific analytic techniques, who will perform each technique, and the sequence of those techniques to ensure analytic insight and mitigate bias. (See figure 9-5.)

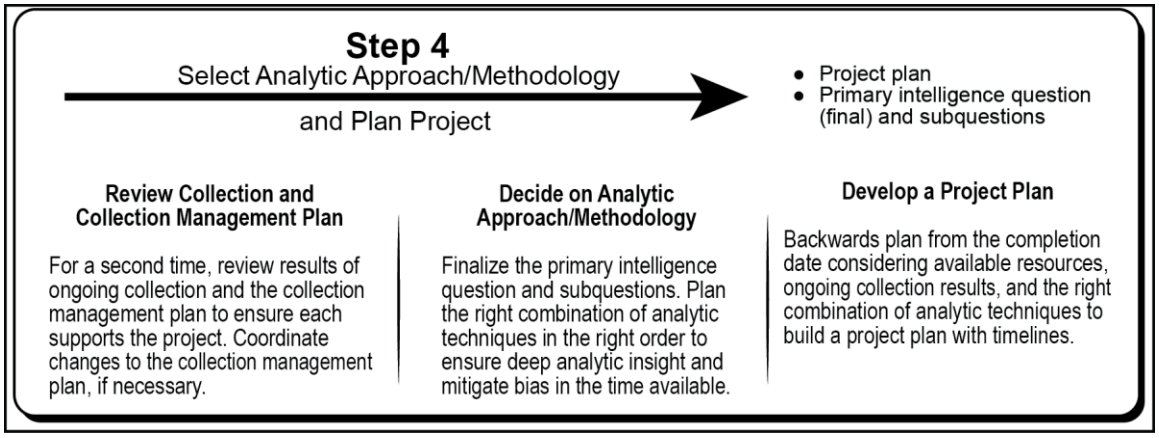

Figure 9-5. Select the analytic approach/methodology and plan project

DEVELOP KNOWLEDGE

9-9. Developing knowledge is the last step before performing analysis. Although discussed as a separate step in the process, developing knowledge occurs continually throughout the process. The analytic team gathers all relevant intelligence and information through ongoing collection, intelligence reach, and internal research. (See figure 9-6.)

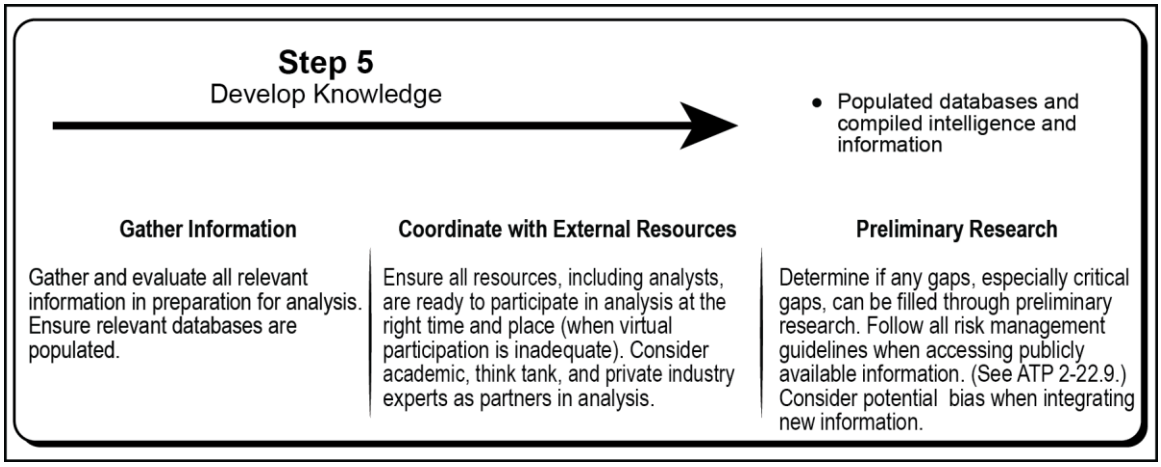

Figure 9-6. Develop knowledge

PERFORM ANALYSIS

9-10. Steps 1 through 5 set the stage for the deliberate execution of analytic techniques, to include adjusting the project plan, if necessary, and assessing the analytical results using the context that was developed while framing the question/issue. (See figure 9-7.)

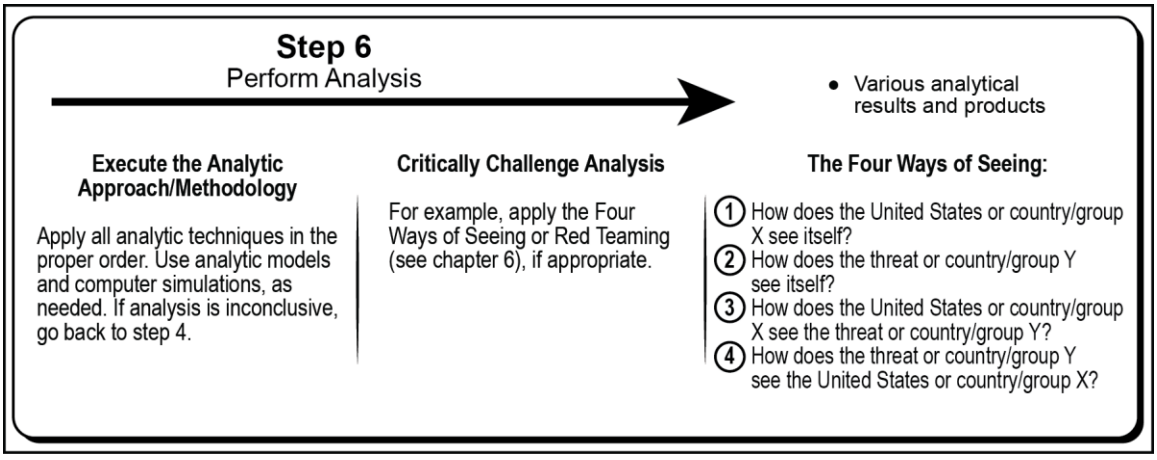

Figure 9-7. Perform analysis

EVALUATE ANALYSIS

9-11. Evaluating analysis, the final step of the process, results in the final analytical results and associated information necessary to make a presentation to the requestor. Evaluating analysis includes assessing the analytical results and the impact of analytic gaps and unconfirmed assumptions, performing analysis of alternatives, and assigning a confidence level to the analytic answer. (See figure 9-8.)

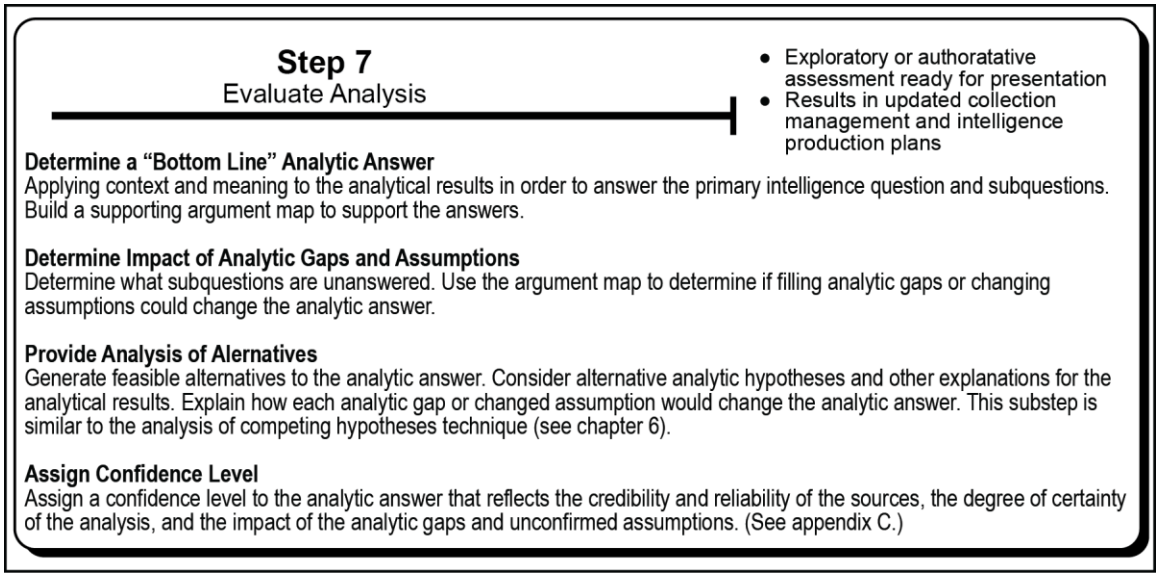

Figure 9-8. Evaluate analysis

COLLABORATION DURING ANALYTIC DESIGN

9-12. Collaboration is critical to long-term analytical assessments and occurs between different stakeholders across the intelligence community. This collaboration ensures a diversity of perspective and depth in expertise that is impossible through any other means. Four specific areas in which collaboration is invaluable are—

- **Bias mitigation:** Analytic teams with diverse backgrounds and different perspectives can effectively identify and check assumptions, interpret new information, and determine the quality of various types of information.
- **Framing/Knowledge review:** Analytic teams can engage early in the process to build context, craft analytic questions, share information sources, and develop analytical issues.
- **Methodology building:** Analytic teams assess the credibility of the analytic approach and clarity of the argument through various means, including peer reviews.
- **Perform analysis:** Analytic teams can perform various analytic techniques, identify hypotheses, and analyze alternatives as a group to improve the quality of the analytical effort.

TRANSITIONING FROM THE ANALYTIC DESIGN PROCESS TO PRESENTING THE RESULTS

9-13. Managing long-term analytical assessments includes not only presenting an analytic answer but also a confidence level to the answer and alternative hypotheses or explanations for gaps and uncertainty. During evaluate analysis, the last step of the process, the analytic team decides whether the question requires more analysis, and therefore, whether the assessment is exploratory or authoritative and ready to present to the requestor. If the results are ready for presentation, the analytic team deliberately prepares to present those results. Transitioning from long-term analysis to presenting the analytic answer includes stepping back from that analysis, reviewing the assessment, and clarifying the relevance of the analytical results. Then the analytic team determines—

- **What is the message:** The message characterizes whether the assessment is authoritative or exploratory and includes the "bottom line" of the assessment. Additionally, the assessment includes any shifts in analysis that occurred over time, any impacts on the requestor (decisions and future focus areas), the confidence level, alternative hypotheses, and indicators.
- **What is the analytical argument:** The analytic team develops an outline for logically progressing through the analytical assessment. An argument map is a useful tool to ensure a logical analytical flow during the presentation and to ensure the message is easily understood. The team may use basic interrogatives (*who, what, when, where, why,* and *how*) or a similar tool to capture the critical elements of the message to present to the requestor.
- **What are critical gaps and assumptions:** Gaps and assumptions identified during the evaluate analysis step become limitations to the certainty of the analytical assessment, and, in some cases, drive future analytical efforts. The analytic team may insert gaps and assumptions within the message and clearly discuss the level of impact on the assessment (for example, in the source summary statement or in the "bottom line" statement).
- **What reasonable analytical alternatives remain:** For authoritative assessments, answering the questions *"what if I am wrong"* and *"what could change my assessment"* provides analysis of alternatives that should be included in the assessment to explain what remains uncertain.
- **What product or products should be presented:** Determine the best format for the presentation that facilitates the discussion of the argument. If it is exploratory analysis, the format should allow the analytic team to effectively describe the new understanding of the topic and its relevance to the requestor. The team should consider the following when choosing the format: requestor preference, specific tasking/requirement, complexity of the argument, urgency/time constraints, and potential interest of others.

CROSSWALKING ANALYTIC DESIGN WITH TACTICAL INTELLIGENCE ANALYSIS

9-14. Tactical intelligence analysis and analytic design have similarities but also differ in a number of ways. Tactical operations are often chaotic and time-constrained, and therefore, driven by specific commander-centric requirements (for example, PIRs and targeting requirements). The commander and staff plan and control operations by employing several standard Army planning methodologies, including but not limited to the Army design methodology, the MDMP, and Army problem solving. (See ADP 5-0 for a discussion of these methodologies.) Large portions of steps 1 through 5 of analytic design equate to the Army's time-tested planning processes, namely the Army design methodology, the MDMP (including IPB), and Army problem solving. Parts of steps 1 through 5 also equate to generate intelligence knowledge, which is a continuous task that develops general intelligence knowledge for subsequent intelligence analysis (see paragraphs 3-6 and 3-7).

9-15. Many of the doctrinal concepts presented in this and other publications are consistent with the analytic design steps discussed in this appendix. Table 9-1 provides a crosswalk of the analytic design steps to various Army doctrinal concepts and their associated references.

Table 9-1. Analytic design to tactical intelligence analysis crosswalk

Analytic design step	*Doctrinal concepts and references*
Step 1: Frame the question/ issue	• ATP 2-33.4: ▪ Develop commander's PIRs, par. 1-30. ▪ Frame the analytic problem with PIRs and other requirements, par. 2-5 and figure 2-1. ▪ Commander's visualization of the OE and threat, pars. 3-8 and 3-9. • ADP 5-0: Identify requirements to support decision points, pars. 1-40–1-43. • ATP 2-01: Refine PIRs into SIRs and indicators, par. 2-9. • ATP 5-0.1: Frame OEs, chapter 3.
Step 2: Review and assess knowledge	• ATP 2-33.4: ▪ Include information and intelligence from all available sources, par. 1-44. ▪ Screen collected information, pars. 2-7 and 2-8. ▪ Review information previously discarded as nonessential, par. 2-21. • ATP 2-01: Plan collection management, par. 1-4. • ATP 5-0.1: Share knowledge and build consensus, par. 1-32. • ATP 2-01.3: Identify intelligence gaps in knowledge, par. 1-16.

Table 9-1. Analytic design to tactical intelligence analysis crosswalk (*continued*)

Analytic design step	*Doctrinal concepts and references*
Step 3: Review resources	• ATP 2-33.4: ▪ Identify planning and execution deadlines, par. 1-23. ▪ Collaborate with available analytic assets, pars. 1-25 and 1-26. ▪ Identify all-source intelligence architecture requirements, pars. 1-32 and 1-33. ▪ Identify availability of time, tools, services, and other sources, pars. 2-8 and 7-2. • FM 2-0: ▪ Leverage intelligence, par. 1-19. ▪ Determine intelligence reach relationships, par. 1-25. • FM 3-55: Conduct information collection with organic and nonorganic resources, par. 1-28. • ATP 2-01: Evaluate resources, par. 4-2. • MI Pub 2-01.2: ▪ Plan the intelligence architecture, chapter 1. ▪ Prepare the intelligence architecture, chapter 2.
Step 4: Select analytic approach/methodology and plan project	• ATP 2-33.4: ▪ Determine optimal all-source structure to address the question, par. 1-34. ▪ Chapter 4, *Analytic Techniques.* ▪ Chapter 5, *Basic and Diagnostic Structured Analytic Techniques*. ▪ Chapter 6, *Advanced Structured Analytic Techniques.* • ATP 2-01: Plan collection management, par. 3-2. • ATP 5-0.1: Plan to facilitate decision making, pars. 1-7–1-10.
Step 5: Develop knowledge	• ATP 2-33.4: ▪ Think critically, par. 1-24. ▪ Screen collected information, pars. 2-7 and 2-8. ▪ Integrate new information with prior holdings, pars. 2-16–2-18. ▪ Review information previously discarded as nonessential, par. 2-21. ▪ Generate intelligence knowledge, pars. 3-6 and 3-7. • ADP 2-0: Generate knowledge through the intelligence process, par. 3-4. • FM 2-0: Access information through intelligence reach, pars. 1-25–1-33. • FM 3-55: Gather data to support primary information collection tasks and operations, par. 1-30.
Step 6: Perform analysis	• ATP 2-33.4: ▪ Conduct intelligence analysis, pars. 1-15 and 1-16. ▪ Reach determination based on facts and assumptions, par. 1-24. ▪ Chapter 2, *The Intelligence Analysis Process.* ▪ Chapter 4, *Analytic Techniques.* ▪ Chapter 5, *Basic Diagnostic Structured Analytic Techniques.* ▪ Chapter 6, *Advanced Structured Analytic Techniques.* ▪ Appendix B, *Cognitive Considerations for Intelligence Analysts.* (This appendix describes thinking abilities, critical and creative thinking, and avoiding analytical pitfalls.)
Step 7: Evaluate analysis	• ATP 2-33.4: ▪ Answer the *'so what'* from the commander's perspective, par. 1-21. ▪ Determine relevancy before producing assessments, par. 1-27. ▪ Appendix B, *Cognitive Considerations for Intelligence Analysts.* (This appendix describes thinking abilities, critical and creative thinking, and avoiding analytical pitfalls.) ▪ Appendix C, *Analytic Standards and Analysis Validation.* (This appendix discusses the analytic standards that govern intelligence analysis.)

Automation Support to Intelligence Analysis

AUTOMATION ENABLERS

A-1. Many different automation and communications systems are vital to intelligence analysis; they facilitate real-time collaboration, detailed operational planning, and support to collection management. Software updates and emerging technologies continue to improve current intelligence analysis systems to operate more effectively in garrison and in deployed environments.

A-2. Automation processing capabilities and tools readily available on today's computers enable the intelligence analysis process. The software or related programs in current automation systems allow intelligence analysts to screen and analyze significantly more data than in previous years. The development of analytical queries, data management tools, and production and dissemination software enhances the intelligence analysis process, facilitating the commander's situational understanding and timely decision making across all echelons.

A-3. Automation is crucial to intelligence analysis; there are four aspects for analysts to consider:

- Automation is a key enabler to the processing and fusion of compatible information and intelligence, but the individual analyst remains essential in the validation of any assessment.
- The analyst must still be heavily involved in building specific queries, analyzing the final assessment, and releasing intelligence.
- Automation relies on the cyberspace domain, which requires extensive defensive actions to ensure data is not corrupted from collection to dissemination. Deception and corruption within the cyberspace domain are likely occurrences; therefore, they require monitoring by both cyberspace experts and intelligence analysts.
- Automation relies on available communications to receive, assess, and disseminate information across the command at all echelons. During periods of disrupted or degraded communications, the intelligence analyst must understand and may have to execute intelligence analysis without the aid of automation.

DISTRIBUTED COMMON GROUND SYSTEM-ARMY

A-4. All communications, collaboration, and intelligence analysis within the intelligence warfighting function are facilitated by the DCGS-A—the intelligence element of Army command and control systems and an Army program of record. DCGS-A can leverage the entire national, joint, tactical, and multinational intelligence community for intelligence reach and federated analysis. DCGS-A enables the intelligence analysis process through software tools, as shown in figure A-1 on page A-3. The following highlights some of the most significant tools across the phases of the intelligence analysis process:

- **Screen:**
  - ***Axis Pro/Link Diagram*** is a software product used for data analysis and investigations that assists in mapping and understanding threat networks comprising threat equipment, units, facilities, personnel, activities, and events.
  - ***Threat Characteristics Workstation*** provides tools to develop and manage threat characteristics, track battle damage assessments (BDAs), and create doctrinal and dynamic situation templates. The workstation also allows analysts to create graphic and written comparisons of threat capabilities and vulnerabilities, which are included in the intelligence estimate.
  - ***Weather Client*** allows analysts to identify segments of the battlefield that require an in-depth evaluation of weather effects on friendly and threat operations. This evaluation gives the commander a general overview of potential effects throughout the AO.

- ***MovINT Client*** provides an integrated, temporal view of the battlefield, and aggregates air- and ground-force locations, moving target intelligence, aircraft videos, sensor points of interest, and target locations.

- **Analyze**:
  - ***SOCET GXP*** (also known as Softcopy Exploitation Toolkit Geospatial Exploitation Product), an advanced geospatial intelligence software solution, uses imagery from satellite and aerial sources to identify, analyze, and extract ground features, allowing for rapid product creation.
  - ***Terra Builder/Explorer*** provides professional-grade tools for manipulating and merging imagery and elevation data of different sizes and resolutions into a geographically accurate terrain database. It also allows analysts to view, query, analyze, edit, present, and publish geospatial data.
  - ***Text Extraction*** allows analysts to quickly extract information from reports, associate elements with relationships, and identify existing matches in the database.
  - ***ArcGIS*** (also known as Arc Geographic Information System) allows analysts to visualize, edit, and analyze geographic data in both two- and three-dimensional images and has several options for sharing with others.
- **Integrate:**
  - ***Multifunction workstation interface***, a customizable interface that streamlines workflow, supports the commander's operations by providing accurate and timely intelligence and analysis to support Army forces.
  - ***ArcGIS***. (See description under **Analyze**.)
  - ***Google Earth***, a geo-browser that accesses satellite and aerial imagery, ocean bathymetry, and other geographic data of a network, represents the Earth as a three-dimensional globe.
- **Produce:**
  - ***Office 2013*** is a suite of productivity applications that includes Microsoft Word, Excel, PowerPoint, Outlook, OneNote, Publisher, Access, InfoPath, and Link.
  - ***Multifunction workstation interface***. (See description under **Integrate**.)
  - ***i2 Analyst Notebook*** is a software product used for data analysis and investigation. It is part of the Human Terrain System, an Army program that embeds social scientists with combat brigades.

A-5. DCGS-A, like any automation system, is subject to software updates, including changes to the current hardware as well as lifecycle replacements. As such, future versions may include greater analytical cross discipline and domain collaboration and improved interoperability with command and control systems and knowledge management components. (See figure A-1.)

Appendix B

Cognitive Considerations for Intelligence Analysts

OVERVIEW

B-1. Analytic skills are the ability to collect, visualize, and examine information in detail to make accurate analytical conclusions. Analytic skills enable Army Soldiers to complete simple and complex tasks; they enable intelligence analysts to use deliberate thought processes to examine a situation critically and without bias.

THE INTELLIGENCE ANALYST

B-2. Intelligence analysis support to any operation involves separating useful information from misleading information, using experience and reasoning, and reaching an assessment or conclusion based on fact and/or sound judgment. The conclusion is based on the intelligence analyst's—

- Experience, skill, knowledge, and understanding of the operation.
- Knowledge of the various intelligence disciplines.
- Knowledge of information collection.
- Understanding of the threats within an OE.
- In-depth understanding of the threat's military and political structure.

B-3. The intelligence personnel conducting the analysis of information and intelligence use basic to advanced tradecraft skills and tools and integrated automated programs to sort raw forms of data and information and apply research skills to formulate an assessment. Analysts are responsible for the timely dissemination and/or presentation (proper writing and presentation techniques) of known facts and assumptions regarding the OE to the commander and staff. There are established tradecraft standards that direct the individual or group of analysts to ensure the analysis meets a common ethic to achieve analytical excellence.

B-4. Intelligence analysts follow guidelines, such as the ICD 203 Intelligence Community Analytic Standards, that promote a common ethic for achieving analytical rigor and excellence and personal integrity in analytical practices. (See appendix C.) Additionally, they must build their foundational understandings and integrate their learned skills—critical thinking and embracing ambiguity. Intelligence analysts must be willing to change their determinations over time. Training, knowledge, and experience further develop analysts' expertise, as these aspects are essential in helping analysts deal with the uncertain and complex environments.

B-5. The OE is complex, and the threat attempts to hide its objectives, intent, and capabilities when possible. Therefore, intelligence analysts embrace ambiguity, recognize and mitigate their own or others' biases, challenge their assumptions, and continually learn during analysis. To assist in mitigating some of the uncertainty associated with conducting intelligence analysis, analysts should increase their proficiency in using analytic techniques and tools, including automated analytic tools and systems, to identify gaps in their understanding of the OE. Furthermore, to be effective, intelligence analysts must have a thorough understanding of their commanders' requirements and the intelligence analysis process (see chapter 2), which directly contributes to satisfying those requirements.

BASIC THINKING ABILITIES

B-6. Army intelligence personnel are required to use basic thinking abilities and complex skills to analyze information. These skills relate to an analyst's ability to think. Intelligence analysis focuses primarily on thinking. Intelligence analysts must continually strive to improve the quality of their thinking to support the commander's requirements. The three basic thinking abilities for intelligence analysis are

- Information ordering.
- Pattern recognition.
- Reasoning.

INFORMATION ORDERING

B-7. *Information ordering* is the ability to follow previously defined rules or sets of rules to arrange data in a meaningful order. In the context of intelligence analysis, this ability allows analysts, often with technology's assistance, to arrange information in ways that permit analysis, synthesis, and a higher level of understanding. The arrangement of information according to certain learned rules leads analysts to make conclusions and disseminate the information as intelligence. However, such ordering can be inherently limiting—analysts may not seek alternative explanations because the known rules lead to an easy conclusion.

PATTERN RECOGNITION

B-8. Humans detect and impose patterns on apparently random entities and events in order to understand them, often doing this without awareness. Intelligence analysts impose or detect patterns to identify relationships, and often to infer what they will do in the future. Pattern recognition lets analysts separate the important from the less important, even the trivial, and conceptualize a degree of order out of apparent chaos. However, imposing or seeking patterns can introduce bias. Analysts may impose culturally defined patterns on random aggregates rather than recognize inherent patterns, thereby misinterpreting events or situations.

REASONING

B-9. *Reasoning* is what allows humans to process information and formulate explanations in order to assign meaning to observed actions and events. The quality of any type of reasoning is based on how well analysts' analytic skills have been developed, which occurs through practice and application. Improving analytic skills occurs by implementing individual courses of study and organizational training strategies.

B-10. There are four types of reasoning that guide analysts in transforming information into intelligence:

- **Deductive reasoning** is using given factual information or data to infer other facts through logical thinking. It rearranges only the given information or data into new statements or truths; it does not provide new information. Therefore, deductive reasoning is, *"If this is true, then this is also true."*
- **Inductive reasoning** is looking at given factual information or data for a pattern or trend and inferring the trend will continue. Although there is no certainty the trend will continue, the assumption is it will. Therefore, inductive reasoning is, *"Based on this trend, this is probably true."*
- **Abductive reasoning** is similar to inductive reasoning since conclusions are based on probabilities or "guessing." Therefore, abductive reasoning is, "*Because this is probably true, then this may also be true."*
- **Analogical reasoning** is a method of processing information that relies on an analogy to compare the similarities between two specific entities; those similarities are then used to draw a conclusion—the more similarities between the entities, the stronger the argument.

Note. Of the four types of reasoning, only deductive reasoning results in a conclusion that is always true. However, during the conduct of intelligence analysis, this statement can be misleading. During operations, there are few situations in which both a rule is always true and there is adequate collection on the threat to apply deductive reasoning with certainty.

Even in the best of circumstances, inductive, abductive, and analogical reasonings cannot produce conclusions that are certain. All of the types of reasoning rely on accurate information, clear thinking, and freedom from personal bias and group thinking.

B-11. Figure B-1 provides hypothetical examples for each type of reasoning. The examples are based on a peer threat with multiple divisions. The threat designates its divisions as first-tier, second-tier, or third-tier based on their equipment, end strength, and ability to conduct complicated operations. Effective execution of a relief-in-place is very complicated.

Deductive Reasoning	*Inductive Reasoning*	*Abductive Reasoning*	*Analogical Reasoning*
General Rule ↓ Specific Conclusion (always true)	**Specific Observations** ↓ General Conclusion (probably true)	**Incomplete Observations** ↓ Best Prediction (may be true)	**Incomplete Observations** ↓ Possible Prediction (may be true) (Requires Further Analysis)
P1: All first-tier divisions are capable of conducting an effective relief-in-place. **P2:** The 87th Tank Division is designated as a first-tier division. **Conclusion:** The 87th Tank Division is capable of conducting an effective relief-in-place.	**P1:** The 87th Tank Division is designated as a first-tier division. **P2:** The 87th Tank Division is capable of conducting an effective relief-in-place. **Conclusion:** All first-tier divisions are capable of conducting an effective relief-in-place.	**P1:** All first-tier divisions are capable of conducting an effective relief-in-place. **P2:** The 87th Tank Division is capable of conducting an effective relief-in-place. **Conclusion:** The 87th Tank Division is designated as a first-tier division.	**Similarities:** The 46th Tank Division has key leaders who all received exceptional ratings throughout their career; the division is manned at 90% strength. **Similarities:** The 87th Tank Division has key leaders who all received exceptional ratings throughout their career; the division is manned at 90% strength. **P3:** The 46th Tank Division is designated as a first-tier division. **Conclusion:** The 87th Tank Division is designated as a first-tier division.
P premise			

Figure B-1. Types of reasoning examples

CRITICAL AND CREATIVE THINKING

B-12. Combining good analytic techniques with an understanding of the requirements, area knowledge, and experience is the best way of providing accurate, meaningful assessments to commanders and leaders. However, subject matter expertise alone does not guarantee the development of logical or accurate conclusions. Intelligence analysts apply critical thinking skills to provide more holistic, logical, ethical, and unbiased analysis and conclusions. Critical thinking ensures analysts fully account for the elements of thought, the intellectual standards of thought, and the traits of a critical thinker.

B-13. *Critical thinking* is a deliberate process of analyzing and evaluating thought with a view to improve it. The elements of thought (the parts of a person's thinking) and the standards of thought (the quality of a person's thinking) support critical thinking. Key critical thinking attributes include human traits such as intellectual courage, integrity, and humility. *Creative thinking* involves creating something new or original.

B-14. Analysts use thinking to transform information into intelligence. Critical thinking can improve many tasks and processes across Army operations, especially the conduct of intelligence analysis. Critical thinking includes the intellectually disciplined activity of actively and skillfully analyzing and synthesizing information. The key distinction in critical thinking is a reflective and self-disciplined approach to thinking.

B-15. For the analyst, the first step in building critical thinking skills is to begin a course of personal study and practice with a goal of improving the ability to reason. This means moving outside the Army body of doctrine and other Army professional writing when beginning this study. Most of the body of thought concerning critical thinking extends throughout various civilian professions, particularly those in academia. The discussion in this publication provides a glimpse of what should become a professional endeavor.

B-16. The Army has used many different sources in its doctrinal discussions of critical thinking. Among those most cited, as well as those used in the development of this discussion, are Dr. Richard Paul and Dr. Linda Elder of the Foundation for Critical Thinking. This foundation has developed many products and tools that assist Army leaders and Soldiers in developing critical thinking skills. Of those, the elements of thought, intellectual standards, and intellectual traits are the most useful tools analysts can initially apply to further their critical thinking skills. These tools can also assist analysts in avoiding the common pitfalls of undisciplined thinking (see paragraph B-30).

ELEMENTS OF THOUGHT

B-17. Whenever people think, they think for a purpose within a point of view based on assumptions leading to implications and consequences. People use concepts, ideas, and theories to interpret data, facts, and experiences in order to answer questions, solve problems, and resolve issues. These eight elements of thought assist in describing how critical thinking works:

- **Element 1—Purpose.** All thinking has a purpose. Critical thinkers will state the purpose clearly. Being able to distinguish the purpose from other related purposes is an important skill that critical thinkers possess. Checking periodically to ensure staying on target with the purpose is also important.
- **Element 2—Question at issue.** All thinking is an attempt to figure something out, to settle some question, or to solve some problem. A critical thinker can state questions clearly and precisely, express the questions in several ways to clarify their meaning and scope, and break the questions into subquestions.
- **Element 3—Information.** All thinking is based on data, information, and evidence. Critical thinkers should support their conclusions with relevant information and be open to actively searching for information that supports and contradicts a position. All information should be accurate, clear, and relevant to the situation being analyzed.
- **Element 4—Interpretation and inference.** All thinking contains interpretations and inferences by which to draw conclusions and give meaning to data. Critical thinkers should be careful to infer only what the evidence implies and to crosscheck inferences with each other. They should clearly identify the assumptions and concepts that led to the inferences, as well as consider alternative inferences or conclusions. Developing and communicating well-reasoned inferences represent the most important parts of what intelligence analysts provide because they aid situational understanding and decision making.
- **Element 5—Concepts.** All thinking is expressed through, and shaped by, concepts. A concept is a generalized idea of a thing or a class of things. People do not always share the same concept of a thing. For example, the concept of happiness means something different to each individual because happiness comes in many different forms. For a star athlete, happiness may be winning; for a mother, happiness may be seeing her children do well. To ensure effective communications, critical thinkers identify the meaning they ascribe to the key concepts used in their arguments and determine if others in their group ascribe different meanings to those concepts.
- **Element 6—Assumptions.** All thinking is based, in part, on assumptions. In this context, an assumption is a proposition accepted to be true without the availability of fact to support it. Assumptions are layered throughout a person's thinking and are a necessary part of critical thinking. The availability of fact determines the amount of assumption an analyst must use in analysis. Critical thinkers clearly identify their assumptions and work to determine if they are justifiable.
- **Element 7—Implications and consequences.** All thinking leads somewhere or has implications and consequences. Analysts should take the time to think through the implications and consequences that follow from their reasoning. They should search for negative as well as positive implications.
- **Element 8—Point of view.** All thinking is performed from some point of view. To think critically, analysts must recognize a point of view, seek other points of view, and look at them fair-mindedly for their strengths and vulnerabilities.

B-18. By applying the eight elements of thought, analysts can develop a checklist for reasoning. Developing and using a checklist, as shown in table B-1, can help analysts focus their efforts to a specific problem and avoid wasting time on irrelevant issues or distractions.

Table B-1. Checklist for reasoning

Element	*Explanation*
Purpose	All reasoning has a purpose. Failure to identify the purpose causes problems throughout the analytical effort: • Express the purpose only. • Distinguish the purpose from similar purposes. • Check periodically to remain on target. • Choose significant and realistic purposes.
Question at issue	All reasoning is an attempt to figure something out, to answer some question, to meet some requirement: • State the question at issue clearly and precisely • Express the question in several ways to clarify its meaning and scope. • Carefully break the question into subquestions. • Distinguish between questions that have definitive answers from those that are a matter of opinion and from those that require consideration of multiple viewpoints.
Information	All reasoning is based on data and information: • Only state facts as facts and clearly identify the assumptions used to help form conclusions. • Search for information that opposes one's position as well as information that supports it. • Ensure all information used is clear, accurate, and relevant to the question at issue. • Gather sufficient information.
Interpretation and inference	All reasoning contains inferences or interpretations from which to draw conclusions and give meaning to data: • Infer only what the evidence implies. • Check inferences for their consistency with others. • Identify assumptions, underlying one's inferences. ***Note.*** Inferring involves uncertainty. Analysts must deal with different degrees of uncertainty. Both the complexity of a situation and the availability of information determine the amount of uncertainty that will exist.
Concepts	All reasoning is expressed through, and shaped by, concepts and ideas: • Identify key concepts and explain them clearly. • Consider alternative concepts or alternative definitions to concepts. • Use concepts with precision.
Assumptions	All reasoning includes assumptions: • Clearly identify and justify assumptions to the audience. • Ascertain those deep-held personal assumptions that can affect one's analysis.
Implications and consequences	All reasoning leads somewhere or has implications and consequences: • Trace the implications and consequences that follow from one's reasoning. • Search for negative and positive implications. • Consider all possible consequences.
Point of view	All reasoning is performed from some point of view: • Identify one's point of view. • Seek points of view from other analysts related to the threat and other significant aspects of the operational environment and identify their strengths and vulnerabilities. • Strive to be fair-minded when considering other points of view.

INTELLECTUAL STANDARDS

B-19. When critical thinkers take apart their thinking and examine its parts, they use standards of quality referred to as the intellectual standards or standards for thought. While the elements of thought provide a framework for analyzing thinking, the standards of thought provide criteria that critical thinkers use to assess the quality of thinking. The effectiveness of intelligence analysis and resulting products can be measured against nine intellectual standards:

- **Standard 1—Clarity.** Clarity is the gateway standard. If the questions a person tries to answer, the information a person uses, the inferences a person makes, and the assumptions that guide a person's thinking are unclear, one cannot determine whether the information the person provides is accurate, relevant, logical, or justifiable. Therefore, analysts should strive to provide information clearly, so the audience understands it.
- **Standard 2—Accuracy.** To be accurate is to represent something in accordance with the way it actually is. People often describe things or events inaccurately. Critical thinkers listen carefully to statements and, when there is reason for skepticism, they question whether what they hear is true or accurate. A statement describing an implication, assumption, inference, or the very question a person tries to answer may be clear but not accurate. ***Note.*** Since people tend to think from an egocentric and/or socio-centric perspective, assessing the accuracy of their own ideas can be difficult. People tend to believe their thoughts are accurate just because the thoughts belong to them; therefore, the thoughts of those that disagree with theirs are inaccurate. Additionally, people often fail to question statements made by others that agree with what the people already believe.
- **Standard 3—Precision.** To be precise is to give the details needed for someone to understand exactly what is meant. Precise thinking seeks more details and greater specificity when necessary. People can apply the standard of precision to evaluate how detailed the question is that one is answering, or how detailed it needs to be. Precision is also the standard to determine if assumptions and facts contain enough detail to evaluate them using the standards of relevance, clarity, and accuracy. However, one should never sacrifice clarity for precision.
- **Standard 4—Relevance.** Something is relevant when it is connected with and bears upon the question people are reasoning through. Something is also relevant when it is pertinent or applicable to a problem people are trying to solve. Relevant thinking also encourages people to identify facts, information, questions, assumptions, implications, and points of view that they should set aside as not being pertinent to the main issue. Thinking that is relevant stays on track. People are often irrelevant in their thinking because they lack discipline in their thinking. They wander into side issues that may be intellectually satisfying to discuss but have no bearing on the issue or question.
- **Standard 5—Depth.** People think deeply when they get beneath the surface of an issue or problem. Depth of thinking is also present when people identify its inherent complexities, and then deal with those complexities not superficially but in an intellectually responsible way. Intelligence analysis generally involves the examination of complex situations and requires deep conclusions.
- **Standard 6—Breadth.** When people consider the issue from every relevant viewpoint, they think broadly. Multiple points of view that are pertinent to the issue are given due consideration. People think broadly about an issue when they recognize other viewpoints and intellectually empathize with those contrary viewpoints so as to understand them. Breadth of thinking improves the quality of the inferences and recommendations developed during intelligence analysis.
- **Standard 7—Logic.** When people think, they bring together thoughts in some order. When the combined thoughts are mutually supporting and make sense, the thinking is logical. If information, inferences, and so forth, are contradictory, if they do not make sense together, they are illogical.
- **Standard 8—Significance.** When people reason, they want to concentrate on the most important information and consider the most important ideas or concepts to answer the question. Too often, people fail in their thinking because they do not recognize that although many ideas may be relevant to an issue, the ideas are not equally important.

- **Standard 9—Fairness.** To think fairly is to think in accordance with reason and to consider the views of others. Fairness as a standard helps one deal with one's propensity for self-deception. Personal biases and ego creep easily into people's thinking. When gauging the fairness of a decision, the critical thinker asks, "Do my selfish interests distort this thinking or is my decision fair to all concerned?" The fairness standard seeks to prevent egocentric thinking. As a person's ego enters the thought process, critical thinking becomes poisoned.

APPLYING THE ELEMENTS AND STANDARDS

B-20. When an analyst exercises self-discipline and thoughtfully analyzes thinking (using the elements of thought) and then assesses the quality of the elements using intellectual standards, the result is a solid foundation for critical thinking. It is important to remember that critical thinking is a deliberate choice. Critical thinking requires self-discipline and a commitment to improve the skills that support this approach. While critical thinking cannot necessarily solve every problem an analyst may face (because some are so complex), it can ensure that every analyst is more effective and efficient while conducting the different analytical tasks, especially those that are the most complicated or ambiguous.

ESSENTIAL INTELLECTUAL TRAITS

B-21. Intellectual traits are the traits of mind and character necessary to support reasoning. Analysts should repeatedly apply and practice the elements of thought and intellectual standards to help develop intellectual traits. The following provides brief descriptions of the essential intellectual traits and related questions that foster their development.

Fair-Mindedness

B-22. A fair-minded thinker strives to treat every relevant viewpoint in an unbiased, unprejudiced way. Fair-mindedness entails an awareness that people tend to prejudge the views of others, placing them into favorable (agrees with others) and unfavorable (disagrees with others) categories. People tend to give less weight to a contrary view than to their own. This is especially true when people have selfish reasons for opposing such views. Fair-minded thinkers try to see the strengths and vulnerabilities of any reasoning they assess. Fair-mindedness entails a conscious effort to treat all viewpoints alike in spite of one's feelings or selfish interests, or the feelings of one's friends, company, community, or social organization. Questions that foster fair-mindedness include—

- "Am I considering how my behavior might make others feel?"
- "Is my reason for doing that fair to everyone?"

Intellectual Humility

B-23. Intellectual humility is knowledge of ignorance, sensitivity to what one knows and what one does not know. It means being aware of one's biases, prejudices, self-deceptive tendencies and the limitations of one's viewpoint. Questions that foster intellectual humility include—

- "What do I really know (about myself, about the situation, about another person, about what is going on in the world)?"
- To what extent do my prejudices or biases influence my thinking?"

Intellectual Courage

B-24. Intellectual courage is the disposition to question beliefs one feels strongly about. It includes questioning the beliefs of one's culture and the groups to which one belongs, and a willingness to express one's views even when those views are unpopular. Questions that foster intellectual courage include—

- "To what extent have I analyzed and questioned the beliefs I hold?"
- "To what extent have I demonstrated a willingness to give up my beliefs when sufficient evidence is presented against them?"
- "To what extent am I willing to stand up against the majority (even though people ridicule me)?"

Intellectual Empathy

B-25. Intellectual empathy is awareness of the need to actively entertain views that differ from one's views, especially those one strongly disagrees with. It is to accurately reconstruct the viewpoints and reasoning of one's opponents and to reason from premises, assumptions, and ideas other than one's own. Questions that foster intellectual empathy include—

- "To what extent do I accurately represent viewpoints I disagree with?"
- "Can I summarize the views of my opponents to their satisfaction? Can I see insights in the views of others and prejudices in my own?"
- "Do I sympathize with the feelings of others in light of their thinking differently from me?"

Intellectual Integrity

B-26. Intellectual integrity consists of holding oneself to the same intellectual standards one expects others to honor (no double standards). Questions that foster intellectual integrity include—

- "Do I behave in accordance with what I say I believe, or do I tend to say one thing and do another?"
- "To what extent do I expect the same of myself as I expect of others?"
- "To what extent are there contradictions or inconsistencies in my views?"
- "To what extent do I strive to recognize and eliminate self-deception in my views?"

Intellectual Perseverance

B-27. Intellectual perseverance is the disposition to work one's way through intellectual complexities despite the frustration inherent in the task. Questions that foster intellectual perseverance include—

- "Am I willing to work my way through complexities in an issue or do I tend to give up when I experience difficulty?"
- "Can I think of a difficult intellectual problem with which I have demonstrated patience and determination in working through the difficulties?"

Confidence in Reason

B-28. Confidence in reason is based on the belief that one's higher interests and those of humankind are best served by giving the freest play to reason. It means using standards of reasonability as the fundamental criteria by which to judge whether to accept or reject any belief or position. Questions that foster confidence in reason include—

- "Am I willing to change my position when the evidence leads to a more reasonable position?"
- "Do I adhere to principles of sound reasoning when persuading others of my position or do I distort matters to support my position?"
- "Do I deem it more important to 'win' an argument or see the issue from the most reasonable perspective?"
- "Do I encourage others to come to their own conclusions or do I try to force my views on them?"

Intellectual Autonomy

B-29. Intellectual autonomy is thinking for oneself while adhering to standards of rationality. It means thinking through issues using one's thinking rather than uncritically accepting the viewpoints of others. Questions that foster intellectual autonomy include—

- "To what extent am I a conformist?"
- "Do I think through issues on my own or do I merely accept the views of others?"
- "Having thought through an issue from a rational perspective, am I willing to stand alone despite the irrational criticisms of others?"

AVOIDING ANALYTICAL PITFALLS

B-30. Critical thinking is a mental process that is subject to numerous influences. Intelligence analysts involved in analyzing complex situations and making conclusions are prone to the influences that shape and mold their view of the world and their ability to reason. These influences are referred to as analytical pitfalls. The elements of thought, intelligence standards, and intellectual traits assist analysts in recognizing these pitfalls in their analysis and the analysis performed by others. Logic fallacies and biases are two general categories of analytical pitfalls.

LOGIC FALLACIES

B-31. Logic fallacies are errors in the reasoning process caused by the failure to apply sound logic. Although usually committed unintentionally, these fallacies are sometimes used deliberately to persuade, convince, or deceive. An analyst must be able to recognize logic fallacies so a false line of reasoning will not distract them and lead to poor conclusions. This appendix discusses the fallacies of relevance, omission, and assumption.

Fallacies of Relevance

B-32. Fallacies of relevance appeal to evidence or examples that are irrelevant to the argument at hand:

- **Appeal to force ("argumentum ad baculum" or the "might-makes-right" fallacy):** This argument uses force, the threat of force, or some other unpleasant backlash to make the audience accept a conclusion. It commonly appears as a last resort when evidence or rational arguments fail to convince. Logically, this consideration has nothing to do with the merits of the points under consideration.
- **Genetic fallacy:** The genetic fallacy is the claim that, because an idea, product, or person must be wrong because of its origin. For example, "That car cannot possibly be any good! It was made outside of the United States!" Or, "Why should I listen to her argument? She comes from California, and we all know those people are not critical thinkers." This type of fallacy is closely related to the fallacy of argumentum ad hominem, below.
- **Argumentum ad hominem (literally "argument to the man"; also called "poisoning the well" and "personal attack"):** This fallacy seeks to discount evidence before it is presented, most often by discrediting the source. For example, an ardent spokesman against the value of strategic bombing states, "You cannot trust that man's testimony regarding the effectiveness of strategic bombing; he's employed by the Air Force." The speaker is trying to discredit contrary evidence by creating the specific impression that the testimony is biased because the testifier represents a certain organization. There are two subcategories:
  - ***Abusive:*** To argue that proposals, assertions, or arguments must be false or dangerous because of an irrational psychological transference with the originator.
  - ***Circumstantial:*** To argue that opponents should accept or refute an argument only because of circumstances in their lives is a fallacy. If one is an environmentalist, suggesting that this environmentalist should not accept hunting because to do so would be incompatible with environmentalism is a circumstantial fallacy. The opponent's special circumstances do not affect the truth or untruth of a specific contention. The speaker or writer must find additional evidence beyond that to make a strong case.
- **Argumentum ad populum ("argument to the people"):** This fallacy uses an appeal to popular assent, often by arousing the feelings and enthusiasm of the multitude rather than building an argument. It is a favorite device with the propagandist, the demagogue, and the advertiser. There are three basic approaches:
  - ***Bandwagon approach:*** "Everybody is doing it." This argumentum ad populum asserts that, since the majority of people believes an argument or chooses a particular COA, the argument must be true or the COA must be the best one. For instance, "Over a million people purchased that phone rather than a competing phone; all those people cannot be wrong. That company must make the best phones." Popular acceptance of any argument does not prove it to be valid.

- ***Patriotic approach:*** This argument asserts that a certain stance is true or correct because it is somehow patriotic, and that those who disagree are somehow unpatriotic. It overlaps with pathos and argumentum ad hominem to a certain extent. The best way to spot it is to look for emotionally charged terms like Americanism, rugged individualism, motherhood, patriotism, or godless communism, for example, "A true American would never use this approach," or, "A truly free man will exercise his American right to drink beer, since beer belongs in this great country of ours."
- ***Snob approach:*** This type of argumentum ad populum does not assert "everybody is doing it," but rather that "all the best people are doing it." For instance, "The top analysts at the Central Intelligence Agency agree that my analytic approach is correct." The implication is that anyone who fails to recognize the truth of the analyst's assertion is not an equal to the "top analysts of the Central Intelligence Agency," and thus has no right to question the analytical conclusions.

- **Appeal to tradition (argumentum ad traditio [also referred to as argumentum ad antiquitatem]):** This line of thought asserts that a premise must be true because people have always believed it or done it. Alternatively, it may conclude that the premise has always worked in the past and will thus always work in the future.

Fallacies of Omission

B-33. Fallacies of omission occur when an analyst leaves out necessary material in a conclusion or inference. Some fallacies of omission include oversimplification, composition, division, post hoc, false dilemma, hasty generalization, and special pleading:

- **Oversimplification** is a generality that fails to adequately account for all the complex conditions bearing on a problem. Oversimplification results when one or more of the complex conditions pertaining to a certain situation is omitted and includes ignoring facts, using generalities, and/or applying an inadequately qualified generalization to a specific case. For example, an ordnance specialist inspecting a captured, hand-carried, surface-to-air missile launcher concludes that the threat has no effective low-level air defense. The assessment is based on the fact that the weapons system is equipped with antiquated guidance mechanisms. The ordnance specialist's conclusion omits the following considerations:
  - That this piece of equipment may not be the threat's only low-level air defense weapon.
  - That the launcher may have been planted by the threat to give a misleading picture of the threat's true capabilities and deceive weapons experts.
  - That the threat abandoned the launcher because it was ineffective and more capable systems were available.
- **Fallacy of composition** is committed when a conclusion is drawn about a whole based on the features of parts of that whole when, in fact, no justification is provided for that conclusion. For example, during a battle with an ethnic militia, a single detainee was captured. This detainee was suffering from malnutrition and low morale. It was noted that the detainee was equipped with a semiautomatic weapon of World War II vintage. After a brief interrogation, the intelligence analyst reported the threat militia recently engaged was starving, diseased, and poorly armed. The intelligence analyst failed to consider that—
  - The detainee may have been captured because the detainee was too sick to keep up with the rest of the unit.
  - The weapon of early vintage did not necessarily make it ineffective.
  - Few captured detainees have high morale; in fact, low morale could just as easily result from being captured as it could contribute to being captured.
- **Fallacy of division** is committed when a person infers that what is true of a whole must also be true of the parts of that whole. For example, members of the threat guard's brigade had never surrendered in previous combat. After a recent engagement, a detainee stated it was a member of the guard brigade. The interrogator doubted the detainee's statement because personnel from that brigade never surrender.

- **Fallacy of post hoc ergo propter hoc** (after this, therefore because of this) is consideration of other factors that might have accounted for the same result that are omitted. Post hoc fallacies often occur when trying to establish cause and effect. For example, an aircraft equipped with a new jamming pod was not fired on while flying over threat-controlled territory. It was concluded that, since the aircraft was not intercepted or fired upon, the jamming pod was extremely effective in suppressing threat electronic systems. The conclusion may or may not account for the aircraft not being attacked. Other considerations include—
  - The threat was obtaining electronic intelligence on this new pod.
  - The threat recently relocated several surface-to-air missile units and did not want to reveal their new positions.
- **False dilemma** (also known as black-and-white thinking) is a fallacy in which a person omits consideration of more than two alternatives when in fact there are more than two alternatives. For example, an S-2 reports to the commanding officer that the threat only has the capability to either defend in place or retreat. The S-2 committed the fallacy of false dilemma by failing to anticipate or ignoring that the threat could attack if it were willing to accept high casualties, withdraw to an alternate defensive position, or conduct a delaying action.
- **Hasty generalizations** are conclusions drawn from samples that are too few or from samples that are not truly representative of the population. For example, after interrogating a detainee, the interrogation officer reports the threat's morale as extremely low and that surrender is imminent. In this case, the interrogator is making a hasty generalization because the sample population considered, one detainee, is too small.
- **Special pleading** is a fallacy in which the writer creates a universal principle, then insists that the principle does not for some reason apply to the issue at hand. For instance, "John Doe claimed to be psychic, but when his 'abilities' were tested under proper scientific conditions, they magically disappeared. John explained this saying that one had to have faith in his abilities for them to work."

Fallacies of Assumption

B-34. Fallacies of assumption implicitly or explicitly involve assumptions that may or may not be true. Some fallacies of assumption include begging the question, stating hypotheses contrary to fact, and misusing analogies:

- **Begging the question** (also known as circular reasoning) is a fallacy in which the conclusion occurs as one of the premises.
  - It is an attempt to support a statement by simply repeating the statement in different and stronger terms. For example, a particular group wants democracy. America is a democratic nation. Therefore, that group will accept American-style democracy.
  - When asked why the enemy was not pinned down by fire, the platoon leader replied, "Our suppressive fire was inadequate." The fallacy in this response is that by definition suppressive fire pins down the enemy or is intended to pin him down. Since the platoon failed to pin down the enemy, the inadequacy of this fire was self-evident.
- **Stating hypotheses contrary to fact** occurs when someone states decisively what would have happened had circumstances been different. Such fallacies involve assumptions that are either faulty or simply cannot be proven. For example, the statement, "If we had not supported Castro in his revolutionary days, Cuba would be democratic today" is contrary to fact. Besides being a gross oversimplification, the assumption made in the statement cannot be verified.
- **Misusing analogies** occurs when one generalizes indiscriminately from analogy to real world. One method for weakening an analogous argument is by citing a counter-analogy. Analogies are strong tools that can impart understanding in a complex issue. In the absence of other evidence, intelligence analysts may reason from analogy. Such reasoning assumes that the characteristics and circumstances of the object or event being looked at are similar to the object or event in the analogy.

B-35. The strength of a conclusion drawn from similar situations is proportional to the degree of similarity between the situations. The danger in reasoning from analogy is assuming that because objects, events, or situations are alike in certain aspects, they are alike in all aspects. Conclusions drawn from analogies are inappropriately used when they are accepted as evidence of proof. Situations may often be similar in certain aspects, but not in others. A counter-analogy weakens the original analogy by citing other comparisons that can be made on the same basis.

BIASES

B-36. A subjective viewpoint, bias indicates a preconceived notion about someone or something. Biases generally have a detrimental impact on intelligence analysis because they obscure the true nature of the information. Intelligence analysts must be able to recognize cultural, organizational, personal, and cognitive biases and be aware of the potential influence they can have on judgment.

Cultural Bias

B-37. Americans see the world in a certain way. The inability to see things through the eyes of someone from another country or culture is cultural bias. Biases interfere with the analyst's ability to think the way a threat commander might think or to give policymakers informed advice on the likely reaction of foreign governments to U.S. policy. Also known as mirror imaging, cultural bias attributes someone else's intentions, actions, or reactions to the same kind of logic, cultural values, and thought processes as the individual analyzing the situation. Although cultural bias is difficult to avoid, the following measures can lessen its impact:

- Locate individuals who understand the culture:
  - Include them in the intelligence analysis process.
  - Ask their opinion about likely responses to friendly actions.
  - Take care when using their opinions since they may be subject to biases regarding ethnic groups or cultures in the region and their knowledge may be dated or inaccurate.
- Locate regional experts, such as foreign and regional area officers, who have lived or traveled through the area and are somewhat conversant regarding the culture. Assess the quality of the information provided against the level of knowledge and experience the individual has for that culture or region.

Organizational Bias

B-38. Most organizations have specific policy goals or preconceived ideas. Analysis conducted within these organizations may not be as objective as the same type of analysis done outside the organization. Groupthink and best case are organizational biases that can significantly skew internal analysis.

- **Groupthink.** This bias occurs when a judgment is unconsciously altered because of exposure to selective information and common viewpoints held among individuals. Involving people outside the organization in the analysis can help identify and correct this bias.
- **Best case.** This bias occurs when an analyst presents good news or bad news in the most optimistic light. The judgment is deliberately altered to provide only the information the commander wants to hear. Analysts can avoid this bias by having the moral courage to tell the commander the whole story, good and bad.

A Useful Tool in Logic: Occam's Razor

The term “Occam's Razor” comes from a misspelling of the name William of Ockham. Ockham was a brilliant theologian, philosopher, and logician in the medieval period. One of his rules of thumb has become a standard guideline for thinking through issues logically. Occam's Razor is the principle that, if two competing theories explain a single phenomenon, and they both generally reach the same conclusion, and they are both equally persuasive and convincing, and they both explain the problem or situation satisfactorily, the logician should always pick the less complex one. The one with the fewer number of moving parts, so to speak, is most likely to be correct. The idea is always to cut out extra unnecessary bits, hence the name "razor." An example will help illustrate this.

Suppose you come home and discover that your dog has escaped from the kennel and chewed large chunks out of the couch. Two possible theories occur to you:

- Theory one is that you forgot to latch the kennel door, and the dog pressed against it and opened it, and then the dog was free to run around the inside of the house. This explanation requires two entities (you and the dog) and two actions (you forgetting to lock the kennel door and the dog pressing against the door).
- Theory two is that some unknown person skilled at picking locks managed to disable the front door, then came inside the house, set the dog free from the kennel, then snuck out again covering up any sign of his presence and then relocked the door, leaving the dog free inside to run amok in the house. This theory requires three entities (you, the dog, and the lock-picking intruder) and several actions (picking the lock, entering the house, releasing the dog, hiding the evidence, relocking the door). It also requires us to come up with a plausible motivation for the intruder-a motivation that is absent at this point.

  Either theory would be an adequate and plausible explanation. Both explain the same phenomenon (the escaped dog) and both employ the same theory of how, for example, that the latch was opened somehow, as opposed to some farfetched theory.

  Which theory is most likely correct? If you do not find evidence like strange fingerprints or human footprints or missing possessions to support theory two, William of Ockham would say that the simpler solution (theory one) is most likely to be correct in this case. The first solution only involves two parts-two entities and two actions.

On the other hand, the second theory requires at least five parts-you, the dog, a hypothetical unknown intruder, some plausible motivation, and various actions. It is needlessly complex. Occam's basic rule was: "Thou shalt not multiply extra entities unnecessarily," or to phrase it in modern terms: "Don't speculate about extra hypothetical components if you can find an explanation that is equally plausible without them." All things being equal, the simpler theory is more likely to be correct.

Personal Bias

B-39. Personal bias is the tendency to base assessments on personal beliefs. This can cause the rejection of valid arguments that conflict with these beliefs. A racially or religiously prejudiced person may reject arguments because of the source. A person with strong political views may discount every argument from another political group.

B-40. There are several types of personal bias. Three common biases exhibited by analysts are—

- **Confirmation bias.** This bias causes analysts to undervalue or ignore evidence contradicting an early judgment and value evidence that tends to confirm already held assessments.
- **Assimilation bias.** This bias involves the modification and elaboration of new information to fit prior conceptions or hypotheses. The bias is toward confirming a preconceived answer.
- **Anchoring bias.** This bias involves the use, often unwitting, of arbitrary values in decision making, including the use of conclusions developed by others.

Cognitive Bias

B-41. The intelligence analyst evaluates information from a variety of sources. The degree of reliability, completeness, and consistency varies from source to source and even from report to report. This variance often creates doubt about the reliability of some sources. Cognitive biases that affect the analyst are—

- **Vividness.** Clear and concise or vivid information has a greater impact on analytical thinking than abstract and vague information. A clear piece of information is held in higher regard than a vague piece of information that may be more accurate. Analysts must consider that an enemy may use deception to portray vivid facts, situations, and capabilities that they want the friendly intelligence effort to believe.
- **Absence of evidence.** Lack of information is the analyst's most common problem, especially in the tactical environment. Analysts must do their best with limited information and avoid holding back intelligence because it is inconclusive. To avoid this bias, the analyst should—
  - Realize that information will be missing.
  - Identify areas where information is lacking and consider alternative conclusions.
  - Adapt or adjust judgments as more information becomes available.
  - Consider whether a lack of information is normal in those areas or whether the absence of information itself is an indicator.
- **Oversensitivity to consistency.** Consistent evidence is a major factor for confidence in the analyst's judgment. Information may be consistent because it is appropriate, or it may be consistent because it is redundant, is from a small or biased sample, or is the result of the enemy's deception efforts. When making judgments based on consistent evidence, the analyst must—
  - Be receptive to information that comes in from other sources regardless of whether it supports the hypothesis or not.
  - Be alert for circular reporting, which is intelligence already obtained by the unit that is then reformatted by other units and intelligence organizations, modified slightly, and disseminated back to the unit. This is a common problem; particularly in digital units, where large volumes of information are being processed. It helps to know, to the degree possible, the original source for all intelligence to ensure that a circular report is not used as evidence to confirm an intelligence estimate or conclusion.
- **Persistence on impressions.** When evidence is received, there is a tendency to think of connections that explain the evidence. Impressions are based on these connections. Although the evidence eventually may be discredited, the connection remains and so do the impressions.
- **Dependency on memory.** The ability to recall past events influences judgment concerning future events. Since memory is more readily available, it is easy to rely on memory instead of seeking new information to support analysis.
- **Acceptance of new intelligence.** Often new intelligence is viewed subjectively; either valued as having more value or less value than current intelligence.

Appendix C

Analytic Standards and Analysis Validation

INTELLIGENCE COMMUNITY ANALYTIC STANDARDS

C-1. During intelligence analysis, the conclusions reached should also adhere to analytic standards, such as those established by the Director of National Intelligence in ICD 203. This directive establishes the analytic standards that govern the production and evaluation of national intelligence analysis to meet the highest standards of integrity and rigorous analytic thinking. The ICD 203 Intelligence Community Analytic Standards act as guidelines and goals for analysts and leaders throughout the intelligence community who strive for excellence in their analytical practices and products. The following identify and describe the five ICD 203 Intelligence Community Analytic Standards, including the nine analytic tradecraft standards:

- **Objective:** Analysts must perform their functions with objectivity and awareness of their own assumptions and reasoning. They must employ reasoning techniques and practical mechanisms that reveal and mitigate bias. Analysts should be alert to the influences of existing analytical positions or judgments and must consider alternative perspectives and contrary information. Analysis should not be unduly constrained by previous judgments when new developments indicate a modification is necessary.
- **Independent of political consideration:** Analytical assessments must not be distorted by, nor shaped for, advocacy of a particular audience, agenda, or policy viewpoint. Analytical judgments must not be influenced by the force of preference for a particular policy.
- **Timely:** Analysis must be disseminated in time for it to be actionable. Analytical elements must be continually aware of events of intelligence interest and of intelligence requirements and priorities in order to provide useful analysis at the right time.
- **Based on all available sources of intelligence information:** Analysis should be informed by all relevant information available. Analytical elements should identify and address critical information gaps and work with collection managers and data providers to develop access and collection strategies.
- **Implement and exhibit the analytic tradecraft standards:** See paragraphs C-3 through C-14.

ANALYSIS VALIDATION

C-2. Intelligence analysis and the resultant judgments are incomplete without the estimative language that provides both the probability that an event will occur and the confidence level of the analyst making this assessment. Analysts employ the analytic tradecraft standards to assess probabilities and confidence levels and the actions associated with analytical rigor to draw accurate conclusions.

ANALYTIC TRADECRAFT STANDARDS

C-3. Intelligence analysts exhibit and implement the nine analytic tradecraft standards, one of the five ICD 203 Intelligence Community Analytic Standards. Specifically, they—

- Properly describe the quality and credibility of all underlying sources, information, and methodologies.
- Properly express and explain uncertainties associated with major analytical judgments.
- Properly distinguish between underlying intelligence information and analysts' assumptions and judgments.
- Incorporate analysis of alternatives.
- Demonstrate customer relevance and address implications.

- Use clear and logical argumentation.
- Explain change to or consistency of analytical judgments.
- Make accurate judgments and assessments.
- Incorporate effective visual information where appropriate.

Properly Describe the Quality and Credibility of All Underlying Sources, Information, and Methodologies

C-4. Analytical products should include all underlying sources, information, and methodologies from which analytical judgments are based. Factors affecting source quality and credibility should be described using source descriptors in accordance with ICD 206, *Sourcing Requirements for Disseminated Analytic Products*. Such factors can include accuracy and completeness, possible denial and deception, age and continued currency of information, and technical elements of collection, as well as source access, validation, motivation, possible bias, or expertise. Source summary statements, described in ICD 206, should be used to provide a holistic assessment of the strengths or vulnerabilities in the source base and explain which sources are most important to key analytical judgments.

Properly Express and Explain Uncertainties Associated with Major Analytical Judgments

C-5. Analysts must properly express and explain uncertainties associated with any major analytical judgment. When briefing their analytical results, analysts, at a basic level, must be able to assess the likelihood of an event happening, expressed by using estimative language. Then, they must express their confidence level—high, moderate, or low—in that assessment. (See figure C-1.) For intelligence analysts to reach a high level of confidence in the accuracy of their analytical assessment, they must apply the actions of high analytical rigor found in table C-1 on page C-5.

Expressions of Likelihood	Almost no chance	Very unlikely	Unlikely	Roughly even chance	Likely	Very likely	Almost certain
	Remote	Highly improbable	Improbable	Roughly even odds	Probable	Highly probable	Nearly certain
Probability	01-05%	05-20%	20-45%	45-55%	55-80%	80-95%	95-99%
Confidence Levels	Low				Moderate		High

Figure C-1. Estimative language: expressions of likelihood

Note. For expressions of likelihood, analysts are strongly encouraged not to mix terms from the different rows. Additionally, commanders are all different and their individual acceptance of the various probability and confidence levels may be different than those of previous commanders.

Assessing the Likelihood of an Event Happening

C-6. Phrases (such as *we judge*, *we assess*, and *we estimate*) commonly used to convey analytical assessments and judgments, are not facts, proofs, or knowledge. Intelligence analysts use estimative language, shown in figure C-1, to convey their assessment of the probability or likelihood of an event and the level of confidence ascribed to the judgment.

Expressing Confidence in Assessments

C-7. Confidence levels express the strength of the assessment given the reasoning, methodologies, gaps, and assumptions; the number, quality, and diversity of sources; and the potential for deception. (See figure C-1.) To avoid confusion, assessment language and confidence levels are no longer combined in the same sentence. Confidence levels are ascribed using high, moderate, and low levels of confidence in analytical assessments:

- **High confidence level.** High confidence generally indicates that sound reasoning and/or methodologies have been applied; no linchpin assumptions have been made; no critical gaps relevant to the issue are evident; consistent evidence from a variety of independent sources supports the judgment; the potential for deception is low; the body of reporting is not consistent with a plausible alternative; and/or the nature of the issue allows one to render a solid judgment. A *high confidence judgment*, however, is not a fact or a certainty, and such judgments still carry a risk of being inaccurate.
- **Moderate confidence level.** Moderate confidence generally indicates that potentially critical assumptions are used to fill gaps; some inconsistencies exist, but the preponderance of evidence supports the judgment; the information is credibly sourced and plausible but is not of sufficient quality or is not sufficiently corroborated to warrant high confidence; moderate potential for deception exists; and/or the body of reporting leaves open the possibility of a plausible alternative explanation of events.
- **Low confidence level.** Low confidence generally indicates that key assumptions have been used to fill critical gaps; significant inconsistencies or questions exist regarding the evidence; the information is fragmented or uncorroborated or is of questionable credibility and/or plausibility; high potential for deception exists; and/or the body of reporting supports an alternative explanation of events.

Properly Distinguish Between Underlying Intelligence Information and Analysts' Assumptions and Judgments

C-8. Analytical products should clearly distinguish statements that convey underlying intelligence information used in analysis from statements that convey assumptions or judgments. *Assumptions* are suppositions used to frame or support an argument; assumptions affect analytical interpretation of underlying intelligence information. *Judgments* are conclusions based on underlying intelligence information, analysis, and assumptions. Products should state assumptions explicitly when they serve as the linchpin of an argument or when they bridge key information gaps. Products should explain the implications for judgments if assumptions prove to be incorrect. As appropriate, products should also identify indicators that, if detected, would alter judgments.

Incorporate Analysis of Alternatives

C-9. *Analysis of alternatives* is the systematic evaluation of differing hypotheses to explain events or phenomena, explore near-term outcomes, and imagine possible futures to mitigate surprise and risk. Analytical products should identify and assess plausible alternative hypotheses. This is particularly important when major judgments must contend with significant uncertainties, or complexity, such as forecasting future trends, or when low probability events could produce high-impact results. In discussing alternatives, products should address factors such as associated assumptions, likelihood, or implications related to Army forces. Products should also identify indicators that, if detected, would affect the likelihood of identified alternatives.

Demonstrate Relevance and Address Implications

C-10. Analytical products should provide information and insight on issues relevant to the commanders and address the implications of the information and analysis they provide. Products should add value by addressing prospects, context, threats, or factors affecting opportunities for action.

Use Clear and Logical Argumentation

C-11. Analytical products should present a clear main analytical conclusion up front. Products containing multiple judgments should have a main analytical conclusion that is drawn collectively from those judgments. All analytical judgments should be effectively supported by relevant intelligence information and coherent reasoning. Products should be internally consistent and acknowledge significant supporting and contrary information affecting judgments.

Explain Change To or Consistency Of Analytical Judgments

C-12. Analysts should state how their major judgments on a topic are consistent with or represent a change from those in previously published analysis or represent initial coverage of a topic. Products need not be lengthy or detailed in explaining change or consistency. They should avoid using reused or unoriginal language and should make clear how new information or different reasoning led to the judgments expressed in them. Recurrent products should note any changes in judgments; absent changes, recurrent products need not confirm consistency with previous editions. Significant differences in analytical judgment, such as between two intelligence community analytical elements, should be fully considered and brought to the attention of customers.

Make Accurate Judgments and Assessments

C-13. Analytical products should apply expertise and logic to make the most accurate judgments and assessments possible, based on the information available and known information gaps. In doing so, analytical products should present all judgments that would be useful to commanders and should include difficult judgments in order to minimize the risk of being wrong. Inherent to the concept of accuracy is that the analytical conclusion that the analyst presents to the commander should be the one the analyst intended to send. Therefore, analytical products should express judgments as clearly and precisely as possible, reducing ambiguity by addressing the likelihood, timing, and nature of the outcome or development.

Incorporate Effective Visual Presentations When Feasible

C-14. Analysts should present intelligence in a visual format to clarify an analytical conclusion and to complement or enhance the presentation of intelligence and analysis. In particular, visual presentations should be used when information or concepts, such as spatial or temporal relationships, can be conveyed better in graphic form, such as tables, flow charts, and images coupled with written text. Visual presentations may range from a plain display of intelligence information to interactive displays for complex issues and analytical concepts. Visual presentations should always be clear and pertinent to the product's subject. Analytical content in a visual format should also adhere to other analytic tradecraft standards.

ANALYTICAL RIGOR

C-15. *Analytical rigor* is the application of precise and exacting standards to better understand and draw conclusions based on careful consideration or investigation. There are eight primary action-metrics that lead to analytical rigor. When analysts combine these action-metrics with the intelligence analysis process, they can determine the analytical sufficiency of their conclusions. (See table C-1.)

Table C-1. Analytical actions and levels of rigor

Analytical rigor actions	*Levels of analytical rigor*		
	Low rigor	*Moderate rigor*	*High rigor*
Consider alternative hypotheses: Hypothesis exploration describes the extent to which multiple hypotheses were considered in explaining data.	• Little to no consideration of alternatives to primary or initial hypotheses. • Interpretation of ambiguous or conflicting data such that they are compatible with existing beliefs. • Fixation or knowledge shielding behaviors.	• Some consideration of how data could support alternative hypotheses. • An unbalanced focus on a probable hypothesis or a lack of commitment to any particular hypothesis.	• Significant generation and consideration of alternative explanations via the direct evaluation of specific hypotheses. • Incorporation of "outside" perspectives in generating hypotheses. • Evolution and broadening of hypothesis set beyond an initial framing. • Ongoing revision of hypotheses as new data are collected.
Evaluate depth of research: Information search relates to the depth and breadth of the search process used in collecting data.	• Failure to go beyond routine and readily available data sources. • Reliance on a single source type or on data that are far removed from original sources. • Dependence upon “pushed” information, rather than on actively collected information. • Use of stale or dated source data.	• Collection from multiple data types or reliance on proximal sources to support key findings. • Some active information seeking.	• Collection of data from multiple source types in addition to the use of proximal sources for all critical inferences. • Exhaustive and detailed exploration of data in the relevant sample space. • Active approach to information to information collection
Validate information accuracy: Information validation details the levels at which information sources are corroborated and cross-validated.	• General acceptance of information at face value, with little or no clear embellishment of underlying veracity. • Lack of convergent evidence. • Poor tracking and citation of original sources of collected data.	• Use of heuristics to support judgments of source integrity. For example, relying on sources that have previously proven to be consistently accurate. • A few “key” high-quality documents are relied on heavily. • Recognizes and highlights inconsistencies between sources.	• Systematic and explicit processes employed to verify information and to distinguish facts from judgments. • Seeks out multiple, independent sources of converging evidence. • Concerned both with consistency between sources and with validity and credibility within a given source.
Examine source bias: Stance analysis is the evaluation of data with the goal of identifying the stance or perspective of the source and placing it into a broader context of understanding.	• Little consideration of the views and motivations of source data authors. • Recognition of only clearly biased sources or sources that reflect a well-defined position on an issue.	• Perspectives and motivations of authors are considered and assessed to some extent. • Incorporates basic strategies to compare perspectives of different sources. For instance, by dividing issues into “for” or “against” positions.	• Involves significant research into, or leverages a preexisting knowledge of, the backgrounds and views of key players and thought leaders. • May involve more formal assessments of data sources, such as faction analysis, social network analysis, or deception analysis.

Table C-1. Analytical actions and levels of rigor (*continued*)

Analytical rigor actions	*Levels of analytical rigor*		
	Low rigor	*Moderate rigor*	*High rigor*
Scrutinize strength of analysis: Sensitivity analysis considers the extent to which the analyst considers and understands the assumptions and limitations of their analysis.	• Explanations are appropriate and valid at a surface level. • Little consideration of critical "what if?" questions, such as, "What if a given data source turns out to be unreliable?" or "What if a key prediction does not transpire as anticipated?"	• Considers whether being wrong about some inferences would influence the overall best explanation for the data. • Identifies the boundaries of applicability for an analyzed information.	• Goes beyond simple identification to specify the strength of explanations and assessments in the event that individual supporting evidence or hypotheses were to prove invalid or unreliable. • Specifies limitations of the analysis, noting the most vulnerable explanations or predictions on which the analysis is at risk of erring.
Amalgamate information: Information synthesis refers to how far beyond simply collecting and listing data an analyst went in their process.	• Little insight with regard to how the analysis relates to the broader analytical context or to more long-term concerns. • Lack of selectivity, with the inclusion of data figures that are disconnected from the key arguments or central issues. • Extensive use of lists or the restatement of material copied directly from other sources with little interpretation.	• Explicit, though perhaps not systematic, efforts to develop the analysis within a broader framework of understanding. • Depiction of events in context and framing of key issues in terms of tradeoff dimensions and interactions. • Provides insight beyond what is available in the collected data.	• Extracted and integrated information in terms of relationships rather than components and with a thorough consideration of diverse interpretations of relevant data. • Reconceptualization of the original task, employing cross-checks on abstractions. • Performed by individuals who are "reflexive" in that they are attentive to the ways in which their cognitive processes may have hindered effective synthesis.
Incorporate expert input: Specialist collaboration describes the degree to which an analyst incorporates the perspectives of domain experts into their assessments.	• Minimal direct collaboration with experts. • Little if an on-topic, "outside" expertise is accessed or sought out directly.	• Involves some direct interaction with experts, though usually via readily available specialists. • Expertise is drawn from within preexisting personal or organizational networks.	• Independent experts in key content areas are identified and consulted. • Efforts to go beyond a "core network" of contacts to seek out domain-relevant experts, with additional resources and "political capital" potentially expended to gain access to such specialist expertise.
Assess breadth of collaboration: Explanation critique is a different form of collaboration that captures how many different perspectives were incorporated in examining the primary hypotheses.	• Few if any instances of alternative or "outside" criticisms being considered. • Reliance on preexisting channels of critiquing, primarily supervisory.	• Brings alternative perspectives to bear in critiquing the overall intelligence analysis process. • Leverages personal or organizational contacts to examine analytical reasoning. For example, peer analysts or proxy decision makers.	• Familiar as well as independent perspectives have examined the chain of analytical reasoning, explicitly identifying which inferences are stronger and weaker. • Use of formal techniques, such as devil's advocacy or team A/team B (see chapter 6, to challenge and vet hypotheses and explanations. • Expenditure of capital, political or otherwise, in critiquing the intelligence analysis process.

Appendix D

Threat Considerations During Large-Scale Ground Combat Operations

OVERVIEW

D-1. A *threat* is any combination of actors, entities, or forces that have the capability and intent to harm United States forces, United States national interests, or the homeland (ADP 3-0). While the Army must be manned, equipped, and trained to operate across the range of military operations, large-scale ground combat against a peer threat represents the most significant readiness requirement.

D-2. Intelligence analysts must be proficient in understanding the threat to ensure they provide quality products and recommendations to commanders and staffs. They should continuously strive to be experts on threat doctrine, capabilities, and equipment. Threat doctrine provides the guidelines a threat often follows or tries to follow during military operations; threat tactics are derived from threat doctrine. Many peer threats require their forces to follow threat doctrine and do not allow these forces to exercise the initiative. Identifying *how* and *when* a threat follows threat doctrine is key to developing COAs. Intelligence analysts must seek the most current (by nation) threat doctrine, capabilities, and equipment from the various U.S. intelligence agencies: Defense Intelligence Agency, NGIC, INSCOM, and several of the DOD organizations responsible for maintaining national threat databases and assessments.

D-3. After mission receipt, analysts should have a basic knowledge of the fundamental maneuver tactics and the combat equipment related to the warfighting functions, which are used to generate threat combat power and access joint and multinational capabilities. Setting the conditions begins with generate intelligence knowledge. Databases and threat signatures developed during generate intelligence knowledge assist in assessing threat capabilities and vulnerabilities during IPB. This information facilitates decision making during the MDMP and provides a common understanding of how friendly forces may gain a position of relative advantage across multiple domains.

D-4. During mission analysis and IPB, analysts reference current intelligence holdings to develop the initial intelligence estimate of the threat situation for the warning order produced during the MDMP. An understanding of the current threat situation enables analysts to recognize potential threat vulnerabilities, which will be developed further during IPB.

D-5. During large-scale ground combat operations, analysts apply their knowledge of threat doctrine, capabilities, and equipment to the OE in order to assess the threat. While maintaining an accurate intelligence threat assessment during combat operations, analysts must be able to—

- **Confirm or deny analytical predictions.** Analysts identify whether or not the threat's actions are consistent with the analytical assessment (for example, validation of the most likely and most dangerous threat COAs).
- **Update the situation template, event template and matrix, and running estimate.** Analysts should recognize the threat's balance of risk and opportunity to create and maintain the conditions necessary to seize, retain, and exploit the threat initiative and achieve decisive results.
- **Assist the commander and staff to update planning.** Analysts continually update the situation template and running estimate to reflect current operations in order to identify windows of opportunity to seize, retain, and exploit the initiative to shape the OE.

THREAT ANALYSIS BY WARFIGHTING FUNCTION

D-6. Analysts must have a detailed knowledge of threat doctrine and capabilities to portray how the threat will conduct operations in a given environment. During the war-gaming step of the MDMP, analysts apply their knowledge of threat doctrine and capabilities. This knowledge enables the staff to determine the threat's likely reaction to friendly COAs and assists the staff in refining the plan recommended to the commander.

D-7. The analysis and predicted implementation of threat doctrine and capabilities must be as accurate and detailed as possible because its inclusion in IPB drives planning. During IPB, this analysis assists the S-2 and S-3 in identifying additional planning considerations and potential operational windows of opportunity for the commander to exploit. Categorizing potential threat capabilities and requirements by warfighting function is a basic way of analyzing the threat. A peer threat force commander is likely to have similar requirements as the Army force commander's requirements. Therefore, categorizing threat elements by warfighting function enables analysts to efficiently convey and commanders and staffs to easily understand threat requirements. Determining the threat's likely requirements assists in determining the threat force commander's likely decision points.

D-8. Intelligence analysts apply techniques and tools to assist them in identifying likely threat requirements, categorized by warfighting function. (See table D-1.) After identifying threat requirements, the S-2 and S-3 collaborate to determine how best to influence the threat's decision-making process.

Table D-1. Threat analysis by warfighting function example

Threat element	*Threat requirements*	*Considerations*	*Support to future friendly operations*
Command and control	Commander's critical information requirements	What must threat commander know to meet the end state?	Provide EEFIs for protection and security.
	CP positioning	How is the threat arrayed on the battlefield?	• Contribute information to the threat overlay. • Provide potential NAIs.
		Does the terrain favor the location of the CPs?	• Identify key terrain. • Identify natural defensive terrain.
		Where are the LOCs that connect CPs across the AO?	Identify AAs
	Commander's location	Which CP has the best defensive posture?	Identify natural defensive terrain.
		What security measures are emplaced at the location?	Identify obstacles for maneuver elements.
		What weapons systems are colocated with the commander?	Develop targets.
	Succession of command	Which personalities would be able to continue operations?	Develop targets.
	Communications guidance	How does the threat communicate throughout the AO?	• Refine the collection plan. • Assess the threat's operations security. • Identify possible bypass routes.
Intelligence	Most likely COA/Most dangerous COA	How much influence can friendly forces apply on the threat?	Identify the threat threshold that would force commitment to a decisive operation.
	Key terrain	What terrain would be advantageous to the threat's mission?	• Develop NAIs. • Identify potential objectives for seizure.
	Weather	What effect will certain weather have on threat operations?	Refine threat COAs.
	Information gaps	What does the threat not know about friendly forces?	• Refine collection plans. • Identify potential threat priority intelligence requirements.
	Intelligence collection guidance	What capabilities is the threat employing to collect information?	• Develop counterreconnaissance plans. • Develop operational security guidelines.

Table D-1. Threat analysis by warfighting function example (*continued*)

Threat element	*Threat requirements*	*Considerations*	*Support to future friendly operations*
Movement and maneuver	Commander's intent	What is the end state the commander is attempting to achieve?	Develop COA criteria.
	Task and purpose of subordinate units	Do projected threat COAs support the threat commander's intent?	COA development
	Task organization	What is the threat command structure?	Develop targets.
	Forms of maneuver	How does the threat conduct specific operations?	Develop threat TTP.
	Reserve composition, mission, priorities, and control measures	How many personnel does the threat have in reserve?	Identify the overall threat strength.
		What is the threat commander's threshold for committing reserve forces onto the battlefield?	Develop COA criteria.
		How will reserve forces operate?	COA development
Fires	• Task and purpose of lethal and nonlethal fires • Schemes of fire	Do projected lethal and nonlethal fires in COAs support the threat commander's intent?	COA development
		What lethal and nonlethal fires capabilities can the threat use?	Develop threat TTP.
		What is the location of fires systems?	Develop NAIs.
		Where would the threat emplace observers?	Develop NAIs.
	Special munitions	Does the threat possess any special munitions?	Adjust planning considerations.
		How much special munitions does the threat possess?	Anticipate potential resupply points.
Protection	Protection priorities	What structures or locations require additional protection?	Refine the collection plan.
		What is the significance of the structures or locations to the threat commander?	Develop high-value targets.
	Terrain factors	Does any terrain provide protection for the threat?	Identify obstacles for maneuver elements.
		What LOCs will the threat prioritize for protection?	• Identify possible AAs. • Develop ways to restrict threat freedom of maneuver.
Sustainment	Sustainment priorities—manning, fueling, fixing, arming, moving the force, and sustaining Soldiers and systems	How will the threat conduct resupply operations?	Develop threat TTP.
		How will the threat refuel vehicles?	• Identify potential LOAs. • Identify AAs. • Identify LOCs for collection.
	Construction of facilities and installations	What types of systems will be needed to degrade threat facilities?	• Identify threat vulnerabilities. • Provide accurate recommendations to friendly capabilities.
	Anticipated requirements of classes III (fuel), IV (fortification), V (ammunition)	How often will the threat require a resupply?	Identify potential threat battle rhythm.

AA avenue of approach
AO area of operations
COA course of action
CP command post
EEFI essential element of friendly information
LOA limit of advance
LOC line of communications
NAI named area of interest
TTP tactics, techniques, and procedures

THREAT EQUIPMENT

D-9. The strengths, vulnerabilities, and functionality of a threat's equipment influence that threat's tactics. Analysts should conduct basic threat equipment analysis combined with threat doctrine for accurate threat capability assessments. Analysis results assist in understanding the threat's ability to employ its capabilities. Understanding the strengths and vulnerabilities of threat equipment by warfighting function assists analysts in identifying key factors about the threat, such as how the threat's equipment status may affect its ability to fight based on threat doctrine, or whether an enemy can go on the offensive, and if so, how far can the enemy advance based on its logistic support. From those factors, analysts can further identify limits of advance and determine the threat's likely objectives. Table D-2, while not all inclusive, provides one way to assist analysts in identifying key factors to consider during large-scale ground combat.

Note. Understanding equipment strengths and vulnerabilities may encompass more than one warfighting function because the equipment may have multiple capabilities. For example, an armored reconnaissance vehicle can fall under the movement and maneuver, intelligence, and protection warfighting functions, as indicated in table D-2, based on its capabilities. In this instance, it is important for analysts to analyze the specific role of the vehicle or unit in order to explain its strengths and vulnerabilities.

Table D-2. Analyst considerations based on threat equipment capabilities

Equipment	*Threat element*	*Description*	*Considerations*	*Strengths and vulnerabilities*
BRM-3K/Kredo 1 (modified BRM for reconnaissance)	**Movement and maneuver**	**Range:** Frag-HE 4000 m (day) 1200–1500 m (night passive sight) 3000 m+ (night-active sight); 4000 m (antiaircraft)	Threat has not been observed conducting night training in 18 months.	• Vehicle can outrange 25-mm bushmaster during daylight hours. • It is unlikely the threat will be proficient on night scopes, providing the advantage to friendly forces.
		Speed: Max road: 70 km/hour Max off-road: 45 km/hour Average cross-country: 35 km/hour Max swim: 10 km/hour **Range:** 600 km (highway)	Open terrain exists throughout the area of operations.	Vehicle will have minimally restricted movement throughout the area of operations.
	Intelligence	• 2-3-m mast with a Kredo-1 radar system • Catherine 2d generation thermal sight extends night range to 5-7 km • 1D22 laser target designator ranges to 7 km	Division capable of detecting radar within 10 seconds of activation.	Threat uses radar to spot targets and call for fire, then quickly transitions to a new location to prevent being targeted.
			Laser designators will enable the threat to send locations rapidly for indirect fires.	When within 7 km of the corps disruption zone and templated reconnaissance positions, units are at an increased risk for indirect fire attack.
	Protection	Six smoke grenade launchers, vehicle engine exhaust systems	Division has reported critical shortages of smoke canisters for the past year.	It is unlikely that smoke will be used for obscuring positions and movement.
		CBRN-automatic overpressure system	Not applicable	Not applicable
		30-355 mm-turret armor (front glacis)	Not applicable	Direct fires from 25 mm or higher are required to penetrate the turret. Tracks are susceptible to .50 caliber direct fire and above for mobility kill.

CBRN chemical, biological, radiological, and nuclear
km kilometer
m meter
mm millimeter

D-10. In-depth analysis of threat equipment assists in nominating equipment critical to the success of the threat's mission. This information assists analysts in nominating HVTs and HPTs for targeting and the S-2 and S-3 in recommending PIRs to the commander. Additionally, it provides friendly forces the ability to exploit threat vulnerabilities by creating defeat mechanisms.

Appendix E
Intelligence Production

OVERVIEW

E-1. The fundamental requirement of intelligence analysis is providing timely, accurate, reliable, and predictive intelligence assessments about the threat and OE to the commander and staff. Therefore, intelligence production requires the dissemination of reports and presentations to support operations. These reports involve various updates to IPB and collection management templates and matrices.

Notes. The development of production and dissemination software in current automation systems enhances intelligence production. DCGS-A and other operational systems must be identified and a location or internet protocol address provided to find maps, overlays, templates, charts, and other analytic techniques and tools.

This appendix contains specific collection requirements and instructions. Unit-level SOP information should not be repeated in the intelligence annex.

INTELLIGENCE PRODUCTS

E-2. The intelligence products described in this appendix are organized based on the following:

- Threat and OE analysis reports.
- Current intelligence reports.
- Supplemental analytical reports.
- Analytical assessments that support orders and briefings.

THREAT AND OPERATIONAL ENVIRONMENT ANALYSIS REPORTS

E-3. The intelligence estimate, intelligence running estimate, and Annex B (Intelligence) to the operation order (OPORD) each maintain an analytical assessment of threat forces' strengths, vulnerabilities, tactics, composition, disposition, training, equipment, and personnel, as well as other OE considerations before, during, and after operations (revision of the original estimate).

Annex B (Intelligence) to the Operation Order

E-4. Commanders and staffs use Annex B (Intelligence) to describe how intelligence supports the concept of operations described in the base plan or order. (See figure E-1 on page E-2.) The purpose of Annex B (Intelligence) is to provide detailed information and intelligence on the characteristics of the OE and to direct intelligence activities. (For more information, see FM 6-0.)

Intelligence Estimate

E-5. An *intelligence estimate* is the appraisal, expressed in writing or orally, of available intelligence relating to a specific situation or condition with a view of determining the courses of action open to the enemy or adversary and the order of probability of their adoption (JP 2-0). Since intelligence analysts will have performed IPB to support the commander's MDMP effort and likely participated in a thorough staff war-gaming effort to validate friendly and threat COAs, the intelligence estimate is a version of the staff planning effort and part of the larger OPORD. (See figure E-2 on page E-4.)

E-6. The intelligence staff develops and maintains the intelligence estimate to disseminate information and intelligence that define the threat COA along with the requirements to determine the adoption of a COA. The assessments in the intelligence estimate of COA development, including threat strengths, compositions, dispositions, and vulnerabilities, form the basis for future intelligence analytical requirements.

Intelligence Running Estimate

E-7. Effective plans and successful execution hinge on accurate and current running estimates. A *running estimate* is the continuous assessment of the current situation used to determine if the current operation is proceeding according to the commander's intent and if the planned future operations are supportable (ADP 5-0). Failure to maintain accurate running estimates may lead to errors or omissions that result in flawed plans or bad decisions during execution. Each staff element is responsible for updating its portion of the running estimate as the operation unfolds.

E-8. The intelligence running estimate enables the intelligence operational officer/noncommissioned officer to continually update the commander on the mission execution from the intelligence perspective. Unlike other intelligence products, the intelligence running estimate combines both the analysis of friendly and allied forces' intelligence activities to support current operations.

E-9. Figure E-3 illustrates an example intelligence running estimate. The analysis focuses on current threat activities, strengths, and assessed intent/objectives to provide the commander and associated reporting requirements with a consistent summary of the threat. As the operation progresses, the collaborative effort may involve further analysis of the terrain and weather, monitoring the flow of displaced persons on the battlefield as inhibitors to friendly force maneuverability, and, when necessary, additional security requirements.

Note. In the highly volatile large-scale ground combat environment, the intelligence operational officer along with the all-source intelligence analyst are likely to maintain the running estimate.

[CLASSIFICATION]

INTELLIGENCE RUNNING ESTIMATE NUMBER___

(U) DATE-TIME GROUP:

(U) REFERENCES: Maps, charts, or other documents.

1. (U) MISSION: The commander determines the unit's mission.
2. (U) AREA OF OPERATIONS (AO): Describe the existing situation in the AO based on:
a. Terrain. How terrain affects a functional area's capabilities.
b. Civil Considerations. Description of areas, structures, capabilities, organizations, people, and events.
c. Weather. How weather affects friendly and threat warfighting function capabilities.
3. (U)ENEMY SITUATION: Summary of each threat characteristic that can influence mission accomplishment:
a. Composition.
b. Disposition. Geographic location of threat elements and how they are deployed or employed.
c. Strength. Committed forces, reinforcements, air, and chemical, biological, radiological, nuclear, and high-yield explosive weapons.
d. Tactics and Training. Strategy, methods of operations, doctrine, tactics, and training.
e. Sustainment. Procurement, maintenance, distribution, and materiel replacement.
f. Operational Effectiveness. Threat morale, weapons effectiveness, equipment readiness, leadership, and personnel.
g. Intelligence. Estimate of the threat's intelligence collection capability.
h. Communications. The threat's communications modes.
i. Other.
4. (U) ENEMY CAPABILITIES: In conventional operations:
a. State Enemy's Capabilities. *What*, *where*, *when*, and in what *strength* for each capability.
b. State Enemy's Limitations. Cause and effect of each limitation.
c. Analysis and Discussion. Effect of capabilities on terrain, civil considerations, weather.
5. (U) CONCLUSIONS: Conclusions based on information and analysis about the total effects of the AO on threat operations.

OFFICIAL: [Authenticator's Name and Position]

[CLASSIFICATION]

Figure E-3. Intelligence running estimate example

CURRENT INTELLIGENCE REPORTS

E-10. Current intelligence reports address the current reporting of threat activities on the battlefield. The goal is to provide the commander with predictive analysis of the threat's intentions for future operations based on what conditions occurred by either threat or friendly actions during the past reporting period. This requires extensive intelligence analytical rigor in assessing threat activities and vigilance to the friendly scheme of maneuver.

Intelligence Summary

E-11. The intelligence summary (also known as INTSUM) is a periodic publication of the G-2/S-2 assessment of the threat situation on the battlefield. It provides the commander with context to support decision making based on the G-2/S-2's interpretation and conclusions about the threat, terrain and weather, and civil considerations over a designated period of time. This is typically identified in unit SOPs and in associated OPORD reporting instructions. The intelligence summary also provides COA updates based on the current situation. Unit SOPs designate the command's format for preparing and disseminating an intelligence summary. At a minimum, the intelligence summary should contain the paragraphs and subparagraphs as shown in figure E-4.

[CLASSIFICATION]

INTELLIGENCE SUMMARY (INTSUM) NUMBER____

(U) References: Maps, charts, overlays, and other relevant documents are available at internet protocol address.

(U) Time Zone Used Throughout the Order: ZULU

1. (U) WEATHER. The weather occurring within the operational environment (OE) will affect friendly and threat warfighting capabilities. This assessment is based on the weather officer and intelligence analyst's evaluation of the impact of specific environment conditions on friendly and threat forces. Normally, current and future weather conditions are displayed as far out as five days.

2. (U) SITUATION HIGHLIGHTS. A summary of the OE situation as it has evolved over the reporting period. Highlighted subparagraphs are as follows:

a. **Air:** Highlights of the current air situation. When in conflict with a threat possessing a capable air force, it is critical to the commander to identify whether or not friendly air power has achieved control of the operational airspace. This includes aircraft and air defense interlocking measures.

b. **Land:** Highlights of the current ground situation, usually divided by area of operations. If there are three divisions forming, the forward battle area along with a corps consolidation area and multiple division consolidation areas, then the land portion can be divided in that manner. Additionally, the main effort is often annotated first followed by the secondary and then any guerrilla or insurgent activities in the consolidation areas.

c. **Maritime:** Highlights of the current maritime situation. Maritime operations are as critical as air lift and air supremacy.

d. **Space:** Highlights of the current space situation. Space operations, including space weather, is critical to all operations whether the threat is capable of operating in this domain.

e. **Cyberspace:** Highlights of the current cyberspace situation. Cyberspace operations are critical to all operations whether the threat is capable of operating in this domain.

f. **Information Environment:** Highlights of the current information environment situation.

g. **Electromagnetic Spectrum:** Highlights of the current electromagnetic spectrum situation.

h. **Civil or Other Considerations:** Highlights of the current civil situation. Knowledge of the civilian population and civilian authorities/government is critical to the commander's situational understanding.

[CLASSIFICATION]

Figure E-4. Intelligence summary example

[CLASSIFICATION]

3. (U) SUMMARY OF THE ENEMY SITUATION. Each subparagraph of the threat situation is oriented on the commander's priority intelligence requirements (PIRs) and other information requirements as the basis for the analysis and assessment. The subparagraphs are as follows:

a. **Land:** The analysis of the land situation must include threat and possible insurgent activities detected during the INTSUM reporting period. Each echelon should publish at least one INTSUM daily, but it is likely that brigade and below commands in the forward combat zones will publish an INTSUM every 12 hours and in some missions even sooner. Based on the echelon, it is important for the analysis to consider terrain, weather, and the threat composition and disposition over the next 12 or more hours of combat. If in the consolidation area, the assessment must focus on the friendly forces' ability to support the forward battle with supplies and reinforcements as needed.

b. **Air:** The analysis of the air and air defense situation must focus on the threat air capability to gain or retain control of the air domain. Even when the threat air power is near depletion, ground air defense and even artillery or missile threats may still have a direct impact on friendly air operations—fixed or rotary wing.

c. **Maritime:** The analysis of the maritime situation must focus on the threat naval capability to gain or retain control of the maritime domain. This includes the ability of the threat maritime assets to support threat ground operations within distance of the sea.

d. **Other Domains:** Advise the commander of the other domains in which the threat may have opportunities to deny, impede, or disrupt friendly operations.

e. **Other:** The battlefield will be congested before, during, and after engagements. Any other considerations that answer PIRs or other requirements may enable the commander's decision making.

4. (U) UNIT ASSESSMENT. In each subparagraph, provide an analysis of current and possibly future threat courses of actions (COAs). All discussions of threat COAs must match what has been identified in the military decision-making process effort. If the threat COA has changed since that time, the G-2/S-2 should update the commander and staff to ensure the INTSUM is not the first notification. The subparagraphs are as follows:

a. **Most Likely COA:**

b. **Most Dangerous COA:**

c. **Other:** Other is reserved for other likely developments in civil considerations or a reiteration of pending serve weather.

5. (U) ENEMY MOVEMENT DURING THE REPORTING PERIOD. Provide all-source intelligence analysts a way to present various forms of identifying major threat units (including at least two levels below that of the reporting command) and coordinates to the last known positions. The information may be presented in written form, on a spreadsheet, or as a graphic summary, which should include where in DCGS-A other intelligence organizations may find this information.

6. (U) PIRs. Provide the commander's PIR list and, when possible, identify which PIRs have been answered. PIRs that have not been answered require explanations as to why they have yet to be answered.

7. (U) REPORTS AND DISTRIBUTION. Provide key reporting and distribution instructions from each echelon as well as reporting guidance from subordinate units. This includes the dissemination of reports, summaries, and dissemination requirements from subordinate echelon reporting. The Army uses DSCG-A and each echelon publishes associated procedures for the exchange/publication of various threat databases and reporting. Also provide authentication of the report.

[CLASSIFICATION]

Figure E-4. Intelligence summary example (*continued*)

Graphic Intelligence Summary

E-12. The graphic intelligence summary (also known as GRINTSUM) can be included with the intelligence summary or disseminated as a separate analytical report. It is a graphical representation of the intelligence summary, with emphasis on the threat forces location compared to friendly forces' location. The graphic intelligence summary also includes current PIRs and a summary of threat activities. (See figure E-5 on page E-8.) Since the emphasis of a graphic intelligence summary is graphical, most of the written details should be captured in the intelligence summary or an accompanying report.

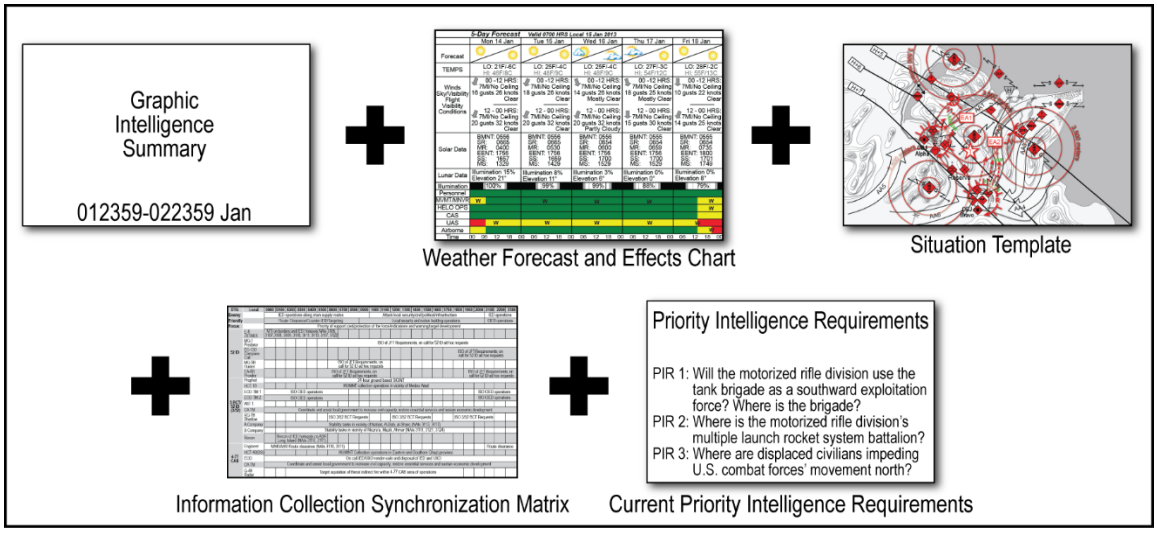

Figure E-5. Graphic intelligence summary example

E-13. There are challenges with using the graphic intelligence summary:

- The size of the graphical portrayal of the OE is often driven by critical facts about the threat that must be shown. Therefore, it is advisable to begin with a general OE map and zoom in on key areas. Ensure the written assessment includes the necessary details by either referencing the accompanying intelligence summary or other report or including the details in the Notes page of a PowerPoint slide.
- The file size must follow the commander's guidance or unit SOPs. Typically, the graphic intelligence summary is one or two graphics (PowerPoint slides) and limited in bit size for ease in emailing and posting on unit web portals. In a tactical large-scale ground combat environment, a brigade or lower command may be unable to send or receive a megabit plus-size file.

Intelligence Report

E-14. The intelligence report (also known as INTREP) demonstrates the importance of intelligence analysis. It is a standardized report, typically one page, used to establish a near current-threat operational standpoint. It points to the threat's responses to friendly actions and the battlefield environment. Intelligence reports may also highlight time-sensitive critical activities that require corroboration with other units and higher echelons. An intelligence report's basic information requirements describe *who*, *what*, *when*, *where*, *why*, and *how* facts in order to provide a conclusion. (See figure E-6.) There is no established timeline for disseminating an intelligence report. Some units may publish one or two daily, while others may publish 15 or 20 reports daily, depending on the activity level of engaging threat forces.

[CLASSIFICATION]

INTELLIGENCE REPORT NUMBER____

(U) References: Maps, charts, overlays, and other relevant documents used to create the intelligence report.

(U) Time Zone Used Throughout the Order: Applicable time zone during the time or reporting.

(U) Commander's Priority Intelligence Requirement: The applicable priority intelligence requirement to which the intelligence report is related.
(U) Summary of Activity: Brief discussion of the threat's general situation or activities, covering the *who*, *what*, *when*, *where*, *why*, and *how*, which support the analyst's conclusion.
(U) Authentication: Authentication by and instructions on handling and destroying.

[CLASSIFICATION]

Figure E-6. Intelligence report example

SUPPLEMENTAL ANALYTICAL REPORTS

E-15. Supplemental analytical reports, such as the periodic intelligence and supplementary intelligence reports, do not fall into a predetermined dissemination timeline. Periodic intelligence reports and supplementary intelligence reports follow a similar format, designated by a senior operational intelligence officer and staff. These reports allow for expanded analytical efforts, providing assessments of a technical or historical comparative nature. However, once the analysis begins to shape an assessment of threat intentions or capabilities, the urgency for releasing these analytical reports may increase.

Periodic Intelligence Report

E-16. The periodic intelligence report (also known as PERINTREP) is a summary of the intelligence situation that covers a longer period than the intelligence summary. (See figure E-7.) It is a means of disseminating detailed information and intelligence, including threat losses, morale, assessed strength, tactics, equipment, and combat effectiveness.

E-17. The periodic intelligence report includes but is not limited to sketches, overlays, marked maps or graphics, and annexes, providing a written and visual representation of the information and/or intelligence. The report is disseminated through the most suitable means based on its volume and urgency.

[CLASSIFICATION]

PERIODIC INTELLIGENCE REPORT NUMBER_____

(U) Period Covered: Date and time to date and time.

(U) References: Maps or charts.

(U) Disposal Instructions: If applicable.

(U) GENERAL ENEMY SITUATION. Briefly summarize threat operations during the period. Furnish amplifying details in the paragraphs that follow and in appropriate annexes or both. Also provide brief highlights of the threat situation and the significance of the threat's major activities, including marked changes in morale, strength, tactics, equipment, and combat effectiveness. Data that is lengthy or can conveniently be shown graphically is presented in annexes.

(U) ENEMY ACTIVITIES. Provide, in conjunction with the paragraphs that follow, details of the situation summarized in paragraph 1. Maximum use of sketches, overlays, marked maps or graphics, and annexes provide written and visual representations of the information and/or intelligence. Omit subparagraphs when appropriate intelligence is not available or is adequately covered by other portions of this report.

(U) ENEMY ORDER OF BATTLE. As appropriate, provide the threat order of battle in the following subparagraphs:

a. **Composition and Disposition.** Include land (airborne, artillery, rocket/missiles, air defense) air, maritime, space, cyberspace, information environment, and the electromagnetic spectrum.
b. **Strength.** Personnel and equipment/weapon losses.
    1. Losses (Killed in Action, Wounded in Action, and Captured).
    2. Assessed or Known Battle Damage Assessment.
    3. Key Personalities and Morale if Known.
    4. Current Strength.
c. **Tactics and Training.**
d. **New Tactics, Weapons, and Equipment.**
e. **Combat Service Support.**
f. **Combat Effectiveness.**
g. **Miscellaneous Details.**
    1. Civil.
    2. Communications (Electronics and Telecommunications).
    3. Electronic Warfare.
    4. Counterintelligence (Sabotage or Espionage).

[page number]

[CLASSIFICATION]

Figure E-7. Periodic intelligence report example

[CLASSIFICATION]

(U) OTHER INTELLIGENCE. Provide a detailed summary of the findings of other intelligence such as technical reports, interrogations, and/or document translations.

a. Technical intelligence summary includes detailed analysis of captured military equipment, communications devices, and can include explosive reports. While this information may not provide current information on the threat situation, it details enemy tactics, techniques, and procedures; new or modified equipment details, and critical information on improvised explosives. Most of the technical information comes from the Department of Defense and the national analysis from the Army's National Ground Intelligence Center.
b. Enemy prisoner of war interrogation reports from human intelligence teams provide key information about the threat forces' leadership, strength, and other details to support future cross-cuing efforts.
c. Translation of captured enemy documents provides similar details of threat capabilities, possible information on supplies, communications securities, and other key military operational details.
d. Additional details on weather and climate summaries.

(U) WEATHER. Provide an update on the impact of weather on future operations. Weather graphics can be presented in the annex as necessary.

(U) TERRAIN. Provide an update on the impact of terrain on future operations. If necessary, use annexes to provide special maps, overlays, and electronic data.

(U) ANALYSIS AND DISCUSSION. List and briefly discuss threat capabilities and vulnerabilities based on the information revealed. The conclusions present the commander's assessment of the most probable courses of actions available to the threat, probability of their adoption, and vulnerabilities that are exploitable by own, higher, adjacent, or lower commanders.

a. Enemy Capabilities.
b. Enemy Vulnerabilities.
c. Conclusions.

(U) REPORTS AND DISTRIBUTION. Provide key reporting and distribution instructions from each echelon as well as reporting guidance from subordinate units. Include the dissemination of reports, summaries, and dissemination requirements from the subordinate echelon's reporting. The Army uses DSCG-A, and each echelon publishes associated procedures for the exchange/publication of various threat databases and reporting. Also provide authentication of the report.

[page number]
[CLASSIFICATION]

Figure E-7. Periodic intelligence report example (*continued*)

Supplementary Intelligence Report

E-18. The supplementary intelligence report (also known as SUPINTREP) is a comprehensive analysis of one or more specific subjects, typically the result of a request or to support a particular operation. This report is formatted similarly to a periodic intelligence report, but it addresses analysis over an extended period of time. Typically, the detailed analysis is from an accumulation of national assessments of threat actions, tactics, and doctrine identified during combat—normally a post-combat review. Maximum use of sketches, photos, overlays, marked maps or graphics, and annexes provides a written and visual representation of the information and/or intelligence. The supplementary intelligence report is disseminated based on the intelligence it contains and the commander's requirements.

E-19. Specific reports may pertain to but are not limited to the following:

- Technical intelligence summary includes detailed analysis of captured military equipment, communications devices, and can include post-explosive reports.
- Enemy prisoner of war interrogation reports from tactical to national sources.
- Translation of captured enemy documents (DOMEX).
- Cyberspace security updates.
- Medical or environmental hazards.
- Changes to civil political and other civilian authorities.

ANALYTICAL ASSESSMENTS THAT SUPPORT ORDERS AND BRIEFINGS

E-20. In addition to designated intelligence production requirements, the intelligence staff also provides analytical assessments to orders, briefings, and staff events, as described in FM 6-0. (See table E-1.) Normally, the intelligence analysis identifies the current threat situation and assessed threat capabilities (often tied to a threat COA); the same information exists in the intelligence summary, intelligence report, and intelligence running estimate. For intelligence analysts, the commander, and often the key staff officer, defines the requirement and may provide additional detailed requirements in unit SOPs.

Table E-1. Support to orders and briefings

Orders			
Reports	***Echelon***	***Dissemination timeline***	***General description***
Operations summary	All	Daily	The commander provides to higher, adjacent, and lower a daily (or twice daily) operations summary that includes an intelligence assessment of threat forces' actions, intent, and assessed strength.
Operation order	All	As needed	The operation order is the same as the intelligence estimate identified in the operation order as Annex B (Intelligence).
Warning order	All	As needed	The G-2/S-2 provides a summary update to paragraph 1.c *Enemy Forces* to the warning order.
Fragmentary order	All	As needed	The G-2/S-2 provides a summary of the threat activity to paragraph 1 *Situation* and as the mission requires to paragraph 3 *Execution*.
Staff briefings			
Briefing	***Echelon***	***Dissemination timeline***	***General description***
Battle update brief	All	Daily	The G-2/S-2 provides an assessment of the threat forces and identifies collection opportunities or requirements to answer the commander's priority intelligence requirement (PIR).
Military decision-making process (MDMP)	All	As needed	The G-2/S-2 provides intelligence analysts to support the planning and war-gaming efforts associated with the commander's MDMP requirements. Normally, the intelligence analysis is in the form of the intelligence preparation of the battlefield steps.
Operations and intelligence brief	All	Likely daily	The G-2/S-2 provides an assessment of the threat forces and identifies collection opportunities or requirements to answer the commander's PIR.
Targeting board	All	As needed	The G-2/S-2 provides an assessment of the threat actions in the high-payoff target and high-value target criteria established by the commander. (See appendix F for more details on intelligence analysis support to targeting.)
After action report	All	As needed	The after action report is a method of capturing lessons learned or, in some cases, identifying what caused a friendly action to occur. In specific cases, the G-2/S-2 may be required to provide a summary assessment of the threat actions that caused a friendly action. (See FM 6-0.)

Appendix F

Intelligence Support to Targeting

OVERVIEW

F-1. The targeting effort is cyclical and closely tied to combat assessments. Targeting is a complex and multidiscipline effort that requires coordinated interaction among many command and staff elements. The functional element necessary for effective collaboration is represented in the targeting working group. Intelligence analysts perform a number of critical tasks as part of this working group and the overall targeting effort. (See ATP 3-60 for more information on targeting.)

TARGETING GUIDELINES

F-2. The threat presents a large number of targets that must be engaged with available information collection assets and attack assets. The targeting process assesses the benefits and the costs of engaging various targets in order to achieve the desired end state. Adhering to the five targeting guidelines should increase the probability of creating desired effects while diminishing undesired or adverse collateral effects:

- Targeting focuses on achieving the commander's objectives.
- Targeting seeks to create specific desired effects through lethal and nonlethal actions.
- Targeting directs lethal and nonlethal actions to create desired effects.
- Targeting is a fundamental task of the fires warfighting function that encompasses many disciplines and requires participation from many staff elements and components.
- Targeting creates effects systematically.

TARGETING GUIDANCE AND CATEGORIES

F-3. The commander's targeting guidance must be articulated clearly and simply to enhance understanding. The guidance must be clearly understood by all warfighting functions, especially by the intelligence staff. Targeting guidance must focus on essential threat capabilities and functions that interfere with the achievement of friendly objectives.

F-4. The commander's targeting guidance describes the desired effects to be generated by fires, physical attack, cyberspace electromagnetic activities, and other information-related capabilities against threat operations. Targeting enables the commander, through various lethal and nonlethal capabilities, the ability to produce the desired effects. Capabilities associated with one desired effect may also contribute to other effects. For example, delay can result from disrupting, diverting, or destroying threat capabilities or targets. Intelligence personnel should understand and only use the 14 terms used in ATP 3-60 to describe desired effects:

- Deceive.
- Defeat.
- Degrade.
- Delay.
- Deny.
- Destroy.
- Destruction.
- Disrupt.
- Divert.
- Exploitation.
- Interdict.
- Neutralize.
- Neutralization.
- Suppress.

F-5. To effectively target the threat, friendly forces use deliberate and dynamic targeting. Deliberate targeting prosecutes planned targets, while dynamic targeting prosecutes targets of opportunity and changes to planned targets. During both categories of targeting, friendly forces may prosecute normal, time-sensitive, and sensitive targets.

TARGETING METHODOLOGY

F-6. The targeting methodology organizes the efforts of the commander and staff to accomplish key targeting requirements. This methodology is referred to as the *decide*, *detect*, *deliver*, and *assess* methodology. The methodology assists the commander and staff in deciding which targets must be acquired and engaged and in developing options to engage those targets. Options can be lethal or nonlethal, organic, or supporting assets at all levels as listed—maneuver, electronic attack, psychological, attack aircraft, surface-to-surface fires, air to surface, other information-related capabilities, or a combination of these operations.

F-7. The *decide*, *detect*, *deliver*, and *assess* methodology is an integral part of the MDMP. During the MDMP, targeting becomes more focused based on the commander's guidance and intent. A very important part of targeting is identifying potential fratricide situations and the necessary coordination measures to positively manage and control the attack of targets. These measures are incorporated in the coordinating instructions and appropriate annexes of the operation plan or OPORD.

DECIDE

F-8. The *decide* function of the targeting methodology provides the overall focus and sets priorities for information collection and attack planning. It is the most important targeting function and requires close interaction between the intelligence, plans, operations, and fires cells, and the servicing judge advocate. This step draws heavily on the staff's knowledge of the threat, a detailed IPB (which occurs simultaneously), and a continuous assessment of the situation. Targeting priorities are addressed for each phase or critical event of an operation. The decisions made are reflected in visual products as follows:

- **HPT list.** The *high-payoff target list* is a prioritized list of high-payoff targets by phase of the operation (FM 3-09). A *high-payoff target* is a target whose loss to the enemy will significantly contribute to the success of the friendly course of action (JP 3-60). An HPT is an HVT that must be acquired and successfully engaged for the success of the friendly commander's mission. A *high-value target* is a target the enemy commander requires for the successful completion of the mission (JP 3-60).
- **Information collection plan.** The information collection plan focuses the collection effort to answer PIRs and other significant requirements. If an HPT is not designated as a PIR, it must still be supported by collection. The information collection plan usually supports the acquisition of more HPTs. (See ATP 2-01.)
- **Target selection standard matrices.** These matrices address accuracy or other specific criteria requiring compliance before targets can be attacked.
- **Attack guidance matrix.** The *attack guidance matrix* is a targeting product approved by the commander, which addresses the how and when targets are engaged and the desired effects (ATP 3-60).

Intelligence Preparation of the Battlefield

F-9. In the same manner that targeting involves coordinated interactions among the commander and entire staff, IPB involves the active participation of the entire staff. The interactions between intelligence personnel and fires personnel are important during the IPB process. (For more information on staff collaboration during IPB, see ATP 2-01.3.) Many of the IPB products significantly influence or are brought forward into the targeting effort. These products assist in target value analysis and war gaming. Some examples of important IPB products include—

- The modified combined obstacle overlay.
- Civil considerations (ASCOPE) products.
- Weather effects products.

- Threat models with recommended HVTs.
- Situation templates with threat time phase lines.
- Event templates and matrices, which have named areas of interest (NAIs).

Target Value Analysis and War Gaming

F-10. From the coordination and work performed during the IPB effort, the targeting working group, especially the intelligence staff and targeting officer, perform target value analysis that yields HVT lists (which may include high-value individual lists) for a specific threat COA. Target value analysis continues the detailed analysis of relevant threat factors, including doctrine, tactics, equipment, capabilities, and expected actions for a specific threat COA. The target value analysis process identifies HVT sets associated with critical threat functions.

F-11. Target spreadsheets (or target folders, as appropriate) identify an HVT compared to a type of operation. Target spreadsheets give detailed targeting information for each HVT, which is used during IPB and war gaming. The intelligence staff and targeting officer collaborate to develop and maintain the target spreadsheet.

F-12. The targeting working group develops HVTs for lethal and nonlethal targeting. For nonlethal targeting, there is no limit on how creative and flexible the working group can be when focusing targeting requirements to support the commander's guidance. In certain circumstances, an HVT may not be focused on a certain geographic area.

F-13. The following assists in identifying and evaluating HVTs:

- Identify HVTs from threat models, situation templates with time phase lines, existing intelligence studies, database evaluations, patrol debriefs, and reporting. The following provide useful information:
  - A review of threat tactics, techniques, and procedures.
  - Previous threat operations.
  - Understanding the threat's objective, tasks, purpose, and intent.
- Identify assets that are key to executing the primary operation or sequels.
- Determine how the threat might react to the loss of each identified HVT. Consider the threat's ability to substitute other assets and adopt branches or sequels.
- After identifying HVTs, place them in order of their relative worth to the threat's operation and record them as part of the threat model. The value of HVTs varies over the course of an operation. Identify and annotate changes in value by phase of the operation. The following are additional considerations:
  - Use all available intelligence sources (for example, patrol debriefs, reporting) to update and refine the threat models.
  - Categorize the updates to reach a conclusion concerning the threat's operations, capabilities, and vulnerabilities.

F-14. HVTs are finalized and prioritized during war gaming. The staff analyzes and identifies those HVTs that must be attacked to ensure mission success. Additionally, the staff analyzes all implications of attacking those HVTs and possible threat counteractions. Those critical HVTs that the staff confirms as acquired and attacked are nominated as HPTs. Then, the staff groups HPTs into a list, associating the HPTs to a specific point in the battle. The completed HPT list is submitted to the commander for approval.

F-15. During war gaming, the commander and staff identify the best places to attack an HPT. These places are known as target areas of interest (TAIs). A TAI is a point or area where the commander can acquire and engage HPTs. The shape of a TAI reflects the type of threat, target, and weapon system that will engage the target.

F-16. The staff may need to develop additional NAIs to support TAIs. NAIs for nonlethal targets may include religious buildings, places of worship, and shrines that are important to assessing key civil considerations (ASCOPE). Decision points or decision time phase lines are used to ensure the decision to engage or not to engage occurs at the proper time. Decision points and TAIs are recorded on the decision support template.

F-17. A thorough war gaming effort ensures the staff sets the foundation for a successful targeting effort. The purpose of war gaming includes building staff running estimates and developing the scheme of maneuver, scheme of fires, and decision support template. The process also synchronizes the attack guidance matrix with the decision support template and ensures the information collection plan supports all HPTs.

Target Selection

F-18. Target selection depends on the ability to acquire the target. The collection manager must be closely involved in ensuring information collection on HPTs is carefully synchronized into the information collection plan. This task includes breaking HPTs into subsets, when necessary; developing adequate collection tasks; and considering the use of cueing, collection redundancy, and sensor mix during the development of the information collection synchronization matrix. (See ATP 2-01 for more information.)

High-Payoff Target List

F-19. Once prioritized, targets are placed on the HPT list and approved by the commander. Figure F-1 provides an example of an HPT list. The list identifies HPTs by operational phase or specific time windows and order of priority. Other considerations include—

- The sequence or order or appearance.
- The ability to detect, identify, classify, locate, and track the target.
- The degree of accuracy of the acquisition system.
- The ability to engage the target.
- The ability to achieve the desired effects based on the attack guidance.

Threat element	*Time (H-hour)*	*Priority*	*Targets*	*Desired effect*
Intelligence	H-24-H+10	1	Air defense radar	Destroy
Fires		2	Air missile defense (SA-13, SA-18)	
Intelligence		3	Artillery locating radar (ARK-1M)	
Fires	H-H+10	4	Field artillery companies (2S1)	
Command and control	H-H+10	4	• Control node/Government Complex • Threat communications networks	Neutralize
H-hour specific hour at which a particular operation commences				

Figure F-1. High-payoff target list example

Target Selection Standards

F-20. Target selection standards are criteria applied to threat activity and used to decide whether the activity is a target. There are two target selection standard categories:

- Targets, which meet accuracy and timeliness requirements for engagement.
- Suspected targets, which must be confirmed before any engagement.

F-21. Target selection standards are based on the threat's activity and available weapon system. The following elements are used to develop the standards:

- Weapon system target location accuracy requirements (target location error).
- Size of threat activity.
- Status of the activity (moving or stationary).
- Timeliness of the information.

F-22. The BCT can develop target selection standards based on anticipated threat characteristics and template threat activities. Different target selection standards may exist for a given threat activity based on different attack systems. For example, a threat artillery battery may have a 150-meter target location error criterion for attack by cannon artillery and a one-kilometer requirement for attack helicopters. The fires cell develops target selection standards in conjunction with the intelligence cell. Units may develop their own worksheet format. Intelligence analysts use the standards to quickly determine targets from combat information and pass the targets to the fires cell.

F-23. The fires cell uses target selection standards to identify targets for attack. Certain situations require the systems to identify friendly and neutral from threats before approval to engage in lethal fire. HPTs that comply with the criteria are tracked until they are attacked in accordance with the attack guidance matrix. Target locations that do not comply with the standards are confirmed before attacked.

F-24. Target selection standards can be depicted in a matrix. Figure F-2 is an example of a target selection standard matrix. Although not shown in figure F-2, it may include a column that lists each friendly information collection system that forwards targets directly to the fires cell or fires direction center. The effects of terrain and weather on information collection assets and threat equipment are considered. While target selection standards are developed specific to the situation, the greatest emphasis is on considering the threat situation, possibility of threat deception, and the reliability of the source or agency that is reporting.

High-Payoff Target	*Timeliness*	*Accuracy*
2S3	30 minutes	500 meters
M-46	30 minutes	500 meters
Air and missile defense	15 minutes	500 meters
Command posts	3 hours	500 meters
Ammunition	6 hours	1 kilometer
Maneuver	1 hour	150 meters

Figure F-2. Example target selection standard matrix

Attack Guidance

F-25. Analyzing target vulnerabilities and the effect an attack has on threat operations within the context of the commander's targeting guidance allows the staff to propose the most efficient available engagement option. During war gaming, decision points linked to events, areas (NAIs and TAIs), or points within the AO are developed. These decision points cue command decisions and staff actions when a tactical activity is needed.

F-26. Based on the commander's guidance, the targeting team recommends target engagement in terms of the effects of fire and attack options. The intelligence staff must understand the definitions of and nuances for each of the 14 terms used to describe desired effects. Desired effects are then translated into automation system values to more effectively engage targets.

F-27. Deciding on which attack system to use occurs simultaneously as deciding when to acquire and attack the target. When deciding to attack by two different means, such as electronic warfare and combat air operations, coordination is required. Coordination requirements are recorded during the war game.

F-28. The commander, with recommendations from the targeting working group, approves the attack guidance, which is more than the attack guidance matrix. The attack guidance details the following:

- An updated prioritized HPT list.
- When, how, and the desired effects of engagement.
- Special instructions.
- BDA requirements.

F-29. This information is developed during the war game. Attack guidance is provided to weapon systems managers via the attack guidance matrix, which, at a minimum, includes—

- Specific HPTs.
- Timing of engagement.
- How targets are engaged.
- Desired effects.
- Remarks, including restrictions.

Target Development

F-30. *Target development* is the systematic examination of potential targets and their components, individual targets, and even elements of targets to determine the necessary type and duration of the action that must be exerted on each target to create an effect that is consistent with the commander's specific objective (JP 3-60). This analysis includes deconfliction, aim point recommendations, target materials production, and collateral damage estimation. Target development generally results in products such as target folders, information collection requirements, and target briefs. Detailed analysis should characterize the function, criticality, and vulnerabilities of each target, linking targets back to targeting objectives and measures of effectiveness. Target development includes target vetting and target validation.

Note. Although target development is discussed under *detect* in ATP 3-60, for this publication, it is more useful to discuss this step under *decide*.

Target Vetting

F-31. *Vetting* is a part of target development that assesses the accuracy of the supporting intelligence to targeting (JP 3-60). Vetting establishes a reasonable level of confidence in a target's designated functional characterization. The BCT intelligence cell accomplishes this by reviewing all target data for accuracy. At a minimum, the assessment includes at a review of target identification, significance, collateral damage estimation, geospatial or location issues, impact on the threat or friendly forces, impact of not conducting operations on the target, environmental sensitivity, and intelligence gain or loss concerns. Vetting does not include an assessment of compliance with the law of war or rules of engagement.

Target Validation

F-32. *Validation* is a part of target development that ensures all candidate targets meet the objectives and criteria outlined in the commander's guidance and ensures compliance with the law of war and rules of engagement (JP 3-60). Targets are validated against multinational concerns during some operations. Target vetting and validation should recur as new intelligence is collected or the situation changes. Target validation is performed by targeting personnel, in coordination with planners, servicing judge advocate, and other experts, as required. (See ATP 3-60 for a list of useful target validation questions.)

DETECT

F-33. As much as possible, the procedures and supporting products that are used during the *detect* function should be developed during the *decide* function. However, the targeting team must periodically update decisions made during the *decide* function concerning IPB products, HPT lists, target synchronization matrices, attack guidance matrices, the information collection plan, and the OPORD. Updating these products can occur throughout the *detect*, *deliver*, and *assess* functions of the targeting methodology.

F-34. Based on targeting priorities, the targeting working group establishes target detection and tracking priorities. Target tracking is inherent in target detection. The fires cell provides the intelligence cell with the degree of accuracy required and dwell time for a target to be eligible for engagement. Then the collection manager can match those requirements to the target location error of the information collection asset.

F-35. Execution of the information collection plan begins as early as possible during planning and continues all the way through the *assess* function and even helps transition operations into the next mission. The execution of the information collection plan to answer targeting information requirements is central to the *detect* function. Targets are detected by using the appropriate information collection assets. ATP 3-60 discusses this effort as detection procedures.

F-36. The *detect* function comprises target detection and additional target development, when necessary. The current operations integration cell is the primary cell responsible for directing the execution of the information collection effort to detect HPTs identified in the *decide* function. The intelligence cell (with the current operations integration cell) must focus their intelligence analysis efforts to support both situation development and the targeting effort. Therefore, close coordination between the intelligence cell and the fire support element is critical. Key staff members in this effort include the G-3/S-3, G-2/S-2, information

operations officer, field artillery intelligence officer (when staffed), targeting officer, and fire support coordinator/officer.

F-37. When detecting a planned HPT, the information is quickly disseminated to the field artillery intelligence officer to determine if the target is an HPT, the target's priority, and if the target complies with target selection standards. To ensure the target information is disseminated quickly, the field artillery intelligence officer should be located in the intelligence cell with communications to the fires cell. If the target is an HPT, the field artillery intelligence officer coordinates with the intelligence cell and disseminates the target directly to the fires cell or fire support element. If the commander approves the target, it is transferred to a firing unit.

F-38. In those cases, where the situation dictates the development of a new HPT or when the staff assesses a significant change to an existing HPT, subsequent target development must occur. When subsequent target development is necessary, the targeting information is forwarded for intelligence analysis and the target development process must occur quickly. Upon identifying a target specified for attack, analysts pass the target to the fire support element. The fire support element executes the attack against the target.

DELIVER

F-39. The *deliver* function executes the target attack guidance and supports the commander's plan once HPTs have been located and identified. Target engagement requires several decisions and actions, which are grouped into tactical and technical decisions.

Tactical Decisions

F-40. Tactical decisions are made based on the analysis that was accomplished during target development. Tactical decisions reconfirm or determine the—

- Time of the engagement.
- Desired effect, degree of damage, or both.
- Delivery system to be used through weaponeering and collateral damage estimation.

Time of Engagement and Desired Effect

F-41. Time of engagement and the desired effect that will be achieved on the target are critical considerations. The commander needs to weigh the operational risk of tactical patience balanced against the immediacy of the planned action in the attack guidance matrix. As the operation evolves, the commander may decide to change the time of engagement or the desired effect on a particular HPT. When a target is a target of opportunity, then the commander and staff must quickly decide on the desired effects.

Delivery System

F-42. This step builds on the analysis performed during target development and includes weaponeering and collateral damage estimation. If the target was already planned, then this step starts with determining if the delivery means is available and still the best weapon or means for the engagement. When the target is a target of opportunity then some analysis is necessary to work through completion of a quick target development.

F-43. *Weaponeering* is the process of determining the specific means required to create a desired effect on a given target (JP 3-60). As much as possible, weaponeering should be planned during the plan function during target development. Weaponeering considers munitions delivery error and accuracy, damage mechanisms and criteria, probability of kill, weapon reliability, and trajectory. Targeting personnel quantify the expected results of fires against targets to produce the desired effects. ATP 3-60 provides a general weaponeering process that can be adapted as needed.

F-44. Collateral damage estimation builds on target validation to assist the commander and unit in staying within the law of war and rules of engagement. Failure to observe these obligations can be very significant to operations and considered a law of war violation. The staff has the responsibility to mitigate unintended or incidental risk of death, injury, or damage according to the law of war and rules of engagement as described in ATP 3-60.

Technical Decisions

F-45. Once the tactical decisions have been made, the G-3/S-3 directs the appropriate unit to engage the target. The fires cell provides the asset or system manager with selected time of engagement, desired effects, and any special restraints or requests for particular munitions types.

F-46. The asset or system manager (for example, field artillery battalion S-3, air liaison officer, or brigade naval gunfire officer) determines if the system can meet the requirements. The fires cell is notified when a delivery system or asset is unable to meet the requirements. In those cases, the fires cell must decide if the selected delivery asset or system should engage the target under a different criterion or if a different delivery asset or system should be used.

ASSESS

F-47. The *assess* function of the targeting methodology is nested in the overall continuous assessment of operations within the operations process. Assessment is directly tied to the commander's decisions throughout the planning, preparation, and execution of operations. Planning for assessment identifies key aspects of the operation that the commander directs be closely monitored, and where the commander wants to make the decisions. Commanders and staffs consider assessment ways, means, and measures. ADP 5-0 discusses overall operational assessment, including measures of effectiveness, measures of performance, and indicators. Intelligence plays a major role in operational assessment.

F-48. Intelligence also plays a major role in assessment as a part of the targeting methodology. The assess function of the targeting methodology is performed through combat assessment. *Combat assessment* is the determination of the effectiveness of force employment during military operations (JP 3-60). Combat assessment comprises three elements:

- BDA.
- Munitions effectiveness assessment.
- Reengagement recommendation.

F-49. Together, BDA and munitions effectiveness assessment provide the commander and staff with an assessment of the effects achieved against targets and whether the targeting guidance was met. Based on this information, the staff can recommend reengagement when necessary.

Battle Damage Assessment

F-50. *Battle damage assessment* is the estimate of damage composed of physical and functional damage assessment, as well as target system assessment, resulting from the application of lethal or nonlethal military force (JP 3-0). The staff determines how combat assessment relates to specific targets by completing BDA. Producing BDA is primarily an intelligence cell responsibility but requires coordination across the staff, similarly to IPB and most steps of intelligence support to targeting. BDA requirements should be captured as PIRs or as similar high-priority information collection requirements. BDA provides—

- Commanders with an assessment of the target's mission effectiveness, overall status, capabilities (whether full or partial), and likely reactions or any change to their intent. This assists the staff in determining if the engagement is meeting the targeting guidance and is critical to any recommendation to reengage the target.
- Important analysis used to conduct quick target development and decide on the allocation or redirection of assets or weapon systems for any reengagement.

F-51. BDA has three components (see table F-1):

- **Physical damage assessment.** The staff estimates the extent of physical damage to a target based on observed or interpreted damage. It is a post-attack target analysis coordinated among all units.
- **Functional damage assessment.** All-source intelligence analysts assess the remaining functional or operational capability of the threat. The assessment focuses on measurable effects and estimates the threat's ability to reorganize or find alternative means to continue operations. The targeting cell and staff integrate analysis with external sources to determine if the commander's intent for fires has been met.

- **Target system assessment.** The staff conducts a broad assessment of the overall impact and effectiveness of all types of engagement against an entire target system capability (for example, threat air defense artillery systems). All-source intelligence analysts assist the staff in assessing the threat's combat effectiveness or major threat subordinate elements or capabilities needed to accomplish a threat mission. This is a relatively permanent assessment (compared to functional damage assessment) that can be used for more than one mission.

Table F-1. Battle damage assessment components

Component	*Description*
Physical damage assessment	• Quantitative physical damage from munitions blast, fragmentation, or fire. • Based on observed or interpreted damage.
Functional damage assessment	• Estimates the effects on the target's capability to perform its mission. • Assessment based on all-source intelligence. • Includes a time estimate required to reconstitute or replace the target. • Temporary assessment—compared to a target system assessment—used for specific missions.
Target system assessment	• The overall effect on an entire target system's capability. • Applicable against a threat's combat effectiveness. • May address significant subdivisions of a target. • A more permanent assessment.

F-52. BDA requirements for specific HPTs are determined during the *decide* function. Often information collection assets can answer either target development and target acquisition requirements or BDA, but not both types of requirements. An asset used for BDA may be unavailable for target development and target acquisition requirements. The intelligence cell receives, processes, and disseminates results that are analyzed based on desired effects to the targeting team attack.

F-53. The targeting team should consider the following BDA principles:

- BDA should measure what is important to commanders, not make important what is easily measurable.
- BDA should be objective. When receiving a BDA product from another echelon, the conclusions should be verified (time permitting) to identify and resolve discrepancies among BDA analysts at different headquarters.
- The degree of reliability and credibility of BDA relies largely on information collection assets. The quantity and quality of information collection assets influence whether the assessment is highly reliable (concrete, quantifiable, and precise) or has low reliability (estimation). Effective BDA uses more than one source to verify each conclusion.

F-54. BDA is more than determining the number of casualties or the amount of equipment destroyed. The targeting team can use other information such as—

- Whether the targets are moving or hardening in response to the attack.
- Changes in deception efforts and techniques.
- Whether the damage achieved is affecting the threat's combat effectiveness as expected.

F-55. Units may choose to use BDA charts. Figures F-3 and F-4 on page F-10 display two techniques for creating these charts. Figure F-3 is based on the threat's organization; figure F-4 is based on the BDA reported at locations within the AO. Units may choose to use figure F-4 when conducting offensive operations because it provides the commander and staff with an estimation of threat strength at a specific location.

F-56. BDA may simply be compiled information about a particular target or area (for example, the area's cessation of fires). If BDA is developed, the targeting team gives the collection management team and operations cell adequate warning to task information collection units and prepare and orient intelligence collection systems to the right target at the right time. BDA outcomes may result in changed plans and earlier decisions. The targeting team periodically updates earlier decisions during the *decide* function concerning IPB products, HPT lists, target selection standards, attack guidance matrices, collection management tools, and operation plans or OPORDs.

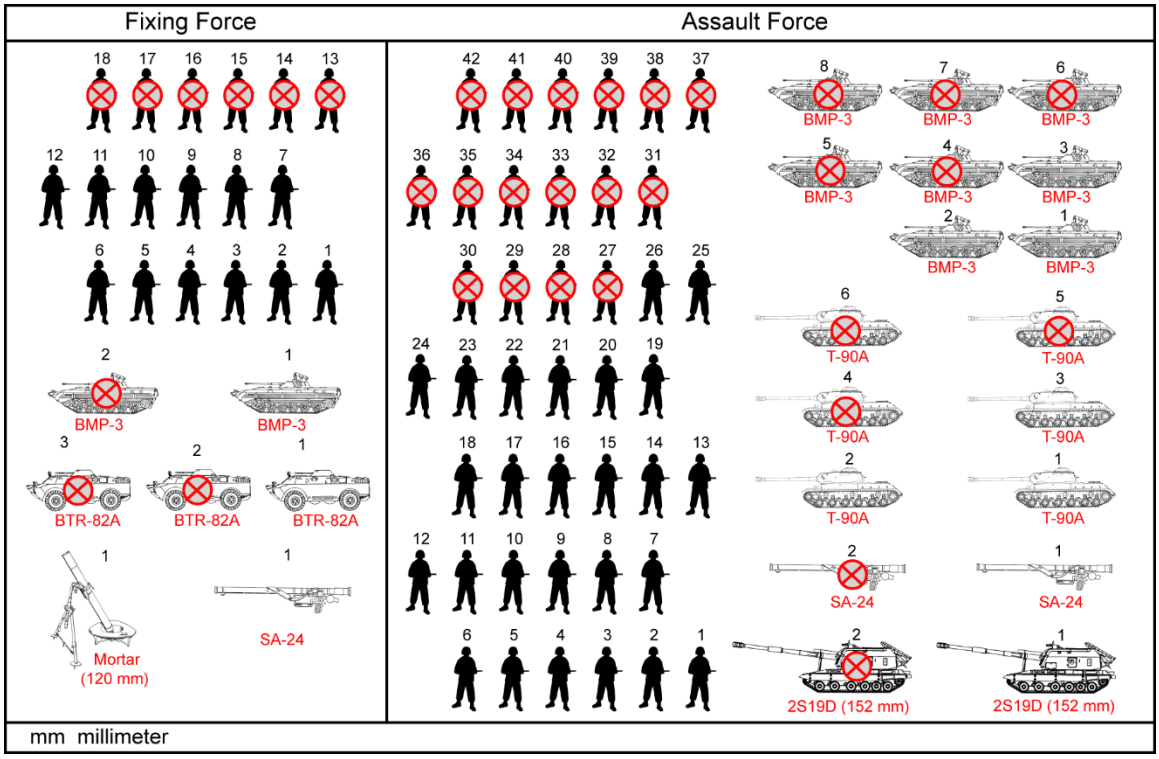

Figure F-3. Battle damage assessment chart (based on threat organization)

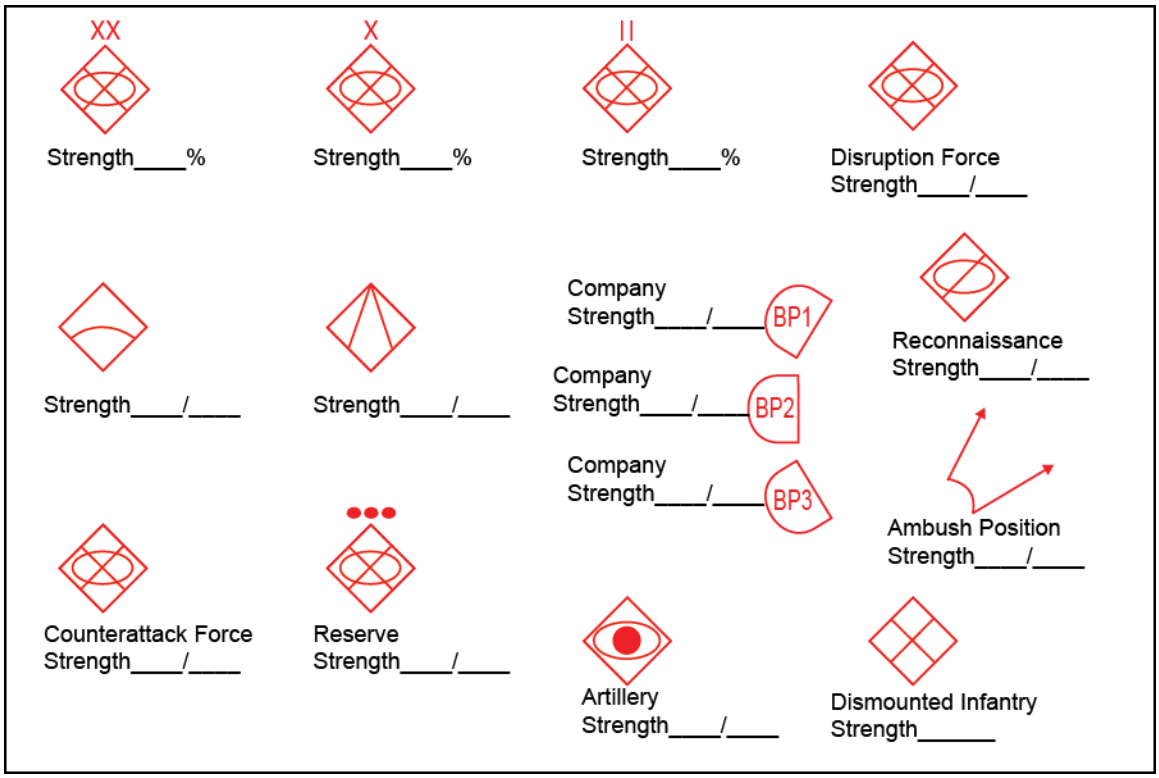

Figure F-4. Battle damage assessment chart (based on location)

Munitions Effectiveness Assessment

F-57. The intelligence cell is not normally involved in the munitions effectiveness assessment but should track them to better understand the unit targeting effort. The G-3/S-3, in coordination with the fires cell and targeting working group, conducts the munitions effectiveness assessment concurrent with BDA. The munitions effectiveness assessment focuses on the munitions effectiveness of the specific threat weapons or other types of systems. The fires cell uses specific weaponeering software. Then the G-3/S-3 and fires cell conducts the munitions effectiveness assessment to increase the effectiveness of the targeting methodology, tactics, weapon systems, munitions, and weapon delivery patterns. Based on the assessment, the targeting working group may recommend modifying the commander's guidance about the unit basic load, required supply rate, and controlled supply rate.

Reengagement Recommendation

F-58. Unlike the munitions effectiveness assessment, the intelligence cell is involved in a reengagement recommendation. When delivery of fires does not achieve a predecided effect or reach a preset BDA criterion, a decision from the commander is necessary. The targeting team and current operations cell must assess the operational risk associated with reengaging or not reengaging an HPT. Based on the BDA and munitions effectiveness assessment, the G-2/S-2, in conjunction with the fire support coordinator and G-3/S-3, considers to what degree the targeting objective has been achieved and makes a recommendation to the commander. Reengagement and other recommendations should address objectives relative to targets, target critical elements, target systems, threat combats for strength, and friendly maneuver.

Glossary

The glossary lists acronyms and terms with Army or joint definitions. Where Army and joint definitions differ, (Army) precedes the definition. The proponent publication for terms is listed in parentheses after the definition.

SECTION I – ACRONYMS AND ABBREVIATIONS

ACE	analysis and control element
ACH	analysis of competing hypotheses
ADP	Army doctrine publication
AO	area of operations
AR	Army regulation
ART	Army tactical task
ASCOPE	areas, structures, capabilities, organizations, people, and events (civil considerations)
ATP	Army techniques publication
BCT	brigade combat team
BDA	battle damage assessment
CFA	critical factors analysis
COA	course of action
DCGS-A	Distributed Common Ground System-Army
DOD	Department of Defense
DOMEX	document and media exploitation
FEBA	forward edge of the battle area
FM	field manual
G-2	assistant chief of staff, intelligence
G-3	assistant chief of staff, operations
HAC	human intelligence analysis cell
HPT	high-payoff target
HUMINT	human intelligence
HVT	high-value target
IADS	integrated air defense system
ICD	intelligence community directive
INSCOM	U.S. Army Intelligence and Security Command
IPB	intelligence preparation of the battlefield
JP	joint publication
MDMP	military decision-making process
METT-TC	mission, enemy, terrain and weather, troops and support available, time available, and civil considerations (mission variables)
MLRS	multiple launch rocket system

NAI	named area of interest
NGIC	National Ground Intelligence Center
OAKOC	observation and fields of fire, avenues of approach, key terrain, obstacles, and cover and concealment (military aspects of terrain)
OE	operational environment
OPORD	operation order
PIR	priority intelligence requirement
PMESII-PT	political, military, economic, social, information, infrastructure, physical environment, and time (operational variables)
S-2	battalion or brigade intelligence staff officer
S-3	battalion or brigade operations staff officer
SOP	standard operating procedure
TAI	target area of interest
U.S.	United States

SECTION II – TERMS

Army special operations forces

Those Active and Reserve Component Army forces designated by the Secretary of Defense that are specifically organized, trained, and equipped to conduct and support special operations. (JP 3-05)

attack guidance matrix

A targeting product approved by the commander, which addresses the how and when targets are engaged and the desired effects. (ATP 3-60)

battle damage assessment

The estimate of damage composed of physical and functional damage assessment, as well as target system assessment, resulting from the application of lethal or nonlethal military force. (JP 3-0)

combat assessment

The determination of the effectiveness of force employment during military operations. (JP 3-60)

combat information

Unevaluated data, gathered by or provided directly to the tactical commander which, due to its highly perishable nature or the criticality of the situation, cannot be processed into tactical intelligence in time to satisfy the user's tactical intelligence requirements. (JP 2-01)

critical capability

A means that is considered a crucial enabler for a center of gravity to function as such and is essential to the accomplishment of the specified or assumed objective(s). (JP 5-0)

critical requirement

An essential condition, resource, or means for a critical capability to be fully operational. (JP 5-0)

critical vulnerability

An aspect of a critical requirement which is deficient or vulnerable to direct or indirect attack that will create decisive or significant effects. (JP 5-0)

defensive operation

An operation to defeat an enemy attack, gain time, economize forces, and develop conditions favorable for offensive or stability operations. (ADP 3-0)

fusion

(Army) Consolidating, combining, and correlating information together. (ADP 2-0)

high-payoff target

A target whose loss to the enemy will significantly contribute to the success of the friendly course of action. (JP 3-60)

high-payoff target list

A prioritized list of high-payoff targets by phase of the operation. (FM 3-09)

high-value target

A target the enemy commander requires for the successful completion of the mission. (JP 3-60)

identity intelligence

The intelligence resulting from the processing of identity attributes concerning individuals, groups, networks, or populations of interest. (JP 2-0)

indicator

In intelligence usage, an item of information which reflects the intention or capability of an adversary to adopt or reject a course of action. (JP 2-0)

information

In the context of decision making, data that has been organized and processed in order to provide context for further analysis. (ADP 6-0)

information operations

The integrated employment, during military operations, of information-related capabilities in concert with other lines of operation to influence, disrupt, corrupt, or usurp the decision-making of adversaries and potential adversaries while protecting our own. (JP 3-13)

intelligence analysis

The process by which collected information is evaluated and intgrated with existing information to facilitate intelligence production. (ADP 2-0)

intelligence estimate

The appraisal, expressed in writing or orally, of available intelligence relating to a specific situation or condition with a view of determining the courses of action open to the enemy or adversary and the order of probability of their adoption. (JP 2-0)

knowledge

In the context of decision making, information that has been analyzed and evaluated for operational implications. (ADP 6-0)

large-scale combat operations

Extensive joint combat operations in terms of scope and size of forces committed, conducted as a campaign aimed at achieving operational and strategic objectives. (ADP 3-0)

large-scale ground combat operations

Sustained combat operations involving multiple corps and divisions. (ADP 3-0)

military decision-making process

An iterative planning methodology to understand the situation and mission, develop a course of action, and produce an operation plan or order. (ADP 5-0)

offensive operation

An operation to defeat or destroy enemy forces and gain control of terrain, resources, and population centers. (ADP 3-0)

operational level of warfare

The level of warfare at which campaigns and major operations are planned, conducted, and sustained to achieve strategic objectives within theaters or other operational areas. (JP 3-0)

relevant information

All information of importance to the commander and staff in the exercise of command and control. (ADP 6-0)

running estimate

The continuous assessment of the current situation used to determine if the current operation is proceeding according to the commander's intent and if the planned future operations are supportable. (ADP 5-0)

stability operation

An operation conducted outside the United States in coordination with other instruments of national power to establish or maintain a secure environment and provide essential governmental services, emergency infrastructure reconstruction, and humanitarian relief. (ADP 3-0)

strategic level of warfare

The level of warfare at which a nation, often as a member of a group of nations, determines national or multinational (alliance or coalition) strategic security objectives and guidance, then develops and uses national resources to achieve those objectives. (JP 3-0)

tactical level of warfare

The level of warfare at which battles and engagements are planned and executed to achieve military objectives assigned to tactical units or task forces. (JP 3-0)

target development

The systematic examination of potential targets and their components, individual targets, and even elements of targets to determine the necessary type and duration of the action that must be exerted on each target to create an effect that is consistent with the commander's specific objective. (JP 3-60)

targeting

The process of selecting and prioritizing targets and matching the appropriate response to them, considering operational requirements and capabilities. (JP 3-0)

threat

Any combination of actors, entities, or forces that have the capability and intent to harm United States forces, United States national interests, or the homeland. (ADP 3-0)

validation

A part of target development that ensures all candidate targets meet the objectives and criteria outlined in the commander's guidance and ensures compliance with the law of war and rules of engagement. (JP 3-60)

vetting

A part of target development that assesses the accuracy of the supporting intelligence to targeting. (JP 3-60)

weaponeering

The process of determining the specific means required to create a desired effect on a given target. (JP 3-60)

FOREWORD

Marine Corps Doctrinal Publication 2, *Intelligence*, and Marine Corps Warfighting Publication (MCWP) 2-1, *Intelligence Operations,* provide the doctrine and higher order tactics, techniques, and procedures for intelligence operations. MCWP 2-12, *MAGTF Intelligence Production and Analysis,* complements and expands upon this information by detailing doctrine, tactics, techniques, and procedures for the conduct of intelligence production and analysis in support of the Marine air-ground task force (MAGTF).

The target audience of this publication is intelligence personnel responsible for the planning and execution of intelligence production and analysis operations.

The MCWP 2-12 provides the information needed by Marines to understand, plan, and execute intelligence production and analysis to support MAGTF operations. It describes intelligence doctrinal fundamentals, the nature of analytical thinking, intelligence preparation of the battlespace, and intelligence support to targeting. This publication also discusses intelligence command and control, communications and information systems support, intelligence products and formats, planning, execution, and training.

Reviewed and approved this date.

BY DIRECTION OF THE COMMANDANT OF THE MARINE CORPS

EDWARD HANLON, JR.
Lieutenant General, U.S. Marine Corps
Commanding General
Marine Corps Combat Development Command

MAGTF INTELLIGENCE PRODUCTION AND ANALYSIS

TABLE OF CONTENTS

Chapter 1 Fundamentals

What is Intelligence Production and Analysis? 1-1
- Intelligence Functions 1-1
- Intelligence Cycle. 1-1

Production Steps. 1-3
- Preparation for Analysis. 1-3
- Analytical Process 1-4
- Product Preparation 1-5

Operations and Command and Control 1-5
Production and Analysis Company, Intelligence Battalion 1-5

Chapter 2 Organizations and Responsibilities

MAGTF Commander 2-1
- Focus the Analytical and Production Effort. 2-1
- Participate in the Analytical Process 2-1
- Evaluate the Product 2-1

Marine Expeditionary Force Command Element Intelligence Officer 2-2
Intelligence Battalion Commander 2-2
- Responsibilities in Garrison 2-2
- Responsibilities During Operations 2-2

Intelligence Battalion 2-3
Production and Analysis Company 2-3
- All-Source Fusion Platoon 2-3
- Organization for Support 2-3

Production and Analysis Cell. 2-4
- Tasks 2-4
- Organization. 2-4
- Supporting Organizations. 2-6

Principal Staff Officers 2-7
Unit Intelligence Officer 2-8
Organic Intelligence Sections 2-8
Organization for Employment 2-8
- Combat Intelligence Center 2-8
- Command and Control 2-9
- Senior Marine Expeditionary Force Intelligence Staff Officers 2-10
- Intelligence Production Support Flow 2-10
- Organization for Combat Operations 2-10

Communications and Information Systems 2-12
Basic Requirements 2-12
Information Systems 2-13

Chapter 3 Filtering, Recording, and Evaluating

Section I Filtering

Filtering Criteria 3-2
Subject Matter 3-2
Location 3-2
Time of Occurrence 3-2
Redundancy 3-2
Methodology 3-2
Manual Filtering 3-2
Automated Filtering 3-2

Section II Recording

Methodology 3-3
Recording Tools 3-3
Intelligence Journal 3-4
Enemy Situation Map 3-5
Intelligence Workbook 3-6
Order of Battle Files 3-6
Target Files 3-11
Tools Automation 3-11

Section III Evaluation

Relevance 3-12
Reliability 3-12
Accuracy 3-12
Evaluation Rating System 3-12
Reliability Evaluation Codes 3-13
Accuracy Evaluation Codes 3-13

Chapter 4 Analytical Thinking

Section I Analytical Process

Analysis 4-1
Synthesis 4-2
Estimation 4-2

Section II Analytic Problem Solving

Analytical Theories 4-3
Proposition or Premise 4-3
A Priori 4-4
Applied Logic 4-4
Facts 4-4
Opinions 4-4
Inferences 4-4
Reasoning 4-5
Deductive 4-5
Inductive 4-6
Tests of Truth 4-7
Correspondence Test of Truth 4-7
Coherence Test of Truth 4-7
Pragmatic Test of Truth 4-8

Section III Pitfalls of Analysis

Logical Fallacies 4-9
Omission 4-9
Assumption 4-11
Biases 4-12
Cultural 4-12
Organizational 4-13
Personal 4-13
Cognitive 4-13

Section IV Decisionmaking

Analytical 4-15
Intuitive 4-15
Comparison 4-15

Chapter 5 Intelligence Preparation of the Battlespace

Section I Step 1—Define the Battlespace Environment

Identify Significant Characteristics of the Environment 5-2
Identify the Command's Area of Operations and Battlespace Limits 5-2
Area of Influence 5-2
Area of Interest 5-4
Battlespace 5-4
Establish the Area of Interest Limits 5-4
Identify the Detail Required for the Time Available 5-5

Evaluate Existing Intelligence Data Bases and Identify Intelligence Gaps 5-5
Collect the Required Intelligence and Materials. 5-6

Section II Step 2—Describe the Battlespace Effects

Analyze the Battlespace Environment 5-6
Terrain. 5-6
Weather. 5-10
Other Characteristics of the Battlespace. 5-11
Describe the Battlespace Effects on Threat and Friendly Capabilities and Broad Courses of Action. 5-12

Section III Step 3—Evaluate the Threat

Update or Create Threat Models. 5-13
Doctrinal Templates 5-13
Description of Tactics and Options 5-13
Identification of Center(s) of Gravity 5-14
Critical Vulnerabilities 5-14
Identification of Type High-Value Targets 5-14
Identify Threat Capabilities 5-14

Section IV Step 4—Determine Threat Courses of Action

Identify the Threat's Likely Objectives and Desired End State 5-15
Identify the Full Set of Courses of Action Available to the Threat 5-15
Evaluate and Prioritize Each Course of Action 5-17
Develop Each Threat Course of Action in the Amount of Detail Time Allows 5-18
Situation Template 5-18
Description of the Threat's Courses of Action and Options. 5-19
High-Value Targets. 5-21
Identify Initial Intelligence Collection, Production, and Dissemination Requirements 5-22
Event Template. 5-23
Event Matrix 5-24

Section V Decision Support Template

Targeted Areas of Interest. 5-25
Decision Points 5-26
Types. 5-26
Considerations 5-26

Section VI Abbreviated Intelligence Preparation of the Battlespace Process

Work Ahead 5-27
Focus on Essentials 5-28
Stay Objective Oriented 5-28
Minimize Essentials 5-28
Output 5-29
Intelligence Estimate 5-29
Target and Objective Studies 5-29

Chapter 6 Analysis of the Battlespace

Section I Responsibilities

Section II Characteristics of the Battlespace

Section III Terrain Analysis

Responsibilities 6-2
Sources of Information 6-3
Geospatial Factors 6-3
Surface Configuration 6-3
Hydrologic Features 6-3
Vegetation Features 6-4
Surface Materials 6-5
Military Aspects of Terrain Evaluation 6-5
Key Terrain 6-5
Observation and Fields of Fire 6-6
Cover and Concealment 6-6
Obstacles 6-6
Avenues of Approach and Mobility Corridors 6-7

Section IV Hydrographic Analysis

Sources of Information 6-9
Hydrographic Conditions 6-9
Seas, Swells, and Surf 6-9
Tides 6-9
Currents 6-9
Beach Selection Considerations 6-10
Size 6-10
Approaches 6-11
Gradient 6-11
Composition 6-11
Trafficability 6-11

Vegetation 6-11
Natural Obstacles 6-11
Manmade Obstacles 6-12
Exits 6-12

Section V Airspace Analysis

Geospatial Analysis Support 6-13
Airspace Evaluation 6-13
Military Aspects of Terrain Evaluation 6-14
Key Terrain 6-14
Observation and Fields of Fire 6-14
Cover and Concealment 6-14
Obstacles 6-14
Avenues of Approach 6-15
Weather 6-15

Section VI Weather Analysis

Responsibilities 6-15
Weather Effects 6-15
Temperature and Humidity 6-16
Precipitation 6-16
Visibility 6-17
Wind Speed and Direction 6-17
Cloud Conditions 6-18
Atmospheric Pressure 6-18
Weather Forecast and Weather Effects Products 6-18

Section VII Infrastructure Analysis

Sources of Information 6-20
Transportation System 6-20
Highway or Road Network 6-20
Railroad Network 6-21
Port and Harbor Facilities 6-21
Airfields 6-22

Characteristics of the People 6-29
Public Opinion 6-30
Education 6-30
Religion 6-30
Public Welfare 6-30
Narcotics and Terrorism Tolerance 6-30

Chapter 7 Threat Analysis Techniques

Section I Intelligence Preparation of the Battlespace Techniques

Threat Order of Battle 7-1
Order of Battle Factors. 7-1
Analytical Considerations 7-5
Threat Model Development 7-5
Doctrinal Templates. 7-5
Description of Tactics and Options 7-5
Identification of Type High-Value Targets 7-7
Threat Courses of Action Determination. 7-8
Criteria for Testing Threat Courses of Action 7-8
Considerations 7-8
Course of Action Evaluation and Prioritization. 7-9

Course of Action Development 7-9
Course of Action Parts 7-10
Considerations 7-10
Course of Action Key Elements 7-10

Section II Specialized Analytical Techniques

Subsystem Threat Analysis. 7-11
Air Defense. 7-11
Artillery. 7-12
Aviation 7-12
Counterintelligence. 7-13
Command and Control Warfare 7-13
Engineer 7-14
Combat Service Support. 7-15
Pattern Analysis 7-15
Coordinates Register. 7-16
Pattern Analysis Plot Sheet. 7-16
Matrix Analysis. 7-17
Activities Matrix. 7-17
Association Matrix 7-19
Link Analysis 7-19
Indicator List. 7-20

Chapter 8 Target Development and Combat Assessment

Section I Targeting

Targeting Cycle. 8-1
Target Development 8-2
Intelligence Preparation of the Battlespace 8-3
Target Value Analysis 8-3
High-Value and High-Payoff Target Identification 8-3
High-Payoff Target List 8-4
Target Analysis. 8-4
Target System Analysis 8-4
Target Complex Analysis. 8-6
Target Element Analysis. 8-6
Role of the Target Analyst 8-7
Target Analysis Products 8-7
List of Targets. 8-7
No-Strike Target List 8-7
Restricted Target List 8-7
Target File. 8-8
Collection Requirements. 8-8
Target or Objective Studies 8-8

Section II Combat Assessment

Battle Damage Assessment 8-9
Munitions Effects Assessment 8-9
Reattack Recommendations 8-9
Battle Damage Assessment Components 8-10
Physical Damage Assessment 8-10
Functional Damage Assessment 8-11
Target System Assessment 8-12
Responsibilities 8-13
Battle Damage Assessment Methodology 8-14
Battle Damage Assessment Principles 8-14
Objectivity 8-14
Reliability 8-14
Accuracy 8-15
Battle Damage Assessment Reporting 8-15
Reports 8-15
Reporting Methods 8-15

Chapter 9 Intelligence Production

CHAPTER 1. FUNDAMENTALS

Marine air-ground task force (MAGTF) intelligence provides decision-makers with an understanding of the battlespace. This understanding encompasses a sophisticated knowledge of the threat and the physical, political, economic, and cultural environment in the area of operations (AO). That knowledge is developed through intelligence production and analysis (P&A).

What is Intelligence Production and Analysis?

P&A is the filtering, recording, evaluating, and analyzing of information, and product preparation of developed intelligence.

Analysis is a process that involves sifting and sorting evaluated information to isolate significant elements related to the mission of the command, determining the significance of the information relative to information and intelligence already known, and drawing deductions about the probable meaning of the evaluated information. Production is the conversion of evaluated material or information into intelligence. All sources of information are integrated, analyzed, evaluated, and interpreted to prepare intelligence products or all-source intelligence in support of known or anticipated user requirements. Production or the process of analysis and synthesis is the most important action in developing usable intelligence for the commander. Production, the fourth step in the intelligence cycle, helps forecast the effect gathered intelligence will have on the commander's ability to accomplish the mission.

Intelligence Functions

To support the commander, MAGTF intelligence organizations carry out six intelligence functions of which the P&A function is an integral part. In each function, data is synthesized into intelligence that provides a portion of the knowledge from which the commander can reach an acceptable level of understanding before making a decision. Intelligence answers the all-important question: "What effect does all this have on our ability to accomplish the mission?" Intelligence organizations—

- Support the commander's estimate.
- Develop the situation.
- Provide indications and warning.
- Support force protection.
- Support targeting.
- Support combat assessment.

Intelligence Cycle

The intelligence cycle consists of a series of related activities that translate the need for intelligence about a particular aspect of the battlespace or threat into a knowledge-based product that is provided to the commander for use in the decision-making cycle (see fig. 1-1).

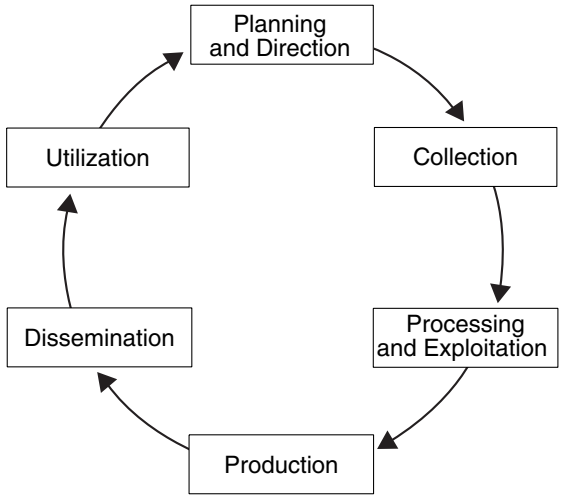

Figure 1-1. Intelligence Cycle.

Planning and Direction

The initial step identifies intelligence needs and develops a plan for satisfying those needs.

Collection

In this step, information used to generate intelligence is drawn from—

- Intelligence data that is derived from assets primarily dedicated to intelligence collection (e.g., imagery systems, electronic intercept equipment, human intelligence sources).
- Sensor data that is derived from sensors whose primary mission is surveillance or target acquisition, air surveillance radar, counterbattery radar, and remote ground sensors.
- Combat data that is derived from reporting by operational units.

Processing and Exploitation

This step converts collected information into an understandable form suitable for the production of intelligence. Processing is accomplished during collection or production. Data collected in a form suitable for analysis is processed automatically during collection. Other types of data require extensive processing, which can affect the timeliness and accuracy of the resulting information. Because processing and production are often accomplished by the same organization, production management generally encompasses processing functions that are required to convert raw data into a usable format. Examples of processing and exploitation include—

- Film processing.
- Document translation.
- Signals intercept.

Production

Production, the fourth step, converts data into intelligence and creates the knowledge (see fig. 1-2) needed for the planning and execution of operations. The intelligence must deliver knowledge, in

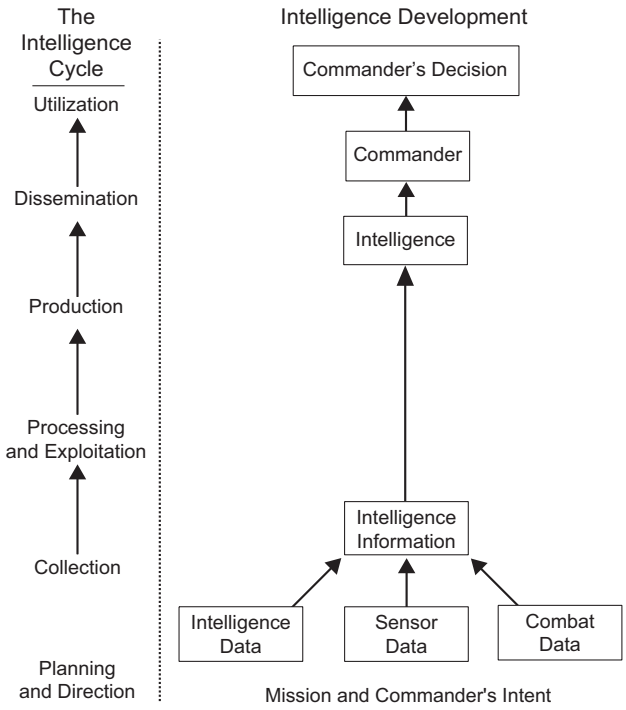

Figure 1-2. Intelligence Cycle in Support of Commander's Decision.

context, in time, and in a form usable in the decisionmaking process. In any situation, providing timely, accurate, and relevant intelligence to commanders and planners is a critical consideration. Production (analysis and synthesis) can be complex, such as comprehensive and detailed intelligence studies required to support the planning of a Marine expeditionary force (MEF) in a major theater war (MTW), or simple, such as direct answers to rapidly changing questions needed to support the ongoing battle at the battalion level. For this reason, production is distinguished as—

- Deliberate production makes full use of available information to provide a complete and extensive product that satisfies non-time sensitive intelligence requirements (IRs). This type of production normally supports operations planning.
- Immediate production identifies information directly applicable to current operations, the information is subjected to a compressed ver-

sion of the production process, and the resulting product is rapidly disseminated to those affected. This production is associated with mission execution.

Dissemination

This step conveys intelligence to users.

Utilization

During utilization, the processed intelligence is used to influence the conduct of operations.

Production Steps

Production (analysis and synthesis) encompasses the following steps, which begin with the receipt of processed information and end with the completion of an intelligence product that is ready for dissemination:

- Filtering is the discarding of irrelevant or repetitive information prior to its entering the production process.
- Recording is the reduction of information to writing or graphical representation and then the arranging of that information into groups of related items.
- Evaluating is the determining of the pertinence, reliability, and accuracy of information.
- Analyzing is the process in which information is analyzed and synthesized to predict possible outcomes.
- Product preparation is the incorporating of developed intelligence into an appropriate product (e.g., text reports and studies, graphics, overlays, or combinations) for dissemination.

Preparation for Analysis

The first three production steps are tools used to prepare information for analysis. The objective is to discard information not pertinent to the situation, organize and document the information in a manner that facilitates analysis, and assess the quality of the individual elements of information to determine the reliability and importance of each report or piece of information.

In deliberate production, comprehensive procedures are often employed to accomplish filtering, recording, and evaluating. The complexity of these procedures increases with the level of command, scope of the operation, and number of agencies or elements participating in the production process. However, it is important to note that filtering, recording, or evaluation systems are tools to support the analytical effort, not an end unto themselves. Intelligence personnel must be thoroughly familiar with the methodology being employed in preparing information for analysis to ensure that the pertinent information is available to the right analyst when needed.

In immediate production, a central node or individual, normally the intelligence watch in the combat operations center, makes a rapid assessment of each piece of incoming information to determine its pertinence and to evaluate its reliability and accuracy. The intelligence watch personnel's evaluation is based on their knowledge and understanding of the enemy situation, the current intelligence estimate, and ongoing and planned friendly operations and IRs. The watch performs the minimal collating and recording necessary so that an immediate tactical analysis may be completed and judgments made. Simultaneous with or upon completion of immediate production, the information is entered into the formal recording and evaluation system for further use in deliberate production. At lower tactical echelons, the entire process, from receipt of information to dissemination and utilization, can take a matter of seconds or minutes. Organization, established standing operating procedures, and individual and unit training are key components of effective preparation for, and conduct of, P&A.

Analytical Process

Intelligence analysis provides the commander with the battlespace and threat knowledge required for planning and executing combat operations. Intelligence analysts lessen the uncertainty facing a commander, permitting the commander to make decisions and to focus combat power on courses of action (COAs) that maximize the opportunity for success. The analysis framework used by intelligence analysts is described as analysis, synthesis, and estimation. This framework provides a disciplined approach to gathering and understanding information and a means for the analyst to place information in context and relate it to planned or ongoing operations.

Analysis

Effective analysis requires that intelligence analysts—

- Possess a thorough knowledge of—
  - Military operations.
  - Characteristics of the battlespace.
  - Friendly situation and IRs.
  - Threat situation (current situation, doctrine, and past practices).
- View collected information in relation to the—
  - Unit's mission.
  - Commander's intent.
  - Commander's IRs.
- Divide the battlespace into component parts to isolate and define the individual elements of significant information that include—
  - Physical dimensions (i.e., length, depth, width, and altitude).
  - Time.
  - Threat force structure (e.g., divisions, wings,groups, task forces).
  - Battlespace activities (e.g., command and control [C2], air and space defense, fire support).
  - Other characteristics that facilitate understanding and satisfy the MAGTF's needs.
- Identify key elements of the situation to—
  - Formulate hypotheses.
  - Make deductions from those hypotheses.
  - Reach conclusions.
- Compare the existing situation to new pieces of information to determine if they relate to the identified key elements and to assess the impact of the new information on the current intelligence estimate.

Synthesis

In this step, intelligence analysts—

- Identify and integrate relationships between individual significant pieces of information with the existing battlespace picture to provide a new image of the situation.
- View the battlespace as a coherent whole.
- Discern emerging patterns in environmental conditions or enemy activity.

Estimation

The bottom line of the analytical process, estimation is based on the detailed study of the tactical situation, experience, intelligence successes, the application of specific tools and methods, and the supported commander's intelligence needs. Estimation is not guessing and it is not predicting! Estimation must describe the current conditions and present an image of future possibilities. Well-founded estimates reduce uncertainty and help the commander plan and execute successful MAGTF operations. Building on the image developed during analysis and synthesis, intelligence analysts determine a threat's—

- Capabilities.
- Intent.
- Probable COA.
- Likely reactions to friendly operations.

Product Preparation

Products are prepared by translating the results of analysis into usable intelligence formats that are timely, accurate, and tailored to both the unit and its mission. Intelligence analysts must strive to provide knowledge that the decisionmaker can easily and quickly visualize and absorb. A series of standard intelligence products are used to support MAGTF operations. Standard production formats facilitate rapid preparation, mutual support between intelligence sections, ease of dissemination, and, most importantly, familiarity for the user. The baseline production formats provided in this manual can be tailored to meet the requirements of any operational situation. The following standard all-source intelligence products are prepared in MAGTF:

- Intelligence preparation of the battlespace (IPB) graphics, matrices, and charts.
- MAGTF contingency intelligence studies.
- Intelligence estimates.
- Target or objective studies.
- Intelligence summaries.
- Intelligence reports.

Operations and Command and Control

Intelligence drives the planning and execution of operations by providing a menu of factors that the commander considers when making a decision. The analytical and production effort identifies these factors and presents them to decisionmakers in a form that enables them to understand the battlespace, place intelligence in context, and use the product to carry out successful operations. P&A shapes operations by—

- Identifying potential advantages offered by the environment.
- Defining the limitations imposed by the environment.
- Locating and assessing enemy strengths to be avoided.
- Determining enemy vulnerabilities to be exploited.
- Providing an estimate of likely enemy actions and reactions based on reasoned analysis, synthesis, and judgment.

Intelligence and operations must be linked throughout the planning, decision, execution, and assessment (PDE&A) cycle at all command echelons. The PDE&A cycle provides the framework for the implementation of C2, which enhances the commander's ability to make sound and timely decisions. Whether the commander uses the analytical or intuitive decisionmaking approach, intelligence P&A reduces uncertainty.

Deliberate intelligence production shapes the operations plan and provides the knowledge that facilitates execution (see fig. 1-3 on page 1-6). Immediate intelligence production identifies situation changes that modify the plan or trigger decisions during execution of the operation. Intelligence production provides the basis for assessing the effectiveness of current operations, while operations drive the P&A effort. The mission and commander's intent focus the initial IPB, while the potential COAs, the concept of operations, the future planning effort, and IRs determine the scope and content of the production process. Intelligence products must be relevant to the mission and be used to satisfy specific operational and tactical IRs.

Production and Analysis Company, Intelligence Battalion

The P&A company is the MEF's primary all-source P&A element. An organic unit within the intelligence battalion (intel bn), P&A company is composed of an imagery intelligence platoon, a topographic platoon, an all-source fusion platoon, and two direct support teams. The P&A company is in general support of the MAGTF and provides direct support teams to MAGTF

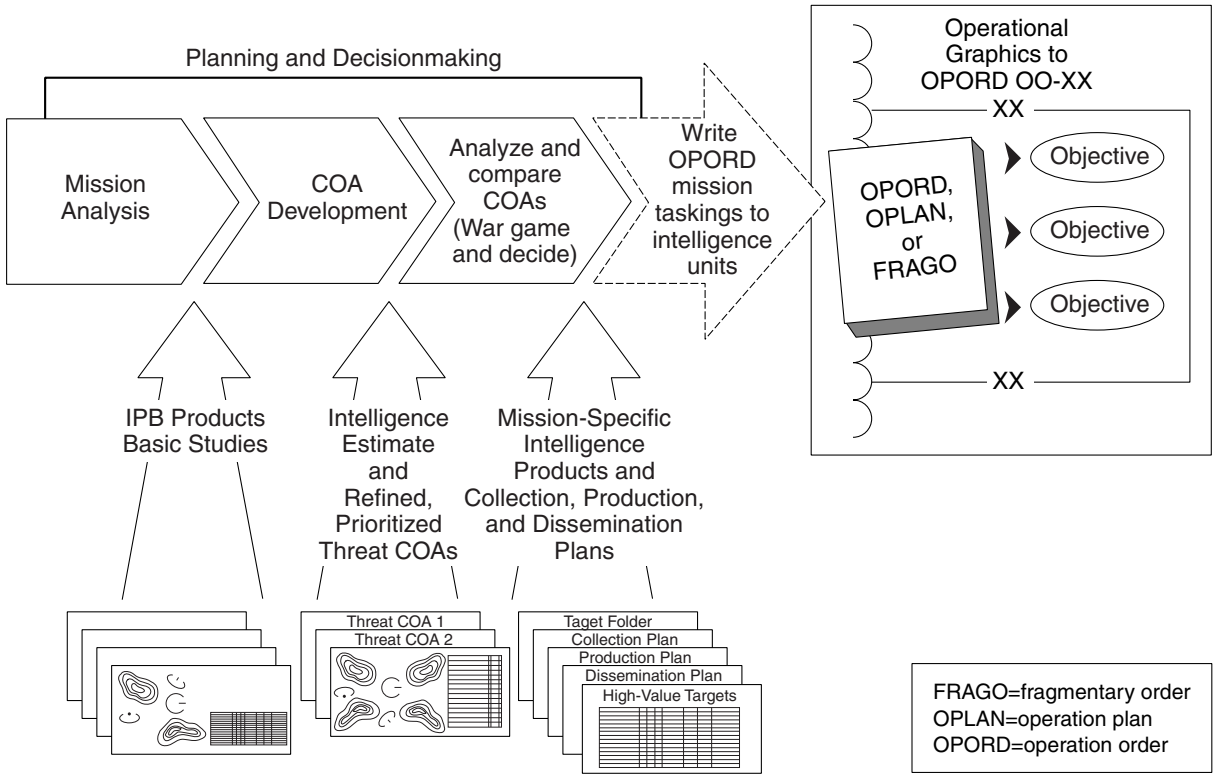

Figure 1-3. Intelligence Support to Planning and Decisionmaking.

subordinate elements, as required. The P&A company performs the following tasks:

- Assists the intel bn commander with planning, developing, and directing the MAGTF intelligence production plan and its integration with the collection and dissemination plans.
- Provides and maintains centralized all-source P&A in support of the MAGTF within the MAGTF P&A cell.
- Maintains an all-source picture of MAGTF AO and area of interest (AOI) threat situation.
- Provides MAGTFs and other commands with geographic intelligence (GEOINT) and geospatial information and services.
- Provides command and control of the topographic platoon.
- Provides imagery analysis and imagery intelligence (IMINT) production support for MAGTFs and other commands.
- Provides command and control of the imagery intelligence platoon.
- Provides task-organized, trained, and equipped detachments or teams to assist MAGTFs or designated commands in the processing, exploitation, evaluation, integration, analysis, interpretation, production, and dissemination of all-source intelligence.

Although the P&A company is a subordinate element of the MEF intel bn and the MAGTF's only dedicated production element, the company responds to the IRs of the entire force. The MAGTF G-2, through the intel bn commander in the role as intelligence support coordinator, establishes the P&A company's analytical and production priorities based on the MAGTF's mission, commander's intent, priority intelligence requirements (PIRs), the current and projected enemy situation, and ongoing planning for future operations. The P&A company focuses primarily on deliberate

production. In garrison or a pre-crisis environment, the P&A company conducts mainly IPB of potential contingency areas to produce MAGTF contingency intelligence studies. During operations and exercises, the P&A company develops intelligence to support future operations, deliberate targeting, and development of the key target or objective area studies. A detailed discussion of the P&A company organization, functions, and employment is provided in chapter 2.

CHAPTER 2. ORGANIZATIONS AND RESPONSIBILITIES

Marine Corps operational forces are organized for combat as MAGTFs. Marine intelligence P&A operations are conducted primarily to facilitate planning and execution of MAGTF operations through the development of tactical intelligence. This chapter discusses responsible officers, organization, supporting organizations, and communications and information systems (CIS) architecture necessary to conduct MAGTF intelligence P&A.

MAGTF Commander

Intelligence is an inherent responsibility of command, and commanders must—

- Be personally involved in the conduct of intelligence activities.
- Specify intelligence requirements and establish PIRs.
- Provide guidance to ensure a timely and useful product.
- Develop an appreciation for the capabilities and limitations of intelligence.
- Make the final synthesis of intelligence.
- Supervise the overall intelligence effort to ensure the product is timely, relevant, and useful.
- Ensure intelligence activities support subordinate commanders as well as the parent unit.
- View intelligence training of all personnel as a command responsibility.

To ensure the timely development of useful intelligence products, the commander has specific P&A responsibilities.

Focus the Analytical and Production Effort

The commander must—

- Provide guidance and direction to ensure that the intelligence developed satisfies requirements.
- Issue a statement of intent and approval of the command's priority intelligence requirements, focusing the analytical and production effort.
- Supervise the process to ensure that it is responding to the intent and intelligence needs.
- Provide direction in the scope of the IPB effort, preferred product formats, and priorities among subordinates' production requirements (PRs).

Participate in the Analytical Process

The commander must understand and participate in the analytical process. Since intelligence analysis is based on incomplete information and involves assumptions and judgments, the commander must scrutinize the process by analyzing intelligence operations and resulting products to determine the operational impact and overall effectiveness.

Evaluate the Product

To provide the basis for continued improvement of the P&A effort, the commander must—

- Evaluate key areas (e.g., product content, presentation, timeliness).
- Identify where the intelligence provided met expectations and where and how it fell short.

- Provide timely and constructive feedback to the intelligence officer, the supporting intel bn commander or detachment officer in charge, and P&A elements.

Marine Expeditionary Force Command Element Intelligence Officer

The MEF assistant chief of staff (AC/S) G-2 focuses on overall C2 and direction of MEF intelligence, counterintelligence (CI), and reconnaissance operations, to include P&A. The MAGTF commander relies on the AC/S G-2 to provide the necessary information on the weather, terrain, and enemy capabilities, status, and intentions. Through intelligence operation plans (OPLANs) and supporting intelligence and reconnaissance and surveillance plans, the AC/S G-2—

- Plans and coordinates intelligence priorities.
- Integrates collection, production, and dissemination.
- Allocates resources.
- Assigns specific missions to subordinate elements.
- Supervises the overall intelligence and reconnaissance efforts.

Intelligence Battalion Commander

The intel bn commander is responsible for planning and directing, collecting, processing, producing, and disseminating intelligence, and providing CI support to the MEF and MEF major subordinate commands (MSCs).

Responsibilities in Garrison

In garrison, the principal task of the intel bn commander is to organize, train, and equip detachments that support MAGTFs or other designated commands to execute integrated collection, intelligence analysis, production, and product dissemination.

Responsibilities During Operations

During operations the intel bn commander is dual-hatted as the intelligence support coordinator (ISC), serving under the direct staff cognizance of the MEF AC/S G-2. The intel bn S-3 section and the MEF G-2 operations center element form the core of the ISC support effort and conduct planning, directing, and C2 within the intelligence operations center (IOC) support cell. Generally, the IOC is collocated with the main command post of the MEF command element (CE). As ISC, the intel bn commander is responsible to the MEF AC/S G-2 for the overall MEF IR management. During operations, the ISC is responsible for—

- Implementing the concept of intelligence operations developed by the G-2 plans officer and approved by the AC/S G-2.
- Establishing and supervising the MEF IOC, which includes P&A cell, surveillance and reconnaissance cell (SARC), and support cell.
- Developing, consolidating, validating, and prioritizing recommended PIRs and IRs to support MAGTF planning and operations.
- Planning, developing, integrating, and coordinating MEF intelligence collection, production, and dissemination plans.
- Exercising C2 staff cognizance of supporting intelligence and reconnaissance organizations to ensure unity of effort and production of all-source intelligence.
- Developing, in conjunction with the G-2 plans officer and G-2 operations officer, and completing Annex B (Intelligence) to MEF operation order (OPORD), supporting appendices, and intelligence input to other OPORD annexes.
- Providing intelligence support to MEF CE G-2 section and MSCs.

- Preparing the intelligence and CI estimates to support G-2 plans.
- Planning, developing, integrating, and coordinating intelligence and CI support to the commander's estimate, situation development, indications and warning, force protection, targeting, and combat assessment.

Intelligence Battalion

Within the MEF, the intel bn is organized to conduct intelligence operations for the MEF, MEF MSCs, subordinate MAGTFs, and other commands as directed (see fig. 2-1).

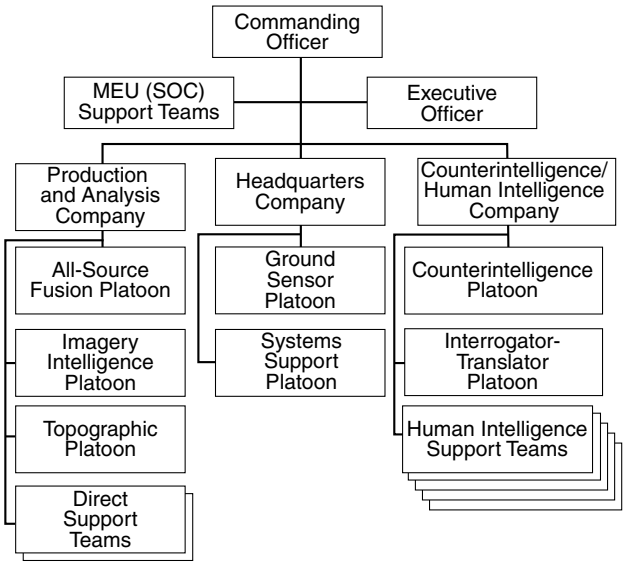

Figure 2-1. Intelligence Battalion Organization.

Production and Analysis Company

The P&A company, intel bn, is the focal point for deliberate intelligence production within the MEF. Although all P&A company elements contribute to the deliberate production process, the focal point for all-source analysis, order of battle (OOB), target intelligence, battle damage assessment (BDA), and deliberate production is the all-source fusion platoon (AFP).

All-Source Fusion Platoon

The AFP, in conjunction with other elements of the intel bn and production elements of radio battalion, force reconnaissance company, Marine tactical electronic warfare squadron (VMAQ), and Marine unmanned aerial vehicle squadron (VMU), provide the capability for all-source intelligence P&A support to the full range of operations conducted by the MEF and other MAGTFs. During operations, AFP forms the core of P&A cell.

Organization for Support

Intel bn's P&A company is organized to provide intelligence support to elements of the MEF CE and MSCs. During operations, P&A company is functionally organized into teams as the P&A cell. The teams support other MAGTF staff organization cells (see table 2-1).

Table 2-1. P&A Company Organization for Support.

Intel Bn, P&A Company Team or Unit	MEF CE Supported Cell
All-source fusion platoon	
• Analysis team	G-3 current and future operations, G-5, and other MEF staff elements*
• OOB team	G-3 current and future operations, G-5, and other MEF staff elements*
• Target analysis and BDA team	G-3 targeting cell and other MEF staff elements*
• IPB team	G-3 current and future operations, G-5, and other MEF staff elements*
Topographic platoon	MEF
Imagery intelligence platoon	MEF
Direct support teams	P&A cell, G-3 current or future operations, G-5, or designated MSC G-2
*The P&A cell supports the G-4, G-1, and other MEF CE staff elements, as appropriate.	

Production and Analysis Cell

The mission of P&A cell is to plan, coordinate, and produce fused all-source tactical intelligence in support of the MEF, its MSCs, and other MAGTFs and commands as directed. A multi-disciplined group of intelligence officers and specialists, the P&A cell provides the intelligence necessary to support contingency planning and current intelligence threat requirements of the MEF, its subordinate MAGTFs, and other commanders as directed.

Tasks

During operations and exercises, the P&A cell provides the intelligence necessary to support current and future operations, future plans, targeting, and development of enemy situation and capabilities. It is responsible for processing information and intelligence from organic and external commands and intelligence organizations. The P&A cell personnel—

- Receive, process and exploit, integrate, analyze, evaluate, interpret, and synthesize intelligence and other information into comprehensive and tailored intelligence products required for the planning and execution of MAGTF operations.
- Provide intelligence support across the conflict spectrum and in support of deliberate and crisis planning, MAGTF deployments, and other operations as directed.
- Provide a dynamic, detailed OOB picture of threats within the MAGTF AO and AOI.
- Provide detailed intelligence P&A support to targeting.
- Maintain a MAGTF-wide summation of damages caused to hostile targets and augment BDA efforts of MAGTF elements as required.
- Provide MAGTF-level BDAs for forwarding to the component, joint task force (JTF), and/or theater commander in chief (CINC) as applicable.
- Provide IPB support to the MAGTF G-3/S-3 and G-5 for battle management and planning efforts and provide IPB-related support to MAGTF elements beyond their organic capabilities.
- Disseminate intelligence products and information to the MAGTF staff and MSCs in a timely, relevant manner.
- Establish and maintain intelligence data bases to support intelligence P&A.
- Coordinate with the collection management and dissemination officer to provide the SARC with collection requirements for MAGTF and external collection units.
- Coordinate with the dissemination manager to disseminate intelligence products throughout the MEF and external organizations.
- Coordinate with the MEF G-2 and intel bn commander/ISC to—
  - Ensure disseminated intelligence and products are understood.
  - Determine whether intelligence products answer commander's PIRs and users' IRs.
  - Identify new intelligence production requirements (IPRs) that result from disseminated intelligence products.
  - Assess the overall effectiveness of intelligence production operations.

Organization

The P&A cell is essentially organized in garrison as it would be organized for operations. Each team has the flexibility to add intelligence and nonintelligence specialists (e.g., G-2 operations red cell members) from other intelligence and reconnaissance organizations as required based on the specific mission and intelligence needs of the MAGTF. For sustained MEF-level operations, global sourcing from other Marine Corps organizations may be required to augment the P&A team structure and to provide sufficient personnel depth for 24-hour operations.

The following P&A cell internal organization and subordinate teams and units provide the P&A functions required to support current and future operations, future planning, targeting, and BDA.

P&A Cell Staff

Members of the staff provide leadership and support functions such as maintenance of the intelligence library. In conjunction with the intel bn's collection management and dissemination officer, P&A cell staff members are responsible for production and IPR management as well as coordination of IPRs with intel bn's overall IR collection and dissemination.

Analysis Teams

The two analysis teams are composed of all-source analysts and specialists from other disciplines (e.g., medical, weather, CI/human intelligence [HUMINT], imagery, terrain, signals intelligence [SIGINT]). With support from other elements of the P&A company, the rest of intel bn, radio battalion, force reconnaissance, VMU, VMAQ, and MSC G-2 intelligence analysts, P&A cell analysis teams produce integrated all-source intelligence products to include—

- Contingency and other focused intelligence studies.
- Intelligence estimates.
- Intelligence summaries.
- Briefings.

OOB Teams

The P&A cell has two OOB teams. These teams analyze and maintain a detailed, comprehensive, evolving picture of ground, air, naval, electronic, weapons of mass destruction, and other threats within the MAGTF AO and AOI. The OOB teams perform OOB analysis, and the primary products include—

- Graphic or electronic situation overlays.
- OOB data bases and files.
- Threat models for various threat elements.

Target Analysis and BDA Teams

The two target analysis and BDA teams focus on detailed analysis of MAGTF commander, staff, and MSC-identified targets not destined for the air tasking order (ATO). (The Marine aircraft wing [MAW] G-2 section generally manages target and BDA analysis and intelligence support for ATO-nominated targets.) These teams—

- Provide target development and analysis to support the MAGTF deliberate and reactive targeting efforts.
- Maintain the comprehensive picture of battle damages caused to targets.
- Prepare BDA reports and assessments, which support the MEF combat assessment effort.

IPB Teams

The two IPB teams focus on IPB production support to the MEF G-3 and G-5 in the areas of current battle management and future planning. They also assist subordinate unit intelligence personnel with IPB-related production when requirements are beyond the organic capabilities of that unit.

Direct Support Teams

The two P&A cell direct support teams allow enhanced IR management, intelligence P&A, and dissemination capabilities to be focused down to one or more MSCs. Direct support teams augment the supported unit's intelligence section by—

- Providing an extension of the intel bn's P&A cell or MSC G-2 intelligence operations element for the receipt, collaborative analysis, production, and dissemination of intelligence to the supported unit.
- Tailoring higher and external intelligence products to the needs of the supported unit.

- Assisting the supported unit's intelligence officer in the formulation and management of external IRs.
- Assisting the supported unit in the production of IPB and other intelligence products to support detailed mission planning and execution.
- Enhancing the intelligence dissemination efforts of the supported unit's intelligence section.

Supporting Organizations

Several organic MAGTF intelligence organizations support the P&A cell P&A effort by contributing specialized MAGTF intelligence expertise and resources. The intel bn commander, serving as the ISC, is directly responsible to MEF AC/S G-2 for exercising C2 staff cognizance of supporting intelligence and reconnaissance organizations to ensure unity of effort and production of all-source intelligence. These supporting organizations contribute to fused, all-source MAGTF intelligence products. The following supporting intelligence and reconnaissance organizations provide significant specialized support to the P&A cell P&A effort.

Imagery Intelligence Platoon

Organized under the intel bn, P&A company, imagery intelligence platoon (IIP) provides imagery interpretation support for MEF requirements and maintains the imagery data base and imagery library for the MAGTF (see fig. 2-2). The IIP is capable of providing IMINT derived from available imagery sources in support of MEF P&A cell products. This includes annotated imagery in support of MEF P&A cell production or in response to separate IRs. A key imagery exploitation resource organic to the IIP is the tactical exploitation group (TEG), which is an element of the broader Joint Services Imagery Processing System (JSIPS). The IIP normally concentrates on the exploitation of imagery and production of IMINT from MEF, JTF, and other tactical resources, such as unmanned aerial vehicles (UAVs) or the F/A-18D (RC) advanced tactical aerial reconnaissance system (ATARS).

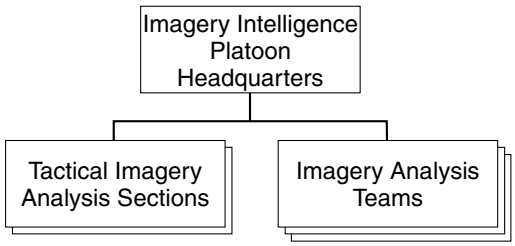

Figure 2-2. IIP Organization.

Topographic Platoon

Organized under the intel bn, P&A company, the topographic platoon provides geospatial information and GEOINT support for all MAGTF requirements (see fig. 2-3). The topographic platoon and IIP work closely as both use many of the same baseline intelligence data and sources for production.

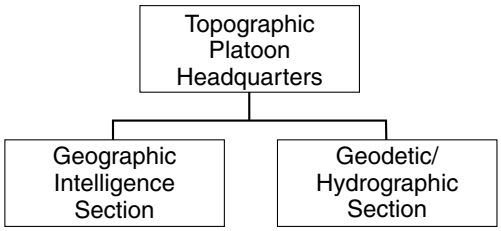

Figure 2-3. Topographic Platoon Organization.

The topographic platoon personnel—

- Integrate, deconflict, analyze, and disseminate theater, Service, and national geospatial data bases for the MAGTF.
- Provide GEOINT and specialized mapping, graphics and other geospatial information and services, and GEOINT products in support of P&A cell all-source intelligence products.
- Provide key support to the IPB process.

- Produce independent GEOINT studies in response to separate requirements.

CI/HUMINT Company

Organized under the intel bn, the CI/HUMINT company is responsible for the development and maintenance of the MEF CI estimate and reporting information (see fig. 2-4). The CI/HUMINT company produces—

- Intelligence derived from human source exploitation, to include—
  - Interrogations of enemy prisoners of war, refugees, and displaced persons.
  - Counterintelligence operations.
  - Human source operations.
- Intelligence derived from exploitation of captured documents or materiel.
- Specialized CI or force protection assessments in support of P&A cell production or in response to specific IPRs.

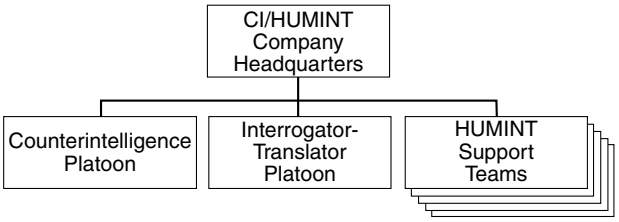

Figure 2-4. CI/HUMINT Company Organization.

Radio Battalion Operational Control and Analysis Center

The radio battalion operational control and analysis center (OCAC) provides the principal MEF SIGINT analytical and production support to MEF IRs. Under staff cognizance of the ISC, the radio battalion is tasked with the responsibility of maintaining the MAGTF electronic OOB and SIGINT data bases and of providing SIGINT analytical and production support to the P&A cell. The OCAC provides MAGTF units with time-sensitive SIGINT and product reporting based on intelligence reporting criteria and the MAGTF intelligence dissemination plan.

VMAQ

In conjunction with the MAW G-2, VMAQ is responsible for the processing, analysis, and production of routine and time-sensitive electronic intelligence reports resulting from EA-6B operations. The resulting information and intelligence is used to help update and maintain the threat electronic OOB, which is used in the planning and execution of aviation and other MAGTF operations. A threat's electronic OOB and the location of electronic emitters in the battlespace are important indicators of threat dispositions, capabilities, and intentions.

Force Reconnaissance Company

The mission of the force reconnaissance company is to conduct amphibious reconnaissance, surveillance, and limited-scale raids in support of the MEF, other MAGTFs, or JTFs as directed.

Under the staff cognizance of the ISC, force reconnaissance company conducts specialized terrain reconnaissance and prepares intelligence products to support hydrographic, beach, road, bridge, route, urban area, helicopter landing zones (HLZs), drop zones (DZs), landing craft air cushion (LCAC) landing zones (LZs), and aircraft forward operating site intelligence studies.

Principal Staff Officers

Like the commander, the other principal staff officers play an important role in intelligence P&A. Through development of focused intelligence requirements, and recommending which should be priority intelligence requirements PIRs, they assist in directing the intelligence P&A effort. They also assist the analytical effort by availing the wide range of skills and backgrounds resident within their staff sections to the intelligence section. A tremendous synergism is achieved when

task-organized teams of intelligence analysts and other occupational specialists form to analyze a specific issue. Likewise, a key component to effective wargaming is a red cell, which has experts in various warfighting functions thinking and fighting like the threat. Principal staff officers must—

- Use the intelligence products.
- Evaluate the worth and effectiveness of those products.
- Provide constructive feedback.
- Develop IRs and recommend their priority.

Unit Intelligence Officer

The intelligence officer manages the intelligence effort for the commander by implementing activities that execute the intelligence P&A function for the command. Understanding the scope and rationale behind the commander's decisionmaking process enables the intelligence officer to anticipate future requirements and properly focus the P&A effort. To execute P&A responsibilities, the intelligence officer must—

- Integrate and focus all-source intelligence on the commander's and sub-ordinate commanders' PIRs to support estimates of the situation, situation development, COA development, planning, and decisionmaking.
- Supervise the development and dissemination of all-source intelligence products that are tailored to the units' needs and concepts of operations and that are provided in time to support planning and decisionmaking.
- Provide the commander and staff with a bottom-line analysis of enemy capabilities, strengths, and vulnerabilities as well as opportunities and limitations presented by the environment.
- Request P&A support for requirements that exceed organic capabilities.
- Ensure the nature of the analytical effort and the content of the intelligence product is understood and properly used in the planning and execution of combat operations.

Organic Intelligence Sections

The unit intelligence section supports the commander, the intelligence officer, and the command through the development of mission-oriented intelligence products. The analytical and production capabilities of organic intelligence sections vary with the size of the section and level or type of command it supports. However, intelligence sections and their supporting intel bn or detachment are capable of performing the following P&A tasks:

- Conducting mission-focused IPB P&A for the unit's AO and AOI.
- Developing and maintaining a comprehensive intelligence estimate.
- Tailoring intelligence products to meet unit requirements.
- Maintaining an accurate all-source picture of the enemy situation in the AO and AOI.
- Preparing target analysis and target intelligence products.
- Providing intelligence operational linkage and communications and information system connectivity with higher, adjacent, supporting, and subordinate analytical elements.

Organization for Employment

When deployed, the P&A cell functions as part of the MEF CE combat intelligence center (CIC), IOC, under C2 of the ISC.

Combat Intelligence Center

The MEF CE CIC is the overarching IOC, which is established within the MEF main command post to conduct the primary functions of MEF intelligence section and intel bn. Key CIC elements (see table 2-2) are designed to

provide tailored, yet flexible, intelligence C2 and functional capabilities to meet MEF and subordinate commander's IRs and supporting intelligence and reconnaissance operations.

Command and Control

The MEF AC/S G-2 focuses on overall C2 and direction of MEF intelligence, CI, and reconnaissance operations by exercising staff cognizance over intel bn, radio battalion, force reconnaissance company, and other MEF intelligence and reconnaissance assets (e.g., UAV squadron). Within this C2 authority, the intel bn commander, serving as the G-2's ISC, performs MEF-wide IR management; develops, integrates, and manages supporting intelligence plans; and supervises plan execution.

These plans encompass the MEF-wide organic efforts for collection, processing, production, and dissemination activities of intelligence and reconnaissance operations. The intel bn commander/ISC is responsible for the establishment and operation of the IOC (see fig. 2-5 on page 2-10).

Table 2-2. MEF CE's CIC Key Elements.

Element	Responsibilities
G-2 Plans	Serves as the G-2 section's main element for coordinating and providing intelligence support to the MEF CE future plans team and leadership and direction of the G-2 section's imagery and mapping, SIGINT, and weather sections.
G-2 Operations	Serves as the G-2 section's main element for coordinating and providing intelligence support to the MEF CE commanding general (CG), battle staff, and current operations center elements; target intelligence support to the force fires and future operations; G-2 section intelligence requirements management activities; red cell support; and MEF intelligence liaison with external commands and organizations.
IOC	Serves as the principal MEF intelligence operations and C2 center that is established by intel bn; performs intelligence requirements management, staff cognizance of ongoing organic and supporting collection operations, intelligence P&A, and intelligence dissemination.
• Support Cell	Serves as primary element for conducting MEF-wide intelligence requirements management, weather support, collections and dissemination planning and direction, and intelligence staff cognizance of MEF organic and supporting intelligence and reconnaissance operations.
• P&A Cell	Serves as the primary P&A element of the MEF; processes and produces all-source intelligence products in response to requirements of the MEF; serves as the principal IMINT and GEOINT production element of the MEF.
• SARC	Serves as the primary element for the supervision of MEF collection operations; directs, coordinates, and monitors intelligence collection operations conducted by organic, attached, and direct support collection assets.
CI/HUMINT Company Command Post	Serves as the primary element for conducting CI/HUMINT planning and direction, C2, and coordination of MEF CI/HUMINT operations with external CI/HUMINT organizations.
OCAC	Serves as the main node for the C2 of radio battalion SIGINT operations and the overall coordination of MEF SIGINT operations; processes, analyzes, produces, and disseminates SIGINT-derived information; and directs the ground-based electronic warfare activities of the radio battalion.
Reconnaissance Operations Center	Serves as the main node for the C2 of force reconnaissance company's operations and the overall coordination of MEF ground reconnaissance operations; processes, analyzes, produces, and disseminates ground reconnaissance-derived information in support of MEF intelligence requirements.

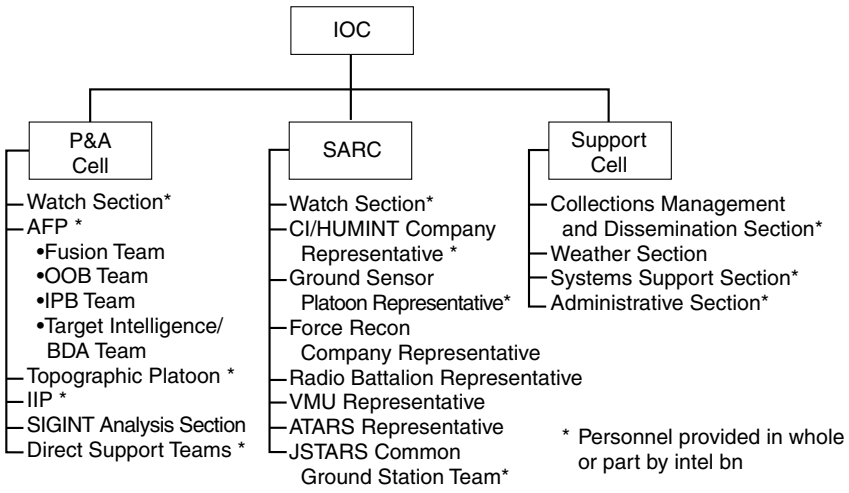

Figure 2-5. IOC Organization.

Senior Marine Expeditionary Force Intelligence Staff Officers

Table 2-3 highlights the key MEF senior intelligence staff officers and their responsibilities, roles, and tasks.

Intelligence Production Support Flow

Requests for intelligence production support from the P&A cell, or other MEF intelligence or reconnaissance elements, must be validated and forwarded via the chain of command to the MEF G-2 for validation, prioritization, and tasking. The intel bn commander, serving as ISC, performs this function for the G-2.

The ISC, upon approval by the AC/S G-2, uses the prioritized intelligence collection requirements (ICRs), IPRs, and intelligence dissemination requirements (IDRs) for planning and direction, follow-on taskings to MEF organic and supporting intelligence and reconnaissance units, C2, and execution. The ISC's overall intelligence production staff cognizance relationships and resulting P&A cell intelligence production support flow are as indicated in figure 2-6.

Organization for Combat Operations

The intel bn and P&A company tailor day-to-day garrison operations to support the IRs of the commander, staff, and MEF subordinate units. With minor adjustments, the P&A company transitions from garrison pre-hostilities organization to P&A cell crisis or combat operations functioning. In practice, the organization of the P&A cell supporting each MEF is based on prospective missions of that MEF and corresponding potential AOs.

During contingency or combat operations, the P&A cell functions as part of the MEF CE's CIC and the intel bn's IOC. The P&A cell may be tasked to provide limited personnel support to an intelligence node or cell with the MEF. In such cases, the intelligence component of these command echelons will contain a limited P&A capability (focused on providing the commander with situational awareness).

Table 2-3. Senior Intelligence Staff Officers.

ISC	G-2 Operations Officer	G-2 Plans Officer
Planning and execution of intelligence operations to support all MEF IRs.	Providing intelligence support to MEF CE battle staff and current operations center agencies.	Providing intelligence support to the plans officer's future planning team for future planning IRs.
Establishing and directing the IOC (P&A cell, SARC, and support cell).	Coordinating intelligence support to higher and adjacent headquarters and agencies.	Recommending IR validation, prioritization, and tasking to AC/S G-2.
Managing IRs (collection, production, and dissemination), validating, prioritizing, and tasking IRs, per AC/S G-2 direction.	Recommending IR validation, prioritization, and tasking to AC/S G-2.	Establishing and directing the G-2 future planning intelligence element.
Exercising C2 of intel bn and staff cognizance over SIGINT, CI, HUMINT, measurement and signature intelligence, IMINT, and air and ground reconnaissance, including staff cognizance of designated G-2 elements.	Establishing and directing intelligence elements and support to the combat operations center, future operations center, target intelligence section, force fires, red cell, and MEF intelligence liaison teams.	Establishing and operating the intelligence section's imagery and mapping, CI, HUMINT, SIGINT, and weather sections (less that under staff cognizance of the ISC).

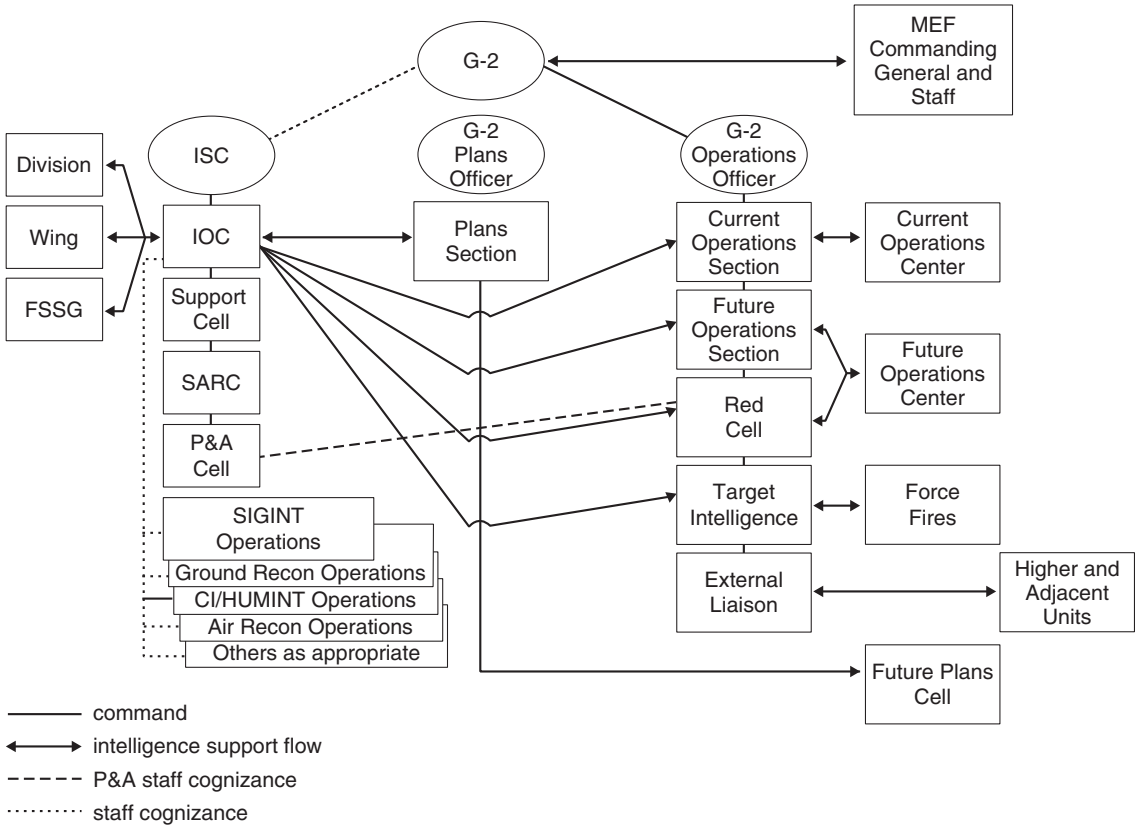

Figure 2-6. C2 and Staff Cognizance of Intelligence Production Support Flow.

The P&A cell may be tasked to provide personnel to support intel bn detachments provided to subordinate commands, MAGTFs, or separate units. Each P&A cell contains within its table of organization (T/O) two direct support teams which can be used to augment the IR management, analysis, production, and dissemination capabilities of the supported unit. Direct support teams can be employed by the MEF AC/S G-2 or ISC to focus intelligence planning, direction, analysis, production, and dissemination support to the main effort or other specified MEF priority. When not so assigned, direct support teams will be integrated within other P&A cell or intel bn operations.

When a MAGTF of less than full MEF size is deployed, the P&A cell may contribute personnel to a task-organized intel bn detachment normally attached to the MAGTF or special-purpose MAGTF (SPMAGTF) command element. A common example would be the detachments provided to Marine expeditionary unit (special operations capable) (MEU[SOC]) CEs. Standing support includes small detachments from the IIP and topographic platoon. The lead and tactical echelons' intelligence nodes and detachments rely heavily on electronic CIS connectivity to allow reach back to the more robust and capable analytical and production resources of the MEF and intel bn.

Communications and Information Systems

The intel bn, P&A cell, subordinate elements, and other key intelligence producers (e.g., radio battalion) must have sufficient communications resources to support internal C2, operations, and IR support. Communications capabilities generally consist of short- and medium-range voice communications equipment. The communications battalion or communications elements provide P&A CIS support beyond the basic requirements.

Basic Requirements

Regardless of the size of the MAGTF, the following standing CIS requirements must be satisfied to facilitate intelligence P&A operations.

Capability to Command and Control Subordinate Units

Intelligence officers and intelligence production element commanders or officers in charge must be capable of positive staff cognizance or C2 of subordinate units and integration of their operations with broader MAGTF and external intelligence and operations C2. Traditionally, single-channel radio and record message traffic have been used to support MAGTF intelligence units' C2, particularly at echelons below the MSC level. At MSC, major subordinate element (MSE), MAGTF CE, and higher command echelons, high capacity communications networks support intelligence production C2, operations, and product dissemination. In semi-static situations, secure electronic mail or telephone provide significant communications capabilities; in highly fluid or mobile scenarios, cellular, satellite communications (SATCOM), and very high frequency (VHF) and high frequency (HF) radios may be used.

Ability to Receive Collected Data, Information, and Intelligence from Organic and External Intelligence Organizations and Production Elements

The CIS architecture must provide connectivity between organic and supporting intelligence units and production elements. Principal and alternate means of CIS are dependent on mission, enemy, terrain and weather, troops and support available-time available (METT-T) factors. The commanders and users' desired product formats also influence the selection of CIS means. The means of communication must include the capability to transmit imagery, GEOINT, and other intelligence products with large data files as well as the capability to

disseminate IMINT and reports digitally via fiber optics, wire, radio, and voice formats.

Ability to Provide Intelligence to Supported Commanders

Supported commanders' intents, concepts of operations and intelligence, command relationships, and standing PIRs and IRs influence intelligence production CIS requirements. The CIS architecture must be capable of integrating production elements' C2 and supporting CIS operations, including general service (GENSER) and sensitive compartmented information (SCI) communications with the primary CIS channels used by supported commanders. The determination of principal and alternate CIS means depends on METT-T. The product format desired by commanders and intelligence users also influences the CIS means. The means of communication must include the capability to transmit imagery, GEOINT, and other intelligence products with large data files as well as the capability to disseminate SCI and GENSER all-source and intelligence discipline-unique reports digitally via fiber optics, wire, radio, and voice formats.

Ability to Share Intelligence Products and Reports with All-Source JTF, Other Components, Theater, National, and Multi-national Intelligence Organizations, Agencies, and Centers

Traditionally, MAGTF GENSER secure record and voice communications provide this capability. While these techniques continue to be used for MAGTF intelligence production, they are now secondary in importance to the use of Joint Worldwide Intelligence Communications System (JWICS), SECRET Internet Protocol Router Network (SIPRNET), and other CIS capabilities which allow participants to access each others' intelligence products and data bases and to immediately pull required data, intelligence, and other products. This CIS requirement includes the capability to disseminate intelligence with designated nongovernmental organizations (NGOs), private volunteer organizations (PVOs), and other U.S. and multinational governmental agencies, particularly during military operations other than war (MOOTW).

Information Systems

Information systems, such as the intelligence analysis system (IAS), and their associated networks are the lifeblood and lifelines of P&A cell and MAGTF intelligence analysis, production, and dissemination operations. Intel bn has sufficient information systems resources to satisfy internal C2, operations, and intelligence needs. Most information systems require access to SIPRNET for GENSER requirements and to JWICS for SCI requirements, which provide intelligence and data base access to MAGTF, JTF, and other components' elements, and theater and national intelligence reporting and data bases.

The nonsecure internet protocol router network (NIPRNET) is also a key resource for intelligence analyst research and access to public domain information, as well as a means to exchange unclassified information. The supporting MEF communications battalions provide the necessary network connectivity for GENSER information networks and communications pathways, and radio battalion provides SCI networks. Figure 2-7 on page 2-14 depicts a notional MEF intelligence processing, analysis, production, and dissemination CIS architecture and resources.

CHAPTER 3. FILTERING, RECORDING, AND EVALUATING

When preparing information for analysis, intelligence personnel—

- Identify Information of Immediate Tactical Value. Every piece of data, information, or intelligence received must be assessed to determine its tactical value and its effect on current operations. Particular attention must be paid to possible alarms, triggers, and high-payoff targets (HPTs), which are defined by, and tied to, the PIRs, commander's decision support tools, and targeting priorities. If the information is relevant to ongoing operations, immediate production is initiated. The information is rapidly evaluated, analyzed, and disseminated for use by the commander and staff as well as subordinate and other affected units.
- Eliminate Redundant and Irrelevant Data Early in Processing. Each item received must be scrutinized to determine its pertinence to the unit's intelligence requirements. The incoming flow of data, information, and intelligence must be filtered for redundancy and relevance to the mission, AOI, and timeliness. This ensures intelligence analysts receive information and data that is useful to the analytical process while not being overwhelmed with unnecessary information or repetitive reporting.
- Identify Relevance to Ongoing Production. An important aspect of preparing an item for analysis is determining its impact on the ongoing intelligence production effort. The received data or information is evaluated to identify how it contributes to ongoing production in order to determine who should get the information, how urgent the information is, and in what format the information should be provided.
- Practice Standing Operating Procedures. The employment of information handling standing operating procedures (SOPs) saves time and effort. Standard methods of filtering, collating, recording, and evaluating speed up the preparation of incoming items for analysis, provide consistency in the way information is handled, and enhance comprehension of personnel performing the procedures and of the analysts receiving the incoming items.
- Employ Reliable and Accessible Recording Tools. Effective analysis depends in part on the ability to access, recall, and manipulate the stream of all-source data, information, and intelligence flowing into the command. Recording methods should be simple and flexible without interfering with timely analysis, production, dissemination, and use of intelligence. Analysts must be able to access information when they need it to receive the information in a form that facilitates understanding, and to rapidly integrate the data with other information or intelligence. The widespread use of automated information systems enhances the speed and utility of intelligence recording tools. However, analysts must ensure the necessary reliability and accessibility are built into the automated information systems and that associated backup procedures are established.

SECTION I. FILTERING

Filtering is the discarding of irrelevant or repetitive information prior to its entering the P&A process. Because current and emerging collection, communications, and intelligence automated information systems provide access to a vast quantity of raw data, processed information, and finished intelligence, there is significant potential for information overload of intelligence

sections and personnel. An effective filtering system is essential for managing the flow of data, information, and intelligence into the unit's intelligence processing and production system.

Filtering Criteria

Before information is entered into the production process, each item's relevance to the unit's intelligence requirements is assessed and unrelated material is discarded. The unit intelligence officer establishes basic criteria for filtering. Critical criteria drive the establishment of PIRs and IRs. The filtering criteria must be reviewed on a regular basis and updated to reflect changes in intelligence requirements, the AOI, and timeliness of information needed. Intelligence analysts use the following criteria when making assessments.

Subject Matter

The content of the data or report must be related to the unit's PIRs/IRs. Information that has no bearing on the PIRs/IRs is discarded, unless the information may impact future requirements.

Location

The event detailed in the data or report must have occurred within the unit's AO or AOI.

Time of Occurrence

The report should have continuing significance. For example, reports of future air or missile strikes may be received after the strike has begun; such reports are discarded unless they contain details of analytical importance.

Redundancy

Multiple reports relating to the same data or event are often received. Reports that repeat the initial information without adding significant data or analysis should be discarded, unless the reports provide critical confirmatory information.

Methodology

Filtering should occur as early as possible in the information processing system. Despite the fielding of automated intelligence systems, such as the Marine Corps IAS and the technical control and analysis center (TCAC), filtering is largely a manual process. A human must review voice reports, translated documents, images, and finished intelligence documents from higher echelons.

Manual Filtering

Most intelligence sections establish a central point for the receipt and distribution of incoming intelligence, counterintelligence, and reconnaissance reports. Normally, the intelligence watch within the combat operations center or the surveillance and reconnaissance cell is the receiving and distribution point. The watch examines each piece of data, information, and intelligence received; compares the content to the filtering criteria; and decides whether to discard the report. Filtering personnel must be able to rapidly identify new intelligence information of immediate tactical value and to quickly initiate the necessary actions.

Automated Filtering

For machine-readable formatted messages, automated intelligence systems are significant filtering tools. Systems such as the IAS can automatically filter incoming messages according to specified parameters such as location, time, and type of report. Use of IAS speeds the filtering process by correlating incoming information to existing units' tracks within the data base. However, the unit name or identification and location data fields in the formatted message must be filled out for this automatic function to occur, or the system will hold the message for

manual correlation. Automated systems are a tool to assist the analyst, not replace them. The system operator must continually review the filtering parameters and assess the effectiveness of the information filtering system. As with manual filtering, IAS operators must be familiar with the unit's intelligence requirements, have situational awareness, and exercise sound judgment.

SECTION II. RECORDING

Recording is the reduction of information to written or other graphical representation and the arranging of this information into groups of related items. This step is performed so items of information can be observed as an integrated picture and studied in relation to each other. Recording information makes evaluation and analysis easier and helps prepare intelligence products by drawing together available information on a specific subject. It also provides a record of events for post-operation study of the enemy and AO.

Methodology

Recording performed by intelligence sections at all levels normally involves—

- Registering all incoming information.
- Logging, map or chart marking, filing and indexing, or entering information in the data base of an automated system.
- Maintaining a system designed for rapid and efficient operations.

At lower command echelons, especially during mobile operations, recording may be no more than the maintenance of a log and marked map. At higher command echelons, recording relies heavily on automated information systems, electronic data bases, and visual display units. Both methods should make full use of graphic recording tools (i.e., maps, overlays, graphs, and charts) that make it possible to visualize and absorb the maximum amount of information in the shortest possible time. The indexing and categorizing of subject matter in a recording system must be related to the projected area, scope, and nature of the operations and must be based on the—

- Commander's PIRs.
- Other IRs.
- Anticipated information flow.

The recording means must be able to handle the volume of information and intelligence received and to serve the needs of individuals requiring access to that information. In addition, recording means and techniques must permit timely dissemination of information and intelligence.

In the past, most recording was manually generated either on a map, journal, or status board. Today, the most common recording devices are automated data processing and information systems such as IAS. Office automation software allows the rapid creation of charts and graphs, the annotation and manipulation of images, and the rapid assembly of words and text. Intelligence journals, files, records, and data bases can be updated automatically, and the data can be recalled and displayed in an overlay form.

Recording Tools

Whether operating in a manual or automated environment, the most common types of recording tools used by the intelligence analyst are the intelligence journal, enemy situation map, intelligence workbook, order of battle or analyst files, and target files.

Intelligence Journal

The intelligence journal is an official, permanent, and chronological record of reports and messages that have been received and transmitted, of important events that have occurred, and of response actions taken (see fig. 3-1). Messages are place in the journal file in the numerical order of the journal entry number. The journal, besides providing a brief chronological account of events, serves as an index to the journal file. The journal covers a stated period, normally 24 hours. Each item entered in the journal normally contains—

- An entry number, which is assigned to an incoming message and is recorded on the message.
- The time the information was sent, received, or noted.
- The message date-time group.

Enemy Situation Map

The enemy situation map is a temporary graphic display of current enemy dispositions, major enemy activities, and other pertinent intelligence and information. By presenting that information in relation to each other, the enemy situation map also helps with interpretation, analysis, and decisionmaking. In addition, it helps dissemination by permitting the ready transfer of intelligence concerning enemy forces capable of interfering with the mission of the unit concerned. A primary analytical tool, the enemy situation map is often the only recording device used during fast-moving combat operations, particularly at lower command echelons.

Methodology

The enemy situation map should cover enough area to facilitate the conduct of current operations and the planning of future operations. A large MAGTF, such as a MEF, normally requires the following three enemy situation maps:

- Large-scale tactical map (approximately 1:50,000) for current ground operations.
- Medium-scale operational map (approximately 1:250,000) covering the AO and portions of the AOI to record deep enemy installations (e.g., airfields, missile sites) and enemy forces that can affect friendly operations.
- Small-scale strategic map (approximately 1:1,000,000 or smaller) to cover the MAGTF AOI and beyond.

At lower echelons, one map may suffice. The scale depends on the mission and threat. The map scale(s) used should be decided between the G-2/S-2 and the G-3/S-3 when the battlespace is defined (step one of the IPB process). Often, a combined G-2/G-3 map is used to conserve space in the combat operations center or other C2 cells. If separate intelligence and operations maps are maintained, overlays must be readily interchangeable between maps. Information displayed on the situation map must be tailored to the—

- Mission.
- Nature of the threat or enemy.
- Terrain.
- Command echelon being supported.
- Unit's PIRs/IRs.
- Force protection.
- Targeting priorities.

Generally, enemy maneuver units posted on the situation map are two echelons below that of the friendly unit. Enemy units, regardless of size, in friendly rear areas are always posted because of the amount of damage they can inflict on C2 and sustainment. The situation map reflects—

- Enemy unit identification, disposition, and boundaries.
- Significant terrain and infrastructure features.
- Locations of manmade and natural obstacles.

When plotting enemy activities and dispositions, intelligence personnel—

- Indicate the latest time when the activity was observed or the disposition was confirmed.
- Post information using standard military symbols and abbreviations. See Field Manual (FM) 101-5-1/Marine Corps Reference Publication (MCRP) 5-2A, *Operational Terms and Graphics*, for standard symbology.
- Explain any deviations from these symbols in the marginal data on the map or overlay.
- Mark maps and overlays clearly with the appropriate classification.

Information is posted on the situation map as it is received. Information is removed promptly when

no longer current, because omissions or outdated information may result in erroneous evaluations, interpretation, and decisions. On a hard copy situation map, separate flaps of acetate can be used to record different types of information, which reduces overcrowding. Also, to reduce overcrowding, a number or letter system can be used to record significant events or activity. The letter or number is marked at the appropriate location on the map where the activity occurred. On a board or marginal area alongside the map, the same letter or number is recorded with a notation of the activity observed. A numbering system that is easily cross-indexed to the journal or message file should be used.

Automation

Automated functions of the IAS and other intelligence information systems greatly assist the maintenance of an enemy situation map. The IAS enables the operator to—

- Zoom in and out through various maps to quickly change scale views of the battlefield, thereby enhancing the number, size, and types of enemy units displayed.
- Call up information, including last report and location, by clicking on the unit of interest.
- Forward electronic overlays to other IAS users or to systems such as tactical combat operations for display.
- Use large-screen displays to deliver information briefings.
- Share a common picture of the battlespace in near-real time with users at separate locations by using robust communications connectivity. Consideration must be given to developing manual and electronic backups in the event of catastrophic failure of the system.

Intelligence Workbook

Incoming information is recorded by subject in the intelligence workbook for ready reference and comparison. The workbook helps in determining the meaning and significance of related items of information, which facilitates further processing, production, and dissemination (i.e., preparation of intelligence summaries and reports). The workbook can be set up in any format; however, the most common format organizes the book according to topics in the intelligence summary.

As information is received, it is recorded in one or more parts of the workbook based on its content. For example, a report concerning a newly identified enemy armor unit could be recorded under the new units section as well as in the armor section. Each entry should include—

- Journal entry number for the source report.
- Time of the event or observation.
- Location.
- Brief extract of the information applicable to the workbook section.

Maintaining the workbook is a time-intensive, manpower effort, but a properly maintained workbook is a powerful analysis tool. The IAS operator has the ability to simultaneously break down portions of incoming messages into numerous sections of an electronic data base or workbook. Employed properly, this capability can significantly streamline the maintenance of an intelligence workbook.

Order of Battle Files

OOB files include information and intelligence on the identification, strength, command structure, and disposition of personnel, units, and equipment of a military force. Combined with information on the threat, terrain, and weather, OOB information is a key element in the creation of finished intelligence products (e.g., IPB, estimates, BDA).

OOB files maintained on threat, allied, and neutral or third party forces can be subdivided into—

- Ground OOB.
- Air OOB.
- Naval OOB.
- Electronic OOB.
- Weapons of mass destruction.
- Other categories tailored to the unit's needs.

The OOB subdivisions and level of detail maintained in each subdivision depends on the—

- Command level where the analysis takes place.
- Type of threat forces that can influence friendly operations.
- Mission assigned.
- Area of responsibility.

A MEF conducting an amphibious operation needs to maintain information on all types of forces, while a battalion or squadron operating as part of sustained operations ashore focuses on the ground or air OOB that most affect them. The battalion or squadron relies on higher, adjacent, supporting, or Service commands in the theater to provide other OOB (e.g., weapons of mass destruction, electronic OOB, naval OOB). Specific factors are evaluated for each type of OOB (see chapter 7 for a detailed discussion of these factors).

Lower command echelons' OOB analysis is generally more focused, less detailed, immediate in nature, and performed by the unit's intelligence personnel as part of their general duties. At higher levels, particularly at a MEF or MAGTF CE, one or more analysts are assigned to each type of OOB. At these levels, OOB information normally becomes voluminous in a short period of time. In organizing this information, OOB analysts must maintain extensive and systematic compilations and filing systems. Specific items of information and intelligence must be located on short notice and incorporated into comprehensive reports or analyses. Regardless of the level of command, analysts at the tactical intelligence level use several OOB tools.

Unit Workbook

The format for the unit workbook depends on the structure of the enemy force being monitored. It consists of a collection of unit worksheets arranged by type of unit or in numerical sequence. Analysts with OOB baseline documents at their disposal use them as unit workbooks by inserting additional pages as new information is received. Normally, the parent unit listed on the unit worksheet is equivalent in size to the level of command performing the analysis. Records are maintained on units one level above and two levels below the enemy unit being monitored; however, this can be modified based on the situation. The date and the source of information are recorded for each entry (see fig. 3-2 on page 3-8). Unit OOB details noted in the remarks column include—

- Reports of branch insignia.
- Number and types of weapons.
- Local residents' statements in abbreviated form.

OOB Situation Overlay

This is a graphic portrayal of current confirmed or unconfirmed enemy OOB. It shows identification and disposition of enemy units and other information that will assist in developing the enemy OOB. Enemy units, down to and including two echelons below the analyst's own level of command, are plotted using the standard symbols included in FM 101-5/MCRP 5-2A.

Peculiarities of enemy organizations, the tactical situation, and time and personnel available determine what to plot or omit on OOB maps. The information time and date are entered below each plotted symbol.

Parent Unit _____						
Subordinate Units	City	Coordinates	Installation	Personalities	Identification or Code No.	Remarks
Division Headquarters	Stein	PV818147	1 and 3	Commander Col Crechin		EPW no. 26, captured 2 Feb 68
96th Mechanized Rifle Regiment	Delltach	PU820934	4	Commander Col Kurshave	16181	Document captured 19 Mar 68
145th Mechanized Rifle Regiment	Ellenburg	PU852961	2	LtCol Shrenko	16182	Deserter 21 Mar 88
3d Battalion	Gladbach	PV891024	1			Gladbach residents report battalion subordinate to headquarters in Ellenburg, 3 Feb 88
43d Medical Tank Regiment	Linburg	PV863106	3	Commander Col Reshvic		Agent report 26 May 68
358th Transportation Battalion	Lehrt	PV825158	1		16195	OOB Bank

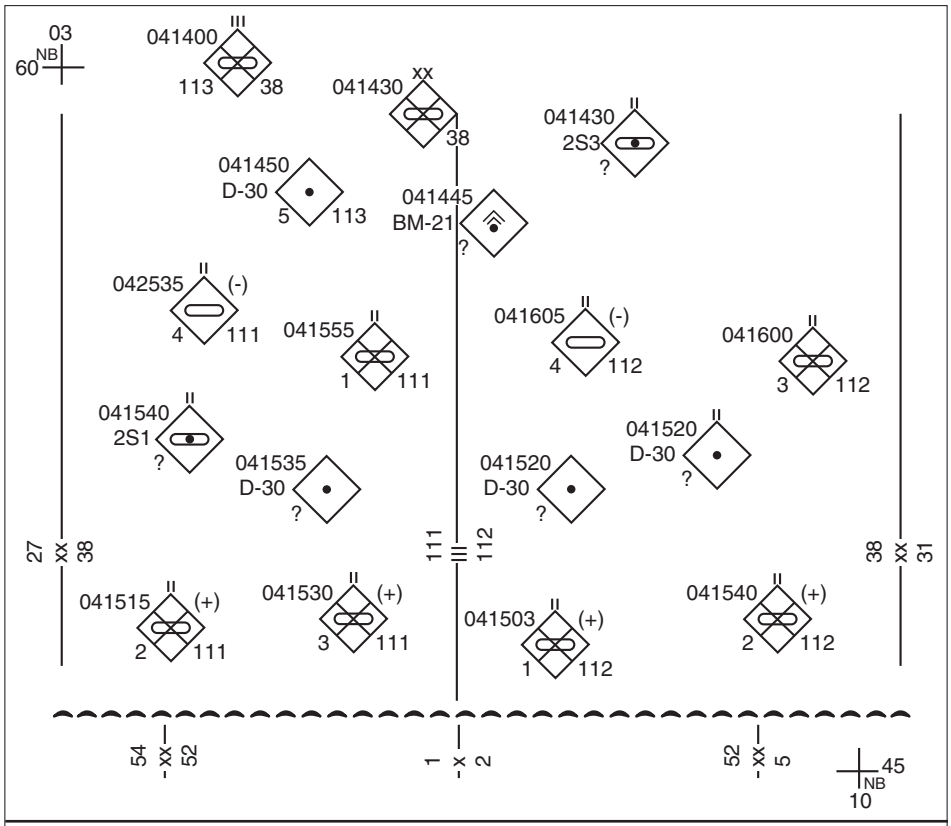
Figure 3-2. Example of a Unit Workbook Page.

An OOB situation map caption box contains annotated information that helps explain the OOB situation. Normally, the three types of caption boxes are: strength, unlocated units, and legend. At lower tactical echelons, the OOB situation overlay and the enemy situation map are combined for simplicity. At higher echelons, applicable analysts maintain separate types of OOB on overlays near their work area. A composite OOB overlay is used for the enemy situation map and for briefings (see fig. 3-3). The IAS allows the rapid generation of tailored electronic overlays based on available data base information.

OOB Record

As referenced in Standardization Agreement (North Atlantic Treaty Organization [NATO]) (STANAG) 2077, *Orders of Battle*, OOB record files are used to maintain accurate and complete data on all units. Normally, one record is maintained on each threat unit in a position to affect current or future operations (see fig. 3-4 on page 3-10). The OOB record contains the following information:

- Service (branch of armed forces to which the unit belongs, including paramilitary and insurgent).
- Formation or unit name (official title).
- Alternative name (unofficial name).
- Role (principal function of the unit, e.g., command, combat, combat service support [CSS]).
- Superior formation (immediate senior formation or unit).
- Headquarters location name (nearest identifiable town or village).
- Headquarters location coordinates (universal transverse mercator [UTM] and latitude and longitude).



Located Units (by type)			Unlocated Units
Committed Forces			
Unit	No.	Weapon	Recon Bn, 38th GMR Div 114th Tk Regt, 38th GMR Div UI Ind Tk Bn, 38th GMR Div SSM Bn, 38th GMR Div

Mech=mechanized
mm=millimeter
MRL=multiple rocket launcher
Recon=reconnassiance
Regt=regiment
SP=self-propelled
SS=surface-to-surface
SSM=surface-to-surface missile
Tk=tank
UI=unidentified

Figure 3-3. Example of OOB Overlay.

PARENT FORMATION									
Service		Formation or Unit Name		Alternative Name		Role		Superior Formation	
HQ Location Name		HQ Location Coordinates		Combat Effectiveness		Allegiance		Commander's Last Name	
SUBORDINATE FORMATIONS/UNITS									
Serial Number	Subordinate Unit or Formation Name	Location Coordinates	Role	Signature Equipment	Equipment Quantity	Commander's Last Name	Personnel Strength	Combat Effectiveness	Record Date/Update
Record Evaluation and Source					Remarks				

SAMPLE

Figure 3-4. Sample OOB Record.

- Combat effectiveness assessment (ability to perform intended mission or function expressed in a percentage).
- Allegiance (entity or country to which unit owes its loyalty).
- Commander's last name.
- Subordinate formations' and units'—
  - Serial number.
  - Subordinate unit name.
  - Location coordinates (UTM and latitude and longitude).
  - Role.
  - Signature equipment (equipment that might identify the unit).
  - Equipment quantity (number of signature equipment in the unit).
  - Commander's last name.
  - Personnel strength (assessed strength).
  - Combat effectiveness.
  - Record date and update (date of information or last time record was updated whichever is later).
  - Record evaluation and source (listing of source and reliability as well as validity of the information).
  - Remarks (e.g., unit history, insignia).

Personality File

Personality data on designated categories of individuals are recorded. Information on key figures is valuable in establishing an opponent's intent.

Military Installation File

This file contains collected information on each installation, to include the—

- Number and types of buildings and their capacities.
- Personnel uniforms and insignia.
- Major items of equipment.
- Maps, town plans, or sketches that show the location of each installation within the city.

Organizational Chart

This chart depicts the organization of units, from the highest headquarters to the lowest unit. It includes personnel and major weapon strengths. Principal weapon and equipment charts may be prepared to supplement organizational charts.

Strength Worksheet

Used to maintain a running numerical tabulation of the enemy's personnel and equipment strengths, the worksheet contains information recorded on committed units, fire support units, and reinforcements. The strength worksheet may be combined with OOB cards or other unit files. See chapter 8 for a detailed discussion of combat strength assessment.

Target Files

Target files are either standard (full page) or card type files.

Target Intelligence Files

Target intelligence files are developed selectively and aggressively to include the targets which, when attacked, will have an effect on the enemy. These files contain the following information:

- Location (geographic and UTM coordinates, accurate within 10 meters).
- Altitude (target location expressed in meters or feet above sea level).
- Description (type, shape, attitude, dispersion, and composition).
- Vulnerability (assessed vulnerability of target to ordnance delivery, including construction, degree of protection, and dependence of the target on component parts).
- Recovery time (accurate assessment of the time required for the enemy to replace or return the target to active or usable status).
- Accessibility (location of a target with respect to other terrain or cultural features that may limit the direction or angle of attack).
- Importance (estimate of how the enemy would be affected by damage to that target).

Target Card Files

These files are comprised of sets of cards; each card contains a target serial number and information concerning a specific target. Target card files are prepared and maintained on current targets and serve as a basis for the preparation of the target list and target bulletins. Cards are also prepared and maintained on potential targets so that a threat unit changing status can quickly be added to the target list. Complete target card files are maintained by commands that will exercise control of the target list during some phase of the operation.

Tools Automation

The IAS provides an automated means to employ the intelligence recording tools. When attached to appropriate communications, the IAS can automatically filter, parse, collate, update, and display threat-related data received from the national and theater level's modernized integrated data base. That data can be manipulated to provide the functionality of an intelligence journal, enemy situation map, workbook, OOB overlays, OOB files, and target files. Desktop application software can be used to generate spread sheets for strength tabulations and other files.

SECTION III. EVALUATION

During evaluation, the intelligence section determines the relevance**,** the source reliability, and the accuracy of recorded information. Evaluating information in this manner also determines whether immediate or deliberate production and dissemination should be performed.

Relevance

Upon receipt, each item of information is examined for its relevance by area, time, and content. Information relevant to the AO or AOI is processed further. Urgent information is rapidly evaluated and disseminated to those who need it. Information that is not of an urgent nature is usually fully evaluated, interpreted, and disseminated later.

Reliability

The information source and the information collection agency are evaluated for reliability. The principal basis for judging the reliability of a source or agency outside the MAGTF is previous experience with the source. Normally, analysts expect a highly reliable source to provide accurate information. Analysts must consider that even highly reliable human sources have limitations and a reliable electronic source may be subject to enemy interference and deception measures. Information reported from reliable sources should be compared with other facts before being classified as fact.

The headquarters closest to the source or agency is ordinarily the best judge of its reliability. Normally, a higher headquarters accepts the reliability evaluation of the reporting headquarters. Criteria for evaluating MAGTF unit reliability include knowledge of the unit's—

- Training.
- Experience.
- Past performance.

Accuracy

Accuracy involves the probable truth of the information. The most reliable method of judging accuracy is comparison with other information obtained through other collection sources and agencies.

A marked difference in the information accuracy evaluation may occur between higher and lower echelons. Higher echelons have access to more sources of information and intelligence than lower echelons, thus they provide more opportunity to confirm, corroborate, or refute the accuracy of reported data.

Regardless of the source, the accuracy of each report or piece of information is reevaluated at each echelon. Processed, evaluated, and interpreted information received from higher headquarters may be old, or new information that was not available at the time of the higher headquarters assessment may alter the information's accuracy.

Evaluation Rating System

A technique for evaluating the reliability and accuracy of information is determined by using a standard system described in STANAG 2022, *Intelligence Reports*. This system uses code letters to indicate reliability of the source and code numerals to indicate accuracy of the information.

Evaluation ratings are most valuable when information is disseminated to higher, adjacent, or lower units. Each item of information in a report should contain an evaluation to aid the recipient in understanding its significance.

Reliability Evaluation Codes

Agencies are ordinarily rated **A, B,** or **C**; however, when the source and the collecting or reporting agency are evaluated differently, the lowest degree of reliability is indicated. Reliability of the source is rated as—

- **A**—Completely reliable (indicates the source has experience and extensive background with the type of information reported).
- **B**—Usually reliable (indicates a source of known integrity).
- **C**—Fairly reliable.
- **D**—Not usually reliable.
- **E**—Unreliable.
- **F**—Reliability cannot be judged (indicates there is no basis for estimating the reliability of the source).

Accuracy Evaluation Codes

Accurate ratings are preferred, but when the truth cannot be judged, the rating of **6** is always favored over the inaccurate of ratings **1** to **5.** The accuracy of information is rated as—

- **1**—Confirmed by other sources (indicates that the information confirms currently held information and originates from a different source).
- **2**—Probably true (indicates that the information confirms all or essential parts of currently held information and does not come from the same source, but cannot be confirmed by other sources).
- **3**—Possibly true (indicates that the reported facts, on which no further information is yet available, are compatible with the previously observed target behavior; or that the known background of a person confirms that person's reported actions).
- **4**—Doubtfully true (indicates unconfirmed information that contradicts estimates or the known behavior of the target).
- **5**—Improbable (indicates information that is not confirmed by available data and that contradicts the experience previously assumed reliable).
- **6**—Truth cannot be judged (indicates there is no basis for ratings 1 to 5 because of the complete absence of other information on the same subject).

Although both letters and numerals are used to indicate the evaluation of an item of information, they are independent of each other. A completely reliable agency may report information obtained from a completely reliable source which, on the basis of other information, is judged to be improbable and rated as **A-5**. A source known to be unreliable may provide raw information that is confirmed by reliable sources, accepted as credible information, and rated as **E-1**. A report evaluated **F-6** may be accurate and should not be arbitrarily discarded.

CHAPTER 4. ANALYTICAL THINKING

Through analysis, information is transformed into knowledge. Understanding is achieved by applying judgment to knowledge, and the future is anticipated by understanding the present. Intelligence analysts enhance the understanding of the commander and staff to reduce uncertainty, limit risk, and support planning and decisionmaking. To enhance understanding for the commander, intelligence analysts must understand how decisionmaking occurs, the forms of reasoning, and the pitfalls often associated with analysis. At a minimum, the analyst must—

- Know the commander's mission, intent, and guidance.
- Understand the battlespace framework, which includes the AO, AOI, battlefield organization, and tangible and intangible factors (e.g., culture, politics, economics, religious, ethnic).
- Understand information management.
- Understand friendly and threat doctrine and tactics.
- Develop PIRs and IRs with the commander, other staff sections, and subordinate units' intelligence officers, who are geared to answer or provide additional information on a threat's capabilities, vulnerabilities, intentions, and COAs.
- Understand how to use analytical tools (i.e., IPB, automated intelligence systems, data bases, indications and warning, situation development, targeting, and OOB factors).
- Relate information to the six intelligence functions and METT-T.

SECTION I. ANALYTICAL PROCESS

Intelligence personnel analyze, synthesize, and estimate data gathered on a specific area or subject to support the commander's decisionmaking process.

Analysis

Analysis is a process used by commanders and analysts to establish IRs, to study information and available intelligence, and to determine a threat's capabilities, vulnerabilities, intentions, and COAs against friendly operations and systems. During analysis, a commander's AO and AOI are dissected for pertinent information and intelligence. In its simplest terms, analysis breaks down a geographic region or subject into bits and pieces of information and evaluates that information for its significance. Analysis considers the battlespace and its parts in terms of depth, width, height, time, surface, subsurface, and both friendly and threat commanders' IRs and decision cycles.

The commander starts the analysis process by defining the battlespace and submitting IRs; analysts can then—

- Focus on the AO and critical aspects of the AOI.
- Prioritize all IRs.
- Query intelligence data bases.
- Determine gaps.
- Leverage collection and production assets to estimate the threat's capabilities, vulnerabilities, and intentions.

Synthesis

Synthesis is the piecing of information into a coherent, meaningful picture. It is based on the ongoing or previous analysis of separate information and events taking place within a given area. More than simply pulling together information, synthesis determines the relationships that exist among that information. It allows commanders and analysts to see the battlespace as a whole and to rapidly discern emerging patterns and indicators. Threat capabilities, vulnerabilities, and intentions are estimated based on the synthesized picture.

Estimation

Estimation is the most challenging element and the last step in the analytical process. It involves a high degree of risk because it addresses future outcomes and probabilities. Intelligence analysts must stretch their intellectual resources to the limit to provide the best estimate possible given the information at hand and the needs of the commander. Employing experience, judgment, intelligence tools, and methodologies, the intelligence analyst must base estimates on solid analysis of identified activity patterns to determine the threat's intentions and probable COAs as well as the effects of those actions on friendly forces. The following example illustrates the analysis, synthesis, and estimation process.

Example: Analysis, Synthesis, and Estimation Process.

Information from aerial reconnaissance indicates the movement of approximately 31 moving target indicators (MTIs). The MTI locations and times are annotated on a mission report. Based on this report, the analyst conducts mental functions (analysis), attempts to fuse this information into what is happening in the battlespace (synthesis), and predicts intentions (estimation). To arrive at a conclusion, the analyst—

- Plots MTI locations on a situation map and annotates the date-time group. Looks for any relationships to previously reported units in the area and—
  - If a relationship is not found, determines what must be done to answer the who, what, where, and why questions.
  - If a relationship is found, determines the type of unit (e.g., tanks, armored personnel carriers), the direction of movement, and the unit's speed as MTIs pass through named AOIs.
- Looks at the big picture to synthesize the information and to answer the following questions:
  - Does the movement indicate where the MTIs will be committed?
  - Is this part of the threat's main effort?
- Prepares to state the threat's intentions through the combination of analysis and synthesis.
  - Provides an estimate, which specifies the type of equipment, the unit designator, the speed of march, and the probable time of attack.

SECTION II. ANALYTIC PROBLEM SOLVING

Intelligence analysis involves the application of reason and logic to solve problems related to the effects of weather, terrain, and threat on current and future friendly operations. During fast-paced, tactical-level operations, the entire analyze-synthesize-estimate process may occur mentally within a matter of seconds. At higher levels, the process may be more involved, with more time available to rigorously apply the analytical techniques. This section discusses

the problem solving analytical theories, terms, and processes most commonly used by military intelligence analysts.

Analytical Theories

Most analytical theories begin with a proposition or premise, which is a statement that may or may not be true.

Proposition or Premise

A proposition or premise is a combination of evidence and assumptions, which, when combined, lay the foundation for an argument, hypothesis, or conclusion. Propositions can be detailed or abstract, observable or inferable, with varying degrees of certainty and fuzziness.

Detailed

In military intelligence, the term for a detailed proposition is a specific information requirement. An example of a detailed proposition is: "An enemy company is defending at named area of interest (NAI) 13." When creating this mental proposition, the analyst is at the "I wonder if stage" of analysis. Because the statement is not known to be true or false, the analyst rephrases the proposition as a question. For example: "Is there an enemy company defending at NAI 13?" The detailed proposition requires verification from a collection asset.

Abstract

The doctrinal term for an abstract proposition is an IR, but commanders designate critical abstract propositions as PIRs. An abstract proposition might be: "Is the enemy's main effort going to be along the landing beaches south of Church Hill?" This proposition is abstract because no one single observation will confirm or deny it. The abstract proposition requires analysis and deduction based on multiple collection asset reports of detailed propositions. These reports would allow the analyst to discern or infer the enemy's main effort.

Observable

A single collection asset can verify a detailed proposition through observation and documentation in a single report.

Inferable

Abstract propositions can only be inferred by the analysis of a set of detailed propositions from multiple reports. The intelligence staff normally generates specific information requirements to subdivide an IR or PIR into more detailed propositions that can be addressed through integrated intelligence operation (i.e., collection, production, and dissemination) planning. The relationship between two propositions allows an intelligence analyst to make inferences and analyze intelligence information or to arrive at analytical conclusions. This relationship is expressed as: "Proposition X causes proposition Y." The same relationship can also be expressed as: "From the observance of proposition Y, we can infer proposition X." The following example illustrates the relationship between two propositions.

Example: Relationship between Two Propositions.

The existence of a regimental artillery group at NAI 14 will cause the existence of certain air defense assets in and around NAI 14. This proposition is restated as: "From the observance of certain air defense assets in and around NAI 14, we can infer the existence of a regimental artillery group at NAI 14."

The probability of each relationship must be taken into account. For example, the types of air defense assets normally associated with the regimental artillery group may also protect a logistic support area or command post. It is more accurate to state: "From the observance of a certain type of air defense near NAI 14, we can infer there is a 50 percent probability of a regimental artillery group in the NAI 14, a 40 percent probability NAI 14 contains a logistic support area, and a 10 percent probability it contains a command post."

Certainty and Fuzziness

Propositions have varying degrees of both certainty and fuzziness. Certainty is the degree of belief in something. An example of certainty is: "I personally saw an enemy company at NAI 13, and we have six corroborating reports." A less certain proposition would be: "HUMINT has a semireliable source that claims there is a company at NAI 13, and we have no other reports on the subject."

Fuzziness is the measure of how well the known information matches the desired information. An example of a certain proposition is: "Our patrol reports the exact number of enemy soldiers and equipment for an enemy company." A fuzzy proposition would be: "Our patrol reports about half the number of personnel and equipment of an enemy company, so this could be an augmented platoon, two understrength platoons, an extremely weak company or an under-reported enemy company."

A Priori

Probabilities, in the absence of other information, are called *a priori*. In practice, the *a priori* is rarely assessed in isolation of other information; however, more information is possessed than the contents of a single report. This leads to the use of a conditional probability. An example of this situation states *a priori* of the enemy commander choosing to concentrate his/her main effort along avenue of approach number 1 (AA-1) may be 66 percent. However, the conditional probability of the main effort along AA-1 might be 25 percent given that an unusually large number of combat vehicles on AA-2 were observed.

Applied Logic

Typically, intelligence deals with obscure data, few facts, and severe time constraints, which can limit the analyst's ability to apply formal logic in intelligence analysis. Nevertheless, there are areas of applied logic that are most relevant to intelligence analysis.

In its most basic form, analysis involves drawing reliable conclusions based on facts, opinions, and inferences. As information is received, it is categorized as either fact or opinion. From these facts and opinions, analysts attempt to piece together a picture of the battlefield and the commander's battlespace and to make certain inferences or conclusions. When presenting the resulting conclusions, it is important to distinguish between what is fact and what is opinion.

Facts

A fact is a statement that has been demonstrated to be true. As an example, it is a fact that you are reading this statement. Given a preference, an analyst will always choose to work with facts. Unfortunately, facts are not always available. In the absence of facts, opinions may be used. Combining available facts and expert judgment, analysts attempt to piece together a picture of the battlefield and the commander's battlespace. When presenting the resulting conclusions, it is important to distinguish between what is fact and what is opinion.

Opinions

When facts are unavailable, an analyst might use opinions. An opinion is what someone believes to be true, but it may or may not be true. Sometimes opinions are uttered as statements of fact and often they reflect value judgments. A value judgment is an expression of personal taste, reference, worthiness, merit, quality, excellence, or bias. For example: "Electronic intelligence is a far more reliable source of intelligence than HUMINT." In this case, the speaker's perception is an opinion or generalization. Analysts must use extra caution when basing conclusions on opinions.

Inferences

Inferences are conclusions drawn from facts, opinions, or other inferences. Noting that one area of foliage appeared discolored in contrast

to surrounding foliage, an image interpreter concluded that the area being looked at contained a camouflaged position. Based on expert knowledge of imagery, the analyst inferred the presence of a camouflage position from the fact of discolored foliage. Such inferences may serve as input for subsequent problems; in this case, determining what is camouflaged at that particular location. Inferences are particularly important in determining a threat commander's intent. Unless the threat commander announces it, intent can only be established by inference. Such inferences are based on facts developed through the continual study of an adversary's doctrine, tactics, and capabilities. Whenever possible, inferences should be drawn from facts, or a mixture of facts and opinion. Conclusions drawn from opinions alone are prone to be wrong and should not carry the same weight as those drawn from facts.

Reasoning

Reasoning is the mental process that is brought to bear on facts, opinions, and inferences. Analysts solve problems through deductive and inductive reasoning.

Deductive

The process of reasoning from general cases to specific cases is deductive reasoning. It is the drawing of conclusions from one or more propositions or premises. For example, the statement, "Air strikes and naval bombardment always precede an amphibious landing," is a proposition based on an assumption. Propositions may or may not be true; in the case of the statement above, not all amphibious landings are preceded by preparatory fires. For deduction to be used effectively, intelligence analysts must make certain their propositions are true and their reasoning is correct or valid.

Example 1: Deductive Reasoning.

A Naval intelligence analyst is given a report about an unidentified submarine transiting the polar ice cap. The analyst deduces that—

- The ability to transit under the ice cap requires long submerged endurance.
- The only submarines with adequate endurance are nuclear-powered.
- The unidentified submarine is nuclear-powered.

In this case, the analyst reasoned from a general type (submarines) to a specific type (nuclear-powered).

In the example, the propositions are stated as facts. However, depending on the time of year, the polar ice cap can be transited on the surface. Furthermore, the second proposition, although stated as a fact, assumes that the threat has not developed high-endurance power sources other than nuclear energy. As a result, the conclusion, although valid, is unreliable. In order to be reliable, a conclusion must be drawn from valid and true propositions. If a deductive argument is valid, and if the propositions of that argument are true, then the conclusion of that argument must also be true.

Example 2: Deductive Reasoning.

During a field training exercise, reconnaissance elements are able to photograph opposing force tanks in defilade. The photograph shows a main gun tube with a 125mm bore and three track-return rollers. Four types of threat tanks are equipped with the 125mm gun (T-64, T-72, T-80, and T-90), but only two have three track-return rollers (T-72 and T-90). Since the T-90 was not replicated in this exercise, analysts conclude that friendly forces will be engaging T-72 tanks. In this case, the reasoning went from the general (125mm gun and three track-return rollers) to the specific (T-72, which was the only tank with both characteristics replicated in the exercise). The argument is valid and the propositions forming the argument are true, so the conclusion of the argument must also be true.

Inductive

The process of arriving at conclusions based on evaluating facts or inferences is inductive reasoning.

Example 1: Inductive Reasoning.

The following reports reach an intelligence agency regarding the actions of two adversarial countries—

- Country X is massing armor and artillery along the border of Country Y.
- Country X has also blockaded sea-lanes used by both countries.
- Finally, Country X has imposed wartime restrictions on its civilian population.

From these reports, the analyst uses inductive reasoning by inferring that hostilities between the two countries are imminent.

Induction goes beyond the facts or observations to a statement that has not been or cannot be verified. Since only verified data can be called reliable, conclusions drawn inductively are somewhat unreliable.

Example 2: Inductive Reasoning.

An intelligence analyst is given the following information about a coalition armored vehicle:

- Fact 1—Five road wheels and four return rollers.
- Fact 2—Armament that includes a single 73mm gun, one coaxial- and two hull-mounted 7.62mm machineguns, and a single SAGGER antitank missile mounted on the barrel of the 73mm gun.
- Fact 3—Crew of four with three passengers.
- Inference 1—A maximum speed estimated to be 80 kilometers per hour.

From these characteristics, the analyst inferred that the reported vehicle was a Russian-made BMD. Since a number of separate facts or inferences were used in the reasoning process, the analyst arrived at a conclusion through inductive reasoning.

The strength of an inductive argument depends on how probable the conclusion would be true if the premises or propositions were true. Inductive arguments are characterized as being strong or weak vice valid and invalid. Arguments are made strong by—

- The number of instances cited in the propositions.
- The number of propositions that confirm the conclusion.
- The closer in time the occurrences are to the conclusion.
- Dissimilarities in the evidence that still support the conclusion.

Very often propositions used in deduction are arrived at inductively and vice versa.

Example: Deduction and Induction.

Major proposition: The massing of troops along a border is a prelude to war.

Minor proposition: A country is known to have massed troops along the border.

Conclusion: This country is about to initiate war with its neighbor.

At first glance, the deductive argument shown above might seem acceptable. However, a closer look will show that the major proposition is not always true. In certain instances, troops could be massed for internal security, exercises, or a show of force. The major proposition, derived from inductive reasoning, by itself is an ambiguous signal. Assuming the propositions are true, and assuming the analyst reasoned validly, the conclusion the analyst reached is valid. An analyst may reason correctly, but from data that is incorrect, thus arriving at conclusions that are not true.

Tests of Truth

Both inductive and deductive reasoning involve three basic tests of truth that intelligence analysts employ to determine the truth of propositions.

Correspondence Test of Truth

The theory that truth is a statement that corresponds to reality is known as the correspondence test of truth. An analyst, who is studying an information report, notices that the presented information is the result of first-hand observation. Knowing the source to be professionally competent, the analyst assumes that every statement in the report corresponds to reality.

In the example, the statements or other evidence corresponded to reality. To test the degree of correspondence, observations are required. These observations must be tested by additional observations. The chief criterion in observations is objectivity, and using a mix of collection assets can attain greater objectivity.

Analysts naturally place more confidence in one source or system than another. In the case of the UAV report verses the pilot's report, the analyst had more confidence in the UAV's ability to observe the target from multiple aspects. The UAV-derived information had more credibility than the pilot's report, because the pilot may have only had a fleeting glimpse of the target while trying to egress. When a variety of sensors tend to corroborate each other, confidence in the conclusions increases.

The correspondence test of truth requires observations to test whether or not, and to what extent, statements correspond to reality. One problem with this theory is that the threat seldom permits direct observations and often goes to great lengths to prevent direct observations or to deceive those observations.

Example: Correspondence Test of Truth.

Pilots returning from an interdiction mission claim three tanks destroyed. The squadron chief interrogated each pilot separately and they gave substantially the same report.

Assuming the pilots' claims are accurate, then it would reflect reality. By reporting battle damage assessment of three tanks probably destroyed, the squadron chief is adhering to the correspondence test of truth.

Despite the fact that all pilots of one flight claimed three tanks destroyed, the MAGTF commander wants more supporting evidence. To provide confirmation, the MAGTF G-2 plans an UAV mission over the area where the tanks were reportedly hit. Both the commander and the G-2 are placing more credibility in visual evidence, because it is believed to be more objective and less prone to human error. This ignores the fact that video requires interpretation, and this interpretation involves a degree of subjectivity.

Humans must interpret all images. When humans interpret images, they use subjective judgment. One of the weaknesses of the correspondence test of truth is that observations are required to establish the truth. Invariably, these observations must be tested by other observations.

The UAV tape revealed three badly damaged tanks in defilade. The MAGTF battle damage assessment analyst considers the UAV report along with the pilot debriefs. Based on the combined information, the analyst reports three tanks confirmed damaged.

Coherence Test of Truth

This test of truth uses consistency with other ideas or facts to validate statements. Where direct access to the threat is denied, the coherence test of truth becomes necessary. The coherence theory refers to how consistent different pieces of information are in relation to each other. An analyst considering a new piece of information

that corroborates known information would place more credibility in the new information and the conclusions drawn from it.

In the realm of theory, intelligence usually works with some factual basis for most inferences or conclusions. The coherence test of truth supplements the correspondence test of truth.

Example: Coherence Test of Truth.

In the latter part of September, the commander in chief's intelligence staff considered the following information:

- The ACME coalition countries normally conclude a training cycle with a large-scale combined exercise (historical record).
- Visitors to Coyote Land reported being denied access to certain areas in the vicinity of Road Runner in the western Tunnel Province (confirmed report).
- Reports indicate certain infantry, armor, and engineer units from Tasmania, Elmer Land, and Chickenhawk have moved from their garrison locations (unconfirmed reports).
- All commercial air traffic to Road Runner will be restricted for a period of 2 weeks, starting 1 October (confirmed report).

The intelligence staff concluded that this year's ACME exercise will take place in or near Road Runner, Tunnel Province, during the period 1 to 14 October. Although no one piece of information pointed directly to this conclusion, all pieces of information seemed consistent with each other as well as to the conclusion.

Pragmatic Test of Truth

This test proposes that a given statement is true if it works in practice.

A practical tool, the pragmatic test of truth has some weaknesses. First, the results may only appear to justify the means used to achieve them. Second, a successful outcome may be attributed to other factors that could have produced the same outcome. In the Admiral Scott example, the use of radar-controlled guns may have produced the same result no matter what formation was used. Lastly, an unsuccessful outcome does not necessarily imply that the means used were unsound; again, other unknown factors may have contributed to the unsuccessful outcome.

Example: Pragmatic Test of Truth.

Prior to the Battle of Cape Esperance in World War II, Admiral Norman Scott organized a task force into a long, single column. Admiral Scott believed this line-ahead formation would be effective against the Japanese units' night tactics. In the ensuing battle, Scott sank two Japanese destroyers and severely damaged two cruisers. After the battle, Admiral Scott concluded the original line-ahead formation theory was indeed effective. By combining radar-controlled fire control systems with line-ahead formation, Admiral Scott believed any night battle could be mastered.

SECTION III. PITFALLS OF ANALYSIS

The application of logic and reasoning is a mental process that is subject to numerous influences. Intelligence analysts involved in discerning facts, inferences, and conclusions are prone to the influences that shape and mold their view of the world and their ability to reason. These influences are referred to as pitfalls of analysis. To minimize their impact, analysts must be able to recognize these pitfalls in their own analysis and the analysis performed by others. Logical

fallacies and biases are two general categories of analytical pitfalls.

Logical Fallacies

Logical fallacies are errors in the reasoning process caused by the failure to apply sound logic. Though usually committed accidentally, these fallacies are sometimes used deliberately to persuade, convince, or deceive. Omission and assumption are two categories of logical fallacies.

Omission

Fallacies of omission leave out something important. The argument may omit a consideration of many cases; it may omit a consideration of a hypothesis that would account for the same conclusion; or it may omit something unfavorable to the argument. Fallacies of omission can occur in many forms.

Oversimplification

Oversimplification is a generality that fails to adequately account for all the complex conditions bearing on a problem.

Example 1: Oversimplification.

"Air power and the M1A1 tank won the Gulf War." This statement ignores the fact that the attack aircraft and the M1A1 tank were only two of many weapons systems and other capabilities used to provide critical support and ultimate success during the Gulf War.

Oversimplification results when one or more of the complex conditions pertaining to a certain situation are omitted and includes—

- Ignoring facts.
- Using generalities.
- Applying an inadequately qualified generalization to a specific case.

Example 2: Oversimplification.

An ordnance specialist inspecting a captured, hand-carried, surface-to-air missile launcher concludes that the threat has no effective low-level air defense. The assessment is based on the fact that the launcher is equipped with antiquated guidance mechanisms. The ordnance specialist's conclusion omits the following considerations:

- That the launcher was planted by the threat to give a misleading picture of their true capabilities.
- That the threat abandoned the launcher because it was ineffective and more capable systems were available.
- The weapon may have been deliberately doctored to mislead weapons experts.

Other weapons (e.g., antiaircraft artillery, small arms) can be very effective in some situations.

Hasty Generalization

Conclusions drawn from samples that are too few or from samples that are not truly representative are hasty generalizations.

Example: Hasty Generalization.

After interrogating an enemy prisoner of war (EPW), the interrogation officer reports the threat's morale as extremely low and that surrender is imminent.

In this case, the interrogator is making a hasty generalization because the sample population considered (one EPW) is too small.

Composition

The fallacy of composition is erroneously reasoning from the properties of a single entity to properties of a group.

Example: Composition.

During a skirmish with a Viet Cong battalion, a single EPW was captured. This EPW was suffering from malaria, malnutrition, and low morale. It was noted that the EPW was equipped with a semiautomatic weapon of World War II vintage. After a brief interrogation, the intelligence analyst reported the enemy battalion recently engaged was starving, diseased, and poorly armed.

The intelligence analyst failed to consider that—

- The one prisoner captured was too sick to keep up with the rest of the battalion.
- The weapon of early vintage did not necessarily make it ineffective.
- Few captured prisoners have high morale; in fact, low morale could just as easily result from being captured as it could contribute to being captured.

In this example, besides falling prey to hasty generalization, the analyst also demonstrated the fallacy of composition by applying the properties of a single prisoner to an entire enemy unit.

Division

The fallacy of division erroneously assumes that the characteristics of a group exist in every member of that group.

Example: Division.

Members of the threat guard's brigade had never surrendered in previous combat. After a recent engagement, an EPW claimed membership in the guard brigade. The interrogator doubted the EPW's statement because personnel from that brigade never surrender.

In this example, the interrogator committed the error of division by assuming that since no guard brigade personnel had ever surrendered, the EPW could not be from that brigade. The analyst took the characteristics of a unit and uniformly applied them to every member of that unit.

Special Pleading

In special pleading, only one side of an argument is presented.

Example: Special Pleading.

At the conclusion of a staff study, the staff members, who are proponents of the proposed COA, are directed to list the pros and cons of the proposal.

Arguments for the proposal:

- Job requires little to no increase in staffing.
- Job can save the Government 2 million dollars.
- Risk to personnel is minimal.
- Equipment is readily available.
- Little special training is required.
- Arguments against: None.

By omitting arguments against the COA, the staff committed the fallacy of special pleading. This fallacy also arises when the many interacting forces that give rise to a situation (i.e., cause and effect) are ignored.

Post Hoc

In the fallacy of *post hoc* ergo *propter hoc* (before the event, therefore caused the event), consideration of other factors that might have accounted for the same result are omitted. Post hoc fallacies often occur when trying to establish cause and effect.

Example: Post Hoc.

An aircraft equipped with a new jamming pod was not fired on while flying over threat-controlled territory. It was concluded that, since the aircraft was not intercepted or fired upon, the jamming pod was extremely effective in suppressing threat electronic systems.

The conclusion may or may not account for the aircraft not being attacked. Other considerations include—

- The threat was obtaining electronic intelligence on this new pod.
- The threat recently relocated several surface-to-air missile units and did not want to reveal their new positions.

False Dilemma

The fallacy of the false dilemma omits consideration of more than two alternatives.

Example 1: False Dilemma.

"Either we attack at dawn or the enemy will be too strong."

The two words that generally warn of a potential false dilemma fallacy are "either" and "or." False dilemmas exclude middle alternatives and consider only options of two extreme positions.

Example 2: False Dilemma.

An intelligence staff officer reports to the commanding officer that the enemy has only the capability to either defend in place or retreat. The intelligence officer committed the fallacy of false dilemma by failing to anticipate or ignoring that the enemy could—

- Attack if they were willing to accept high casualties.
- Withdraw to an alternate defensive position.
- Conduct a delaying action.

Assumption

Fallacies of assumption relate to begging the question, stating hypotheses contrary to fact, poisoning the well, and misusing analogies. All of these fallacies implicitly or explicitly involve assumptions, which may or may not be true.

Begging the Question

This fallacy occurs when a speaker gives what is assumed to be a legitimate response to a question but it is merely a rephrase of the question.

Example 1: Begging the Question.

When asked why the enemy was not pinned down by fire, the platoon leader replied: "Our suppressive fire was inadequate."

The fallacy in this response is that by definition suppressive fire pins down or intends to pin down the enemy. Since the platoon failed to pin down the enemy, the inadequacy of this fire was self-evident.

Example 2: Begging the Question.

A pilot reporting to a debriefing officer stated: "In response to your questions about whether or not all of my bombs landed on target, I'd like to say that as soon as I completed my pass there were two large secondary explosions."

The pilot begs the question by shifting attention from the primary issue to a secondary one. The response did not address the question that was asked.

Stating Hypotheses Contrary to Fact

This fallacy occurs when someone states decisively what would have happened had circumstances been different. Such fallacies involve assumptions that are either faulty or simply cannot be proven.

Example: Hypotheses Contrary to Fact.

If we had not supported Castro in his revolutionary days, Cuba would be safe for democracy today.

Besides being a gross oversimplification, the assumption made in the statement cannot be verified.

Poisoning the Well

This fallacy seeks to discount evidence before it is presented, most often by discrediting the source.

Example 1: Poisoning the Well.

An ardent spokesperson against the value of strategic bombing states: "You can't trust that Air Force employee's testimony regarding the effectiveness of strategic bombing.

The speaker is trying to discredit contrary evidence by creating the specific impression that the testimony is biased because the testifier represents a certain organization.

Example 2: Poisoning the Well.

One intelligence analyst says to another analyst engaged in pilot debriefs: "Be careful with these pilots; it is their first mission."

This statement intends to discredit evidence before it is presented. It pleads against the subject by assuming that the pilots' lack of experience will result in bad information.

Misusing Analogies

Analogies are strong tools that can impart understanding in a complex issue. In the absence of other evidence, intelligence analysts may reason from analogy. Such reasoning assumes that the characteristics and circumstances of the object or event being looked at are similar to the object or event in the analogy. The strength of a conclusion drawn from analogy is proportional to the degree of similarity between two objects or events. The danger in reasoning from analogy is assuming that because objects, events, or situations are alike in certain aspects, they are alike in all aspects.

Conclusions drawn from analogies are inappropriately used when they are accepted as evidence of proof. Situations may often be similar in certain aspects, but not in others. When one generalizes indiscriminately from analogy to real world, this is misusing analogies. One method for weakening an analogous argument is by citing a counteranalogy. A counteranalogy weakens the original analogy by citing other comparisons that can be made on the same basis.

Biases

A subjective viewpoint, bias indicates a preconceived notion about someone or something. Although biases interfere with successful analytic thinking, they can have a positive influence on analysis. With a lack of information, a preconceived notion can give the analyst a starting point for thinking about a situation. However, biases generally have a detrimental impact because they obscure the true nature of the information. Intelligence analysts must be able to recognize cultural, organizational, personal, and cognitive biases and be aware of the potential influence they can have on judgment.

Cultural

Americans see the world in a certain way. The inability to see things through the eyes of someone from another country or culture is cultural bias. Biases interfere with the analyst's ability to think the way an enemy commander might think or to give policymakers informed advice on the likely reaction of foreign governments to American policy. Also known as mirror imaging, cultural bias attributes someone else's inten-

tions, actions, or reactions to the same kind of logic, cultural values, and thought processes as the individual analyzing the situation. Although cultural bias is difficult to avoid, the following measures can lessen its impact:

- Locate individuals who were born or raised in the analyzed country or culture and—
  - Include them in the analytical process.
  - Ask their opinion about likely responses to friendly actions.
  - Take care when using their opinions, since they may be subject to biases regarding ethnic groups or cultures in the region and their knowledge may be dated or inaccurate.
- Locate regional experts such as foreign area officers and regional area officers who have lived or traveled through the area and are somewhat conversant regarding the culture. Assess the quality of the information provided against the level of knowledge and experience the individual has for that culture or region.

Organizational

Most organizations have specific policy goals or preconceived ideas. Analyses conducted within these organizations may not be as objective as the same type of analysis done outside the organization. Groupthink and best case are organizational biases that can affect subjective internal analysis.

Groupthink

This bias occurs when a judgment is unconsciously altered because of exposure to selective information and common viewpoints held among individuals. Involving people outside the organization in the analysis can combat this bias.

Best Case

This bias occurs when an analyst presents good news or bad news in the most optimistic light. The judgment is deliberately altered to provide only the information the commander wants to hear. Analysts can avoid this bias by having the moral courage to tell the commander the whole story, good and bad.

Personal

Personal biases stem from past experiences. If a thought pattern previously led to success, the analyst tends to follow that pattern. Even if the situations have nothing in common, the tendency to follow past successful methods is very strong.

Cognitive

The all-source intelligence analyst evaluates information from a variety of sources (e.g., HUMINT, SIGINT, IMINT, open source). The degree of reliability, completeness, and consistency varies from source to source and even from report to report. This variance often creates doubt about the reliability of some sources. Cognitive biases that affect the analyst include vividness, absence of evidence, oversensitivity to consistency, persistence of impressions, dependence on memory, and acceptance of new intelligence.

Vividness

Clear and concise or vivid information has a greater impact on analytical thinking than abstract and vague information. A clear piece of information is held in higher regard than a vague piece of information that has more value as evidence. Analysts must consider that an enemy may use deception to portray vivid facts, situations, and capabilities that they want the friendly intelligence effort to believe.

Absence of Evidence

Lack of information is the analyst's most common problem, especially in the tactical environment. Analysts must do their best with limited information and avoid holding back intelligence because it is inconclusive. To avoid this bias, the analyst should—

- Realize that information will be missing.
- Identify areas where information is lacking and consider alternative hypotheses.
- Adapt or adjust judgments as more information becomes available.
- Consider whether a lack of information is normal in those areas or whether the absence of information itself is an indicator.

Oversensitivity to Consistency

Consistent evidence is a major factor for confidence in the analyst's judgment. Information may be consistent because it is appropriate, or it may be consistent because it is redundant, is from a small or biased sample, or is the result of the enemy's deception efforts. When making judgments based on consistent evidence, the analyst must—

- Consider if the evidence represents all available information and intelligence. If it does not, or if it is not known, then the confidence level will be low, regardless of the consistency.
- Be receptive to information that comes in from other sources regardless of whether it supports the hypothesis or not.
- Be alert against confirmatory circular reporting, which is intelligence already obtained by the unit that is then reformatted by other units and intelligence organizations, modified slightly, and disseminated back to the unit.
- Know, to the degree possible, the original source for all intelligence to ensure that a circular report is not used as confirmatory evidence for an intelligence estimate or conclusion.

Persistence of Impressions

When evidence is received, there is a tendency to think of connections that explain the evidence. Impressions are based on these connections. Though the evidence eventually may be discredited, the connection remains and so do the impressions.

Dependence on Memory

The ability to recall past events influences judgment concerning future events. Since memory is more readily available, it is easy to rely on memory instead of seeking a proper sample to predict events.

Acceptance of New Intelligence

Often newer intelligence reports are valued more than older intelligence reports, which can occur when the intelligence collectors or sources are different.

> **Example: New versus Old Intelligence.**
>
> A ground reconnaissance team reports at 1300 that an enemy mechanized column is moving along a line of communications (LOC) at a given speed and direction. Later, at 1325, an AV-8B in-flight report indicates that the enemy column is moving along a different LOC.
>
> In such cases, the newer intelligence report should be assessed against the full tactical context, and not simply its timeliness, to preclude incorrect intelligence interpretations.

Using the above example, follow-on coordination with the better situated ground reconnaissance team, capable of observing the same LOC and enemy targets for a greater period of time, may lead to a very different intelligence interpretation.

SECTION IV. DECISIONMAKING

One aim of intelligence analysis is to allow the commander to make timely and informed decisions by providing the right elements of available information at the right time and place. Gaining more information can reduce uncertainty, but a decrease in uncertainty occurs at the expense of time. Uncertainty and time always influence the commander's analytical and intuitive decisionmaking ability.

Analytical

In analytical decisionmaking, several options for solving the problem at hand are identified, studied, and compared to arrive at the best solution. Basically, comparing multiple options concurrently produces the optimal solution. This approach to decisionmaking tends to be methodical and time-consuming.

Intuitive

In intuitive decisionmaking, the commander assesses the situation in an effort to recognize a pattern; once a pattern is identified, experience and judgment guide the commander in evaluating the key elements of the problem and rapidly determining a satisfactory solution. The intuitive approach focuses on situation assessment instead of on the comparison of multiple options. Generally much faster than analytical decisionmaking, intuitive decisionmaking aims at finding the first solution that will satisfactorily solve the problem.

Comparison

Each analytical and intuitive decisionmaking approach has strengths and weaknesses. Although conceptually distinct, the two are rarely mutually exclusive. Intelligence supports analytical decisionmaking by helping to identify available options and by providing the estimates and studies for comparisons of those options.

Intelligence supports intuitive decisionmaking by providing the knowledge that helps the commander recognize emerging patterns. The process of intelligence analysis employs both analytical and intuitive decisionmaking to arrive at the conclusions presented to the commander. The IPB process, particularly if the various types of products are prepared in detail, is a distinctly analytical process. The decision support template derived from the IPB process, however, is a tool that facilitates intuitive decisionmaking. Generally, the analytical approach conforms well to the prehostility or contingency planning phase, while the intuitive model is usually more appropriate during execution of tactical operations.

The challenge for the intelligence analyst is knowing how much and what kinds of information the commander requires. Too much information may only confuse an intuitive decisionmaker and information requirements will change continually. Too little information for an analytical decisionmaker may result in procrastination and the continual demand for more information. The key to overcoming these challenges is a solid understanding of the commander, constant interaction through training and exercises, and a well developed process for identifying information requirements.

CHAPTER 5. INTELLIGENCE PREPARATION OF THE BATTLESPACE

An analytical methodology, IPB is employed during operations to identify, assess, and reduce the effects of enemy, environment, and terrain uncertainties on friendly and threat forces. The IPB process analyzes the threat and environment in a specific geographic area to determine and evaluate the threat's capabilities, vulnerabilities, and probable COAs. Designed to support staff estimates, planning, and decisionmaking, IPB results are incorporated into the intelligence estimate, which provides knowledge-based intelligence that can be visualized and absorbed by decisionmakers. See appendix A for a detailed outline of the intelligence estimate format. The formatted graphics and images provided through the IPB process help the commander to rapidly visualize, assimilate, and apply intelligence in the decisionmaking process. This enhances the commander's ability to discern patterns as they emerge and to conduct recognitive or intuitive decisionmaking, thereby increasing operational tempo.

Operations and intelligence must have a common focus to successfully apply the interactive IPB process. See FM 34-130/Fleet Marine Force Reference Publication (FMFRP) 3-23-2, *Intelligence Preparation of the Battlefield*, for a detailed discussion of the IPB process.

The IPB requirements for a humanitarian assistance operation differ significantly from a combat operation against a conventional armed force. In a given situation, a unit or staff section may prepare some or all IPB products. Determining which products to prepare and identifying their relative priority depends on the factors of METT-T and command guidance.

The IPB process develops tailored, mission-focused, knowledge-based intelligence that is incorporated into a variety of intelligence products. Intelligence preparation of the battlespace provides intelligence in graphic and image formats that help the commander rapidly visualize, absorb, and apply the intelligence in the decisionmaking process. Numerous standard overlays and graphics are associated with the IPB process; however, each situation is unique. A modified combined obstacle overlay and threat doctrinal template that support conventional operations may be of limited use in military operations other than war (MOOTW). The type of products generated as a result of IPB vary based on the—

- Size of the unit.
- Time available.
- IRs.
- Characteristics of the mission and AO.

The IPB process defines the battlespace environment, describes the battlespace effects, evaluates the threat, and determines threat COAs. These steps are discussed in this chapter and remain constant regardless of the type of mission or size of the staff section; however, the application of the steps varies with each situation. This chapter also goes into detail about the decision support template and discusses the abbreviated IPB process.

SECTION I. STEP 1—DEFINE THE BATTLESPACE ENVIRONMENT

The first step of the IPB process identifies the physical space and specific features of the environment or activities that may influence friendly and enemy COAs and commander's decisions. When defining the battlespace environment, intelligence analysts conduct the following procedures.

Identify Significant Characteristics of the Environment

Characteristics of the battlespace environment that will influence the commander's decisions or affect the COAs available to friendly forces or the threat are of special significance. During a humanitarian assistance operation, for example, the location and activities of civilian relief organizations might be a significant characteristic of the battlespace. During support to counterdrug operations, significant characteristics might include narcotics production or weapons trading. During a conventional war, typical characteristics may include location and activities of enemy reserves, reinforcements, and long-range fire support. When identifying significant characteristics of the battlespace, intelligence personnel consider threat forces and other aspects of the environment that may have an effect on accomplishing the unit's mission. Depending on the situation, these environmental aspects may include—

- Geography (e.g., area terrain and weather).
- Population demographics (e.g., ethnic groups, religious groups, age distribution, income groups).
- Political or socioeconomic factors (e.g., the role of clans, tribes, gangs).
- Infrastructures (e.g., transportation, telecommunications).
- Rules of engagement or legal restrictions (e.g., international treaties, agreements).
- Threat forces and their capabilities (e.g., paramilitary and unconventional forces).

Initially, each environmental characteristic is examined in general terms to identify its significance to the command and its mission. Identifying the significant characteristics of the battlespace environment helps establish the geographical limits of the AOI and directs analytical efforts in steps 2 and 3 of the IPB process. It also helps identify uncertainties or gaps in the type of information and intelligence required to complete the IPB process and answer the PIRs and IRs (see fig. 5-1).

Identify the Command's Area of Operations and Battlespace Limits

The AO represents an area assigned to a commander with authority and responsibility for the conduct of operations (see fig. 5-2). The limits of the AO are normally the boundaries specified in the OPORD or higher headquarters execute order that defines the command's mission.

Area of Influence

This is the geographical area where a commander is able to influence operations through C2 of maneuver or fire support systems. Based on the range of organic or supporting weapon systems, the area of influence may extend beyond the AO.

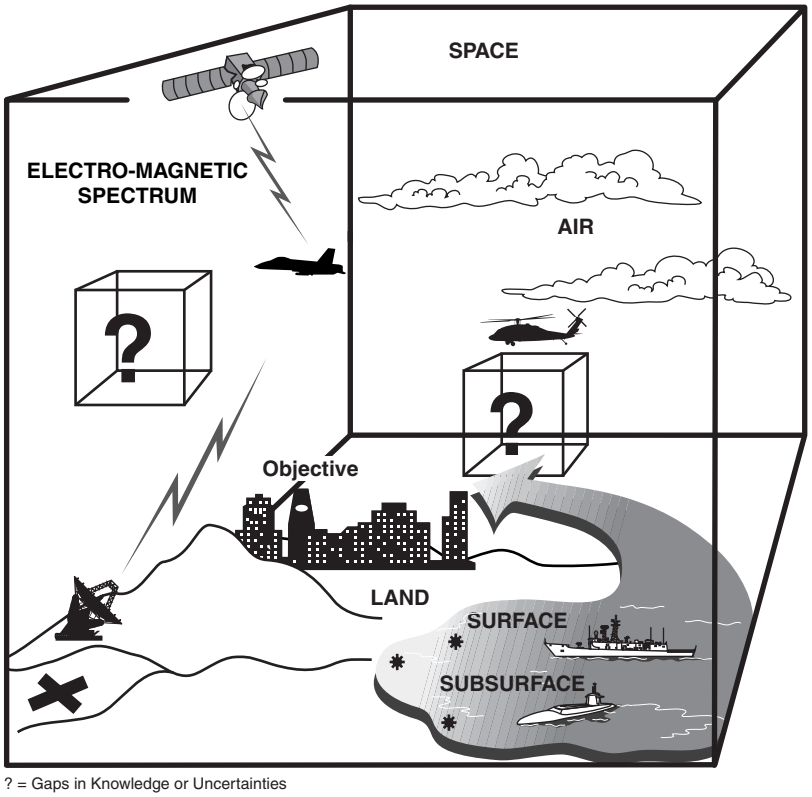

Figure 5-1. Battlespace Examination.

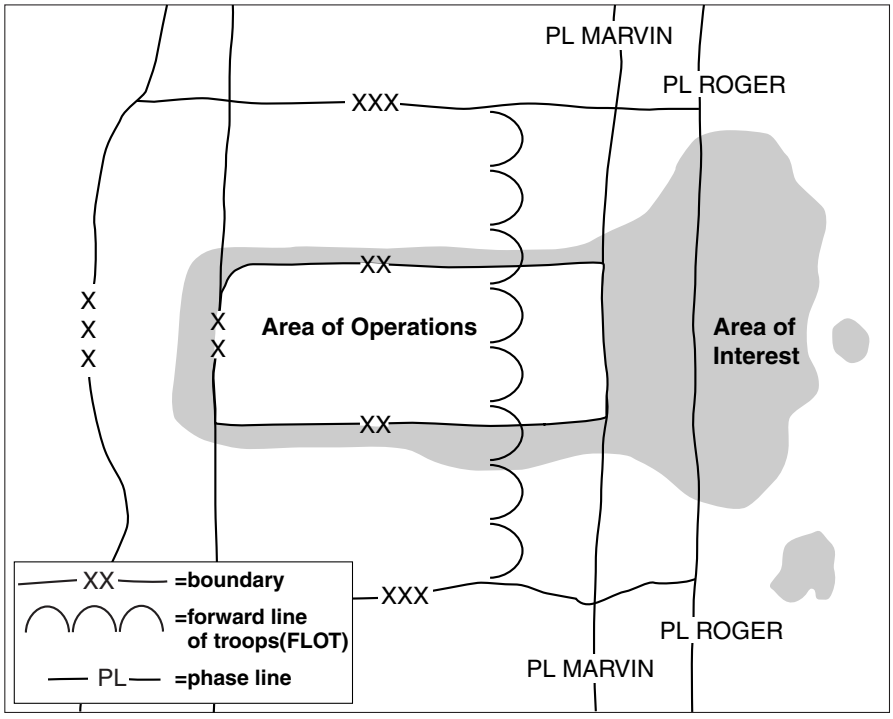

Figure 5-2. AO and AOI.

Area of Interest

The commander selects the AOI based on the estimate of the situation. The dimensions are not constrained by the organic ability to acquire information on that area. The AOI must extend, in as irregular a shape and as far as needed, in all directions to safeguard the command from surprise (see fig. 5-2). The AOI must be viewed in terms of width, depth, height or airspace, and time.

Battlespace

The battlespace is all aspects of air, surface, subsurface, land, and space, as well as the electromagnetic spectrum, the information environment, and other dimensions which encompass the AO, the area of influence, and the AOI. Figure 5-3 depicts many of these battlespace dimensions and factors.

Establish the Area of Interest Limits

The AOI is the geographical area from which information and intelligence are required to permit planning or successful conduct of the command's operation. The command's AOI is generally larger than its AO. The limits of the AOI include each of the characteristics of the battlespace environment identified as exerting an influence on potential COAs or command decisions.

The limits of the AOI are based on the ability of the threat to influence the accomplishment of the command's mission. The geographical locations of other activities or characteristics of the environment that might influence COAs or the commander's decision and the resulting changes in the command's battlespace must be considered when establishing AOI limits.

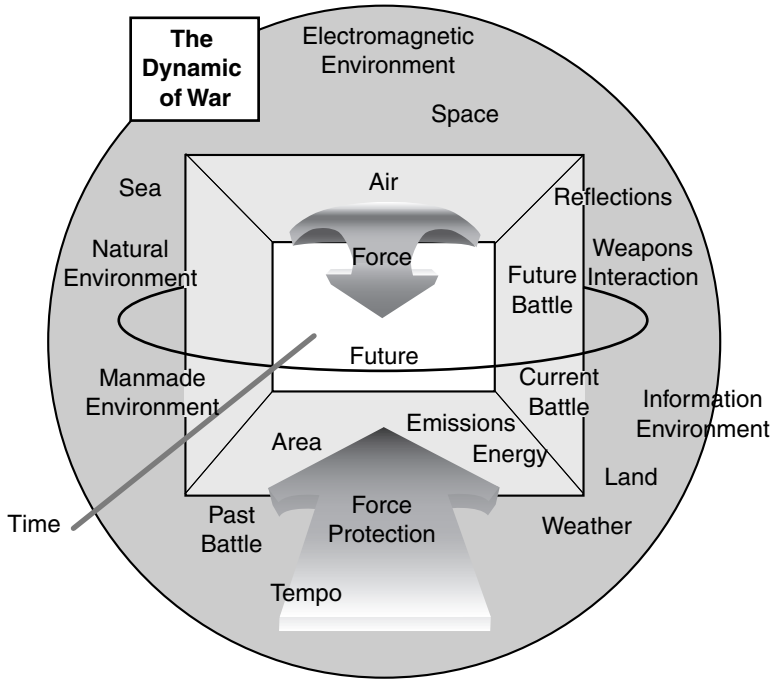

Figure 5-3. Battlespace Dimensions and Factors.

Areas of interest can be divided into several components (e.g., ground, air, political). Altitude must be considered in the air AOI when the projection of air power is of interest. When an air defense-related IPB is conducted, the AOI should extend upwards to the maximum service ceiling of the threat's aircraft. When an aviation-related IPB is conducted, the AOI should extend to the maximum service ceiling of friendly aircraft or the maximum effective altitude of threat air defense systems, whichever is greater. When space-based IPB is conducted, the AOI must extend to the maximum effective altitude of relevant space-based systems. Although AOIs may be developed separately, at some point they must be considered as an integrated whole.

One of the primary considerations in establishing the limits of the AOI is time. The time limit is based on the threat's ground and air mobility and the amount of time needed to accomplish the friendly mission. For missions of relatively short duration, such as the evacuation of noncombatants or raids, the AOI may be relatively small and usually includes only immediate, direct threats to mission accomplishment. A helicopter raid where the MAGTF has air superiority might have an AOI that includes only air defense systems within the range of the engagement area and the air routes. Some long-term missions, such as peacekeeping, will result in an extensive AOI that considers political, economic, and conventional military factors.

Since the limits of the AOI are based on threats to mission accomplishment rather than strictly terrain considerations, the limits may cross into neutral countries. If developments in a neutral country might influence accomplishment of the unit's mission, that country must be included in the AOI.

Identify the Detail Required for the Time Available

The time available for completion of the IPB process may not permit the luxury of conducting each step in detail. The focus must be on the parts of IPB that are most important to the commander in planning and executing the mission. Identifying the amount of detail required avoids wasting time on developing more detail than necessary in each step of the process. For example, the situation may require detailed threat analysis only on selected areas within the command's AO based on the assigned mission or other METT-T factors. Some geographical areas or threat forces within the AO may require only a summary type evaluation of their effects or capabilities.

Evaluate Existing Intelligence Data Bases and Identify Intelligence Gaps

Data bases may only contain some of the intelligence and information required to evaluate the effects of each battlespace characteristic and each threat force. This is especially true of the majority of countries where the MAGTF may conduct operations in the future. Identifying the intelligence gaps early allows the intelligence analysts to initiate action required for collecting intelligence and filling the gaps, to perform the necessary production, and to disseminate the intelligence products in a timely manner. When evaluating existing data bases, intelligence analysts must—

- Identify and prioritize the intelligence gaps in current holdings, using the commander's PIRs and intent to set the priorities.
- Identify any gaps that cannot be filled within the time allowed for IPB.
- Inform the commander and operators of unfilled gaps so that reasonable assumptions can be formulated.

Collect the Required Intelligence and Materials

Ideally, intelligence operations enable the analyst to develop estimates of the battlespace and the threat that match the actual situation. In reality, intelligence will never eliminate the unknown aspects or uncertainties that concern a commander and staff. Intelligence analysts must be prepared to fill in the gaps with reasonable assumptions and estimates. When collecting the required intelligence and materials, intelligence analysts must—

- Initiate collection or requests for intelligence to fill the gaps and to conduct IPB.
- Prioritize collection against all identified significant characteristics of the battlespace.
- Initiate action on identified IPRs and continuously update the IPB products as additional intelligence is received.
- Inform the commander as assumptions are confirmed during the initial mission analysis and IPB process.
- Re-examine the evaluations and decisions on which proven invalid assumptions were based.

SECTION II. STEP 2—DESCRIBE THE BATTLESPACE EFFECTS

The second step in the IPB process is to determine how the battlespace environment affects both threat and friendly operations. This evaluation step begins with an analysis of existing and projected conditions of the battlespace environment and determines how those conditions will affect friendly and threat operations and broad COAs. Intelligence analysts describe the battlespace effects by analyzing the battlespace environment, such as terrain, weather, and other battlespace characteristics, and by describing the battlespace effects on threat and friendly capabilities and broad COAs.

Analyze the Battlespace Environment

The degree of detail in the analysis varies depending on the area of the battlespace environment being evaluated. Generally, the AO is evaluated in more detail than the AOI. Additionally, the focus varies throughout each area. For example, rear areas within the AO may require a different focus than areas near the main battle area. Certain areas or subsectors affect various types of operations to varying degrees. During the evaluation, intelligence analysts must identify areas that favor each type of operation (e.g., offensive, defensive, force protection, peace enforcement). Terrain, weather, and other characteristics of the battlespace are analyzed as part of the IPB process.

Terrain

Terrain analysis is the means to determine which friendly COAs can best exploit the opportunities the terrain provides and how the terrain affects the threat's available COAs. The best terrain analysis is based on a reconnaissance of the AO and AOI. Analysts must identify gaps in knowledge of the terrain that a map analysis cannot satisfy and use the identified gaps to guide reconnaissance planning and to focus on areas most important to the commander and the mission.

The members of intel bn's topographic platoon usually conduct the major portion of the terrain and hydrographic analysis and development of supporting GEOINT products. They also receive

support from Army topographic units operating as part of or in support of the joint force. Topographic personnel work closely with weather personnel and weather analysts to ensure that terrain analysis incorporates the effects of current and projected weather events.

The National Imagery and Mapping Agency (NIMA) produces specialized maps, overlays, and automated data bases for specified areas of the world to aid in map-based evaluations. The tactical terrain analysis data base consists of selected terrain information that is limited to natural and manmade features of tactical military significance, which can be exploited by terrain analysts to satisfy military requirements. Specialized NIMA products address—

- Cross-country mobility.
- Transportation systems (road and bridge information).
- Vegetation type and distribution.
- Surface drainage and configuration.
- Surface materials (soils).
- Ground water.
- Obstacles.

Terrain analysts must ensure that the analysis includes the effects of existing and forecasted weather on the military aspects of the terrain, because changes to the battlespace environment may change the terrain analysis evaluation results. Analysts express the results of evaluating the terrain's effects by identifying areas of the battlespace that favor, disfavor, or do not affect each broad COA. These conclusions are reached through analysis of the military aspects of the terrain and evaluation of the terrain's effects on military operations.

Analyze the Military Aspects of the Terrain

Terrain analysts evaluate the following military aspects of terrain to determine the effects on military capabilities:

- Key Terrain—Any locality or area (natural or manmade) that the seizure, retention, or control of will afford a marked advantage to either combatant.
- Observation and Fields of Fire—Observation is the ability to see the threat either visually or through the use of surveillance devices. Fields of fire are areas that a weapon may effectively cover with fire from a given position.
- Cover and Concealment—Cover is protection from the effects of direct and indirect fires. Concealment is protection from observation. Ditches, caves, river banks, folds in the ground, shell craters, buildings, walls, embankments, woods, underbrush, and other natural or manmade features can provide cover and/or concealment.
- Obstacles—Any natural or manmade feature that stops, impedes, slows, or diverts military movement.
- Avenues of Approach and Mobility Corridors—Avenues of approach (AAs) are air, sea or ground routes of an attacking friendly or threat force of a given size leading to its objectives or to key terrain in its path (see figs. 5-4 below and 5-5 on page 5-8). Mobility corridors are areas where a force will be

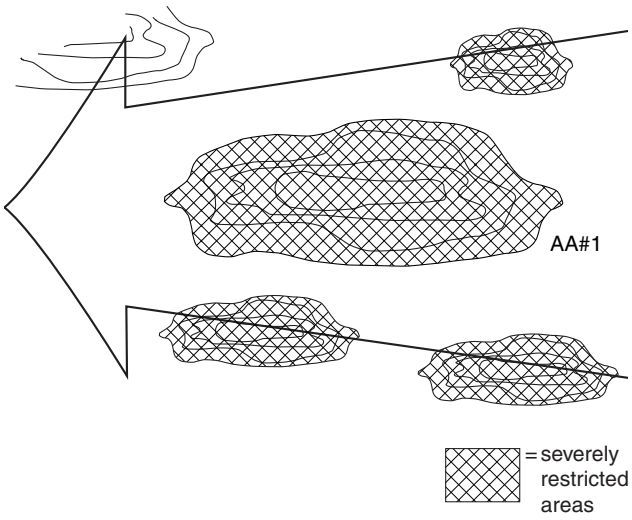

Figure 5-4. Regimental Ground AA.

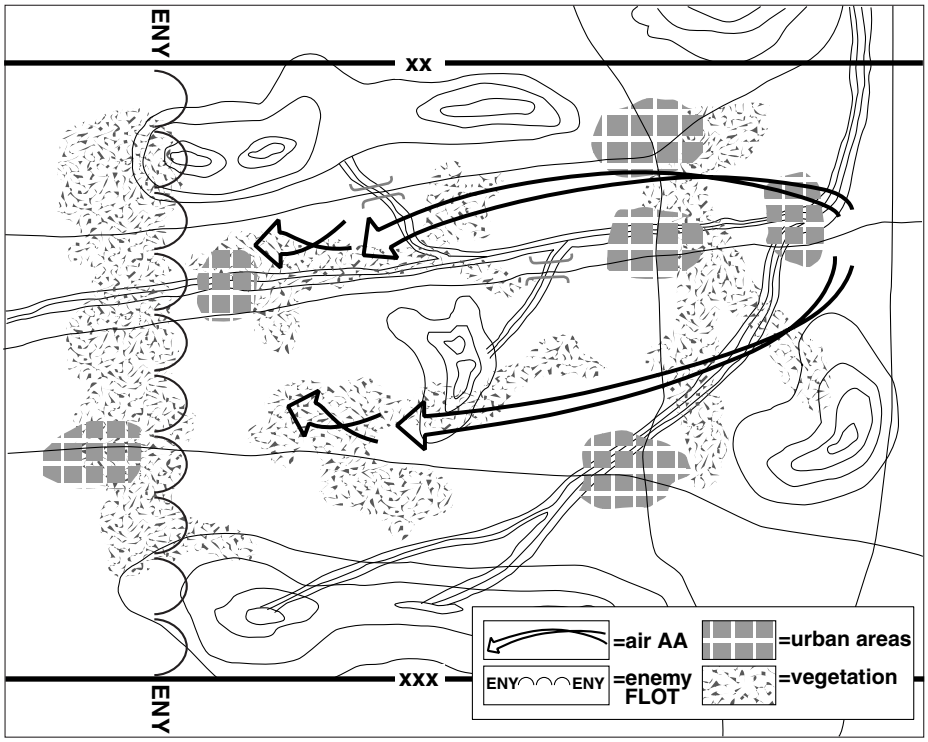

Figure 5-5. Air AAs Overlay.

canalized due to terrain restrictions. A mobility corridor is relatively free of obstacles and wide enough for maneuver of tactical formations, which allows military forces to capitalize on the principles of mass and speed. When grouped together, mobility corridors constitute an AA (see fig. 5-6). Based on previous terrain analyses, the analyst determines how the terrain will allow maneuver to objectives. Analysts must consider littorals/waterways (e.g., beaches, rivers) as possible mobility corridors and AAs.

Evaluate the Terrain's Effects on Military Operations

Terrain analysts evaluate the terrain's effects on friendly and threat offensive and defensive COAs by identifying the areas along each AA best suited for use as potential—

- Engagement areas and ambush sites—Using results of concealment and cover evaluation, terrain analysts identify areas where maneuvering forces are vulnerable to fires. They consider ranges of weapons, flight times of missiles, and the likely speed of maneuvering forces. If the unit is attacking, analysts identify areas where the unit will be vulnerable to threat fires. If the unit is defending, analysts identify potential engagement areas (see fig. 5-7).
- Battle positions—These positions may be used by friendly attacking forces to block enemy counterattacks. Terrain analysts identify concealed and covered positions that offer observation and fields of fire into potential engagement areas. If a command is defending, these positions are potential defensive positions; if a command is attacking, the positions provide a start point for determining possible threat COAs.

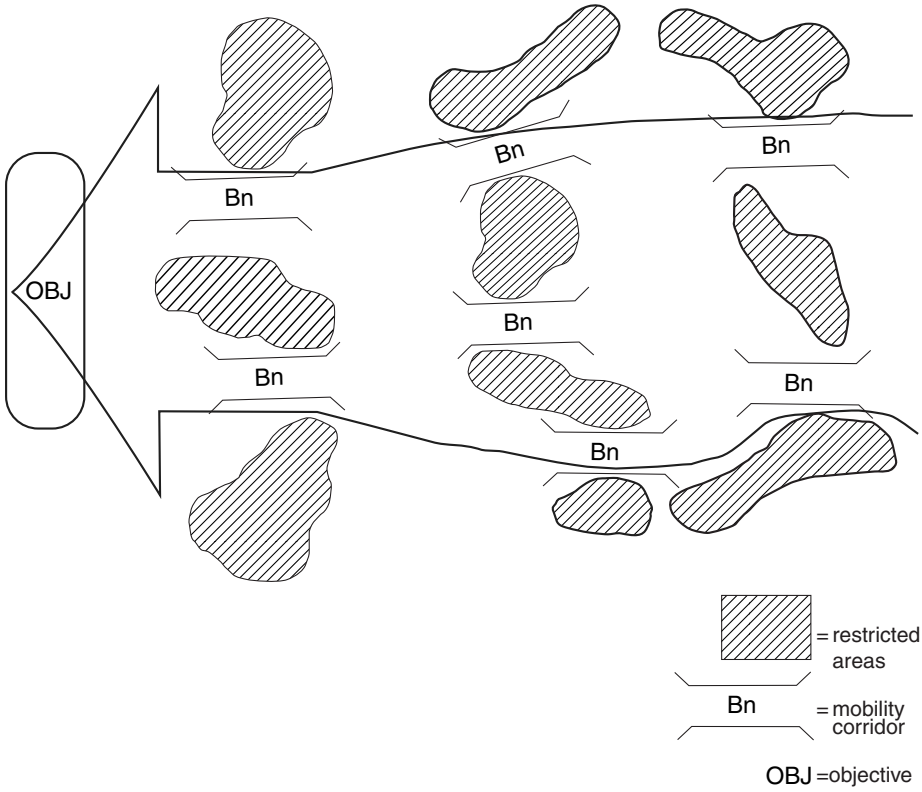

Figure 5-6. Mobility Corridors Grouped to Form an AA.

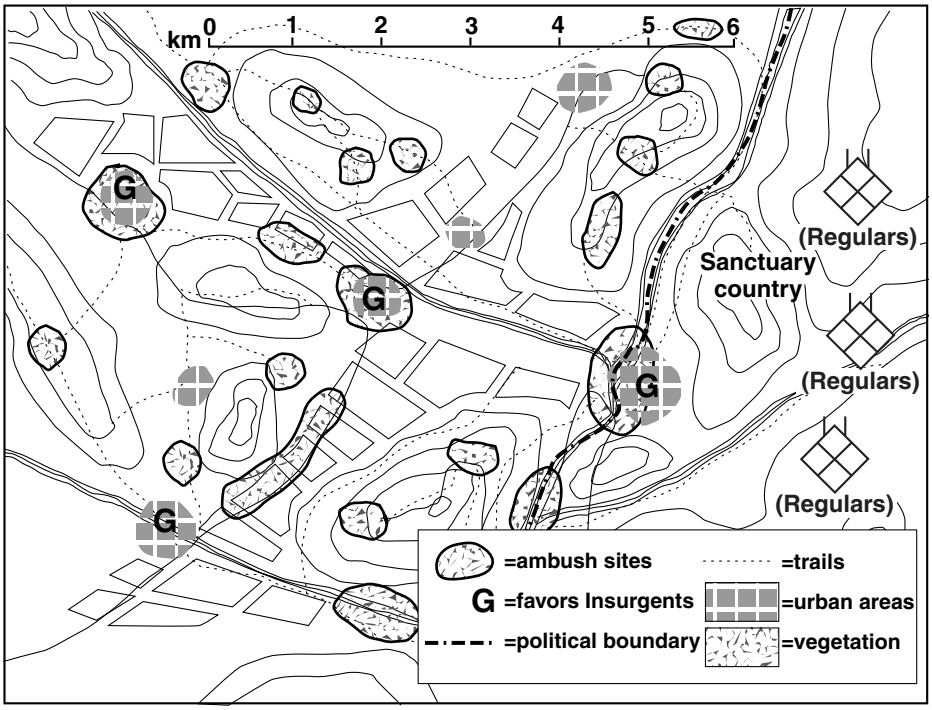

Figure 5-7. Lines of Communications and Likely Ambush Sites.

- Immediate or intermediate objectives—Terrain analysts identify any areas or terrain features that dominate AAs or assigned objective areas. These areas usually correspond to areas already identified as key terrain. As time permits, or situation requires, analysts also identify potential assembly and dispersal areas, observation posts, artillery and air defense positions, LZs, and DZs.

The terrain rarely favors one type of operation throughout the width, depth, and height of the battlespace. Based on the location and nature of the potential engagement areas and battle positions, analysts determine which areas of the battlespace favor attack or defend COAs.

Analysts consider all terrain factors in any order that best supports their analysis, but must focus on the factors most relevant to the specific situation and needs of the commander. To aid the commander's staff in the completion of their estimates and plans, analysts construct a combined obstacle overlay (COO) or a modified combined obstacle overlay (MCOO), which are graphic products that depict battlespace effects on military operations (see fig. 5-8).

Weather

Commanders can take advantage of the weather or minimize its effects through planning based on a weather analysis. During the weather analysis step, weather is studied to determine how it affects friendly and enemy capabilities to move, shoot, and communicate. Terrain and weather are inseparable factors of tactical intelligence and must be integrated. Weather forecasts and assessments contribute to intelligence and must be considered when commanders develop their COAs. The type and amount of weather support needed for a particular mission depends on the mission, the forces, the terrain, and the enemy.

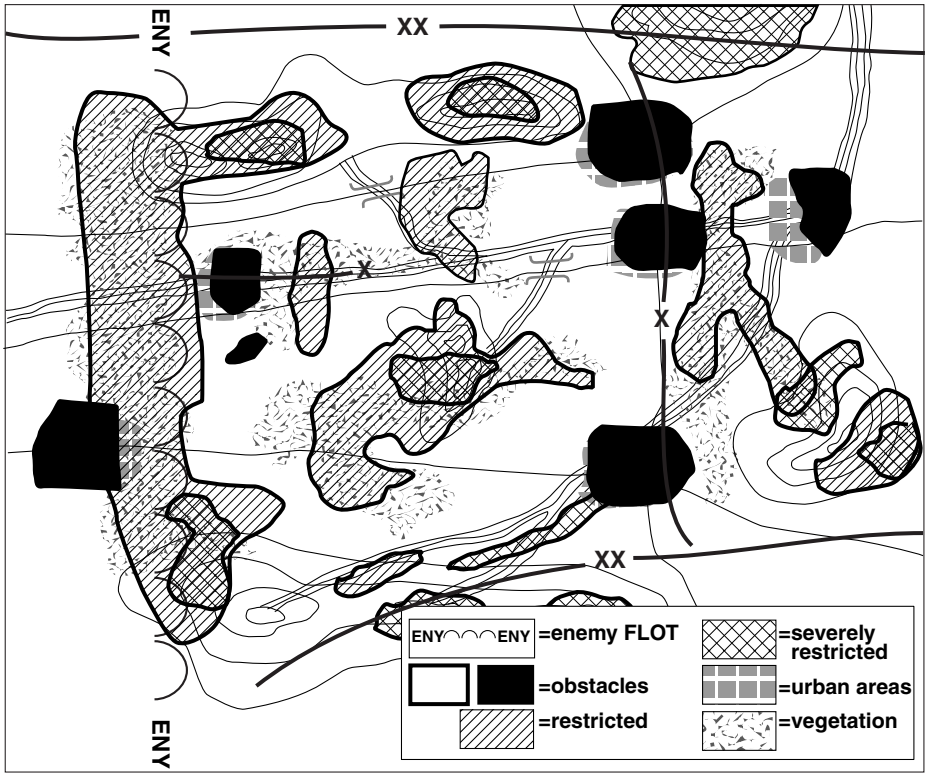

Figure 5-8. Combined Obstacle Overlay.

Evaluation of the direct effects of weather begins by establishing critical values for each aspect of the weather's effects on personnel, equipment (to include all sensors), and military operations the command may be required to perform. Unit intelligence officers and operations personnel develop detailed critical value tables for their units as part of the IPB process. These critical values are used to measure the effects of local weather on both friendly and enemy military operations. See appendix B for an example of a weather critical values table. Weather analysis is covered in more detail in chapter 6 and in Marine Corps Warfighting Publication (MCWP) 3-35.7, *MAGTF Meteorological and Oceanographic Support*. Weather analysis is accomplished by analyzing the military aspects of weather and evaluating the weather's effects on military operations.

Analyze the Military Aspects of Weather

Analysts consider the following five military aspects of weather:

- Temperature and humidity.
- Precipitation.
- Wind.
- Visibility.
- Clouds.

Evaluate the Weather's Effects on Military Operations

Weather has both direct and indirect effects on military operations. Examples of indirect effects include—

- Temperature inversions that might cause some battle positions to be at risk to the effects of chemical warfare.
- Local conditions of visibility, such as fog, that might make some potential engagement areas attractive.
- Hot, dry weather that might force a unit to consider water sources as key terrain.

Other Characteristics of the Battlespace

These characteristics include all aspects of the battlespace environment that affect friendly and threat COAs not incorporated into terrain and weather analysis. For example, an intelligence officer may report that religious considerations will make cordon and search operations on Wednesdays difficult to execute since the local population will be praying at the time of the scheduled search. Examples of other characteristics include—

- Logistic infrastructure (e.g., land use patterns, sources of potable water, bulk fuel storage, natural resources, industries and technologies, chemical and nuclear facilities).
- Population demographics (e.g., living conditions, cultural distinctions, religious beliefs, political grievances, political affiliation, education levels).
- Naval approaches.
- Economics.
- Local, regional, and international politics (e.g., treaties, agreements, legal restrictions, unofficial systems, gangs).

Although effects of other characteristics are usually discussed in text or matrix form, analysts should use graphics wherever possible. Examples of graphic depictions include an overlay showing areas most vulnerable to insurgent activity based on demographic distribution or an overlay showing high-value targets (HVTs) in the logistic infrastructure.

Describe the Battlespace Effects on Threat and Friendly Capabilities and Broad Courses of Action

Intelligence analysts combine the evaluation of the effects of terrain, weather, and other characteristics of the battlespace into one integrated product. They focus on the total environment's effects on COAs available to both friendly and threat forces.

Prior to development of friendly COAs, intelligence analysts provide the operations officer or planning staff with the following IPB products:

- An evaluated and prioritized set of AAs to assist in the designation of axis of advance, direction of attack, or zone of attack for each subordinate unit in offensive operations.
- Sets of defensible terrain along threat AAs to assist in the development of strongpoints, battle positions, or sectors for each subordinate unit in defensive and retrograde operations.
- Periods when weather conditions will optimize the use of friendly target acquisition and aviation operations to help time operations.

After the development of friendly COAs, intelligence analysts provide an evaluation of how each COA does or does not use the opportunities the battlespace provides. When addressing effects on threat COAs, intelligence analysts should view capabilities from the perspective of the enemy. The evaluation of the battlespace effects on the threat must be tailored to include weather and terrain that may affect threat weapon systems, vehicles, and personnel differently than friendly personnel. Operations and planning staffs must understand these battlespace effects on the threat to avoid assumptions that the battlespace will affect both forces equally. Other characteristics may influence threat actions more than weather and terrain, and cultural biases may cause threat personnel to view legal, political, economic, and demographic issues in an entirely different manner than friendly personnel would.

When describing the battlespace effects on threat and friendly capabilities and broad courses of action, intelligence analysts must—

- Evaluate the battlespace from the perspective of the threat.
- Express the evaluation in terms of COAs, not detailed descriptions of the analytical factors that led to the conclusions.
- Focus the commander by relating specific threat activities in both time and space.
- Back their conclusions with the detailed analysis performed.
- Communicate final conclusions in written reports such as the analysis of the AO or intelligence estimate.
- Disseminate graphic products developed during the analysis and evaluation to the staff and other commands for use in their own IPB and planning efforts.

SECTION III. STEP 3—EVALUATE THE THREAT

The third step in the IPB process is to determine the threat force capabilities and the doctrinal principles, tactics, techniques, and procedures it has historically used. This involves a detailed study of the threat's composition, tactical doctrine, procedures, weapons and equipment, and supporting systems. The intelligence section determines threat capabilities and how the threat operates by updating or creating threat models and identifying threat capabilities.

Update or Create Threat Models

Threat models depict how threat forces prefer to conduct operations under ideal conditions. They are based on the threat's normal or doctrinal organization, equipment, tactics, techniques, and procedures. Threat models result from a detailed study of the threat force. Ideally, threat models are constructed prior to deployment. Threat models consist of doctrinal templates, a description of preferred tactics and options, and identification of HVTs.

Doctrinal Templates

Doctrinal templates illustrate the deployment pattern and disposition preferred by the threat's normal tactics when not constrained by the effects of the battlespace environment. They are usually scaled graphic depictions of threat dispositions for a particular type of standard operation, such as a battalion moving to contact or an insurgent ambush (see fig. 5-9).

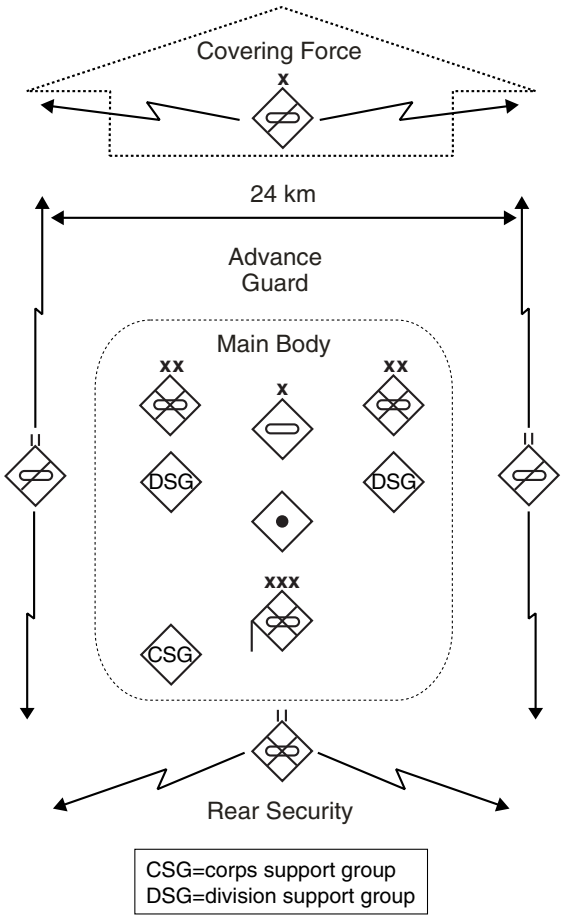

Figure 5-9. Doctrinal Template.

Doctrinal templates must be tailored to the needs of the unit or staff section creating them. Templates are constructed through an analysis of intelligence data bases and an evaluation of the threat's past operations. The analysis should focus on patterns in task organization, timing, distances, relative locations, groupings, and the use of terrain and weather. Some doctrinal templates consider the threat force as a whole, while others focus on a single battlefield function like intelligence or fires.

Description of Tactics and Options

The threat model includes a description of the threat's preferred tactics. It addresses the operations of the major units or elements portrayed on the template and the activities of different battlefield functions. It also contains a listing or description of the options (branches) available to the threat should the operation fail, or subsequent operations (sequels) if it succeeds. Even if the threat's preferred tactics can be depicted graphically, the threat model includes a description.

The description aids in mentally wargaming the operation over its duration during the development of threat COAs and situation templates. It should address typical time lines and phases of the operation, points where units transition from one formation to another, decision criteria, and each battlefield function's contribution to the operation's success. This analysis of the individual role of battlefield functions, related in time and space, will aid in the later identification of HVTs and HPTs.

Identification of Center(s) of Gravity

Marine Corps Doctrinal Publication (MCDP) 1, *Warfighting*, defines a center of gravity (COG) as any important source of strength. It may be mental, moral or physical strength, power or will. COGs may exist at each level of war: strategic, operational, and tactical. It may be tangible or intangible, and there may be multiple COGs. While knowledge of a threat's COGs at all levels is useful, the analyst should focus on the COGs appropriate to the level of operations that concern their friendly force. At this stage of the IPB process, the identification of COGs is an initial assessment.

Critical Vulnerabilities

Aspects of a COG that, if exploited, will do the most significant damage to an adversary's ability to resist are critical vulnerabilities. Vulnerability cannot be critical unless it undermines a key strength. Some vulnerabilities may contribute significantly to the enemy's downfall while others may lead only to minimal gains. Therefore, analysts must focus on a vulnerability that will do the most damage to the enemy's ability to resist.

Identification of Type High-Value Targets

Assets that the threat commander requires for the successful completion of the mission depicted and described on the template are HVTs. Examples of type HVTs include C2, intelligence, fire support, communications and information systems, air defenses, engineers, and logistics and CSS. When evaluating the threat, intelligence analysts must—

- Identify HVTs from an evaluation of the data base, the doctrinal template, the template's supporting narrative, and the use of tactical judgment.
- Develop the initial list of HVTs by mentally wargaming and thinking through the operation to identify assets that are critical to the operation's success, particularly at critical junctures or phases.
- Identify assets, which are key to executing the primary operation, particularly those that are key to satisfying decision criteria.
- Group the identified key assets into one of 13 categories used to develop target sets, thus assisting in the development of targeting strategies.
- Determine how the threat might react to the loss of an HVT; consider his/her ability to substitute other assets or modify his/her plan to compensate.
- Rank the identified HVTs with regard to their worth to the threat's operation.
- Identify HVT value changes by phase because that value usually varies over the course of an operation.
- Tailor IPB products to the command's needs by concentrating on HVTs that are important to the mission.

Identify Threat Capabilities

Threat capabilities are the broad COAs and supporting operations that the threat can take to influence the accomplishment of the friendly mission. The following four tactical or broad COAs are generally open to military forces in conventional operations:

- Attack.
- Defend.
- Reinforce.
- Retrograde.

Each of these broad COAs can be divided into more specific COAs. An attack may be envelopment, penetration, or other variations of an attack. A retrograde movement may be a delaying action, a withdrawal, or a retirement. Other threat capabilities include support to

broad COAs or specific types of operations, including—

- Deception operations.
- Riverine operations.
- Psychological operations.
- Intelligence operations.
- Nuclear, biological, and chemical weapons employment.
- Espionage, sabotage, subversive, and terrorist operations.

Threat capabilities take the form of statements, such as—

- The enemy has the ability to insert up to two infantry battalions in a single lift operation.
- The enemy can establish a prepared defense by 14 May.
- The demonstrators can effectively block traffic at up to seven intersections in our zone.

When identifying threat capabilities, intelligence analysts—

- Start with developed threat models.
- Consider other types of operations and broad COAs at other levels of war and during operations other than war.
- Consider the threat's ability to conduct each operation based on all factors related to the current situation. (The threat may be understrength in equipment or personnel, short of logistic support, lacking air support, or his/her troops may be inexperienced or poorly trained.)

SECTION IV. STEP 4—DETERMINE THREAT COURSES OF ACTION

This step of the IPB process is the identification and development of likely threat COAs that will influence the accomplishment of the friendly mission.

Identify the Threat's Likely Objectives and Desired End State

Depending on METT-T, intelligence analysts generally start identifying threat objectives and desired end state of the threat command at least one level above their own command. Analysts repeat the process for the next subordinate level to at least two levels below their own command, ensuring that each threat level's objective will accomplish the likely objectives and desired end state of its parent command. In operations other than war, analysts may be required to start more than one level above their command (e.g., the government or major clan leadership level). Usually, analysts state the threat's objectives and desired end state as assumptions. The analysts must make sure the assumptions are clearly identified as such and ensure the assumptions are discussed with the commander and staff. During operations other than war, analysts must consider more than the conventional objectives of terrain or friendly forces. This is also true at higher levels of command where the threat's political and economic objectives have a direct influence on his/her COAs.

Identify the Full Set of Courses of Action Available to the Threat

When identifying the COAs available to the threat, analysts must—

- Consider the COAs that the threat historical doctrine and tactics, techniques, and procedures (TTP) indicate are appropriate to the current situation and the likely objectives identified. This requires an understanding of the threat's decisionmaking process as well as

an appreciation for how he/she perceives the current situation.

- Consider the threat COAs that could significantly influence the command's mission, even if the threat's doctrine and TTP indicate these as infeasible under current conditions; and consider any indirect COAs that the threat is capable of executing.
- Consider the threat COAs indicated by recent activities and events. To avoid surprise from an unanticipated COA, consider all possible explanations for the threat's activity in terms of possible COAs.
- Consider each COA's subset independently to avoid forming biases that restrict the analysis and evaluation.
- Combine the subsets to eliminate redundancy and minor variations.
- Compare the consolidated list of COAs to threat capabilities identified in step 3 of the IPB process and eliminate any COAs that the threat is incapable of executing.
- Select threat models that will accomplish the threat's likely objectives based on the evaluation of the threat's capabilities.
- Examine how the effects of the battlespace described in step 2 of the IPB process influence the application of COAs (see fig. 5-10).
- Define COAs open to the threat, such as deliberate attack, hasty attack, defend, and delay.
- Define each general COA as a set of specific COAs by integrating the threat models with a description of the battlespace effects.

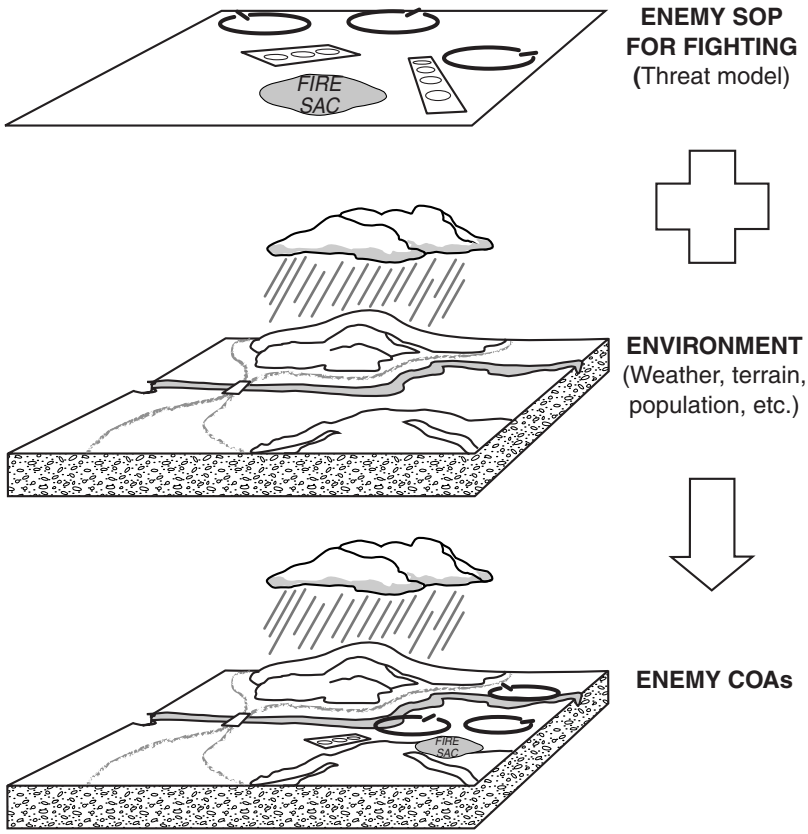

Figure 5-10. Combining Doctrine and Battlespace Effects to Develop Threat COAs.

- Ensure each COA identified is suitable, feasible, acceptable, unique, and consistent with threat doctrine or TTP and recently observed activities and patterns (see figs. 5-11 and 5-12).

Evaluate and Prioritize Each Course of Action

Analysts must evaluate each identified threat COA and prioritize it according to an estimate

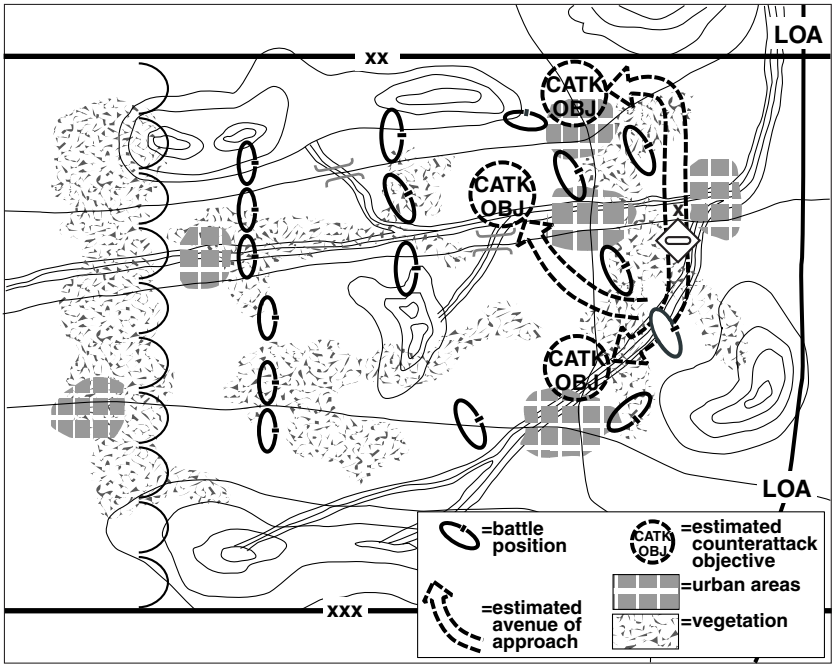

Figure 5-11. Enemy COA 1—Counterattack.

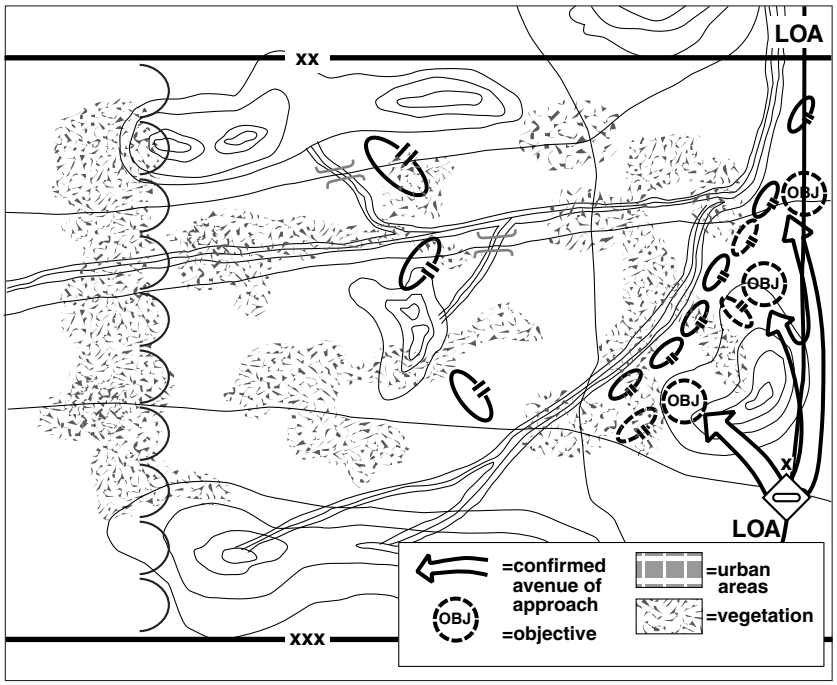

Figure 5-12. Enemy COA 2—Withdrawal from Current Position and Set Up Defense on Eastern Shore of River.

of likely adoption by the threat. The priority list allows the commander and staff to develop a plan for friendly COAs that is based on assumptions about the threat. Once the commander selects a friendly COA, the list may need to be reprioritized to reflect possible reactions to friendly dispositions and activities.

Develop Each Threat Course of Action in the Amount of Detail Time Allows

Once the complete set of threat COAs has been identified, analysts develop each COA in as much detail as the situation requires and time allows. The order in which each COA is developed is based on its probability of adoption and the commander's guidance. To ensure completeness, each COA must answer the following five questions:

- What (type of operation)?
- When (time the action will begin)?
- Where (sectors, zones, axis of attack)?
- How (method by which the threat will employ his/her assets)?
- Why (objective or end state of the threat)?

When developing each COA, analysts must consider threat forces at least one level above their own command level. For example, a battalion S-2 would consider the COAs available to threat regiments and brigades. This helps account for possible reinforcing forces and the higher threat command's objectives and intent. Generally, analysts consider threat COAs two levels of command below their own command when the MAGTF is in the offense and at least one level below their command when the MAGTF is in the defense. Thus the previously discussed battalion S-2 would depict missions and actions down to the platoon level.

Each developed threat COA has a situation template; a COA description, COGs, critical vulnerabilities, and options; and a listing of HVTs.

Situation Template

Situation templates are graphic depictions of expected threat COAs (see fig. 5-13). Templates usually depict the most critical point in the operation as agreed upon by the G-2/S-2 and G-3/S-3. An analyst may prepare several templates to illustrate different points of time in an operation, starting with the threat's initial array of forces. These templates are useful in depicting points where the threat may adopt branches or sequels to the main COA, places where the threat is especially vulnerable, or other key points in the battle such as initial contact with friendly forces. Situation templates are used to support staff wargaming and to develop event templates. Analysts construct a situation template by—

- Beginning with the threat model representing the operation under consideration.
- Overlaying the doctrinal template on the products (generally, COO or MCOO) that depict the battlespace environment's effects on operations.
- Adjusting the dispositions portrayed on the doctrinal template based on the battlespace environment's effects.
- Viewing the situation from the threat commander's point of view when selecting from among available options.
- Checking the situation template to ensure that all the threat's major assets have been accounted for, particularly the locations and activities of the HVTs listed in the threat model.
- Evaluating time and space factors to develop time phase lines (TPLs) to depict threat movement. The TPLs can be refined during wargaming (see fig. 5-13).

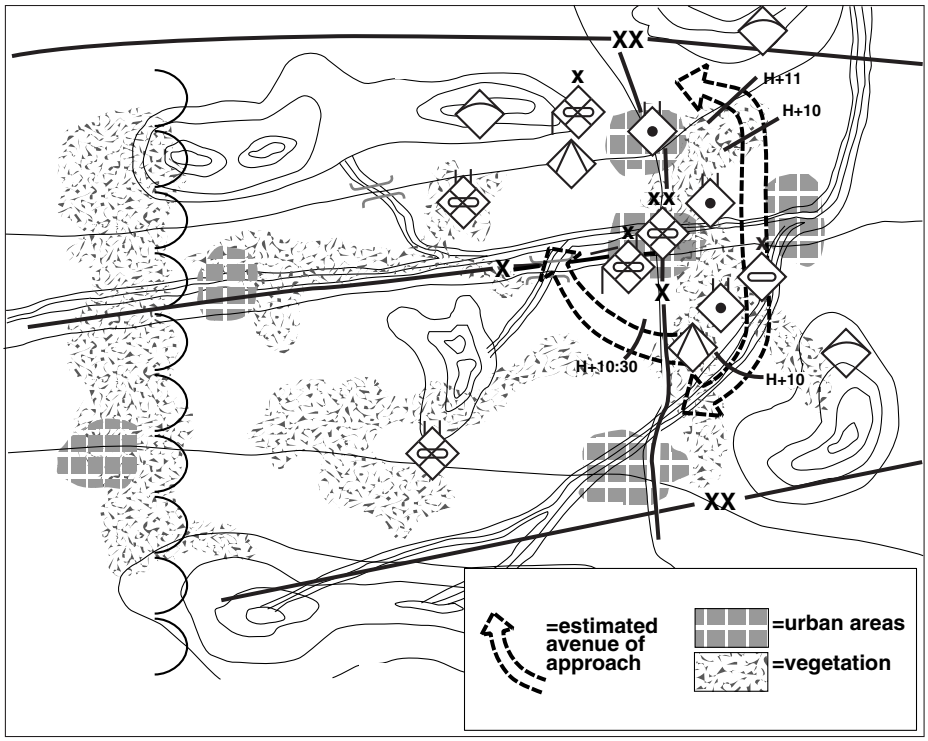

Figure 5-13. Counterattack Situation Template with TPLs and HVTs.

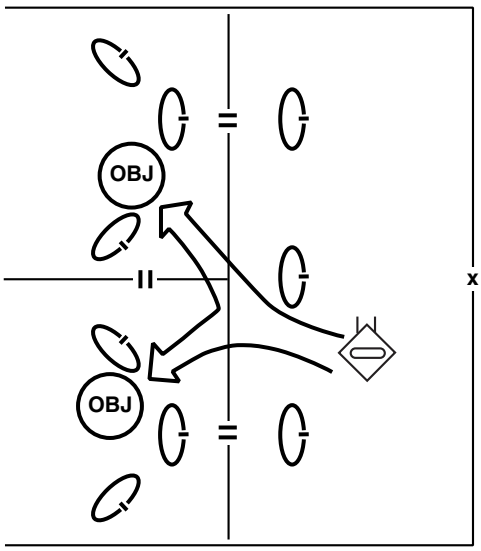
Description of the Threat's Courses of Action and Options

This is a description of the forces' activities depicted on the situation template. It can range from a narrative description or a combined graphics overlay or text matrix (see fig. 5-14 on page 5-20) to a detailed intelligence synchronization matrix depicting the activities of each threat unit and battlespace function in detail (see fig. 5-15 on page 5-20). The COA description supports staff wargaming and the development of the event template and supporting indicators. When preparing the description, analysts mentally war game the COA and attempt to tie threat actions and decisions to both time and space. The description should address the—

- Earliest time the COA can be executed.
- Threat COGs.
- Time lines and phases associated with the COA.
- Decisions the threat commander will make during and after execution of the COA.

Intelligence synchronization is more than simply ensuring that collection systems are operating 24 hours a day. The G-2/S-2 must plan and direct the intelligence system, receive the information it produces, process it, and then produce and disseminate intelligence of value to commanders and planners in time to support their decisions. The coordination of this entire cycle is intelligence synchronization. The IPB process provides the products and tools the G-2/S-2 needs to quickly evaluate incoming information and intelligence as it relates to the command's IPRs and IRs, intelligence synchronization matrix, and the decision support template (DST). These products and tools support the commander's decisions during COA execution and help the commander to quickly confirm or deny the assumptions used during COA wargaming. During operations, the commander and staff track the DST and the intelligence synchronization matrix against incoming intelligence and other tactical reports. As the commander and staff near each decision point, they look to the G-2/S-2 for the intelligence that supports that decision.



Description:

- Defense in two echelons with a reserve.
- Local counterattacks to restore defensive positions.
- Tank battalion counterattacks if defense compromised.
- Detailed and coordinated fire support plan supporting defense and counterattack.
- They prefer obstacle systems (usually minefields) that turn enemy forces into their engagement areas. They seldom employ fixing, blocking, or disrupting obstacles.
- Surface-to-air missiles usually deploy forward with companies. Antiaircraft artillery usually protects battalion assets.

Failure Options:

- Local counterattacks.
- Counterattack by division reserve.
- Withdraw.

Figure 5-14. Threat COA Overlay with Text Description.

Figure 5-15. Intelligence Synchronization Matrix.

Sometimes a battle progresses in a direction unanticipated during the initial IPB and wargaming, because the enemy follows his/her own plans and time lines. As the operation unfolds and the enemy's intentions become clearer, key staff members reinitiate the IPB and decision-making processes and conduct a modified war game as needed. During these sessions, the G-2/S-2 reviews and modifies the initial IPB. The battle staff then war games the best friendly response or preemptive action based on the updated set of IPB predictions. New decisions and COAs lead to updating and refining the collection plan, intelligence synchronization, and new decision support tools.

The intelligence synchronization matrix and other intelligence tools are consolidated and displayed within the current operations center to provide all watch leaders and personnel with critical current intelligence operations information. This tool is called the intelligence synchronization sheet, which is tailored to the command echelon or C2 node being supported (see fig. 5-16). Generally, the intelligence synchronization sheet includes lists of—

- Threat objectives and battlespace conditions.
- Current PIRs.
- Anticipated critical threat events, critical intelligence actions, and likely threat activities.
- Targeting priorities.
- Intelligence support priorities.
- Key intelligence collections, production, and dissemination activities.

High-Value Targets

While preparing and mentally wargaming the situation template, the analyst notes how enemy systems provide critical support to the COA. This

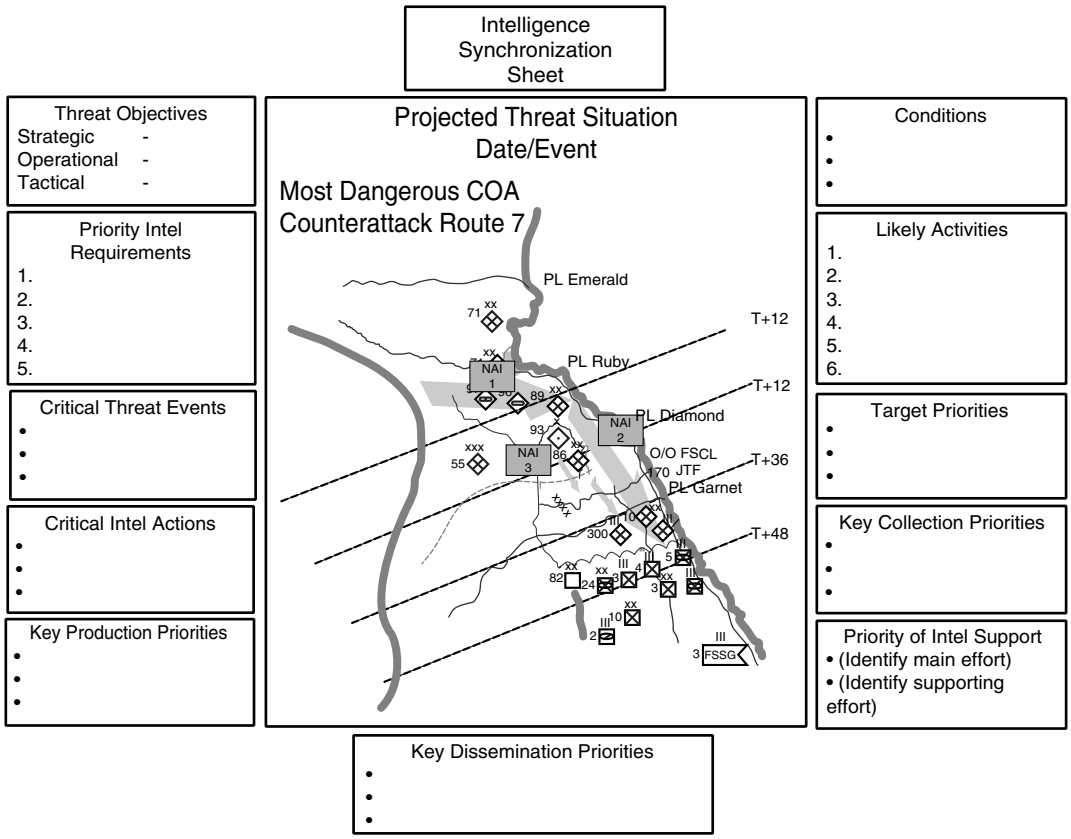

Figure 5-16. Intelligence Synchronization Sheet.

exercise leads to identification of HVTs that may be COGs, critical vulnerabilities, or assets, which if destroyed or neutralized may allow friendly forces to attack a COG or critical vulnerability. Once the HVTs list is compiled, analysts—

- Use the list in the threat model as a guide.
- Determine the effect on the COA of losing each HVT and identify likely threat responses.
- Identify the times or phases in the COA when the target is most valuable to the threat commander and make the appropriate notations on the list of HVTs.
- Transfer the refined and updated list of HVTs to the situation template (see fig. 5-17). The list will support staff wargaming and the targeting process.
- Note on the situation template any areas where HVTs must appear or be employed to make the operation successful.
- Focus on HVT locations at the times they are most valuable or just before. These are potential targeted areas of interest (TAI) and engagement areas that will be refined and used by the G-3/S-3.

Identify Initial Intelligence Collection, Production, and Dissemination Requirements

After identifying potential threat COAs, the analyst must determine which one the enemy will adopt. Initial collection requirements are designed to help answer the challenge. The identification of initial ICRs revolves around predicting specific areas and activities, which, when observed, will reveal which COAs the threat has chosen. The area where the analyst expects key events to occur is designated an NAI. The activities that reveal the selected COA are called indicators. Identified IPRs support prioritization and planning of necessary intelligence products, and identified IDRs support prioritization and planning for the eventual

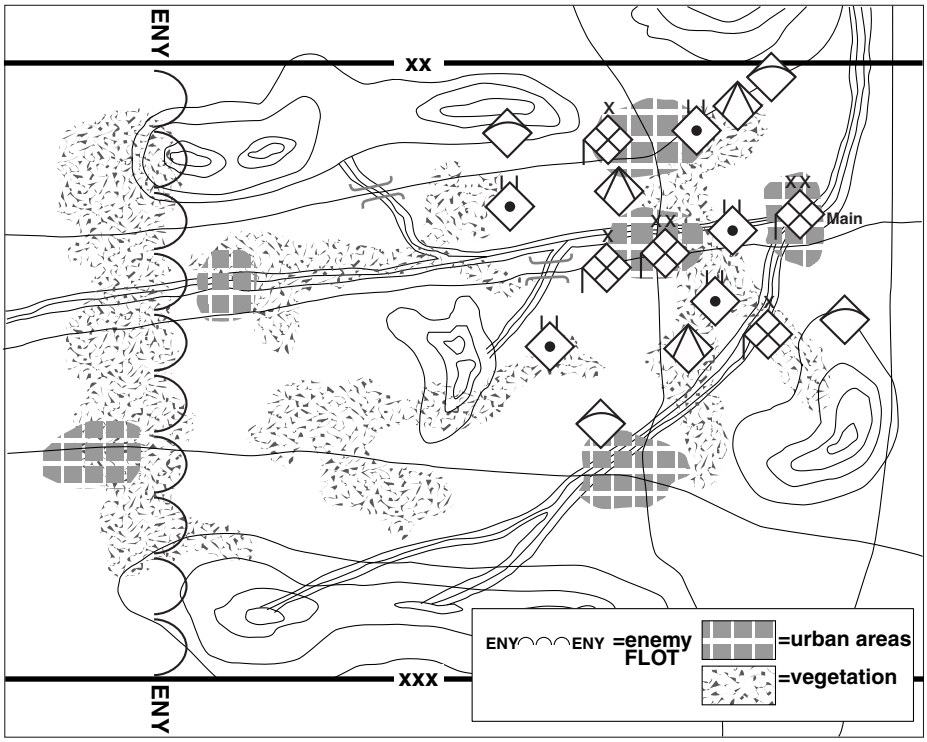

Figure 5-17. Templated Locations of HVTs for Enemy COA 1.

dissemination of intelligence products, such as the event template and event matrix, to commanders and staff sections needing them.

The event template and matrix form the basis for planning integrated collection, production, and dissemination strategies, and synchronize friendly intelligence operations. They enable the G-2/S-2 to develop precise ICRs, IPRs, and IDRs by maximizing the effectiveness of limited resources over extended areas against a vast array of threat targets.

Event Template

The differences between the NAIs, indicators, and TPLs associated with each threat COA form the basis of the event template (see fig. 5-18). The event template is a guide for collection, reconnaissance, and surveillance planning. It depicts where to collect information that will indicate which COA the threat has adopted.

Analysts evaluate each threat COA to identify its associated NAIs. They mentally war game execution of the COA and note places where activity must occur if that COA is adopted. Intelligence analysts must pay particular attention to times and places where the threat's HVTs are employed or areas where HVTs can be easily acquired and engaged. Analysts must also consider places where the threat is expected to take actions or make decisions, such as adoption of a branch plan or execution of a counterattack. These areas will evolve into NAIs in support of targeting.

An NAI can be a specific point, a route, or an area. They can match obvious natural terrain features or arbitrary features, such as TPLs or engagement areas. Analysts must make the NAIs large enough to encompass the activity that serves as the indicator of the threat's COA.

Intelligence analysts compare, contrast, and identify the differences between each COA's NAIs

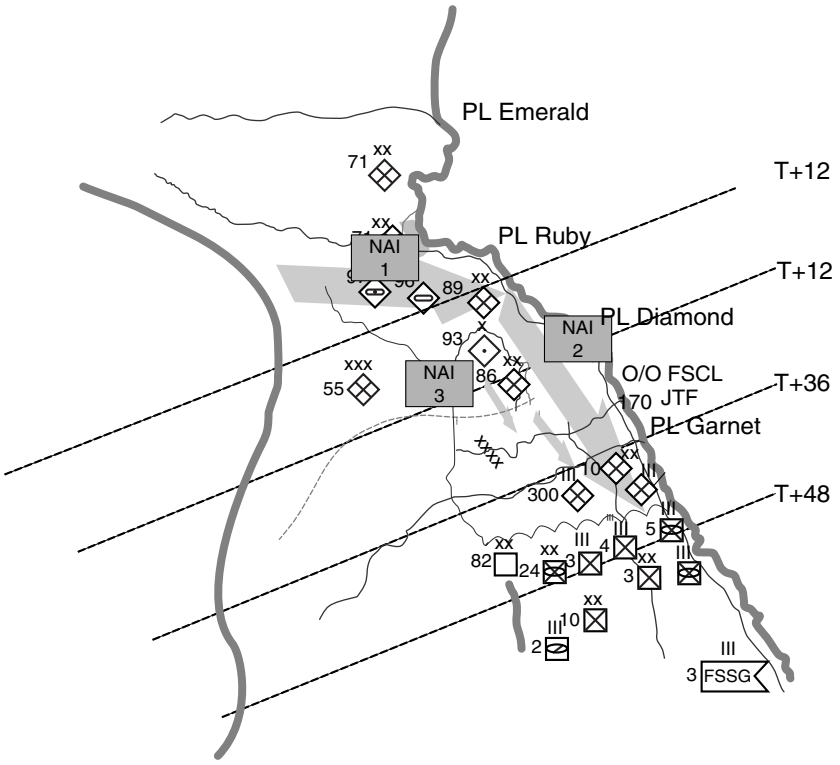

Figure 5-18. Event Template.

and indicators, concentrating on the differences that will provide the reliable indications of COA adoption. Selected NAIs are marked on the event template. The initial event template focuses on identifying which of the predicted COAs the threat has adopted. Analysts update and refine the event template and its supporting matrix to support friendly decisions identified during staff wargaming (see fig. 5-19).

Event Matrix

The event matrix supports the event template by providing details on the type of activity expected in each NAI, the times the NAI is expected to be active, and the relationship of the activity to other events on the battlefield. Primarily used in planning intelligence collection, the event matrix also serves as an aid to situation development (see fig. 5-20).

When preparing the event matrix, intelligence analysts—

- Examine the events associated with each NAI on the event template and restate them in the form of indicators.
- Enter the indicators along with the times the indicators are most likely to occur by using TPLs from the situation template or the description of the COA to establish the expected times.
- Record the latest-time-information-of-value time line, if available, based on the expected flow of events, as a guide for the collection manager.

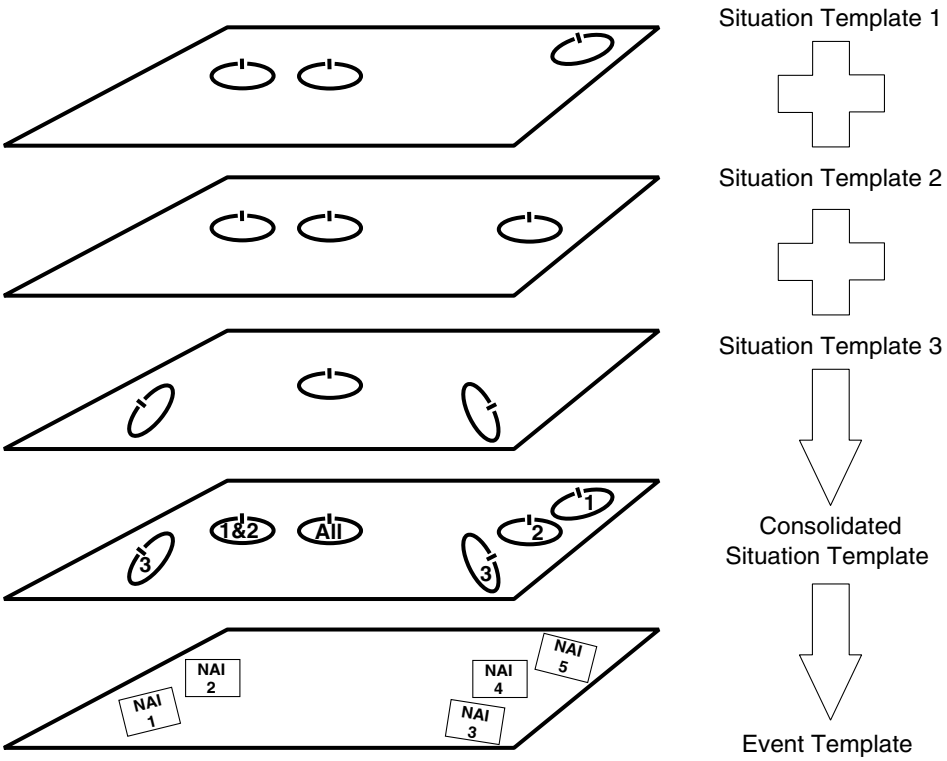

Figure 5-19. Event Template Development by Comparing and Contrasting Each COA's NAIs and Indicators.

NAI	Estimated Time	COA Indicators	COA 2 Indicators	COA 3 Indicators	Other COA Indicators
1	H-15		air assault forces

Figure 5-20. Detailed Event Matrix for a Specific NAI.

SECTION V. DECISION SUPPORT TEMPLATE

The DST is the capstone product in the staff planning process and the logical conclusion to IPB, although it is not part of the formal IPB process. The DST relates time, space, and threat actions to assist the commander in determining when decisions need to be made, either to employ fires or maneuver forces (see fig. 5-21 on page 5-26). This template helps the commander think ahead in the battle to reduce uncertainty and aids in recognitive or intuitive decisionmaking.

The DST is normally developed during COA wargaming as threat and friendly actions are compared in time and space. Unlike the previous products, the DST is a staff product prepared under the staff cognizance of the G-3/S-3. It reflects the judgment and expertise of the intelligence, maneuver, fires, CIS, and logistic support staffs. The threat COA models, the event template, and event matrix developed during IPB form the basis for and drive wargaming and development of the DST.

Targeted Areas of Interest

Through event templating, identification is made of those areas on the battlefield where significant events and activities will likely occur and where targets will likely appear. As the wargaming process proceeds, the staff identifies areas where the commander can influence the action through fire and maneuver. These areas are designated TAIs. A TAI is an engagement point or area, usually along a mobility corridor, where the interdiction of threat forces by fires, maneuver, or jamming will deprive or reduce a threat capability. It can also cause the threat commander to abandon a particular COA or require the use of unusual support to continue operations. Times and

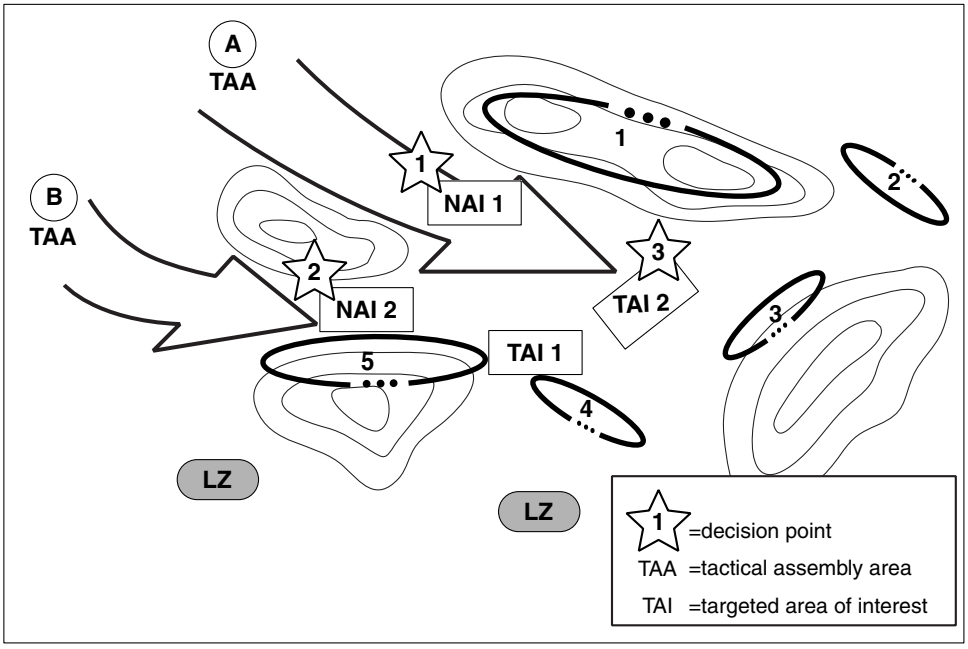

Figure 5-21. Decision Support Template.

locations where HVTs will appear are particularly suited to become TAIs.

The identification of TAIs is a joint effort between the intelligence, operations, and fire support staffs. The intelligence staff identifies the times and places where opportunities present themselves and the effect of interdiction on threat capabilities. The operations and fire support staffs consider the availability of interdiction resources, the effects of interdiction on the accomplishment of the friendly mission, and the priorities for the use of available resources.

Decision Points

Following the selection of TAIs, analysts identify decision points. The location of decision points is largely influenced by the availability and capability of friendly fire and maneuver systems; therefore, decision point selection is primarily a G-3/S-3 function, with support from the fire support coordinator and other key participants in the planning staff.

Types

Decision points identify battlefield events that may require tactical decisions. These points also identify when the tactical decisions must be made for the commander to retain available options. Examples of the types of decisions include—

- Commit the reserve.
- Surge friendly air support.
- Concentrate artillery on TAIs, perhaps in conjunction with electronic attack (EA) operations.
- Deliver scatterable mines.
- Shift the main effort.
- Commence the next phase of an operation.
- Change subordinate unit's overall mission.
- Request assistance from higher headquarters.

Considerations

Decisions must be made early enough to ensure that they can be coordinated across all command echelons and implemented in time to achieve the desired results. The developed NAIs must

provide the required indicators in sufficient time and preciseness to ensure timely decisions.

When identifying decision points, the G-3/S-3 must consider the—

- Time required for intelligence collection, processing, analysis, production, and dissemination to take place.
- Time required to prepare and/or move friendly assets that will execute the mission.
- Activities and movements of the target or threat during the time elapsed between decision and execution.

As the wargaming progresses, a recorder tracks decision points, both by time and location, and develops the synchronization matrix to ensure all battlespace functions are working in harmony toward the same goals. After the commander selects a friendly COA, the intelligence staff develops detailed collection and dissemination plans to support the decision points, NAIs, and TAIs.

SECTION VI. ABBREVIATED INTELLIGENCE PREPARATION OF THE BATTLESPACE PROCESS

Many of the steps involved in IPB are time, labor, and resource intensive, especially at lower tactical echelons where automated systems and personnel support for terrain analysis and other intelligence production functions are usually not available. Those same echelons generally have less time available for the IPB process. Besides the available time, intelligence personnel and resource constraints affect the scope and depth of IPB activities. Consequently, most Marine Corps units use the abbreviated IPB process.

The intelligence product that results from the abbreviated approach is far less than the comprehensive set of previously discussed products. The one-overlay product, when developed to a quality standard and focused on the unit's mission, PIRs, and IRs, has repeatedly proven to be effective on the battlefield. In its most elementary form, the IPB process can be abbreviated by working ahead, focusing on essentials, staying objective oriented, and minimizing essentials.

Work Ahead

When conducting an abbreviated IPB, intelligence personnel should complete as much work ahead of time as possible by—

- Establishing a series of base products, particularly those that deal with the battlespace environment's effects on operations.
- Keeping the products updated by periodic review instead of waiting until receipt of a new mission.
- Updating data bases on potential threats and changing the threat models as intelligence is received that indicates changes or evolution in threat doctrine.
- Conducting periodic reviews to ensure that the base IPB products, such as descriptions of the battlespace environment and the threat, are updated regularly.

- Becoming familiar with the support available from higher headquarters, theater intelligence centers, and Service agencies; knowing how to get needed information and products.
- Submitting PRs for information and intelligence products on areas where the unit is most likely to be employed.
- Developing checklists on how to get support, before, during, and after deployment.
- Maintaining an awareness of plans and priorities for all ICRs, IPRs, and IDRs submitted to higher headquarters.

Focus on Essentials

When starting the IPB effort, intelligence personnel should focus on essentials by—

- Considering the METT-T factors, particularly the factor of time.
- Determining how much time can be devoted to each step of the IPB process, and ensuring that the time line allows for the proper support of the planning and decisionmaking process.
- Deciding which products will be developed and to what degree of detail, and focusing on products most important to the mission.
- Identifying the full range of available threat COAs, rather than fully developing one threat COA at the expense of the others; determining the degree of detail required; and then developing all threat COAs to that level of detail.
- Working in a priority order established by the commander's intent and needs, and developing in detail only those COAs the commander has specified.

Stay Objective Oriented

The objective of IPB is to help the commander and staff make decisions and develop the best possible plans in the time available. This requires models of viable threat COAs that will influence mission accomplishment. Supporting the finished plan with intelligence requires a good event template and matrix.

Minimize Essentials

When minimizing essentials, intelligence personnel can get by with a good set of threat models and a good event template and matrix. They can also save time and materials by—

- Combining threat COA model templates and the event template on a single map overlay or using cartoons and sketches as a map substitute.
- Working directly from the map or sketch of major terrain features if the battlespace environment's effects have not been described.
- Identifying the set of threat COAs and briefly comparing them to determine which is most likely and which is most dangerous based on the current situation and the command's mission; and ranking the remaining threat COAs in order of likely adoption.
- Developing the most dangerous and most likely threat COA, and in the absence of guidance from the commander or G-3/S-3, using judgment in deciding which COA to develop first.
- Constructing an event template that focuses on identifying which of the two COAs the threat adopted, developing the remaining COAs, and working each COA in priority order.
- Incorporating each COA's NAIs in the event template as each threat COA is finished.
- Developing the second most likely or second most dangerous threat COA if the most likely COA is also the most dangerous COA, and ensuring at least two COAs are war gamed.
- Waiting until the staff conducts wargaming before structuring the ICRs.

Output

Throughout the IPB process, various products such as the threat models, threat COA graphics, and the event template are produced to support staff planning. The graphics developed, particularly the weather and terrain effects graphics, the situational templates, and the event template, can be disseminated to assist subordinate units in their own planning. Done correctly, these graphics can provide tremendous volumes of understanding and knowledge in concise and easily usable forms. At other times, however, additional written products can and should be prepared. The two products discussed below are the most commonly used, and both are directly derived from the IPB process.

Intelligence Estimate

In order to facilitate staff planning, the G-2/S-2 prepares the intelligence estimate before the remainder of the staff complete their own estimates. The intelligence estimate is the standard means of conveying key basic and current intelligence and relating it to the operational mission. It is a snapshot in time and forms the basis for the facts and assumptions of the decision-making process, driving the other staff estimates and the remaining steps of the Marine Corps Planning Process.

At higher command levels, the intelligence estimate provides major portions of the commander's written estimate. The products of IPB are the basis for the intelligence estimate. If the G-2/S-2 lacks the time required to prepare a written estimate, usually graphics that depict the results of the IPB evaluations and analysis are used as a substitute. A detailed outline for the intelligence estimate format is provided in appendix A.

Target and Objective Studies

The IPB impacts development through the evaluation of terrain and weather and the association of threat forces at specific times and locations within the battlespace. Situation, event, and decision support templates identify NAIs. Once identified, NAIs can then confirm or deny a threat's activities or adoption of a particular COA. Decision points and TAIs are also identified, requiring key intelligence that supports either fire or maneuver. From the IPB and wargaming processes, HVTs and HPTs are derived. Target and objective studies are focused, detailed intelligence products that aid in the application of fires or the maneuver of forces against a specific target set or area. Small units, such as MEU(SOC)s, can also use these studies for mission preparation and execution. See chapter 8 for a detailed discussion of target development.

CHAPTER 6. ANALYSIS OF THE BATTLESPACE

Analysis of the battlespace is a comprehensive study to determine the characteristics and effects of weather, oceanographic, and terrain environmental factors on enemy and friendly operations throughout the commander's AO and AOI. The battlespace analysis serves as a basis for developing specific friendly COAs and for determining enemy capabilities and COAs. This analysis allows the commander and staff to—

- See the battlespace in both spatial (width, depth, height or airspace) and temporal (time) dimensions.
- Appreciate fully the opportunities and limitations afforded by major terrain and oceanographic features, zones of entry, transportation networks, obstacles, and built-up areas within the AO and AOI.
- Fit an operational concept to that battlespace environment.

The limits of the battlespace are determined for all aspects of air, surface, subsurface, land, space, and the electromagnetic spectrum that can impact friendly forces. Defining the limits of the battlespace is a joint effort between the operations and intelligence staffs based on the commander's guidance.

SECTION I. RESPONSIBILITIES

When time permits, the intelligence officer coordinates the development of a battlespace analysis based on anticipated missions. On receipt of the warning or execute order, the intelligence officer reevaluates the analysis in terms of the commander's assigned AO and potential AOI. Changes in the mission and the commander's AO and AOI, or receipt of additional or more accurate information, necessitate revision of the analysis as the operation progresses. Normally, MEF and higher headquarters staff prepare a detailed written analysis when planning anticipated missions. In MSCs, the G-2s may prepare a written analysis tailored to the unit's specific mission and intelligence needs. However, in most operations, the geospatial information and services officer, the intel bn commander or intelligence support coordinator, and the P&A cell officer in charge use the MEF's analysis supplemented by graphic representations of weather and terrain data covering the MAGTF's AO and AOI.

The intelligence officer is responsible for initiating, coordinating, and ensuring that the analysis of the MAGTF's AO and AOI is completed and disseminated. The final analysis represents a coordinated effort of the intelligence officer, the operations officer, and other staff personnel who contribute within their respective warfighting functional areas. At the MEF or MAGTF level, the following organizations and personnel contribute to the final analysis:

- Topographic platoon, P&A company, intel bn—
  - Provides tailored terrain, littoral, and infrastructure studies and factor overlays.
  - Supports integration of weather factors into terrain studies portraying environmental effects.
  - Disseminates products such as graphic tactical decision aids to support IPB and COA development.
- Staff weather officer, intelligence section, MEF CE provides operational weather forecasts and environmental impact graphics as well as other weather and climatic data (e.g., light and tidal information).

- All-source fusion platoon, P&A company, intel bn—
  - Develops information on sociological, political, economic, technological, and related conditions covering countries of interest.
  - Provides fused, all-source IPB and other intelligence products to support MEF staff planning and decisionmaking.
- Civil affairs officer provides information on civilian personnel, local labor conditions, and capabilities.
- Engineer officer assists in the analysis of routes, potential obstacles and barriers, and other information related to mobility and countermobility.
- Psychological operations officer assists in the assessment of local conditions for psychological operations.

SECTION II. CHARACTERISTICS OF THE BATTLESPACE

The limits of the battlespace are determined for aspects of air, surface, subsurface, land, space, and the electromagnetic spectrum, which can directly or indirectly impact friendly forces. The battlespace generally includes all or most of the AO as well as the AOI. The AOI encompasses that area beyond the AO from which intelligence and information are required to permit planning, decisionmaking, and the successful conduct of operations. Defining the limits of the AO, the AOI, and the battlespace is a joint effort between the operations and intelligence staffs based on the commander's guidance. The AO and AOI are dynamic in nature and include interrelated factors capable of affecting a unit's operation.

The battlespace is measured in four dimensions: depth, width, height, and time. A battlespace analysis of the AO and AOI evaluates and integrates four environmental dimensions: terrain analysis (land), hydrographic analysis (sea), airspace analysis (air), and climatological analysis (weather). The battlespace analysis study allows the operational commander and staff to fully appreciate the opportunities and limitations afforded by major terrain and oceanographic features, zones of entry, transportation networks, obstacles, and built-up areas within the AO and AOI and fit an operational concept to that environment.

SECTION III. TERRAIN ANALYSIS

Terrain analysis is the evaluation of natural and manmade geographic features. This evaluation provides the planning headquarters with information on AAs (location and trafficability), zones of entry (deep, close, and rear areas), and key or decisive terrain.

Responsibilities

Much of the detailed terrain analysis work is done by P&A company GEOINT support teams attached to or in direct support of the MSCs or by GEOINT teams attached to a MEU(SOC) CE. The P&A company's topographic platoon and imagery intelligence platoon personnel conduct the major portion of the terrain analysis production by—

- Using data bases as a guide for collection, production, and dissemination planning and operations while focusing on the areas of most importance to the commander and the mission.
- Combining data base information with the results of tactical, aerial, and ground reconnaissance.
- Working closely with staff weather officers to ensure terrain analysis products incorporate the effects of current and projected weather phenomena.

- Using AO and AOI reconnaissance analysis results to focus on areas of most importance to the commander and the mission.
- Analyzing terrain continuously to evaluate the effects of changes in the battlespace environment.
- Forming conclusions regarding the effects of terrain through analysis of the military aspects of the terrain, and evaluation of the terrain's effects on military operations.

Sources of Information

National Imagery and Mapping Agency produces numerous digital data bases that support the development of geospatial factors and geographic classification. Topographic and geodetic maps, aerial charts, and facility maps are basic sources of information used by terrain analysts. Topographic publications can also be obtained from—

- Geographic societies.
- Engineering and scientific firms.
- Government intelligence agencies.
- Libraries.
- Bookstores.
- Universities.

Geospatial Factors

Terrain analysts need data on the trafficability of soils, the presence of bedrock, as well as the type and density of vegetation when developing cover and concealment, cross-country movement, or other geographic data bases.

Surface Configuration

Surface configuration refers to the shape of the earth's land surface. Terrain analysts study surface features such as mountains, slopes, ravines, embankments, ditches, plowed fields, and rice field dikes, because they can profoundly influence military operations. This factor is limited only by physical shape, size, and arrangement; it is not concerned with whether the feature is manmade or of natural origin.

Analysts categorize surface features or landforms by size and shape. The principal groups of landforms are plains, hills, and mountains; within each of these groups are smaller surface features, such as flat lowlands, and valleys. For geospatial analysis and GEOINT production purposes, major landforms are defined on the basis of local relief. Local relief represents the differences in the elevation of each landform group and subgroup (see table 6-1).

Table 6-1. Landform Elevations.

Landform	Elevation
Plains	less than 150 meters
Flat	less than 15 meters
Undulating	15 to 50 meters
Gently rolling	50 to 100 meters
Rolling	100 to 150 meters
Hills	150 to 600 meters
Low	less than 300 meters
High	300 to 600 meters
Mountains	more than 600 meters
Low	600 to 1500 meters
High	more than 1500 meters

Hydrologic Features

Hydrology is the science of surface and subsurface waters. Terrain analysts are concerned with the shape, size, distribution, and temporal variance of water bodies. Analysts classify hydrologic features as surface water, subsurface water, and wet areas.

Surface Water

This hydrologic feature encompasses inland waters, which are classified as watercourse (e.g., streams, rivers, canals) and standing bodies of water (e.g., lakes, ponds, glaciers). Terrain analysts evaluate watercourses because drainage conditions vary from place to place and from time to time. Military planners are concerned with the flow and channel characteristics of these watercourses and their effect on military operations. Water bodies affect the characteristics of surface drainage by storing precipitation and runoff and by retarding or augmenting flood flows. These water bodies can obstruct cross-country movement or provide AAs when sufficiently frozen.

Subsurface Water

Groundwater or subsurface water is located beneath the surface of the earth. Groundwater is less susceptible to contamination and may be the only source of water in arid regions.

Wet Areas

These tracts of ground are covered with water seasonally or perennially (e.g., swamps and marshes). These areas are treated separately in the collection of data because information requirements differ from other water bodies, especially in evaluation for cross-country movement.

Vegetation Features

Vegetation includes plant life growing on the surface of the earth or other flora in or on the water. Terrain analysts evaluate area vegetation to determine the potential effect on vehicular and foot movement, concealment, cover, observation, airdrops, and construction. The vegetation present indicates the climatic conditions, soil, drainage, and water supply. Vegetation is grouped by type (e.g., trees, scrub and shrubs, grasses, crops).

Trees

This group of vegetation includes perennial woody plants at least 10 feet in height, with single stems and defined crown shapes. An area extensively covered by trees is classified as a forest. Smaller areas covered by trees are classified as woods, groves, or woodlots. On military maps, any perennial vegetation high enough to conceal troops or thick enough to be a serious obstacle to free passage is classified as woods or brushwood.

Scrub and Shrubs

Either deciduous or coniferous, scrubs include a variety of trees that have had their growth stunted because of soil or climatic conditions. Scrub growth includes cactus, stunted shrubs, sagebrush, mesquite, and similar plants found in arid or semiarid areas.

Shrubs, like trees, are either deciduous or coniferous. Shrubs comprise the undergrowth in open forests; in arid and semiarid areas they are the dominant vegetation. Shrubs normally offer no serious obstacle to movement and provide good concealment from ground observation; however, they may restrict fields of fire.

Grasses

This vegetation group includes nonwoody plants. A grassland is an extensive area where the natural vegetation consists primarily of grasses and herbaceous plants, the dominant type in alpine and certain semidesert areas. In low latitudes, grasslands often are termed savannas; in middle latitudes, they are called prairies (tall grass) and steppes (short grass). Grasslands in wet or poorly drained areas are commonly called meadows. For geospatial analysis purposes, grass more than 1 meter (3 feet) high is considered tall, and below that height, grass is considered short. Grass often improves the trafficability of some soils; very tall grass may also provide concealment for foot troops.

Field Crops

The predominant class of cultivated vegetation is field crops. Vine crops and orchards are common but not widespread, and tree plantations are found in relatively few areas. Sizes of cultivated areas range from paddy fields covering a quarter of an acre to vast wheat fields extending for thousands of acres. In a densely populated agricultural area where all arable land is used for the crop that brings the highest yield, it may be possible to predict the nature of the soils from information about the predominant crops.

For example, rice requires fine-textured soils. Other crops generally must have firm, well-drained land. An area of orchards or plantations usually consists of rows of evenly spaced trees, which shows evidence of planned planting that can be distinguished on aerial photographs. Usually such an area is free from underbrush and vines. Rice fields are flooded areas surrounded by low dikes or walls. Some crops, such as grain, improve the trafficability of soils, while other crops, such as vineyards, present a tangled maze of poles and wires that are definite obstacles to vehicles and dismounted troops. Wheeled vehicles and some tracked vehicles are unable to cross-flooded paddy fields, although they can negotiate them when the fields are drained or frozen.

Surface Materials

Terrain analysts evaluate the composition and physical properties of the earth's surface materials, which are classified as soil and rock, to determine their effects on military operations and construction.

Soil

This unconsolidated material is an accumulation of disintegrated and decayed rock and vegetation that overlies bedrock. This accumulation can be hundreds of feet thick or it may be absent in given areas. Soils between 15 centimeters (6 inches) and 2 meters (6 feet) in depth are the most important. Next in importance are the soils from 2 to 6 meters (6 to 20 feet). Soil depth can be measured directly from borrow pits, road cuts, building excavations, and stream banks. For field identification, analysts classify soils as gravel, sand, silt, clay, and organic matter.

Rock

Rock is the firm or consolidated mineral matter of the earth's crust. Bedrock is solid undisturbed rock either exposed at the surface or underlying the soil. Terrain analysts evaluate the physical and engineering characteristics of bedrock for use in construction and in locating ground water.

Military Aspects of Terrain Evaluation

Using portions of the IPB process, the intelligence officer evaluates the battlespace in terms of **K**ey terrain, **O**bservation and fields of fire, **C**over and concealment, **O**bstacles, and **A**As and mobility corridors (KOCOA). The KOCOA analysis is appropriate at the battalion, squadron, regimental, Marine aircraft group, and CSS detachment levels. At division, Marine aircraft wing, force service support group (FSSG), and higher levels, KOCOA is absorbed into the terrain analysis process. Analysts use KOCOA to determine which friendly COAs can best exploit the opportunities the terrain provides and how the terrain affects the threat's available COAs.

Key Terrain

Key terrain is any location or area that the seizure, retention, or control of affords a marked advantage to either combatant. Terrain analysts depict key terrain on overlays with a large "K" in a circle that encloses and follows the contours of the designated terrain.

Observation and Fields of Fire

Cover and concealment factors can limit or deny observation. Observation analysis is useful in—

- Selecting LZs and DZs.
- Planning helicopter forward arming and refueling point (FARP) locations.
- Identifying areas vulnerable to aerial intelligence collection systems.
- Selecting low-level flight routes and aerial battle positions.

An ideal field of fire for flat trajectory weapons is an open area in which the threat can be seen and on which he/she has no protection from the fire of those weapons, out to the weapon's maximum effective range.

Geographic factors that offer good observation and fields of fire generally favor defensive COAs. Analysts represent areas of poor observation and fields of fire on an overlay with marked parallel diagonal lines or crosshatching. Observation and fields of fire evaluations identify—

- Potential engagement areas (often referred to as fire sacks or kill zones).
- Defensible terrain and system or equipment positions.
- Locations where maneuvering forces are most vulnerable to observation and fires.

Cover and Concealment

Analysts can combine the cover and concealment evaluation with the overlay developed during the observation and fields of fire evaluation (see fig. 6-1). When preparing the overlay, analysts identify factors that provide cover and concealment. Commanders and staffs use the results of the evaluation to—

- Identify and evaluate AAs.
- Identify defensible terrain and potential battle positions.
- Identify potential assembly and dispersal areas.

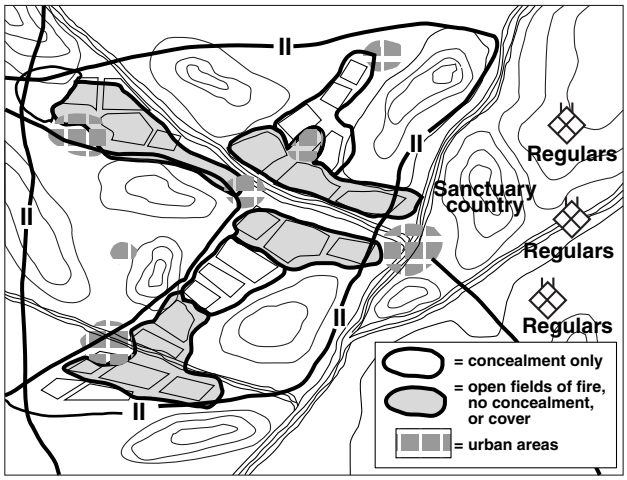

Figure 6-1. Concealment and Cover Overlay.

Cover that provides protection from the effects of direct and indirect fires can be provided by—

- Ditches.
- Caves.
- Riverbanks.
- Folds in the ground.
- Shell craters.
- Buildings.
- Walls.
- Embankments.

Concealment that provides protection from observation can be provided by—

- Woods.
- Underbrush.
- Snowdrifts.
- Tall grass.
- Cultivated vegetation.

Obstacles

Analysts identify natural and manmade obstacles that stop, impede, or divert military movement. Obstacles to air mobility include features that exceed the aircraft's service ceiling, restrict nap-of-the-earth (NOE) flight, or force the aircraft to employ a particular flight profile. An evaluation of obstacles leads to the identification of mobility corridors. This in turn helps identify defensible terrain and AAs.

Evaluation

When evaluating obstacles, analysts—

- Identify pertinent obstacles in the AO by considering—
  - Vegetation.
  - Surface drainage.
  - Surface materials.
  - Surface configuration.
  - Transportation systems (e.g., bridge classifications, road conditions).
  - Weather effects (actual or projected).
- Determine the effect of each obstacle on the mobility of the evaluated force by preparing a separate overlay for each factor, or combine the effects of individual obstacles into an integrated product or COO, which depicts the battlespace effects on mobility.

Classification

Analysts graphically depict and classify the cumulative effects of obstacles as unrestricted, restricted, and severely restricted areas, which are defined below:

- Unrestricted. Indicates terrain free of any restrictions to movement. Nothing needs to be done to enhance mobility. Typically this terrain is flat to moderately sloping terrain with scattered or widely spaced obstacles such as trees or rocks, which allows for armored or mechanized forces and wide maneuvers.
- Restricted. Indicates terrain that hinders movement to some degree. Units may have difficulty maintaining preferred speeds, moving in combat formations, or transitioning from one formation to another. This terrain slows movement by requiring zigzagging or frequent detours. Moderate to steep slopes or moderate to densely spaced obstacles such as trees, rocks, or buildings may restrict armored or mechanized forces. Swamps or rugged terrain may restrict dismounted infantry forces. Poorly developed road systems may restrict logistical and rear area movement. Analysts depict restricted terrain on overlays and sketches by marking the areas with parallel diagonal lines.
- Severely restricted. Indicates terrain that severely hinders or slows movement in combat formations unless some effort is made to enhance mobility. The mobility enhancement efforts could include committing engineer assets to improve mobility, moving in column instead of line formations, or moving at slower than preferred speeds. Steep slopes and large or densely spaced obstacles with little or no supporting roads typically characterize severely restricted terrain for armored and mechanized forces. Analysts depict this type of terrain on overlays and sketches by marking the areas with crosshatched diagonal lines.

Avenues of Approach and Mobility Corridors

To develop the air or ground routes of an attacking force, analysts must identify and categorize mobility corridors. Mobility corridors are areas where a force is channeled around obstacles. The best mobility corridors use unrestricted terrain with enough space for a force to move in its preferred doctrinal formations while avoiding major obstacles. These corridors usually follow the direction of roads and trails.

Considerations

Analysts use the COO to identify mobility corridors wide enough to permit maneuver in tactical formations. If friendly and threat forces require

mobility corridors of different widths as a result of organizational or equipment differences, analysts may conduct two separate evaluations. Identification of mobility corridors requires some knowledge of friendly and threat organizations for combat and preferred tactics. When identifying mobility corridors, analysts must evaluate obstacles and force mobility. The analyst should also consider that—

- Mechanized and armored units generally require large open areas to move.
- Dismounted infantry, most insurgents, and terrorists are less restricted by the presence of obstacles or hindering terrain and prefer areas that provide concealment and cover.
- The mobility corridor used by a jet aircraft with a minimum operating altitude of 1,000 feet is quite different from that considered by a helicopter with a maximum service ceiling of 10,000 feet.

Categories

Once identified, mobility corridors are categorized according to the size or type of force they will accommodate. Mobility corridors are normally identified for forces two echelons below the friendly command. In addition, where terrain is restrictive, the evaluation may need to look several echelons below the friendly command.

Analysts group mobility corridors together to form AAs. Avenues of approach may include areas of severely restricted terrain since they show only the general area through which a force can move. Analysts depict AAs on an overlay using an outline arrow that encompasses the mobility corridors. Threat AAs are generally depicted in red, friendly AAs are depicted in blue.

Evaluation

During offensive operations, analysts evaluate AAs to recommend the best route to the command's objective and to identify avenues available to the enemy for force withdrawal or movement of reserves. During the defense, analysts identify AAs that support the threat's offensive capabilities and avenues that support the movement and commitment of friendly reserves.

An evaluation of AAs identifies those that best support maneuver capabilities. This evaluation should be a combined effort performed by the intelligence section, the imagery and mapping officer or GEOINT support team, and the operations section. These AAs are evaluated for—

- Access to key terrain and adjacent avenues.
- Degree of channelization and ease of movement.
- Use of cover and concealment.
- Use of observation and fields of fire.
- Sustainability.
- Directness to the objective.

SECTION IV. HYDROGRAPHIC ANALYSIS

Sea or hydrographic analysis is the study of areas containing shorelines. Intelligence of coasts and landing beaches is important to military planners because the coast is a country's first line of defense. The hydrographic analysis is subdivided into the offshore, nearshore, and foreshore environments. The land analysis is subdivided into the beach and inland environments. Intelligence personnel conduct hydrographic P&A to evaluate coastal conditions that support amphibious operations. Amphibious operations require detailed oceanography studies that are discussed in Joint Publication (JP) 3-02, *Joint Doctrine for Amphibious Operations,* and FM 34-81, *Weather Support for Army Tactical Operations*.

Sources of Information

The Naval Oceanographic Office (Major Shared Resource Center, John C. Stennis Space Center, National Aeronautics and Space Administration, MS), conducts comprehensive analysis of littoral and hydrographic factors worldwide. Joint Intelligence Center, Pacific; Joint Forces Intelligence Command; and Marine Corps Intelligence Activity (MCIA) produce detailed imagery-based beach studies. Graphic and text-based analysis are available both online via intelligence link (INTELINK) or intelligence link-SECRET (INTELINK-S) and via request for production validated through the operational chain.

Hydrographic Conditions

Analysts evaluating the hydrographic conditions of a coastal region study seas and surf, tides, and currents that can affect amphibious landings.

Seas, Swells, and Surf

Seas are waves that originated in local storms. Swells are waves that have traveled hundreds to several thousands of miles from a distant storm before arriving at the landing site. Breaking waves or surf 4 feet in height normally are considered too high for amphibious assault operations or for logistics over the shore. By identifying the following types of breakers, analysts can determine the trafficability of the nearshore bottom:

- Spilling breakers indicate a gentle sloping bottom. The waves lose energy gradually as they approach shore by breaking only at the crest, and it is common to see a number of such breakers existing simultaneously.
- Plunging breakers indicate an unstable nearshore bottom. These waves break in a rollover, plunging action that causes abrupt changes in the form of a longshore bar or degree of steepness at the shore.
- Surging breakers indicate a steep nearshore gradient and are the least common of all types of breakers. This type of wave peaks near the shoreline, but instead of breaking or spilling, it actually surges up the face of the beach.

Tides

Tides are the alternate rising and falling of the sea caused by the gravitational attraction of the moon and sun. The tidal range is the complicated product of various forces, including local bottom configuration and the size and configuration of oceanic basins that can alter the height and time of the tides. When identifying beach widths, hazards, and depths, analysts must specify the time of day observations were made to permit tidal computations. Tidal information for most places on the coasts of the world can be obtained from tide tables published by the U.S. Department of Commerce.

Currents

Currents in the nearshore zone which influence amphibious landing operations are generally classified as wave-generated, tidal, or river currents.

Wave-Generated Currents

These currents are caused by the angular breaking of waves on the beach slope and the resultant back rush normal to the beach, which results in a littoral current (longshore current) in the nearshore zone, flowing generally parallel with the shoreline. It is found shoreward of the outermost edge of the breaker zone and varies in velocity or force with the force of the waves, their angle of impingement upon the shore, and the steepness of the foreshore. Littoral currents may be insignificant in terms of amphibious operations, or they may be strong enough to cause personnel to lose their footing, to make maneuvering of craft difficult, and to throw landing or assault craft out of control and expose them to broadside attack by the surf. Littoral currents are particularly significant where depths

shoreward of the breaker zone are such as to make wading hazardous.

Tidal Currents

These currents affect amphibious landings in the proximity of tidal inlets, estuaries, river mouths, and similar restricted channels. With large tidal ranges these currents may make the maneuver of landing craft on beaches adjacent to the tidal inlet extremely hazardous.

River Currents

Currents that extend from rivers into the open sea are frequently of such strength that they affect the maneuver of landing craft near the river's mouth.

Beach Selection Considerations

Beaches are the most prevalent natural features of the coastal region. They are accumulations of loose sand, gravel, or boulders that are shaped by waves and currents acting on the shore. Along many lowland coasts, beaches occur as barrier islands that parallel the coast and are separated by a lagoon or bay. Along other stretches of coast, beaches are backed by eroding cliffs, or the beach may be absent with high rocky cliffs facing the waves.

Hydrographic conditions shoreward of the 30-meter depth curve should be thoroughly investigated and surveyed. Shallower depths of the surf zone from 0 to 30 meters are of primary concern in amphibious operations because crafts ground and troops and vehicles disembark in this area. When preparing hydrographic beach surveys, analysts must—

- Record accurate locations of obstructions.
- Determine clear boat passages to the beach.
- Determine trafficability of bottom materials.
- Select suitable beaching locations for amphibious vehicles.
- Determine maneuver areas for crafts.

From a tactical perspective, the ideal sea approaches to the beach should have—

- No obstructions.
- Deep water close inshore.
- Nearshore gradients deep enough for dry-ramp beaching of landing craft and ships.
- Soil composed of firm sand with gentle gradients.
- Small tides.
- No currents or surf.

The ideal beach terrain should be—

- Flat or gently rising.
- Backed by a coastal range high enough to mask the landing area.
- Relatively clear.
- Firm with adequate drainage.

Analysts evaluate the following beach features to determine those areas that come nearest to the optimum landing requirements.

Size

Analysts measure the beach to determine the force size that can be supported. The beach size also defines requirements for follow-on logistical forces and establishment of logistical base sites or dumps. Analysts determine the usable beach length by measuring, in kilometers, the gross length minus unsuitable landing features, such as rivers and rock outcroppings. When preparing the overlay, analysts describe and plot—

- Unsuitable beach sections.
- Features that might affect movement along the beach.
- Beach widths available at the low-water tide stage (maximum width) and at the high-water tide stage (minimum width), noting each stage of the tide.
- Locations of major changes in width.

Approaches

Analysts identify major obstructions and obstacles in the offshore approaches for an area seaward of the 30-meter depth curve. More detailed analysis and information are provided shoreward from the 30-meter depth curve giving distances and azimuths of obstructions and obstacles from the centerline of the beach. When describing general approach conditions, analysts note the presence of—

- Shoals.
- Bars.
- Kelp beds.
- Island groups.
- Exposed rocks.

Gradient

The foreshore gradient may be so steep as to prohibit the landing of vehicles from beached craft without use of matting, or it may be so flat as to cause personnel and vehicles to move great distances from boats over exposed areas to cover. Analysts express the gradient as one unit of vertical rise in relation to horizontal distance (e.g., 1 foot vertical height over 20 feet of horizontal distance = 1:20). Gradient may also be given in percent of slope or degree of angle. Analysts record gradients when—

- High-water zone of the foreshore is much steeper than the foreshore.
- Seasonal gradient changes information is available.
- Backshores are not level.

Composition

A description of the characteristics of the beach material gives a valuable clue to the slope or gradient of a beach when other information is lacking. Analysts can determine the gradient by the size of the beach material and the character of wave action. The depth of beach materials and the nature of subsurface materials are also indications of beach firmness and trafficability.

Trafficability

The beach's ability to sustain troop and vehicle traffic depends on factors such as moisture content, slope, grain size, and compacting. When evaluating beach trafficability, analysts must consider the following general rules:

- Changes in beach firmness may occur in short periods of time.
- Sandy beaches are more firm when damp.
- Beach backshores are frequently dry and therefore soft.
- Pebbles and cobbles are firm for bearing capacity but are loose for vehicle traction.
- Clay is soft when wet, but combinations of clay and sand may be firm.
- Fine to coarse sand mixtures tend to be firm.
- Soft zones are common near the upper level of wave wash at high tide because air pockets are trapped under the wet sand.
- Sand beaches exposed to wave action are generally firmer than beaches of similar material in sheltered locations.

Vegetation

Beach vegetation rarely affects military operations except for mangrove. These tropical trees and shrubs normally grow in sheltered tidal areas that have a soft, fine bottom material, but they may exist on foreshores that do not experience heavy wave action. Analysts identify the mangrove's interlaced roots, which constitute a barrier to movement.

Natural Obstacles

Analysts evaluate cusps, beach ridges, scarp, and berm to identify areas that could impede movement.

Natural Cusps

These are more or less evenly spaced ridges or horns of beach material and intervening crescent shaped troughs. The horns trend at right angles to the shoreline and taper to their point seaward. Cusps present on beaches should be noted. There are several characteristics of this beach feature that may be significant in amphibious landings. Along gravel beaches, the cusps may develop very large proportions, rising several feet above adjacent troughs and becoming a serious hindrance to traffic. Cusps are soft, whereas the troughs are usually of the same firmness as the normal beach face.

Beach Ridges

These continuous mounds or ridges are created by wave action along the upper limits of the beach. They may occur as single ridges or as a series of parallel ridges extending some distance inland. Commonly 3 to 8 feet in height above mean high tide, beach ridges can attain a height of 30 feet on pebble beaches. Ridges may consist of sand, pebbles, or gravel. Gravel or shingle ridges are high and loose and are very difficult to traverse.

Scarp

This near-vertical face cut into beach materials is caused by erosive wave action and may be a formidable barrier to movement across the beach. Scarps cut into the backshore have permanence, but normal wave action will eliminate foreshore scarps.

Beach Berm

A horizontal formation of material deposited by wave action, beach berm begins at the limit of normal-wave up rush and extends landward. Where more than one berm exists, they are separated by beach scarps in various stages of deterioration. The seaward margin of a berm is know as the berm crest. Berms are usually dry and soft but may be firm for a short time when damp.

Manmade Obstacles

Groins, jetties, bulkheads, and sea walls are manmade structures that could hinder beach operations.

Groins

These structures are used to stabilize a beach. They are long, low, narrow structures extending seaward from the backshore that are built to trap water-suspended sand on shore. Because groins are usually built as a system of structures spaced at regular intervals along the beach, analysts identify them as obstacles to the lateral movement of vehicles.

Jetties

Used to improve and stabilize inlets and river mouths, jetties project seaward from the shoreline through the normal surf zone. They are larger and more massive than groins. They prevent sand deposits in the channel, regulate the inflow and outflow of tides and river discharge, and protect vessels entering the inlet or river. Analysts evaluate jetties to determine if they are high enough to protect vessels against storm wave action and to prevent sand movement in the channel.

Bulkheads and Sea Walls

These structures protect areas of the coast against heavy storm wave action. They limit the shoreward movement of destructive waves, but under severe wave action they may cause the removal of sand from the beach. Analysts evaluate bulkheads and sea walls because they are normally strongly built and difficult to break through, which can prevent troop and vehicular movement from the beach to inland areas.

Exits

Uninterrupted movement inland from a beach is necessary to provide direct, rapid support and supply of combat forces and to avoid the creation of lucrative targets of accumulated material

and personnel on beaches. However, movement off a beach inland onto favorable terrain in many localities is one of the most difficult aspects of a landing because of the prevalence of bluffs, dunes, swamp, or lagoons close behind the beach. Existing exits require little or no preparation. They may be manmade or natural, such as roads, ramps, stairs, paths, gullies, dry stream beds, and gaps between dunes. Another characteristic of an exit requiring evaluation is the width. An exit should have a minimum width of 8 feet to permit the passage of vehicles.

SECTION V. AIRSPACE ANALYSIS

The addition of the airplane and helicopter to the arsenal of war requires that the battlespace be viewed in terms of width, depth, and a third dimension, height or airspace (measured in cubic kilometers). Because airspace has no reference points to guide the analyst and evidence of air activity is erased seconds after the activity occurs, it is often difficult to establish NAIs, TAIs, and air operations decision points. Airspace analysts are required to tie air events to time and the ground and to integrate the terrain analysis with analysis of—

- Aircraft maximum service ceilings.
- Minimum operating altitudes for fixed- and rotary-wing aircraft.
- Maximum effective ranges of air defense weapons systems.

Geospatial Analysis Support

The intelligence staff receives support from the terrain team during airspace analysis. However, this support must be augmented by personnel from other functional areas with an understanding of the air threat, air defense systems and operations, and close air support techniques.

Geospatial analysis and GEOINT production in support of air defense, counter air, and air-associated operations deal with an environment that extends several thousand meters above ground level and with forces whose mobility is limited only by the ability of their equipment. Terrain analysis is required because aircraft and air defense elements use the terrain to their best advantage.

Standard military topographic maps are not normally considered suitable for other than the most basic airspace analysis. Standard 1:50,000-scale topographic maps are most useful when analyzing the ability of an aircraft to approach, acquire, and engage a target. The analysis of an aircraft's approach (from air base to target vicinity) or of enemy air corridors should be conducted using standard 1:250,000-scale joint operations graphic-air (JOG-A) specifically designed for this purpose.

Airspace Evaluation

The third dimension of the battlespace includes the air AO and the air AOI. The air AO is the area where the commander is assigned responsibility and authority for military operations. The air AOI includes airspace adjacent to the air AO and extends into enemy airspace upward to the maximum service ceiling of enemy aircraft and the maximum effective altitude of enemy air defense weapons systems. It takes into consideration any space-capable system, i.e., satellites. In addition, the air AOI may extend as far as enemy airfields and to the maximum range of enemy surface-to-surface missile systems. During the airspace evaluation of the battlespace, analysts identify potential locations of LZs, DZs, FARPs,

and forward assembly or expeditionary airfields to pinpoint requirements for further analysis.

Military Aspects of Terrain Evaluation

Terrain analysis for air operations focuses on the same military aspects of terrain as ground operations. However, the analysis of these aspects is directed first at their effects on airspace operations and then on their resultant effects on the overall operation.

Key Terrain

Key terrain in airspace analysis is any terrain feature that allows air defense weapons to engage channeled or constrained air or airborne forces. Analysts should identify—

- Areas that limit aircraft lateral movement.
- Areas that restrict air maneuver.
- Elevations higher than maximum aircraft service ceilings.
- Airfields.
- LZs and DZs.
- Fixed or surveyed air defense weapons and radar sites.
- FARPs.

Observation and Fields of Fire

As with ground operations, observation involves the effects of the terrain on reconnaissance and surveillance as well as target acquisition. Fields of fire involve the effects of terrain on weapon's effectiveness. In air defense, both counterair and other air operations are closely related to line of sight (LOS). Ground operations are concerned primarily with horizontal LOS; air and air-associated operations are primarily concerned with air and ground oblique and vertical LOS.

Attack aircraft and air defense assets want as much protection as possible from enemy observation, and both require direct LOS to the target. It is, therefore, necessary to analyze airspace regarding the routes which provide the best protection for aircraft entering the target area and those which provide the best fields of fire for the aircraft once it reaches the target area. Similarly, the analysts must consider where air defense assets can best be hidden from observation and retain good fields of fire against the primary air AAs and mobility corridors.

Cover and Concealment

Friendly force operations require cover from aerial direct fires and concealment from aerial reconnaissance and surveillance. The enemy also uses terrain to provide cover from direct fires and to conceal their operations from friendly detection. Analysts evaluate airspace routes that provide the best protection for aircraft entering the target area and identify locations where air defense assets can best be hidden from observation.

While not considered as either concealment or cover in the strictest sense, NOE flight enhances both fixed- and rotary-wing aircraft survivability. An NOE flight makes the optimum use of available terrain for concealment and cover and hinders quick countering responses by ground forces and air defense assets.

Obstacles

When evaluating terrain, analysts identify the following types of obstacles, which channel aircraft movement and restrict evasive' actions:

- Obstacles to the effective employment of air defense target acquisition or weapon systems (e.g., terrain that masks LOS, built-up areas, tall buildings, vegetation).
- Obstacles that restrict NOE flights, which are below 22.8 meters or 75 feet in height (e.g., tall trees; radio, television, and microwave relay towers; power transmission lines; support towers; smoke and obscurants; tall buildings).

- Obstacles that force aircraft to employ a particular profile or attack route or to gain excessive altitude that is above 22.8 meters in height (e.g., mountains, large hill masses, built-up areas, excessively tall trees).
- Obstacles that restrict lateral movement within the air AA or mobility corridor. These obstacles have the same effect on aircraft as ground obstacles, that is, channeling movement and restricting evasive action. They often become key terrain for the employment of air defense weapons systems.

Avenues of Approach

A good air AA permits maneuver while providing terrain masking from air defense weapons systems. In addition to the criteria evaluated for ground AAs, analysts consider the following variables when analyzing air AAs:

- Type of aircraft.
- Maximum service ceiling of the aircraft.
- Attack profile being employed.
- Weapon system or expected ordnance.
- Type of target to be attacked.

Weather

Aviation operations are especially susceptible to weather effects, because temperature, humidity, and cloud cover can have a significant impact on an aircraft's ability to use a particular AA. Analysts must evaluate the effects of visibility, wind speed and direction, precipitation, cloud cover, temperature, and humidity when conducting analysis for airspace operations.

SECTION VI. WEATHER ANALYSIS

Commanders and their staffs must acquire weather information about the entire battlespace area and know how to exploit the opportunities the weather offers while minimizing its adverse effects on personnel, equipment, and mission accomplishment.

Responsibilities

The following units and personnel are responsible for determining weather effects on the battlespace environment:

- MEF topographic platoon.
- MSC supporting GEOINT support teams.
- MEU(SOC) CE GEOINT teams.
- Staff engineer officer.
- Staff weather officer.
- Weather team.

Weather Effects

Weather, climate, and terrain are so interrelated they must be considered together when planning MAGTF operations. Weather elements are capable of drastically altering terrain features and trafficability. Conversely, terrain features exert some influence on local weather. This relationship of weather and terrain must be carefully correlated in terrain studies to produce accurate geospatial analysis. Terrain features are affected by such elements as visibility, temperature, humidity, precipitation, winds, clouds, and electrical phenomena. The specific factors described vary with the geographic area, time, and season. Terrain features also influence the climate of an area. The effects of temperature, humidity, precipitation, visibility, wind speed and direction, clouds, and atmospheric pressure can affect the battlespace environment, which can enhance or limit military operations.

Temperature and Humidity

Temperature is the value of heat or cold recorded by a thermometer, which is normally placed 6 feet above the ground. Temperatures are recorded in Fahrenheit and Celsius values.

Humidity is the water vapor content in the atmosphere. It is expressed as relative or absolute humidity.

When evaluating temperature and humidity, analysts must consider the following effects on operations:

- Aircraft efficiency is reduced in areas of high temperature and high humidity, because when temperature and humidity are high, the air is denser.
- Extreme temperature and humidity will reduce personnel capabilities and may necessitate a reduction of aircraft payloads.
- Tactics devised for one climatic zone may require considerable revision if used in another zone.
- High temperature and humidity conditions found in the tropics are conducive to growth of dense foliage and jungles, which affects trafficability and cross-country mobility.
- Cold weather periods—
  - Create a need for heated shelters.
  - Make the construction of fortifications difficult.
  - Increase the amount of dependence upon logistical support.
  - Necessitate special clothing, equipment, and combat skills.
- Periods of freezing temperatures—
  - Increase the trafficability of some soils.
  - Create ice sheets on roads, making movement more difficult.
  - Decrease a projectile's ability to penetrate the earth.
  - Increase the casualty effect of contact-fuzed shells.
- Melting snows may cause floods and avalanches.
- Temperature inversions (air nearest ground is colder than overlying air) cause the air to remain stable and to hold dust and smoke near the ground, which reduces both visibility and air purity.
- The amount of water vapor in the air affects the trajectory of projectiles.
- Humidity affects the distance sounds travel, thus affecting listening posts and sound-ranging operations.

Precipitation

Precipitation is any moisture falling from a cloud in frozen or liquid form. Common types of precipitation are rain, snow, hail, drizzle, sleet, and freezing rain. The intensity of precipitation is described as light, moderate, or heavy.

The primary significance of precipitation is its effect on the state of the ground and trafficability, on the efficiency of personnel, and on visibility. The effects of restricted visibility caused by precipitation are just as important as those caused by airborne particles such as dust or smoke. When evaluating precipitation, analysts must consider the following effects on operations:

- Rain, snow, and fog mask patrol and guerrilla activities by decreasing the enemy's surveillance and detection capability.
- Precipitation severely reduces trafficability by altering the surface condition of different soils to varying extents.
- Heavy rain may make some types of unsurfaced roads impassable.
- Heavy or prolonged precipitation usually aids the protected defense by limiting the mobility of an offensive force.
- Precipitation can drastically reduce the efficiency and effectiveness of exposed personnel.

- Precipitation may aid offensive operations by degrading the surveillance capabilities of radar, electro-optical, and infrared devices.
- Seasonal precipitation may change soil trafficability and affect cross-country movement.
- Seasonal floods or swelling streams may make fording and bridging operations difficult or impossible.
- Snow and sleet hamper movement on roads, often making them impassable in mountainous areas.
- Snow accumulations in mountains afford lower, drier regions with a water supply throughout the year.
- Precipitation usually has an adverse effect on visibility and observation.
- Rain may wash excessive impurities from the air.
- Rain and snow aid concealment, which may facilitate surprise attacks.
- Precipitation often limits operations of listening posts and many electro-optical systems.

Visibility

Weather personnel determine visibility by measuring the horizontal distance that the unaided eye can discern a large object or terrain feature. Visibility is reported in meters or fractions of a mile for the prevailing value of the visibility in all directions. Diminishing visibility measurements are noted in the remarks section of the weather observation report.

When evaluating the weather effects on military operations, analysts must consider that poor visibility—

- Aids ground offense and withdrawal.
- Restricts visual reconnaissance and surveillance.
- Tends to conceal concentrations and maneuver of friendly forces from the enemy, which enhances the possibility of achieving surprise.
- Hinders the defense because defensive cohesion and control are difficult.
- Decreases the ability to place aimed fire on the advancing force, making target acquisition less accurate.
- Enhances patrol activities and guerrilla operations by masking and screening movement.

Wind Speed and Direction

When weather personnel determine wind speed or velocity and direction, they measure the air movement rate past a given point and the direction from which the wind is blowing. A gust is a rapid fluctuation in wind speed with a variation of 10 knots or more between peak and lull.

When evaluating wind speed effects on the environment, analysts must consider the following effects on operations:

- Wind velocity on the surface and aloft favors the upwind force in any type of operation.
- Chemical and biological weapons will saturate the low-level, downwind atmosphere with contaminating aerosols.
- An upwind force, with the wind at its back, has better forward visibility and can advance easier and faster.
- Strong winds in arid or semiarid areas frequently raise large clouds of dust and sand, which greatly reduce observation.
- Blowing snow may reduce visibility over wide areas, which may ground observation aircraft and sensors.
- Winds tend to deflect projectiles from their normal paths, particularly when they are fired at long ranges. The effect that wind will have on a projectile increases with an increase in the wind velocity and the projectile size. The wind direction and velocity must be known to apply compensating corrections to firing data.

- Strong winds hinder amphibious operations by creating high seas, which can prevent landing craft from landing or retracting and restrict helicopterborne operations during the ship-to-shore movement.

Cloud Conditions

Cloud conditions are described by the amount and height of the cloud cover. Weather personnel measure the height of the cloud base from ground level and report that measurement in feet. A cloud base is the height of the lowest broken or overcast layer, while a cloud ceiling is the height of the highest layer of several scattered cloud layers. The types of clouds help determine the intensity and amounts of precipitation.

The type and amount of cloud cover, as well as the height of cloud bases and tops, influence ground tactics because they affect the entire range of both friendly and enemy aviation. Analysts should consider the following effects on operations when evaluating cloud conditions:

- Extensive cloud cover reduces the effectiveness of air support but provides a tactical advantage as cloud cover increases, as cloud bases lower, and as associated conditions increase (e.g., icing, turbulence, poor visibility).
- Clouds affect ground operations because they may limit illumination and visibility.
- As solar radiation interceptors, clouds tend to reduce extremes of surface temperature.
- Daytime cloudiness reduces the amount of heat received from the sun at the earth's surface, slowing down the drying of roads and affecting the trafficability of soils.
- Extensive night cloudiness prevents the loss of heat from the earth's surface, resulting in higher nighttime temperatures.
- Cloudiness affects air operations by limiting aerial observation and reconnaissance.

Atmospheric Pressure

The pressure exerted by the atmosphere at a given point is atmospheric pressure, which is measured by a barometer in millibars or in inches of mercury. The air density is measured at high and low altitudes and is reported as high pressure and low pressure. High pressure is critical to air operations because it affects the lift capability of helicopter and fixed-wing aircraft.

Weather Forecast and Weather Effects Products

While planners cannot control the weather, they should be able to exploit the opportunities offered by weather effects while reducing or minimizing its adverse effects on battlespace operations. Analysts provide planners with weather forecasts that cover the geographical layout of the battlespace and meet or exceed the duration of the planning and execution cycles. Using weather critical values tables created during IPB and weather forecast graphics (see fig. 6-2), analysts can quickly identify and determine the impact of weather effects on personnel, equipment, and planned operations. These impacts are displayed in the weather effects matrix (see fig. 6-3).

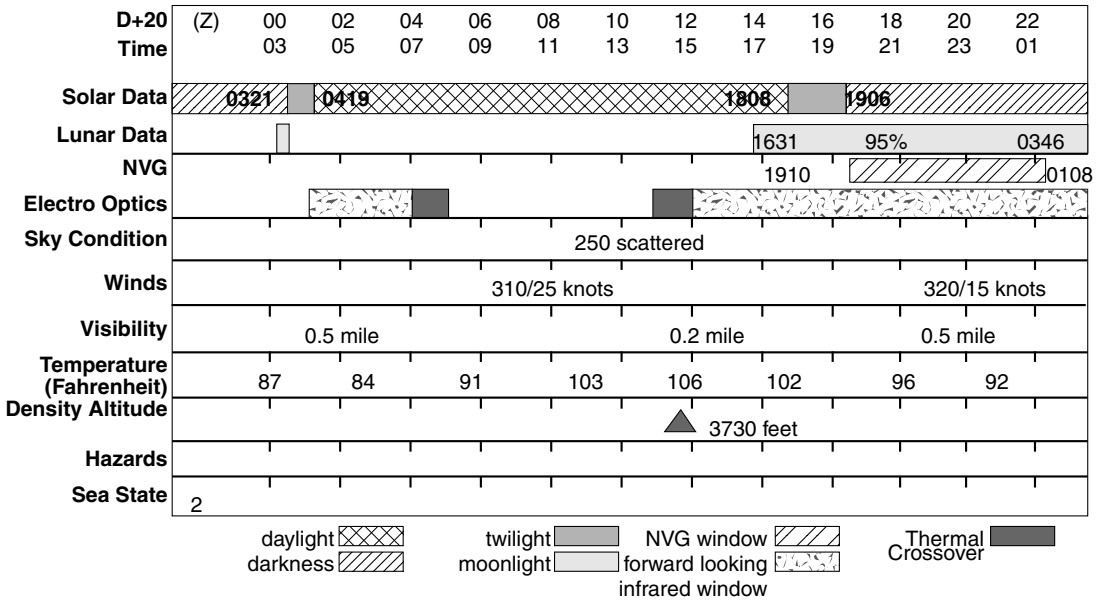

Figure 6-2. Weather Forecast Graphic.

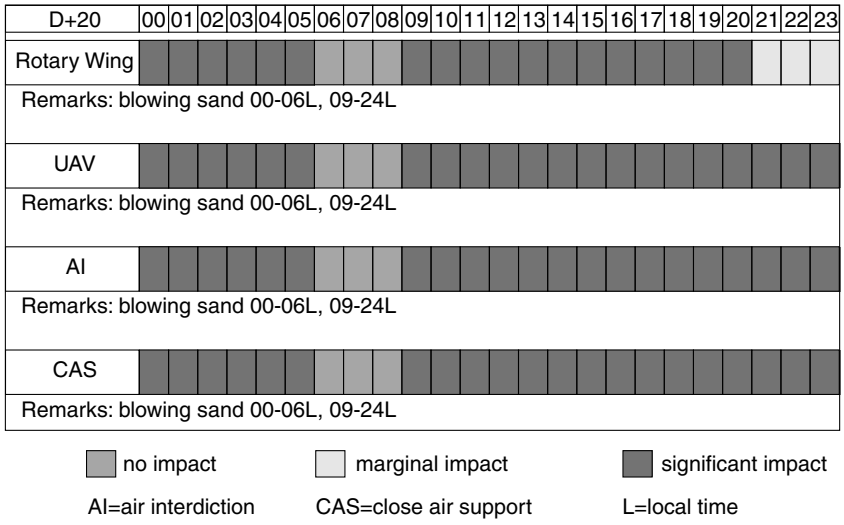

Figure 6-3. Weather Effects Matrix.

SECTION VII. INFRASTRUCTURE ANALYSIS

The infrastructure of a potential AO is a key element of information in an expeditionary environment. Points of entry, transportation systems, economic infrastructure, and social infrastructure, impact how friendly forces enter into, move through, and sustain themselves in the

AO. Infrastructure also impacts a potential threat's ability to conduct operations. The importance of particular facilities depends on the units involved and the type of operations envisioned. The study of a target area's infrastructure must focus on factors that are crucial to mission accomplishment. Most commands, particularly lower level tactical commands, must rely on other organizations and agencies to conduct infrastructure analysis and to provide accessible information.

Sources of Information

Detailed infrastructure analysis can be resource and time intensive, thus identification of analytical requirements prior to conflict or crisis helps ensure the availability of the information when needed. The intelligence staff must be familiar with all sources of infrastructure information that can be rapidly accessed when needed. Infrastructure analyses are performed by—

- Theater joint intelligence centers (JICs).
- U.S. Transportation Command.
- NIMA.
- Defense Intelligence Agency (DIA).
- Service intelligence centers (e.g., National Ground Intelligence Center, MCIA).
- Nonintelligence organizations (e.g., Marine Corps and Army civil affairs units).

Transportation System

In preparing intelligence studies, all transportation facilities must be carefully evaluated to determine their effect on the proposed operations. At higher levels of command, each major facility may be the subject of a detailed study by unit intelligence analysts or by external agencies such as theater JICs, U.S. Transportation Command JIC, or DIA.

Highway or Road Network

For intelligence purposes, a highway means roads, trails, multilane super highways, pack trails, and footpaths. Associated structures and facilities necessary for movement and for protection of routes, such as bridges, ferries, snowsheds, tunnels, and fords are integral parts of the highway system. An adequate highway system is required to conduct a major military operation. Military interest in highways of a given area or country covers physical characteristics of the existing system and various administrative and operational aspects pertaining to construction and maintenance.

Transportation studies should provide information on existing routes, major repair or rehabilitation requirements, and locations of new routes needed to support planned operations. The terrain study should indicate the minimum maintenance and construction requirements that may be anticipated during a planned operation. When evaluating the road network, analysts should consider—

- Routes in the combat zone should meet minimum standards.
- Roads in rear areas near water terminals, airfields, and supply installations must be well surfaced and capable of carrying heavy traffic without excessive maintenance.
- Operations on a wide front require a large number of secondary routes in forward and rear areas. The information presented in a terrain study should indicate the minimum maintenance and construction requirements that may be anticipated during a planned operation.
- Large volumes of heavy traffic severely abuse roads.
- Important bridges, intersections, and narrow passes are primary targets for enemy fires or unconventional operations.

- Maintenance should be conducted only on necessary routes.
- Construction of new routes must be held to a minimum.

Railroad Network

A railway includes fixed property belonging to the line. The fixed property includes land, facilities, bridges, tunnels, snowsheds, galleries, ferries, and other structures necessary for the movement of traffic. Railroad studies cover information pertaining to the development, construction, maintenance, and physical characteristics of the existing system. The network's physical characteristics information is necessary for determining capacities and maintenance requirements. Physical characteristics include the railroad's critical features, component parts (e.g., roadbed, ballast, track, rails/gauge), and horizontal and vertical alignment.

When evaluating railroad networks, analysts must consider the following factors:

- Railways are often the main transportation system in countries without an extensively developed road system.
- Suitability for mass movement and low susceptibility to weather effects make railroads useful for logistic support.
- Secondary and feeder railway lines are important to maneuver warfare with its emphasis on dispersal and the requirement for more and smaller rear installations.
- Railways and their associated facilities are highly vulnerable to enemy attack (e.g., sabotage, guerrilla operations).
- Keeping a railroad operational requires trained security forces and extensive protective measures.

Port and Harbor Facilities

Information and intelligence on ports, naval bases, and shipyard facilities is essential for estimating their capacities, capabilities, vulnerability, and other items of military significance. In wartime, principal and secondary ports and bases are prime targets for destruction. A port normally consists of a harbor plus terminal facilities. When natural, improved, or artificial harbors are developed for transactions between ship and shore, they become part of a port. Analysts classify these harbors as coastal, bay and estuary, and river. When evaluating port and harbor facilities, analysts are interested in harbor works, depths, navigable fairways, and anchorage.

Harbor Works

Structures designed to provide shelter, to control water flow, and to regulate erosion for the improvement of the navigability of a harbor are protective or harbor works. Harbor works do not include port facilities that are designed specifically for the transfer of cargo and the servicing of ships. The principal types of structures are—

- Breakwaters.
- Jetties.
- Groins.
- Sea walls.
- Bulkheads.
- Dikes.
- Locks.
- Moles.

Depths

Analysts compute depths of harbors, entrances, anchorages, wharves, and dry docks in reference planes based on tidal levels. When reporting depth, analysts must clearly indicate the reference plane or chart datum on the hydrographic chart. Datum established for ports is the basis for soundings.

Navigable Fairways

The approach, entrance, and the harbor itself frequently determine the size of ships that can

be accommodated in the port. Analysts must evaluate these fairway dimensions and describe any limitations on a ship's navigation (e.g., draft, length, beam, height above water). In addition, analysts should report ships' experiences entering the fairway.

Anchorage

Analysts show anchorage data on large scale charts and plans. Operational information reported includes—

- Anchorage designations.
- Berth assignments.
- Anchoring practices.
- Ships' experiences.

Airfields

Whether military or civilian, airfields are of vital importance to military combat situations. The size and features of an airfield determine its combat and reconnaissance capabilities.

Types

Installations termed airfields include—

- Air bases.
- Airports.
- Airstrips.
- Landing strips.
- Air depots.
- Heliports.
- Helipads.
- Seaplane stations.

Characteristics

Analysts conduct geographic studies to identify the airfield's—

- Type.
- Physical dimensions.
- Construction materials.
- Field condition.
- Support facilities.

Considerations

When evaluating the airfield, analysts report answers to the following questions:

- Is it serviceable?
- Is it occupied?
- Is it under construction?
- Is it in full or partial operations?

Structures and Crossings

Structures and crossings on highways or railways may reduce or interrupt the flow of traffic on a transportation route. Detailed information on structures and crossings is essential to a battlespace analyst and to an engineer, who may be required to repair or restore a structure. These structures and crossings include bridges, culverts, tunnels, galleries, snowsheds, retaining walls, ferries, fords, cableways, and tramways.

Bridges

Highway and railway bridges are vulnerable points on a LOC. Timely preservation, destruction, or repair of a bridge may be the key to an effective defense or to the successful penetration of an enemy area. A bridge seized intact has great value in offensive operations; even a small bridge facilitates the movement of forces over a river or stream.

Analysts obtain bridge information from reconnaissance or from the NIMA-produced planning terrain tactical data base. Using aerial photographs, analysts can determine bridge length, width, clearance, and height above water. Basic information requirements reported on a bridge include—

- Summary of its structural characteristics.
- Critical dimensions (length, usable width, overhead clearance).

- Capacity estimation.
- General conditions.

Tunnels, Galleries, and Snowsheds

Features on a transportation route where it would be relatively easy to block traffic or that affect the traffic capacity of the road, are considered to be critical features of the road. Such features include tunnels, snowsheds, galleries, mountain passes, terrain gaps, gorges and defiles, deep cuts, steep grades, and sharp curves. Any obstructions to traffic flow, which limit the physical dimensions of vehicles utilizing a specific route, are important aspects of route studies. Reductions in traveled way widths, such as narrow streets in built-up areas, drainage ditches, embankments, and war damage limit vehicular movement. Underpasses and other covered traveled ways may restrict traffic flow not only as to width but also as to height.

A tunnel is an underground section of the route that has been made by cut-and-cover or bored for the passage of a route. It consists of the bore(s), a liner (optional), and portals. Common shapes of tunnel bores are semicircular, elliptical, horseshoe, and square with arched ceiling. Bores may be unlined or lined with brick, masonry or concrete. Some long tunnels are artificially ventilated by blowers at the portals or in ventilating shafts above the bore. Alignment of tunnels may be straight or curved.

Snowsheds and galleries are protective structures built in rugged mountainous terrain. These are not as common as bridges or tunnels. Snowsheds offer protection against snow accumulations as well as drifts and slides on exposed sections of the permanent way. Galleries offer protection against snow and rock avalanches. They may be cut into the side of a cliff and have a natural overhang, or the cover may be a concrete slab, either of which guides the avalanche across the track or road. One side of a gallery is usually open.

Retaining walls are built to support embankments, either on the uphill or downhill side of the roadway. Retaining walls also are necessary where an embankment requires support against the pressure of water.

Ferries

A ferry site is that place where traffic and cargo are conveyed across a river or other water barriers by a vessel called a ferry or ferryboat. Ferryboats or vessels vary widely in physical appearance and capacity depending on the depth, width, and current of the stream and the characteristics of traffic to be moved. Propulsion of ferries may be by oars, cable and pulleys, poles, stream current (trail and flying ferries), or by steam, gasoline, and diesel engines. Analysts report the capacity of a civil ferryboat in tons and total number of passengers. In addition, it is often assigned a military load classification number. Ferry slips or piers are generally provided on the shore to permit easy loading of passengers, cargo, and vehicles. The slips may vary from simple log piers to elaborate terminal buildings. A distinguishing characteristic of a ferry slip is often the floating or adjustable approach ramp, which accommodates variations in the ferry deck level.

The limiting characteristics of ferry sites includes the width of the water barrier from bank to bank, the distance and time traveled by the ferryboat from one side to the other side, and the depths of the water at each ferry slip. Climatic conditions have a marked effect on ferry operations. Fog and ice substantially reduce the total traffic moving capacity and increase the hazard of the water route. Therefore, data on tide fluctuations, freezing periods, floods, excessive dry spells, and their effects on ferry operation are important considerations. Ferry slips are often optimal places for grounding displacement landing craft or as exit points for amphibious vehicles.

Fords

A ford is a location in a water barrier where the physical characteristics of the current, bottom, and approaches permit the passage of personnel or vehicles and other equipment under their own propulsion. Analysts assess a ford site for use as a bridge bypass.

Ford approaches may be paved with concrete or bituminous surface material but are usually unimproved. The composition of the stream bottom determines its trafficability. In some cases, the natural river bottom of a ford may have been improved to increase load-bearing capacity and to reduce the water depth. Improved fords may have gravel or concrete surfacing, layers of sandbags, metal screening or matting, timber or wooden planking. Bottom conditions are determined by checking the stability and composition of the bed. Known and suspected ford sites are key information when assessing the ability of a bridge to be bypassed.

Basic information requirements reported on a ford include—

- Trafficability.
- Approaches.
- Bottom composition.
- Current.

Cableways and Tramways

Cableways and tramways may be encountered in rugged mountainous regions and beach areas or used as connections between two primary supply routes. Cableways and tramways are considered obstacles to low flying aircraft.

Inland Waterways

The term inland waterways is applied to rivers, streams, canals, lakes, and inland seas which are used as avenues of transport. It also includes the intercoastal waterways, usually running parallel to the coastline of a landmass and sheltered to permit the navigation of small vessels. When evaluating inland waterways, analysts must consider the following factors:

- Inland waterways provide an economical form of transportation for bulk supplies, freeing faster modes for shipments of a higher priority.
- Depths of rivers and streams fluctuate with maximum and minimum rainfall.
- Falls and rapids commonly interrupt streams with fairly direct courses.
- Streams of low and uniform gradients are usually slow moving and their channels shift constantly, creating sandbars, which are a menace to navigation.
- Traffic is halted completely during a freezing period unless ice-breaking operations can be conducted.
- Thaw following a freeze may cause floods.
- Periods of drought may result in insufficient water for the movement of vessels.
- Waterway locks, bridges, cuts, dams, and other fixed facilities are vulnerable to enemy action.

Supply Systems

Utilities, services, facilities, and construction resources comprise the essential internal supply systems and installations used to protect and maintain the life of a region or city. Military interest in this field is primarily logistical, although these facilities take on greater importance during urban operations, particularly operations other than war. Analysts must report the adequacy and quality of the petroleum and natural gas facilities, as well as power, water, and telecommunications systems, to ensure their maximum use by military forces.

Power System or Grid

Electricity is essential to the life of modern regions and cities. Destruction of electrical generation and distribution facilities in most

cities would bring industrial production and most utilities and services to a halt.

Petroleum, Oils, and Lubricants Facilities

Information on a nation's petroleum and natural gas resources provides a means for evaluating the capacity of a nation to produce, process, and supply fluid or gaseous hydrocarbons for military purposes. Analysts also evaluate the petroleum supply system's vulnerability to attack.

Water

Water is the most extensively used commodity in both urban and rural habitats. Water supply systems maintain and control the quality and quantity of water in urban areas. Analysts evaluate an area's water supply system to ensure there is an adequate supply of quality water for military purposes.

Telecommunications

Analysts evaluate an area's civil and military telecommunications systems, services, facilities, and equipment for use by military forces. Governmental and commercial organizations that regulate and operate the area's systems are also evaluated. Telecommunications services evaluated include—

- Telephone.
- Telegraph.
- Teleprinter.
- Facsimile.
- Data transmission.
- Radio broadcast.
- Television broadcast.

Urban Areas

The ever-increasing urbanization of the world's population dictates that urban areas will increasingly be the AO for war and operations other than war. Urban area geospatial studies are important in the planning of operations, targeting, and logistical support for operations.

Characteristics

Knowledge of the characteristics of urban areas is essential to the conduct of civil affairs and counterintelligence operations. Urban areas are significant as military objectives, targets, and bases of operations. Often they will be the focal point for internal ethnic, class, religious, or cultural conflict. Urban areas may be one or a combination of—

- Power centers (e.g., political, economic, military).
- Industrial production centers.
- Population centers.
- Transportation centers.
- Service centers (e.g., distribution points for fuels, power, water, raw materials, food, manufactured goods).
- Cultural and scientific centers (e.g., seats of learning, modern technological developments).

Urban Area Classification

An important aspect in the classification of cities is the determination of construction type. Rarely is a city of one type of construction; instead there will be a mixture of everything from shantytowns to skyscrapers. The analyst should attempt to determine what the predominant construction type is as well as what percentages of the city are composed of varying types. Urban areas or cities are classified according to their—

- Population size and density.
- Position in the country's society, economy, and defense establishment (strategic, secondary, or minor).
- Function.
- Construction type (e.g., shantytowns, skyscrapers).

Evaluation Factors

Line of sight considerations in cities are crucial, thus the urban area must be assessed in ground-level, above-ground, and below-ground dimensions. Since urban operations are manpower intensive and generally conducted at low unit levels, the information required is usually very detailed. The MCIA-1586-005-99, *Urban Generic Information Requirements Handbook*, discusses the components of urban area analysis. The primary factors evaluated in urban area GEOINT studies include—

- Physical characteristics.
- Building construction type.
- Accessibility.
- Utilities.
- Civil facilities.
- Industrial facilities.
- Military and other important installations.
- Underground facilities (e.g., subways, sewers, underground rivers, utility tunnels).

Construction Resources

Analysts conduct construction resource studies to evaluate a foreign area's capability to support friendly military operations. To determine construction capabilities, analysts compare area construction types to the work carried out by the U.S. Army Corps of Engineers. These studies include data on—

- Available construction materials.
- Construction industry organization.
- Major construction firms, including data on the firm's—
  - Size.
  - Capital assets.
  - Organization.
  - Amount of equipment.
  - Personnel skills.
  - Experience.
  - Specialization.

SECTION VIII. POLITICAL, ECONOMIC, AND SOCIOLOGICAL ANALYSIS

The current and historical setting of a country is an important and integral part of intelligence analysis. Most of the analysis effort is expended on armed forces and GEOINT, but the factors that can make a difference in many operations, especially operations other than war, involve political, economic, and sociological aspects of the target area.

Political Intelligence

Political intelligence begins with an assessment of the internal political dynamics of a country to include its leadership, internal political stability, economic position, labor supply, physical resources, and relative military power. The first consideration is the distribution of political power—is it a democracy, an oligarchy, a dictatorship, or has political power devolved to multiple interest groups such as tribes, clans, or gangs?

Consideration must be given to the sources of political power: authority based on a legitimate constitution and the will of the people, political magnetism, skill and competence of the leaders, or brute force. It is particularly important for western-trained analysts to understand nonwestern political institutions. In other countries, institutions that on the surface are western in nature may in fact operate quite differently. For example, civil and military bureaucracies may not be neutral agents of policy but may operate almost entirely in their own self interest. Armies

may function as political parties or administrators rather than as guardians of the national security. Parliaments may have a developmental or honorary role rather than a legislative role.

The analyst must evaluate the political system as it really operates, not the way it is supposed to operate. Political analysis of a foreign country begins with an assessment of the basic principles of government, governmental operations, foreign policy, political parties, pressure groups, electoral procedures, subversive movements, as well as criminal and terrorist organizations.

Basic Governmental Principles

The starting point of political analysis is the formal political structure and procedure of a foreign nation. Analysts must evaluate—

- Constitutional and legal system.
- Legal position of the legislative, judicial, and executive branches.
- Civil and religious rights of the people.
- People's national devotion to constitutional and legal procedures.

Governmental Operations

Governments are evaluated to determine their efficiency, integrity, and stability. Information about how the government actually operates and changes in the method of operation give the intelligence user clues about the probable future of a political system. When assessing governmental operations, analysts should consider the following:

- Marked inefficiency and corruption, which differs from past patterns, may indicate an impending change in government.
- Continued inefficiency and corruption may indicate popular apathy or a populace unable to effect change.
- Increased restrictions on the electoral process and on the basic social and political rights of the people may mean the government is growing less sure of its position and survivability.

Foreign Policy

Analysis of a target country's foreign policy addresses the country's public and private stance toward the United States, foreign policy goals and objectives, regional role, and alliances. Analysts gather foreign policy data from various sources, to include—

- Diplomatic and military personnel.
- Technical collection systems.
- Official foreign government statements.
- Press releases.
- Public opinion polls.
- International businessmen.
- Academic analyses.

Political Parties

Analysts study special interest parties and groups, (e.g., labor, religious, ethnic, industry) to evaluate their—

- Aims.
- Programs.
- Degree of popular support.
- Financial backing.
- Leadership.
- Electoral procedures.

Pressure Groups

With few exceptions, most states have some type of formal or informal pressure groups. Examples include political parties, associations, religious or ethnic organizations, labor unions, even illegal organizations (e.g., banned political party). The analyst must identify these pressure groups and their aims, methods, relative power,

sources of support, and leadership. Pressure groups may have international connections, and in some cases, may be almost entirely controlled from outside the country.

Electoral Procedures

Elections range from stage shows of limited intelligence significance to a means of peaceful, organized, and scheduled revolution. In addition to the parties, personalities, and policies, the intelligence analyst must consider the circumstances surrounding the actual balloting process and changes from the historical norm.

Subversive Movements

In many countries there are clandestine organizations or guerrilla groups whose intention is to overthrow or destroy the existing government. When analysts report on subversive movements, they should include the organization's—

- Size.
- Character of membership.
- Power base within the society.
- Doctrine or beliefs system.
- Affiliated organizations.
- Key figures.
- Funding.
- Methods of operation.

Criminal and Terrorist Organizations

Criminal organizations in some countries are so powerful that they influence or dominate national governments. Analysts must examine the organization's influence or forceful methods of control. Most terrorist organizations are small, short-lived, and not attached to any government. Analysts should determine if external factors or even the area's government assists the terrorist group.

Economic Intelligence

The study of economics involves the production, distribution, and use of wealth. It analyzes the factors of production and how those factors are used to produce the things that people need and want. Economics focuses on production within nations and on relations between nations, especially on the competition for the world's scarce resources. That competition continues to be a major cause of international conflict.

Economic intelligence focuses on the use of natural and human resources, and especially on the functioning of national economies and economic relations between countries. Economic intelligence is vital to estimating the magnitude of military or other threats to ourselves and our allies. A nation can undertake and carry out only those operations, military or economic, that its economy is able to mount or sustain. In the short run, national strength consists of staffing that can be mobilized and weapons and supplies that have been manufactured or purchased.

The extraordinary expense of modern warfare means that anything beyond the briefest of campaigns will require the total economic resources of a nation. Despite the simplicity of the concept, this task is elusive and difficult.

A large nation's economic resources offer a wide range of possible actions. For example, efforts to increase military preparedness do not necessarily foretell military aggression. While it is possible to develop probability estimates based on key indicators, it would be unwise to think that analysis of economic information alone will yield completely dependable results.

Economic intelligence provides indications and warning of potential crisis or conflict. Economic failure often generates social unrest or disputes with neighboring nations. The resulting instability

may require United States or other national force intervention.

Sources of Economic Intelligence

Because nations and businesses often hide information to limit competition or to prevent the discovery of sensitive military-related technologies, the most reliable information may have to be obtained from more traditional intelligence methods such as informed reporting by attaches and officers on the scene. The most comprehensive and reliable sources of economic intelligence are printed and electronic trade and business publications. These open sources should be supplemented with reports from—

- Attaches and officers on the scene.
- Foreign broadcasts.
- Defectors.
- Commercial contacts.
- Clandestine sources.

Evaluation Factors

Analysts gather the following information for economic studies:

- Size of the area's economy.
- Sources of raw materials (e.g., minerals crucial to production of military weaponry).
- Products of the area manufacturers.
- Methods of production (e.g., advanced technologies).
- Profits from narcotics trafficking.
- Funds transfers by terrorist organizations.

Narcotics and Terrorism

Tracking profits from narcotics trafficking has been one of the most useful forms of intelligence activity against these organizations. Drugs enter the United States via a huge number of routes, but the profits exit by a more limited, and potentially traceable, number of routes. In some cases, narcotics are a country's prime resource and export. Terrorist organizations can also be tracked and studied using information on funds transfers, although the amounts tend to be smaller than those of narcotics traffickers.

Sociological Analysis

Analysts must study the way people organize their day-to-day living, including the study of groups within society, their composition, organization, purposes and habits, and the role of the individual in society. For intelligence purposes, analysts study seven sociological factors.

Population

Intelligence data derived from censuses and sample surveys describe the size, distribution, and characteristics of the population, including rate of change. Most countries now conduct censuses and publish detailed data. The U.S. Census Bureau and the United Nations are prime sources for detailed data on foreign populations. Analysts use censuses and surveys to evaluate an area's population in terms of—

- Location.
- Growth rates.
- Age and sex structure.
- Labor force.
- Military staffing.
- Migration.

Characteristics of the People

Analysts study social characteristics to determine their contribution to national cohesion or national disintegration. Social characteristics evaluated by analysts include—

- Social stratification.
- Number and distribution of languages.

- Prejudices.
- Formal and informal organizations.
- Traditions.
- Taboos.
- Nonpolitical or religious groupings and tribal or clan organizations.
- Idiosyncrasies.
- Social mobility.

Public Opinion

Key indicators of a society's goals may be found in the attitudes expressed by significant segments of the population on questions of national interest. Opinions may vary from near unanimity to a nearly uniform scattering of opinion over a wide spectrum. Analysts should sample minority opinions, especially of groups capable of pressuring the government.

Education

Analysts concentrate on the general character of education and on the quality of elementary through graduate and professional schools. Data collected for these studies include—

- Education expenditures.
- Relationship between education and other social and political characteristics.
- Education levels among the various components of society.
- Number of students studying abroad.
- Extent to which foreign languages are taught.
- Subjects taught in schools.

Religion

Religious beliefs may be a potentially dangerous friction factor for deployed U.S. personnel; this was experienced in the Middle East with fundamentalist Islamic sects. Understanding those friction factors is essential to mission accomplishment and the protection of friendly forces. Analysts evaluate data collected on an area's religions, which includes—

- Types.
- Size of denominations.
- Growth or decline rates.
- Cooperative or confrontational relationships between religions, the people they represent, and the government.
- Ways the government deals with religious organizations.
- Roles religious groups play in the national decisionmaking process.
- Religious traditions and taboos.

Public Welfare

To evaluate the general health of a population, analysts must identify—

- Health delivery systems.
- Governmental and informal welfare systems.
- Social services provided.
- Living conditions.
- Social insurance.
- Social problems that affect national strength and stability (e.g., divorce rate, slums, drug use, crime) and methods of coping with these problems.

Narcotics and Terrorism Tolerance

A population's level of tolerance for narcotics and terrorist activities depends on the relations between these organizations and the population as a whole. Analysts should determine if the tolerance is a result of the huge sums of money traffickers pump into the economy or a result of trafficker's use of force. Terrorists may be accepted and even supported by the local populace if they are perceived to be working for the good of the local people. The intelligence analyst must evaluate the way these organizations operate.

CHAPTER 7. THREAT ANALYSIS TECHNIQUES

Intelligence analysts make the greatest impact on plans and operations by conducting threat analysis. Using the IPB threat analysis techniques, analysts provide commanders and planners with paragraphs 3 through 5 of the intelligence estimate (see appendix A). To enhance the intelligence estimate, analysts use specialized analytical techniques. This chapter provides a detailed view of the knowledge essential in conducting threat analysis.

SECTION I. INTELLIGENCE PREPARATION OF THE BATTLESPACE TECHNIQUES

When conducting threat IPB, intelligence analysts evaluate the threat OOB, develop a threat model, and determine, evaluate, prioritize, and develop threat COAs.

Threat Order of Battle

An integral part of intelligence analysis, OOB is the identification, strength, command structure, and disposition of units, personnel, and equipment of foreign military forces, including irregular force units, auxiliary, insurgent, and criminal elements. The analyst must consider and integrate OOB intelligence with other METT-T factors to determine threat capabilities, vulnerabilities, intentions, and COAs.

Order of Battle Factors

The OOB analysis involves evaluating a threat force's composition, disposition, strength, tactics, training, logistics, combat effectiveness, electronic technical data, command and control warfare (C2W) data, and other supporting data.

Composition

The identification and organization of specific threat units or commands are keys to OOB intelligence. Through identification, the analyst develops a history of the threat unit's composition, tactics, training, and combat effectiveness. To determine a unit's composition, analysts identify the threat unit by—

- Name.
- Number.
- Type.
- Size or strength.
- Subordination.

Organization is the physical structure of a unit and the relationship of the various elements within that structure. The threat unit's identification within an organization alerts the analyst to the possible presence of other units in the same organization. With knowledge of the threat's organization, analysts can develop accurate intelligence on current strength and combat efficiency.

When analyzing composition, intelligence personnel should consider the unit's self-sufficiency. Units subordinate to a self-sufficient tactical unit, although capable of limited independent action, cannot sustain themselves over relatively long periods of time. These subordinate units are seldom employed independently or separately from the basic self-sufficient tactical unit. For example, a new threat battalion is reported to be operating in the AO. Knowing that the threat normally organizes and operates in brigades composed of three

to five battalions and that those battalions are normally not employed independently, analysts determine it is probable that the remaining elements of the threat brigade are in or near the AO.

Disposition

The threat unit's disposition consists of the unit's location and tactical or administrative deployment method. When evaluating a threat unit's disposition, analysts include the unit's current and projected movements to determine the capabilities of the enemy force and its effect on friendly mission accomplishment. A threat that has moved, is moving, or is planning to move may become capable of a number of actions (e.g., attacking, reinforcing, replacing, withdrawing). Analysts must continually monitor threat movements to integrate the threat unit's disposition with terrain analysis into doctrine and situation templates. When assessing a threat unit's disposition, analysts should consider—

- Predetermined doctrinal deployment, which may lead to an accurate appraisal of probable threat COAs.
- Knowledge of the threat's echelon arrangement may indicate which units will be employed in supporting and reserve roles.
- Patrol activity may indicate planned movement (but in itself is not movement).

Strength

A threat unit's strength is described in terms of personnel, weapons, and equipment. Information concerning enemy strength provides the commander with an indication of threat capabilities and helps determine the threat commander's probable COA. When assessing a threat's strength, analysts should consider—

- Lack of strength lowers the threat force's capabilities estimate, while superiority of strength raises the force's capabilities estimate.
- Marked concentration or buildup of units in an area may indicate a probable COA and threat objectives.
- Changes in strength of potential threat forces during peacetime may indicate the threat's intention to wage conflict.

Tactics

In OOB intelligence, tactics include tactical doctrine as well as tactics employed by specific units. While tactical doctrine refers to the threat's accepted organization and employment principles, tactics refer to the threat's conduct of operations. From tactical doctrine knowledge, the analyst can determine how the threat may employ his/her infantry, mechanized, armor, and artillery units in the offense and defense under various conditions. Analysts integrate tactics in doctrinal templates and other intelligence products.

Training

Individual and unit training can significantly contribute to the combat effectiveness of any military organization. Analysts assess the thoroughness, degree, and quality of individual training received by the threat's recruit, specialist, noncommissioned officer, and officer to determine the overall efficiency of its armed force. When evaluating the threat's training, analysts should consider—

- Small unit exercises to large scale training maneuvers conducted in seasonal cycles are an essential part of the training necessary for a unit to operate at its full potential.
- Each type or phase of training accomplished by a unit adds to its capabilities and effectiveness.
- Crew training for weapons systems (e.g., tanks, artillery, and aircraft) increases weapons systems effectiveness.

Logistics

The threat's adoption of a COA depends on the ability of the logistical system to support that action. With knowledge of the threat's logistic capabilities, analysts can accurately evaluate the threat's capabilities, strength, and combat effectiveness. The location of a threat unit's logistical support structure elements aids analysts in determining the disposition of maneuver formations. Logistic information critical for effective intelligence analysis includes—

- Classes and types of supply.
- Lines of communication.
- Logistical requirements.
- Procurement methods.
- Distribution priorities and procedures.
- Transportation networks and modes.
- Installations and terminals.
- Evacuation and salvage procedures.
- Maintenance.

Combat Effectiveness

The abilities and fighting qualities of a unit are affected by numerous tangible and intangible factors. Analysts are expected to rate threat combat effectiveness by analyzing the following factors:

- Personnel strength, including estimated losses.
- Conditions and amounts of weapons and equipment.
- Status of training.
- Quality of leadership.
- Individuals' combat experience.
- Length of time a unit has been exposed to combat.
- Efficiency and training of the officer and noncommissioned corps.
- Past performance and traditions.
- Commander's personality traits.
- Morale, esprit, health, discipline, and political reliability (belief in the cause).
- Status of technical and logistical support of the unit.
- Adequacy of military schooling.
- Socioethnic characteristics of the people.
- Geographic area in which committed.

For each unit of interest, analysts must define, evaluate, and assign a color value to each applicable factor. This assessment is highly subjective; the experience and knowledge of the analyst and the scope of available intelligence will determine its validity.

Example: Assessment Values

When evaluating the length of time a unit has been exposed to combat, analysts use the following values:

- *Green*—Sporadic to intermittent limited combat (small arms fire, fire fights).
- *Amber*—Constant limited combat to sporadic intense combat (artillery barrage, heavy weapons).
- *Red*—Sustained intense combat (deliberate attack or defense).

Where a factor has elements, analysts assign a value to each element and then synthesize an overall value for that factor. After assigning a value to each factor, analysts assign an overall combat effectiveness rating to the unit. This process is highly subjective, and allowances can be made for prioritizing or weighting the individual factors. The values assigned to factors and the definitions of the effectiveness rating may be adjusted as the situation dictates.

The values and definitions should be understood by personnel using the information and should be marked on summaries or reports disseminated outside the command.

Example: Combat Effectiveness Values

Threat unit combat effectiveness can be expressed as a color corresponding to the following example definitions. The following associated percentages are not indicators of T/O and table of equipment (T/E) strength, but are shown to indicate a relative range for each definition:

- *Green:* Combat Effective (80-100%)—The unit possesses the required resources to undertake the wartime mission for which it is organized or designed. Few, if any, negative factors exist. The unit does not require any compensation for deficiencies.
- *Amber:* Marginally Combat Effective (60-79%)—The unit possesses the required resources to undertake most of the wartime missions for which it is organized or designed. Some negative factors are present. The unit would require little, if any, compensation for deficiencies.
- *Red:* Limited Combat Effectiveness (40-59%)—The unit possesses the required resources to undertake some, but not all, of the wartime mission for which it is organized or designed. Significant negative factors are present. The unit would require significant compensation for deficiencies.
- *Black:* Combat Ineffective (less than 40%)—The unit is not prepared to undertake its wartime mission. Numerous debilitating negative factors are present.

Electronic OOB and Technical Data

Electronic OOB and other electronic technical data are required to plan and execute SIGINT, electronic warfare, CIS, C2W, and other operations against the threat. This data includes threat communications and noncommunications equipment parameters, modulation, multiplex capability, pulse duration, pulse repetition, frequency, bandwidth, associated weapons systems, and other technical characteristics of electronic emissions. The data also includes critical threat C2 nodes such as command posts, air defense operations centers, and communications relay sites.

With sufficient data, analysts can template threat emitters, which can be used to locate and develop the disposition of forces based on the forces' electronic emission assets. With electronic technical data, a more accurate evaluation of the threat's vulnerabilities to friendly EA and deception can be determined. Additionally, signals intercept and direction finding for SIGINT production are made easier and enhance support to electronic protection.

C2W Data

Analysis of C2W provides the commander with an assessment of the threat's ability to interfere with the friendly force's C2. The C2W data includes threat assets and capabilities to conduct electronic warfare, deception operations, psychological operations, and information warfare. Of increasing importance is the ability of any enemy to penetrate and disrupt friendly C2 and information systems or to deceive or jam friendly position locating devices (e.g., the global positioning system). This requires knowledge of a threat's deception capabilities, EA systems and protection measures, and monitoring capabilities.

Supporting Data

Analysts need supporting information to develop other OOB elements and comprehensive intelligence estimates. Basic intelligence describes the enemy and includes personalities' biographic data, unit history, uniforms and insignia, vehicle numbers, and other information important to mission accomplishment. Biographic data contains information on characteristics and attributes of a threat force's members. Knowledge of personalities is important in identifying units and, in some

cases, predicting a unit's COA. Personality data is valuable because the tactics and combat efficiency of particular units are closely tied to the commander's character, schooling, and personality traits. In MOOTW, supporting data may include tribal, clan, or ethnic group traits and their effects on the combat capabilities or limitations of the threat force.

Analytical Considerations

When assessing OOB factors, analysts should consider that—

- OOB factors must be analyzed as a whole.
- Changes in training status, command personality, strength, or any other OOB factors may affect a unit's tactics.
- The OOB factors form a framework for evaluation of any force.
- Extended family ties of suspected traffickers should be included when evaluating composition during a counternarcotics operation.
- The insurgent political structure and its relationship to the military elements should be included when evaluating an insurgent force.
- Composition analysis of a local terrorist organization would identify the support infrastructure among the local population.
- The OOB evaluation framework should be adapted to the mission and a unit's needs.
- An aviation unit's evaluation of composition would focus more on threat units that contain air defense assets; the equipment evaluation would focus on vulnerabilities of threat targets and technical characteristics of threat air defense systems.
- Properly maintained OOB files are sources of information on the threat's operations, capabilities, and weaknesses. See chapter 2 for a discussion of OOB files.

Threat Model Development

The threat model is a method of synthesizing information into a coherent evaluation of threat intentions and capabilities and predicting COAs. See chapter 5 for a discussion of doctrinal templates, description of preferred tactics and options, and identification of type HVTs.

Doctrinal Templates

When evaluating doctrinal templates, analysts must—

- Determine how the threat normally organizes for combat and how he/she deploys and employs his/her maneuver units and various supporting assets.
- Look for patterns in task organization of forces, timing, distances, relative locations, groupings, or use of terrain and weather.

Doctrinal templates can also portray the threat's normal organization for combat, typical supporting elements available from higher commands, frontages, depths, boundaries, engagement areas, objective depths, and other control measures. The amount of this detail available will vary from situation to situation or may not exist at all. In the latter case, the analyst will need to rely on basic principles of war and tactics to develop an initial doctrinal template. Doctrinal templates are tailored to the needs of the unit creating them.

Description of Tactics and Options

Like the template, the description of the threat's tactics and options is developed from an evaluation of his/her doctrine and previous and current operations. Analysts include a description of the branches and sequels available to or preferred by the threat should the depicted operation succeed or fail. For example, the threat might prefer to follow successful attacks with pursuit. Should an attack begin to fail, his/her preferred branches might

include committing reserves, reinforcement, or shifting the main effort. Should the attack fail, his/her preferred sequel might be a hasty defense.

Analysts include decision criteria revealed in the data base that cause the threat to prefer one option over another. This intelligence will aid in wargaming threat and friendly COAs, targeting, and deception planning. When developing a threat model, analysts use the following techniques to describe tactics and options:

- Start with the scheme of maneuver and examine how each battlespace function provides support.
- Use time-event charts to describe how the threat normally conducts operations. These are particularly useful for describing large-scale air operations, which are difficult to depict graphically. With a time-event chart the time relationship between various echelons and their normal composition can be described easily.
- Make marginal notations on the graphic template and combine words with pictures to enhance understanding. Marginal notes are particularly effective when tagged to key events or positions on the template.
- Use a battlespace or warfighting function synchronization matrix (see fig. 7-1) to dissect threat operations and relate particular actions to time for threats with well-developed tactics and complex combined-arms organizations.

Time	H-10	H-1	H	H+4	H+7	H+8.5	H+10
Friendly Action	Begin move to attack position	Prepare fires	Cross line of departure	Engage 1st echelon	Defeat 1st echelon		
Enemy Decision Point							
Enemy Maneuver				Local counterattack	Close air support and attack helicopters to counterattack objective	Reserves begin move	Reserves pass NAI 9
Enemy Fire Support		Counterbattery	Engage HPTs	Defensive fires	Countermobility fires	Support reserve in engagement areas 7, 8, and 9	
Enemy Intelligence	Locate main effort	Locate artillery, identify main effort	Locate reserve, HPTs				
Enemy C2					Commit reserve to counterattack option 1 or block options 2 and 3		
Enemy Engineers	Continue countermobility in main battle area						

Figure 7-1. Threat Synchronization Matrix.

Identification of Type High-Value Targets

Analysts use the following techniques to identify type (e.g., air defense, engineer) HVTs for the threat model:

- Use tactical judgment when evaluating the data base, the doctrinal template, and its supporting narrative to identify HVTs.
- Mentally war game the threat operation under consideration to determine how the threat will use battlespace assets and to identify those assets critical to the operation's success.
- Identify assets necessary to satisfy decision criteria or initial adoption of the branches and sequels listed in the description and option statements.
- Determine the threat's reaction to the loss of each identified HVT. Consider his/her ability to substitute other assets and to adopt branches to the operation.
- Rank the set of HVTs in order of their relative value to the threat's operation, record sets as part of the threat model, and note value changes by phase of operation.
- Use a target value matrix to annotate identified HVTs in the margins of the doctrinal template. Figure 7-2 is a threat model depicting a doctrinal template, tactics and options description, and target value matrix.

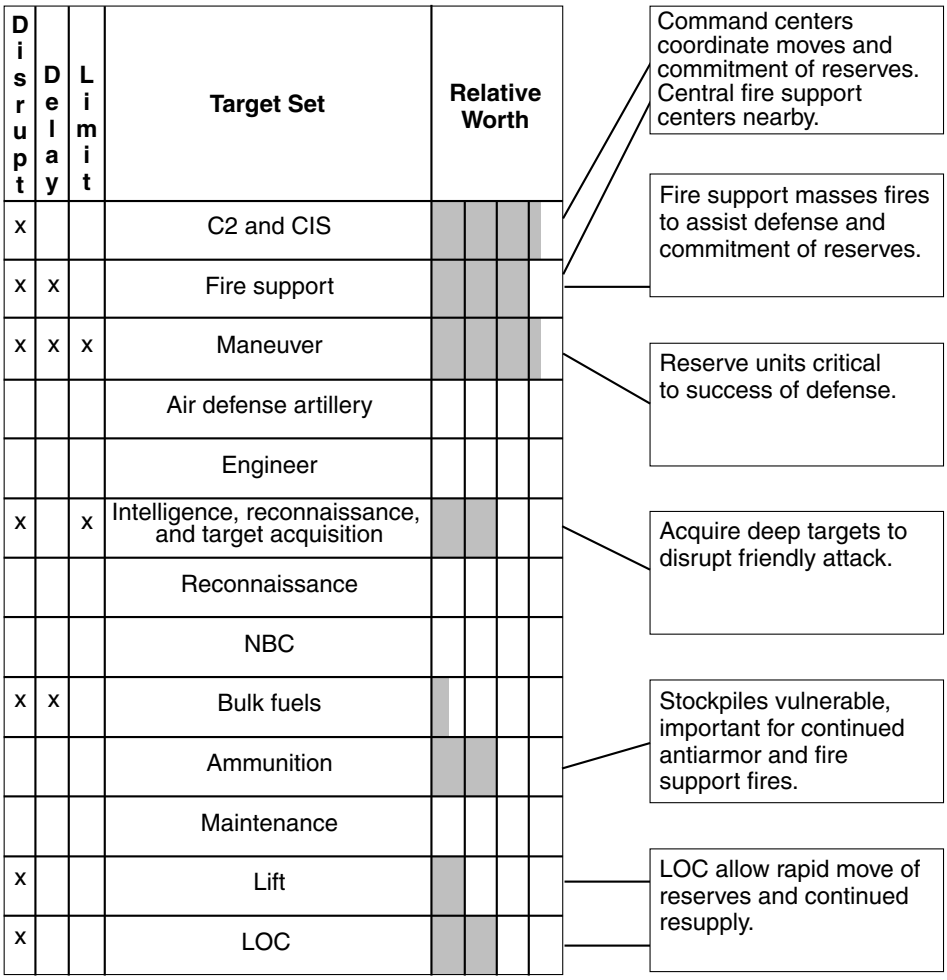

Figure 7-2. Threat Model with Target Value Matrix.

Threat Courses of Action Determination

To determine threat COAs, analysts start with general COAs open to the threat, such as deliberate attack, defend, and delay. They further define each general COA as a set of specific COAs by integrating the threat models developed in IPB process step 3 with the description of the battlespace effects from IPB process step 2.

Criteria for Testing Threat Courses of Action

Analysts must test each enemy COA using the criteria of suitability, feasibility, acceptability, uniqueness, and consistency with doctrine.

Suitability

When determining the suitability of a threat COA, analysts must evaluate the COA's potential for accomplishing the threat's objective.

Feasibility

Analysts evaluating the feasibility of a threat COA must answer the following questions:

- Are the time and space required to execute the COA available?
- Does the threat have the physical means required to make the COA a success?
- What radical measures can he/she take to create the conditions for success?

Acceptability

In determining the acceptability of a threat COA, analysts must consider the amount of risk involved by answering the following questions:

- Will threat forces accept the amount of risk entailed in adopting the COA?
- Can they afford the expenditure of resources for an uncertain chance at success? (This is a subjective judgment based on knowledge of the threat and his/her doctrine. In some instances, the threat might undertake otherwise unfavorable COAs, particularly if they are the only means to accomplishing his/her objective.)

Uniqueness

To determine the uniqueness of each threat COA, analysts must use their experience and training to answer the following questions:

- How will the COA affect the friendly mission?
- Will the threat use reserves or a second echelon?
- Where is the threat's main effort?
- What is the threat's scheme of maneuver?
- How is the threat task-organized?

Consistency with Doctrine and Recent Activities

When evaluating a threat COA's consistency with doctrine and recent activities, analysts must answer the following questions to be consistent with the threat's doctrine and recently observed activities, practices, and patterns.

- Is the COA consistent with the threat's written doctrine and past application of doctrine observation, as revealed in the intelligence data base?
- Will the threat achieve surprise by deviating from its known doctrine?

Considerations

To determine the COAs the threat believes are available, analysts should—

- Consider the effect of friendly dispositions or the threat's perception of friendly dispositions on the threat's COA.
- Conduct reverse IPB or replicate the process the threat is employing to discern friendly COAs.
- Consider the intelligence and reconnaissance assets available to the threat, their ability to collect information and produce intelligence, and the picture that intelligence will give threat commanders.

- Focus on threat COAs that will affect accomplishment of the friendly mission and include those indications that the threat might adopt a COA that favors accomplishment of the friendly mission. This prepares the commander to take advantage of opportunities that might arise.

> **Example: Threat COA That Favors Friendly Mission Accomplishmentp**
>
> If the friendly mission is to attack to destroy the threat, interfering threat COAs could be defend (including counterattacks), reinforce, and withdraw. If the friendly mission is to seize a terrain objective, interfering threat COAs could be defend (including counterattacks) and reinforce. Threat withdrawal would favor the accomplishment of this friendly mission and should also be included in the set of COAs if there are indications the threat might actually withdraw.

- Identify less likely but viable threat COAs by considering the threat's—
  - Superior understanding of the political, cultural, or information characteristics of the battlespace.
  - Ignorance of the military arts and sciences.
  - Immature decisionmaking.
  - Uncertainty as to friendly dispositions or intent.
  - Unexpected objectives or desired end states.
  - Cultural definitions of defeat and victory.
  - Willingness to sustain defeat at the tactical or operational level to achieve victory at the strategic or political level.
  - Desperation.
  - Bureaucratic inefficiency.
  - Audacity.

Course of Action Evaluation and Prioritization

The resulting set of COAs developed should depict the full set of options available to the threat. At this point the analyst should remember that the threat COAs identified are assumptions about the threat, not facts. For this reason, the analyst cannot predict with complete accuracy which of the COAs the threat will employ. However, the commander and staff still need to develop a plan that is optimized to one of the COAs, while allowing for contingency options if the threat chooses another COA. Therefore, the analyst must evaluate, analyze, and form an estimate for each COA and prioritize it according to how likely it is that the threat will adopt that option. The analysts must establish an initial priority list to allow the staff to plan for friendly COAs. Once the commander selects a friendly COA, the analyst may need to reorder the list of threat COAs and consider changes in the threat's perception of friendly forces.

Course of Action Development

Once the complete set of threat COAs has been identified, analysts develop each COA into as much detail as the situation requires and time allows. Analysts base the order in which each COA is developed on its probability of adoption and the commander's guidance. Each COA must answer the following five questions:

- **What**—The type of operation (e.g., attack, defend, reinforce, conduct retrograde).
- **When**—The time the action will begin is usually stated in terms of the earliest time that

the threat can adopt the COA under consideration.

- **Where**—The sectors, zones, axis of attack, AAs, and objectives that make up the COA.
- **How**—The method by which the threat will employ his/her assets (e.g., dispositions, location of main effort, the scheme of maneuver, and support required).
- **Why**—The objective or end state the threat intends to accomplish.

Course of Action Parts

Analysts consider threat forces available to at least one level of command above their own command when developing each COA. This helps to ensure accountability for possible reinforcing forces and the higher command's own objectives and intent. Each developed threat COA should contain a—

- Situation template.
- Description of the COA and options.
- Listing of HVTs.

Considerations

When considering an attacking threat, less detail is required. For example, depending on the situation, a friendly battalion might need only to work to a level of detail of threat companies. Considering the possible variations in the threat's COA based on the details of employment of individual platoons adds a tremendous amount of effort to the process, perhaps for little gain.

When considering a defending threat, a greater level of detail generally is required. For example, an attacking friendly battalion might be concerned with individual crew-served weapons positions given their relative contribution to the threat's defense.

Operations other than war will generally require a greater level of detail. The situation template may address such things as locations and movements of potential evacuees, displaced persons, or protesters as well as threats such as individual air defense systems and irregular forces. Analysts must focus on what is essential to accomplishing the friendly mission.

Course of Action Key Elements

The key elements of each COA are indicators, NAIs, and HVTs. These key elements will drive the collection and production efforts to determine which COA the threat will actually adopt. The art of identifying initial ICRs and IPRs revolves around—

- Predicting specific areas and activities which, when observed, will reveal the COA the threat has chosen.
- Determining the type intelligence products, formats, and who needs them.

As a threat force is visualized executing a COA during situation templating, analysts identify places where activity must occur if that COA is adopted. The NAIs facilitate intelligence collection, reconnaissance and surveillance, and analysis because—

- Attention is focused on areas where the enemy force must appear if the enemy has selected a particular mobility corridor or AA.
- Military significant events can be framed by time and location within the NAI.
- Events in one NAI can be compared to events occurring in the NAI of other mobility corridors as the basis for determining enemy intentions.
- Events within NAIs can be analyzed for indicators and HVTs against which intelligence and target acquisition resources can be directed.

SECTION II. SPECIALIZED ANALYTICAL TECHNIQUES

While IPB provides the overall framework and techniques for analyzing the threat, situations may dictate the use of more specialized techniques to enhance the overall product. Discussed below are a few of the more common techniques used by intelligence analysts.

Subsystem Threat Analysis

Subsystem analysis plays a major role in determining the overall posture of a threat force. Most of the products prepared during the IPB process will only partially satisfy the requirements of other staff sections and subordinate units. The targeting process may require focus on a particular aspect of the threat force. The intelligence analyst must be aware of the important threat analysis factors that specialized staff sections and units use in their IPB responsibilities. Intelligence analysts serve as the focal point for supplying information and data on a specific subsystem to other staff sections and units. Intelligence personnel assigned to specialized units discussed below will tailor their IPB efforts to the needs of their unit.

Air Defense

Evaluation

When air defense units and staffs evaluate the threat, they focus on threats posed by UAVs, cruise and ballistic missiles, fixed- and rotary-wing aircraft, and airborne and air assault forces. In addition to the broad range of OOB factors and threat capabilities, air defense staffs and units must evaluate—

- Flight operations tactics.
- Ordnance types and availability.
- Ordnance delivery techniques (e.g., standoff ranges, release speeds and altitudes, guidance systems).
- Technical capabilities of aircraft (e.g., all-weather or night, maximum and minimum speeds, ceilings, range, payloads, aerial refueling).
- Target selection priorities for air strikes or attack by air assaults.
- Air strike allocation procedures.
- C2 and supporting CIS procedures and techniques.
- Navigation capabilities.
- Threats to friendly air defense artillery (ADA) assets, including threat ground forces and electronic warfare assets.

COA Determination

The threat's air activities will be a part of his/her overall operation. Intelligence personnel begin determining the threat's air COAs by acquiring the supported command's basic IPB products, to include situation templates. Analysts evaluate the general COAs that situation templates portray and determine how the threat might support COAs with air power. When determining air COAs, analysts must consider the maneuver forces the COAs support. The employment flexibility of modern aircraft makes the determination of specific threat COAs extremely difficult. When determining the threat's air COAs, analysts should answer the following questions:

- Where will the threat locate FARPs?
- When will the threat's air strikes or air assault operations occur?
- What are the threat's targets and objectives?
- What are the threat's likely air corridors and air AAs?
- What are the threat's strike package composition, flight profiles, and spacing in time and space, including altitudes?

- Where do friendly air defense assets fit into the threat COA?
- Will the threat ground COAs require movement of friendly ADA assets?

Artillery

Evaluation

When evaluating the threat, the artillery unit personnel or staff should—

- Refine standard threat models to focus on HVTs.
- Evaluate the threat's ability to fight the counterfire battle by—
  - Identifying the threat's target acquisition assets and describing their normal deployment patterns and tactics.
  - Describing the accuracy and timeliness of each threat target acquisition system.
  - Identifying CIS that moves target acquisition information to decision-makers or weapons systems, and describing the system in terms of efficiency and timeliness.
- Describe the threat's ability to locate and destroy friendly target acquisition assets.
- Use techniques associated with the rear battle to evaluate rear area threat to artillery units.

COA Determination

When determining threat COAs, analysts—

- Refine the threat COA models to reflect—
  - HVTs.
  - Dispositions and activity of threat fire support.
  - Dispositions of threat target acquisition assets.
  - Rear area threats to friendly units.
- Focus on COAs that primarily deal with counterfire against friendly assets, other aspects of force protection, and threat activities that will require friendly units to displace.

Aviation

Evaluation

When evaluating the threat, aviation unit personnel identify—

- Units supported by ADA assets.
- Types of ADA systems and their capabilities, such as—
  - Ranges.
  - Altitudes.
  - Engagement times.
  - Fusing systems.
  - Radars.
  - Countermeasures.
  - Range capabilities.
  - Altitude restrictions.
- Other threats such as lasers or artillery fire zones.
- Artificial illumination effects on target acquisition and night vision devices.
- Target characteristics, such as—
  - Normal deployment patterns.
  - Capability to detect attacking aircraft.
  - Typical reactions.
  - HVTs within each formation.

COA Determination

When refining the higher command's threat COA model, analysts—

- Include air defense system range fans.
- Determine where radars and weapons systems are masked by terrain.
- Identify areas with the least amount of air defense coverage.
- Identify likely threat air approaches to friendly engagement areas and battle positions.
- Develop situation templates for threat actions within the engagement area and include reactions to aviation attack.

- Identify threat units along flight paths, consider threat units' reactions, and develop appropriate situation templates.
- Consider threat reactions to downed pilots.

Counterintelligence

Evaluation

When assessing the threat, counterintelligence personnel—

- Describe the threat decisionmaking process and include descriptions of the threat's—
  - IPB process.
  - Command estimate and wargaming methods.
  - Techniques for selecting intelligence requirements.
  - Collection planning and collection management.
  - Asset reporting system.
  - Intelligence processing architecture.
  - Dissemination procedures.
- Estimate the standard lengths of the threat decision cycle for both anticipated and unanticipated decisions by answering the following questions:
  - How long does it take the threat staff to plan and execute a new mission?
  - How long does it take the threat staff to plan and execute changes to the current mission?
  - What is the length of time between acquisition of key indicators by collection assets and execution of that decision?
- Identify the collection systems available to each threat unit, develop doctrinal templates and descriptions for the standard employment of these systems, and rank each collection system in relative order of importance to standard threat operations.

COA Determination

When formulating threat COAs, the analyst should—

- Determine threat intelligence requirements by using the basic maneuver COA model and by answering the following questions:
  - What does the threat need to know to make operations successful?
  - Where are the decision points?
  - When does the threat need to know?
- Estimate the threat's intelligence requirements and attempt to recreate his/her version of the event template, matrix (NAIs and indicators), and collection plan.
- Develop products that show the employment of each collection system and the ensuing coverage by—
  - Depicting range fans for each system.
  - Describing the type of activity that can be collected within each range fan.
  - Highlighting the strengths and weaknesses of the threat collection plan.
- Develop a friendly event template to support counterintelligence and counterreconnaissance.
- Identify locations (NAIs) and activities (indicators) that confirm or deny key elements of the threat collection assumptions.

Command and Control Warfare

Threat analysis in support of C2W can be divided into areas of threat capabilities to conduct C2W and threat vulnerabilities to C2W.

Evaluation of Capabilities

When evaluating threat C2W capabilities, the analyst should consider the threat's—

- Ability to locate and intercept our C2 centers and agencies and supporting CIS.
- Targeting speed and accuracies of threat intelligence collection systems and capabilities of its production elements.

- EA equipment and techniques effectiveness, to include capabilities against space-based systems and computer networks.
- Ability to link collection systems to indirect fire systems.
- Range capabilities of supporting indirect fire systems.
- Ability to conduct deep strikes or special operation forces operations.
- Deception doctrine, tactics, techniques, procedures, and effectiveness.
- Psychological operation capabilities and effectiveness.
- Deployment patterns and tactics of SIGINT collection systems and EA assets, as depicted on the threat model.
- Deployment patterns, tactics, and range capabilities of long-range indirect fire systems, as depicted on the threat model.
- Techniques of intrusion or electronic deception, as depicted on the threat model.

Evaluation of Vulnerabilities

When evaluating threat vulnerabilities to C2W, analysts consider the threat's—

- C2 structure and CIS, with emphasis on locating key C2 nodes.
- Decisionmaking process and speed.
- Command personalities.
- Intelligence, reconnaissance, and target acquisition assets and their vulnerability to jamming or deception.
- Communications security procedures and their ability to work through or around EA.
- Counterintelligence effectiveness.
- Operations security procedures and effectiveness.
- Effectiveness of electronic protective measures and computer network protection.
- Susceptibility to psychological operations and ability to conduct counterpsychological operations.

COA Determination

When developing threat COAs, analysts consider threat C2W capabilities and how those capabilities will be used to support specific operations. The threat command, control, and communications posture and associated vulnerabilities are considered during the identification of COGs and HVTs and contribute to development of HPTs and targeting strategies.

Engineer

Evaluation

Analysts conducting threat analysis in support of engineer planning should evaluate the threat's—

- Engineer units' organization, standard operations, equipment, and employed tactics for conducting mobility, countermobility, survivability, obstacle placement, and breaching operations.
- Engineering capabilities required to lay each type of obstacle system, to breach obstacles, to entrench a type unit, and to bridge different size rivers and streams.
- Logistical system ability to sustain engineer operations.
- Weapons capabilities to penetrate friendly survivability measures and systems.
- Survivability techniques (e.g., use of chain-link fence to defeat antitank rounds and missiles).
- Engineer capabilities of threat infantry, armor, and other nonengineer units.

COA Determination

When determining threat COAs, analysts should include engineering factors in threat models and templates. To develop situation templates for engineers, analysts use the maneuver situation

template of the supported unit and develop multiple threat engineer COAs that include—

- An engineer status estimate, which includes the percentage of combat vehicles with entrenched primary, alternate, supplementary, and deception positions and the extent of likely obstacle system measures.
- Likely locations and obstacle systems required to support, disrupt, turn, fix, or block defensive measures.
- A mobility support estimate, which includes the maneuver and supporting engineer detachments' breaching and fording capabilities.

Combat Service Support

Evaluation

When conducting threat analysis in support of CSS staffs and units, analysts should include—

- Regular threat formations, particularly reserves or second echelon units, that might penetrate main defenses or conduct counterattacks through CSS areas.
- Details on air assault, airborne, unconventional warfare, and light infantry forces and their means of infiltration (e.g., air, ground, and sea).
- Insurgent and partisan forces.
- Terrorist organizations.
- Criminal organizations.

COA Determination

When preparing threat models in support of CSS units, analysts include—

- Air assault, airborne, and light infantry techniques for deep attack.
- Unconventional warfare techniques for deep operations.
- Standard procedures for insurgent raids and ambushes.
- Typical procedures for terrorist attacks.
- Targets and methods of operations for criminal organizations.

COA Development

When evaluating threat COAs, the analyst should consider each maneuver COA available to the threat and develop multiple CSS COAs that include—

- Likely areas of penetration for ground forces.
- Likely objectives in the rear area that will facilitate the threat's main attack or defense.
- The HVTs and HPTs (e.g., key terrain, specified CSS activities) that the threat will identify to support their concepts of operations.
- Situation templates for air assault and airborne operations (e.g., air avenues to LZs and DZs, infiltration lanes, exfiltration lanes).
- Insurgent or partisan activities (e.g., assembly and hide areas, infiltration routes, objective actions, exfiltration).
- Terrorist and sabotage activities.

Pattern Analysis

Pattern analysis is the process of careful observation and evaluation of threat activities to deduce the doctrinal principals and techniques, tactics, and procedures that threat forces or groups prefer to employ. When faced by an opponent whose doctrine is unknown or undeveloped, the intelligence analyst must use pattern analysis to create or update threat models and doctrinal templates. This form of analysis is used in operations other than war, such as counterinsurgency, peacekeeping, or even humanitarian assistance operations. The coordinates register and pattern analysis plot sheet are used to develop threat models when it is necessary to determine threat operational patterns.

Coordinates Register

Sometimes referred to as an incident map, a coordinates register illustrates cumulative events that have occurred within the AO (see fig. 7-3). Coordinates registers focus on where an event occurred, but it can contain additional information as the situation dictates. The date and time of the incident are recorded next to the location. As reports of individual events or sightings are recorded, the analyst attempts to identify links between the location and time of those events. What may appear to be random events will often develop into coordinated actions. When time lined and illustrated, these events form patterns that provide the basis for developing threat models and doctrinal templates. Although the time of the event is normally recorded on the coordinates register, it should always be used with the pattern analysis plot sheet and the doctrinal template, if developed.

Pattern Analysis Plot Sheet

The pattern analysis plot sheet focuses on the time and date each incident occurs in the AO. In figure 7-4, the rings depict the days of the month and the radial segments depict the hours of the day. Events are recorded using the same alphanumeric designator as was used on the coordinates register to allow easy cross-referencing. Along the right side of the plot sheet, the events are recorded by the day and date they occurred. By organizing the events in this manner, it is possible to identify the times of the day and days of the

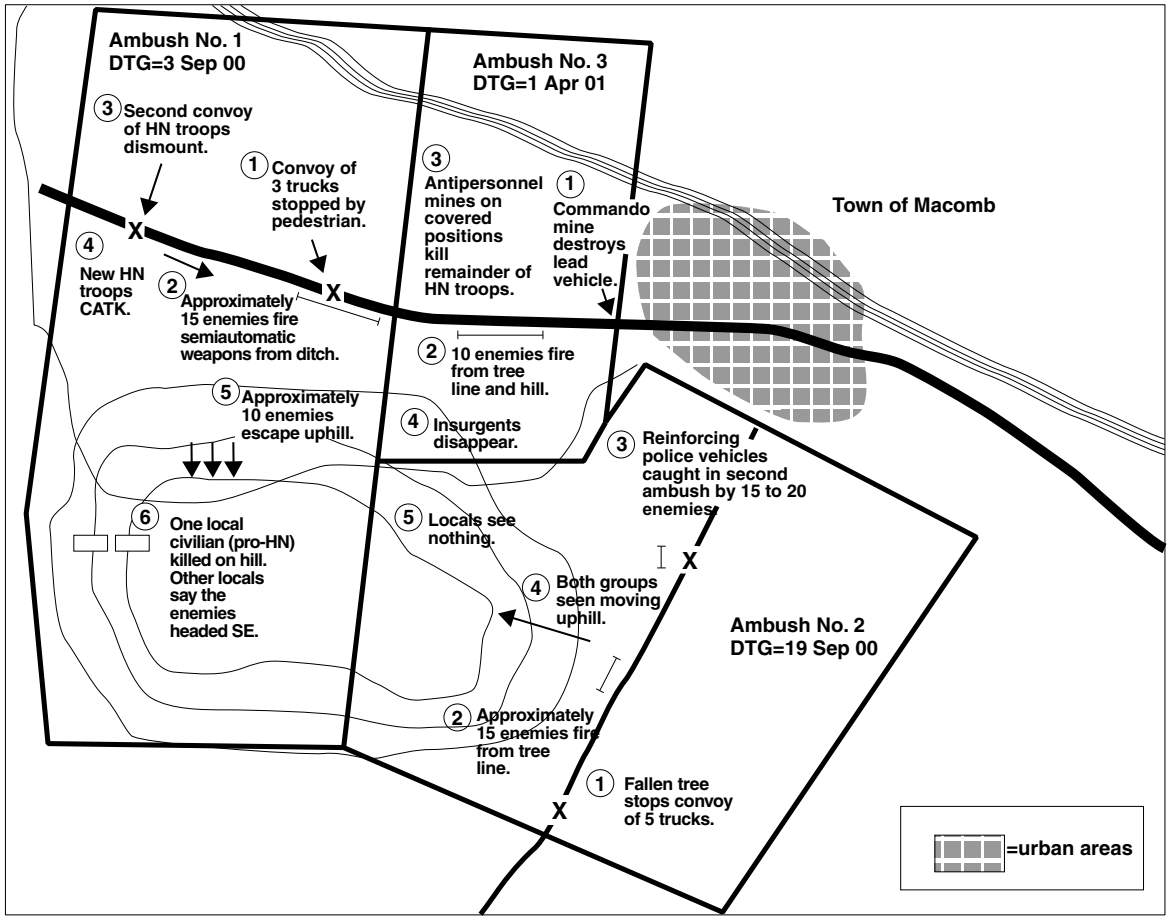

Figure 7-3. Coordinates Register.

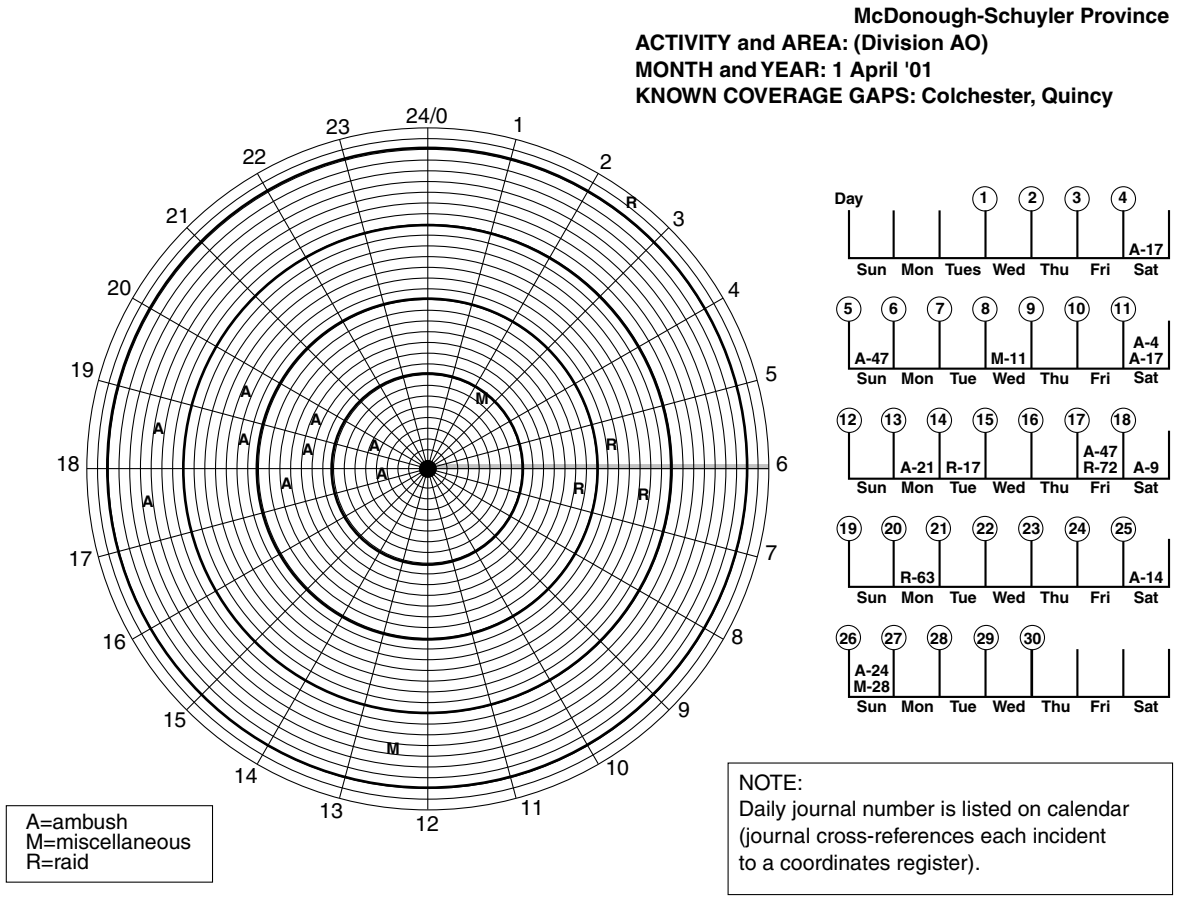

Figure 7-4. Pattern Analysis Plot Sheet.

week or month when threat activities occur. Used in conjunction with the coordinates register, the pattern analysis plot sheet identifies where, when, and how past actions occurred. This allows the analyst to use information derived from the coordinates register and pattern analysis plot sheet, to develop threat models and doctrinal templates, and to predict potential threat activity.

Matrix Analysis

Constructing a matrix is a simple, graphical way to organize a large volume of complex data. Matrices are used to show relationships between numbers of entities, such as people, incidents, organizations, weapons, locations, functions, and actions. Analysts use activities and association matrices to organize a large volume of complex data, particularly in cases where the tracking of individuals and organizations is emphasized. Activities and association matrices are useful in analyzing insurgent, terrorist, criminal or drug trafficking activity.

Activities Matrix

Analysts use the activities matrix to link people to events or organizations. An activities matrix quickly displays which notable personnel within the AO are related to a particular organization or type of activity. This matrix can also link certain activities or incidents within the AO with organizations or units.

In figure 7-5, individuals are listed down one side, with organizations listed across the top. Reported relationships are noted on an individual's row that intersects the appropriate organization's column. This example demonstrates the use of dots to signify the confirmed, possible, or probable certainty of the relationship. The absence of a dot indicates either no relationship or a lack of information. The system used must be explained in a legend. To complete this particular example, the analyst created a remarks column to record significant information regarding each individual.

● – confirmed ◌ – probable
○ – possible

Remarks		Christian Reform Party (good people)	Society for the Preservation of Order (SPO) (right wingers)	Farmer's Alliance (unknown peasant group)	People's Democratic Society (peaceful moderate)	Insurgent Company	New Liberation Movement (political front for New Metropolitan Edict [NME])	NME	Name of Individual	
Warrant Outstanding	Leader in the insurgent company. Possible platoon commander or company commander.					●	●	●	Johnston, S. D. alias "The Red"	Bandolph
	Possibly linked to death squad activities.	●	◌						Garra, N. A.

	"Doctor of Death" leads the SPO.	●	●	○	○				Mueller, H.	
Warrant						●	◌	◌	Martinez, E.	

Figure 7-5. Activities Matrix.

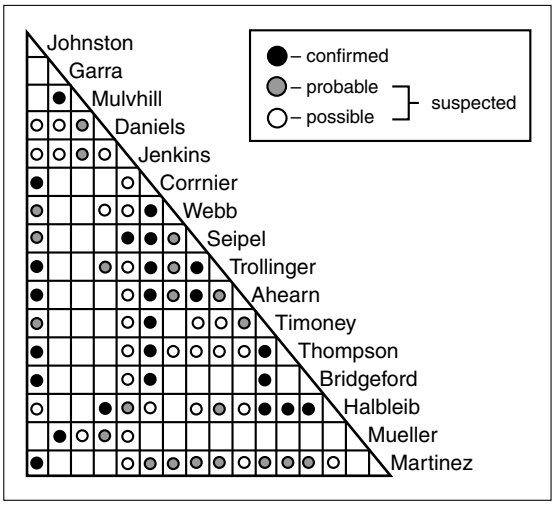

Figure 7-6. Association Matrix.

Association Matrix

The association matrix is used to show relationships between individuals. In figure 7-6, the individual names constitute both a column and a row. A dot indicates that a relationship exists. Through the use of the activities matrix, analysts note individuals that are members of the same organization and indicate the relationship on the association matrix.

Link Analysis

Link analysis is a method of evaluating and displaying relationships and activities information that has been organized into matrices. In link analysis, pictures or symbols are used to display intelligence data that depicts relationships between people or entities. Analysts assess the reliability and validity of the intelligence data and assemble a link diagram to gain greater insight into the construction of a relationship network.

In figure 7-7, the link analysis diagram uses circles to represent people, squares or rectangles to represent organizations, and lines to represent their connections. Solid lines represent confirmed or strong relationships, while dashed lines indicate suspected or weak relationships. When

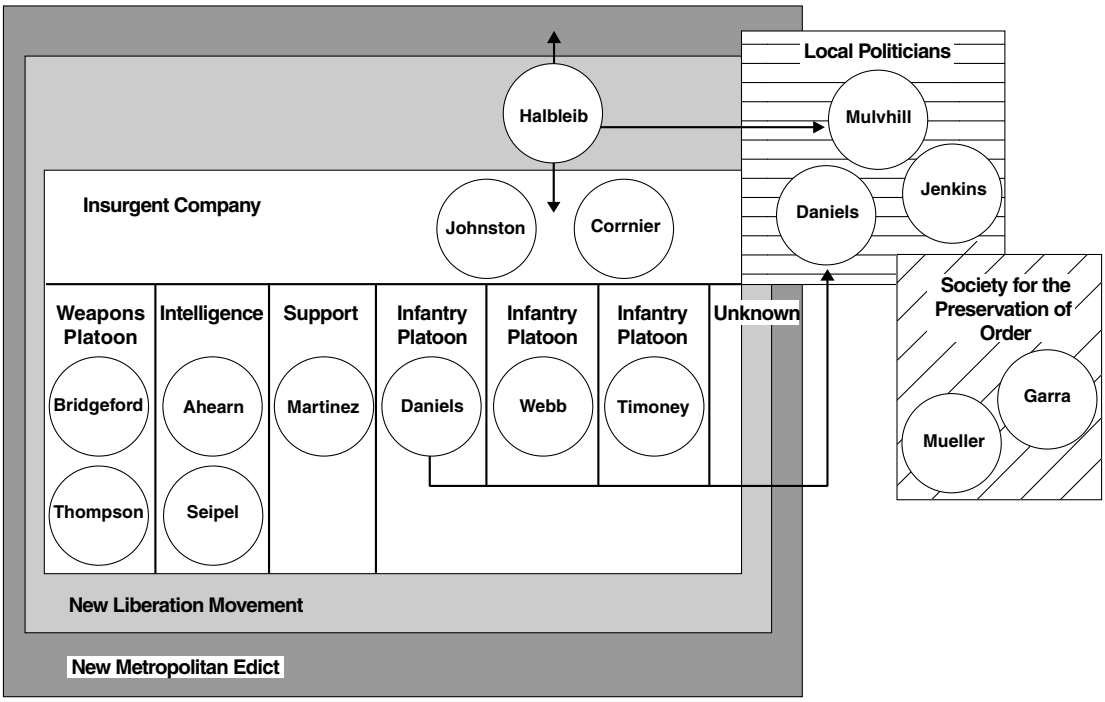

Figure 7-7. Link Diagram.

the analyst suspects that two people are actually the same person, the circles are overlapped. Circles and lines should be arranged so that their relationship lines do not cross. In complex cases, such as large groups, the circles should be arranged to keep the number of relationship-line intersections to a minimum.

The relationship of an individual to an organization can be shown a number of ways. When an individual is confirmed to belong to an organization, that individual's circle is placed within the organization's rectangle. By overlapping organizations, the analyst shows that an individual belongs to more than one organization and that there is a connection between the two organizations.

In cases where an individual is connected to but not a member of an organization, a line is drawn from the individual outside the organization to the rectangle representing the organization. If an individual's contact within the organization has been confirmed, the relationship line would be drawn between the circles representing the individuals.

Indicator List

The activities that reveal a COA are called indicators. Indicators are essential to discerning threat intentions. The analyst uses indicators to cross-reference specific events and activities with probable threat COAs and intentions. When used with other analytical tools (e.g., threat models, event templates, pattern analysis, matrices, and link diagrams), indicators are the key to estimative intelligence. During IPB, indicators are developed for each NAI to focus collection and analysis efforts. This list of indicators is constructed to satisfy the commander and staff's PIRs and IRs.

Indicator lists are formed by asking questions. Intelligence analysts develop a list of threat indicators by focusing on METT-T questions. Using METT-T, analysts determine what the threat must do and define the threat's probable activities (see the example below). These determinations become indications and warning.

Example: Forming an Indicator List Using METT-T

PIR: Will the threat defend objective C using a reverse-slope defense between 230600 to 270800 hours?

Mission: What does the threat commander accomplish by forming a reverse-slope defense?

Enemy: What types of units are available to conduct the defense? What units are necessary to construct and aid in the defense?

Troops and Support: Are threat troops experienced in reverse-slope techniques? What is their SOP for reverse-slope defense?

Terrain and Weather: Is objective C suitable terrain for a reverse-slope defense? If so, where is the most suitable terrain?

Time Available: How long will it take to develop a prepared defense versus a hasty defense? Will threat forces be able to prepare or assume a defense in the specified time period?

To further develop the indicator list, analysts can refine the questions developed using METT-T by breaking them down by battlespace functions. Information based on IPB, OOB factors, and experience aids intelligence analysts in deriving lists of activities that answer the commander's PIRs. These questions serve to narrow and focus on certain activities, equipment, troops, and training which an adversary must possess or do to accomplish their mission. For a representative listing of common tactical level indicators, see appendix C.

CHAPTER 8. TARGET DEVELOPMENT AND COMBAT ASSESSMENT

Successful MAGTF operations depend on an efficient, organized targeting effort to affect those enemy capabilities that could interfere with achievement of the friendly mission and objectives. The targeting process of detecting, selecting, and prioritizing targets requires coordinated interaction between intelligence, maneuver, fires, and planning elements of the MAGTF, joint force commander (JFC), Service components, and supporting agencies. This chapter introduces the targeting cycle, intelligence targeting support, the analyst's role in target development, and combat assessment.

SECTION I. TARGETING

Based on the friendly scheme of maneuver and tactical plans, targeting includes an assessment of the weather, terrain, and enemy to identify those enemy formations, equipment, facilities, and terrain which when attacked or controlled will ensure success. Through the targeting process, analysts develop a prioritized list of targets to be attacked and determine the weapons required to achieve the desired effects.

Targeting Cycle

Defined as deliberate or reactive, targeting is an integral part of the planning process that begins with receipt of the mission and continues through the development of the approved plan. Deliberate targeting is associated with fixed or semi-fixed targets, while reactive targeting is associated with mobile targets. Whether deliberate or reactive, the targeting cycle integrates intelligence, maneuver, fires, and C2 processes to assist the commander in deciding which targets to engage when, where, and to what effect.

Through the targeting cycle, fires planners and targeteers derive nomination lists of forces, installations, or locations that if attacked will promote the commander's warfighting objectives. The higher the command level performing the targeting process, the more formal it becomes and the more the process focuses on events well in the future. At the MAGTF or joint force level, the targeting cycle tends to be deliberate, encompasses greater resources, and involves—

- Establishment of commander's objectives, guidance, and intent.
- Target development, nomination, validation, and prioritization.
- Capabilities analysis.
- Commander's decision and force assignment.
- Mission planning execution.
- Combat assessment.

At lower tactical levels, the same process tends to be reactive, occurs in a shorter time span with less formality, and focuses on events of an immediate nature. The tactical-level targeting cycle is simplified to decide, detect, deliver, and assess

(D3A). Figure 8-1 depicts the joint targeting cycle and its relationship to D3A. Although intelligence is an integral part of each targeting cycle phase, intelligence P&A directly affects target development (decide) and effects assessment (assess).

Target Development

Target development is the analysis of potential enemy military, political, or economic systems to determine their significance and relevance to the commander's objectives, guidance, and intent. The analysis proceeds from broad systems to specific components and finally to individual elements or aim points. Analysts evaluate system components and interrelationships to establish their criticality to the threat's operation and their vulnerability to attack. Through this systematic evaluation, analysts develop targeting strategies to select potential targets and to determine the type of damage that will accomplish the friendly commander's defined objective. Objective definition and target development must comply with the commander's guidance, law of armed conflict, and rules of engagement.

Analysts evaluate each target's lethal and nonlethal capabilities to develop a prioritized list of targets and the intelligence requirements that support target acquisition and combat assessment. The scope, level of detail, and time involved depend on the situation and the level of command conducting targeting. Common processes and procedures employed in target development include IPB, target value analysis, HPT identification, and use of the high-payoff target list (HPTL).

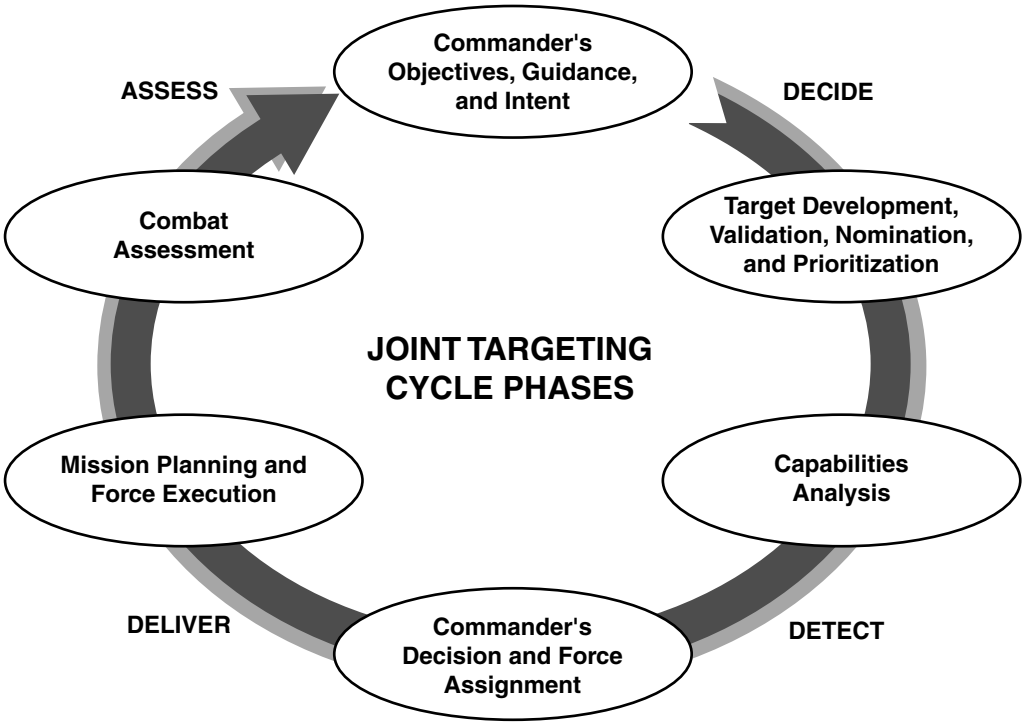

Figure 8-1. Joint Targeting Cycle and D3A.

Intelligence Preparation of the Battlespace

Through the IPB process, intelligence analysts contribute to target development by—

- Determining the threat commander's COAs through systematic analysis of the region, weather, terrain, and doctrine.
- Evaluating doctrinal templates to identify a threat's COGs, critical vulnerabilities, and HVTs.
- Constructing situation templates and examining the threat commander's decision cycle and each potential COA's decision points to refine HVTs.
- Wargaming, mentally, each COA and the threat commander's decisions to identify his/her key assets as HVTs.
- Developing event and decision support templates to help identify NAIs, decision points, decision phase lines, TAIs, and HPTs.
- Analyzing the threat's target systems, complexes, and components to develop their relevance and importance.

Target Value Analysis

Target value analysis is a method of identifying and ranking potential HVT sets in a COA. The target analyst, in coordination with the G-3/S-3, G-2/S-2, fire support coordinator, and other staff members, war game the COAs to—

- Finalize individual staff estimates.
- Develop a fire support plan, a scheme of maneuver, as well as friendly and threat decision support templates.
- Determine critical assets required by the threat commander to accomplish his/her mission.

High-Value and High-Payoff Target Identification

An HVT is an asset that the threat commander requires for the successful completion of a mission. Its loss to the threat can be expected to contribute to substantial degradation of an important battlespace function. Contributing to the targeting development process, G-2/S-2 section personnel, the fire support coordinator, and other staff members identify key threat assets that must be dealt with and nominate HVTs to be HPTs. The key to HPTs is that they are based on the friendly commander's scheme of maneuver.

The HPTs are developed during the wargaming process. As the staff fights the different options, the G-2/S-2 identifies specific HVTs. The HPTs for a specific phase of the battle are recorded on the decision support template and synchronization matrix. Those locations where HPTs are expected to appear become TAIs.

The G-2/S-2 and/or collection manager evaluate HVTs at different points in the battle to determine required collection asset capabilities and to provide the necessary target resolution. This evaluation becomes the basis for the collection plan for intelligence support to targeting. Because of their importance, HPTs receive priority in the allocation of detection systems. The G-2/S-2 and the commander must consider the impact the priority will have on maintaining situational awareness, because the same collection assets are used for targeting and battlespace awareness.

The fire support coordinator, air officer, electronic warfare officer, C2W and other representatives use their knowledge of friendly lethal and nonlethal means to determine if a capability exists to attack the HVT and the expected effects of the attack. The G-2/S-2 then assesses the threat response. This effects-based targeting assessment sequence helps determine if attacking the HVT is necessary to ensure the success of the friendly force. If the HVT is acquirable, attackable, and capable of ensuring friendly success, it becomes an HPT. The HPTL identifies prioritized HPTs for a specific battle point.

High-Payoff Target List

The commander-approved HPTL is a tool in determining attack guidance and in developing targeting intelligence collection, production, and dissemination plans.

Collection

Collection efforts focus on NAIs and TAIs that the IPB process identifies during the decide phase. Knowledge of target type and its associated signatures (electronic, visual, thermal) enables friendly forces to direct the most capable collection asset to be tasked against the target. The asset is positioned in the best location based on friendly estimates of when and where the threat target is located.

The decision to destroy, degrade, disrupt, or delay a given HPT results in a requirement to detect that target. Intelligence needs to support the detection of the target are expressed as PIRs and IRs. The PIRs and IRs that support detection of a target are incorporated into the collection plan. The collection manager translates the PIRs and IRs into ICRs and supporting specific IRs. The collection manager considers the availability and capability of MAGTF and external collection assets.

Production

Production efforts focus on developing timely, tailored intelligence products to meet maneuver and fires needs.

Dissemination

Dissemination efforts focus on ensuring CIS readiness to support both routine and time-sensitive intelligence reporting in support of MAGTF targeting needs.

Target Analysis

Target analysis helps to determine the military importance, priority of attack, scale of effort, and weapons required to obtain a desired level of damage or casualties. Other considerations for analysis include target criticality, accessibility, and recognizability. While target analysis helps to determine which targets to hit, operations planning determines how to do it. At strategic and operational levels of war, targeting is more deliberate and focuses on fixed installations or large arrays of targets.

At the tactical level, the MAGTF commander has capabilities to strike deep targets that support threat maneuver or ground forces. These targets are often complex groupings of installations, units, and defenses that may require a methodical approach to ensure success. This methodology is referred to as target system analysis.

Target System Analysis

A target system includes installations, facilities, or forces that are functionally related and situated in the same geographical area. A target system comprised of components and elements can be either fixed installations or mobile target sets. While an individual target may be significant based on its characteristics, its worth is usually derived from its relative importance within the target system. Target system elements are smaller, more intricate parts of the target system than the component and are necessary to the operation of the component. Figure 8-2 depicts the relationship of a target system, its components, and its elements.

Components

A target system's components can also be targets, such as airfields, which are a component of an air defense system. Within industrial or economic systems, a system component belongs to one or more groups of industries or basic utilities

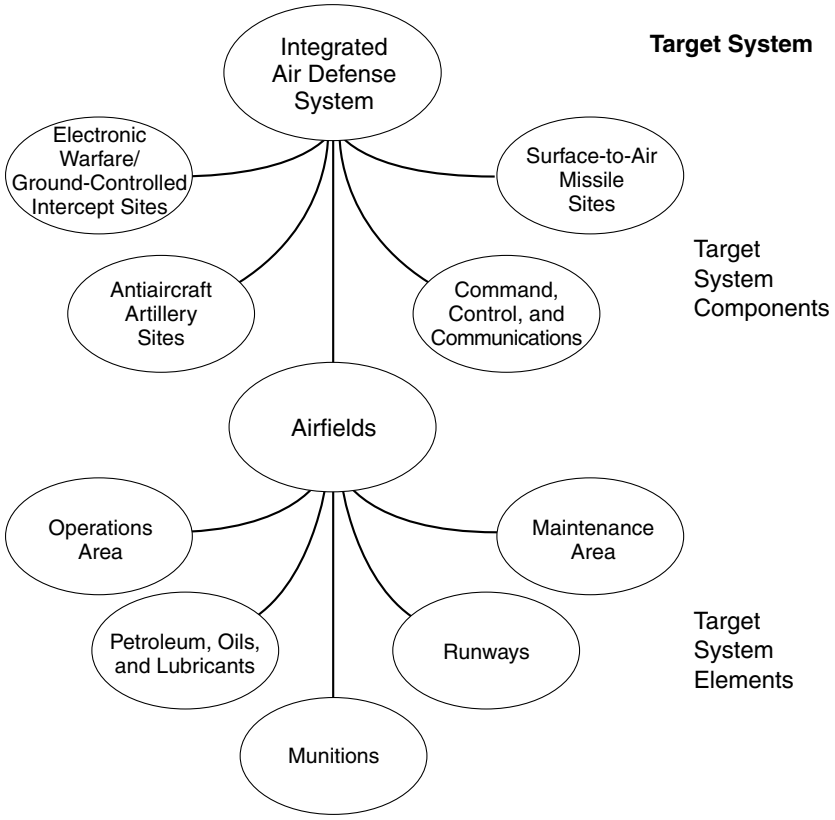

Figure 8-2. Target System, Components, and Elements.

required to produce individual parts of an end product. Target system components can also refer to component services. For example, an air defense system may include C2, early warning and target acquisition radars, antiaircraft artillery and surface-to-air missile batteries, support facilities, and other components that are neither industries nor utilities.

Activity

Target system activities encompass those actions or functions performed by the target system components in pursuit of system goals. By this definition, a combined-arms maneuver division could be viewed as a target system, with components that include air defense units, artillery, armor, mechanized infantry, and engineers. The target development process should focus on the activity of the system or its components. Analysts conduct a comprehensive evaluation of target system components and elements to understand the activities of the total system.

Once analysts have identified the enemy activity that must be affected or defeated, they can determine the key target systems, components, or elements that should be attacked, degraded, or exploited to produce the desired effects. For example, enemy air attacks against friendly ports and LOCs may seriously threaten resupply of friendly forces. To modify or defeat this enemy activity, targeteers analyze the enemy's air force system and identify threat system components and elements. They target the enemy aircraft home bases and identify runways; petroleum, oils, and lubricants storage; and maintenance facilities as potential target elements, which

friendly forces should modify to defeat the enemy's air attack activities.

Linkage

Analysts must understand the linkage or connection between installations performing identical, similar, related, or complementary activities or functions. To develop targets, analysts identify critical nodes or points where target system components and elements are linked and dependent upon each other. These key nodes also exist where target systems interact with other target systems. Matrix and link analysis, as discussed in chapter 7, are highly effective tools for determining linkages and critical nodes.

Target development focuses on identifying the critical nodes within target systems that will satisfy objectives. For example, an enemy's air defense system consists of a number of components, such as surface-to-air missile sites, early warning and ground-controlled intercept sites, antiaircraft artillery sites, and airfields. To function effectively, the elements are linked at a sector headquarters, which exercises responsibility for a specific geographic area. Analysts would target these sector headquarters to sever the critical node within the air defense system.

Target Complex Analysis

A complex is a group of physical elements in close proximity containing multiple target elements that are integrated to contribute to some function of military or civilian value. For example, a system of military airfields distributed throughout the country is made up of individual airfields (e.g., target complexes), containing multiple elements (e.g., individual aircraft, runways, hangars) in close proximity.

After target system analysis identifies a critical target complex, target complex analysis identifies the target environment and defenses associated with the complex. Target complex analysis is used to determine specific targets within the complex as well as supporting actions (e.g., defense, suppression, deception, tactics) that may be necessary to attack the target.

Target Element Analysis

A target element is the smallest identifiable activity of a target component (e.g., sheltered aircraft, control tower, defensive radar site). Based on the targeting objectives, target elements are evaluated as targets for attack. Detailed analysis must be conducted on the individual target element. When conducting target element analysis, the target intelligence officer is responsible for evaluating the element's—

- **Location**—Exact location expressed in geographic or UTM coordinates.
- **Elevation**—Altitude above sea level of the element's ground location expressed in feet or meters.
- **Identification**—Accurate determination of—
  - **Type**—Brief description of the target's military functions.
  - **Size**—Length, width, and height dimensions.
  - **Shape**—Definition of the spatial form.
  - **Attitude**—Azimuth of the element's long axis expressed in degrees (090-270) or descriptive words (east-west).
  - **Dispersion**—Pattern of individual elements in the target area expressed as a short word-picture description.
- **Vulnerability**—Susceptibility to fire.
- **Recuperability**—Time required for enemy to reactivate the target or reconstitute it in another location.
- **Importance**—Value within the enemy's operation and degree to which destruction of the potential target would reduce the enemy's capability.

Role of the Target Analyst

Target analysts should complete the following steps when conducting target P&A:

- Collect target information and intelligence.
- Collate data.
- Evaluate potential list of targets.
- Construct flow of threat target component, complex, and system.
- Determine most suitable targets.
- List targets and priorities.
- Present recommendation.
- Refine data and develop required intelligence products.

Target Analysis Products

Analysis products used in target development include a target list, no-strike target list, restricted target list, target files, and collection requirements.

List of Targets

Target intelligence analysts conduct a thorough analysis of targets and coordinate with the other P&A personnel and the G-3/S-3 maneuver and fires targeting team to provide required intelligence supporting the list of targets for the commander's consideration. The fire support coordinator maintains and prioritizes the list of targets in order of relative importance to the commander's objectives. The operations section and ultimately the commander are responsible for validation of targets and formulation of the commander's target list, which is derived from the HPTL developed during IPB and COA wargaming.

No-Strike Target List

During the target validation process that occurs during target development, some potential targets are placed on a no-strike list. Commanders designate no-strike targets, which are prohibited from attack, to avoid—

- Interference with military operations.
- Damage to relations with indigenous personnel or governments.
- Violation of international law, conventions, or agreements.

No-strike lists are nominated by elements of the joint force and approved by the JFC. This list also includes no-strike targets directed by higher authorities. Examples of no-strike targets include—

- Hospitals.
- Schools.
- Places of worship.
- Cultural shrines.

Restricted Target List

This list is composed of targets with specific restrictions. Actions exceeding those restrictions must be coordinated with the establishing headquarters. Restricted targets are nominated by elements of the joint force and approved by the JFC. This list also contains restricted targets directed by higher authorities. The decision to restrict a target centers on the importance of the target to the threat and the plans and intentions of the friendly commander. The following are examples of restricted targets:

- An area in which a friendly reconnaissance team is operating. To avoid fratricide, fires may be placed into the area, but only upon coordination with the establishing headquarters.

- A bridge identified by a commander as critical to future operations. To ensure the bridge is available to friendly forces, this target may be restricted as to the type of ordnance that can be used against it or the level of damage that may be inflicted on it.

Target File

A target file contains pertinent target system, complex, or component information collected during the target development process. Information in the target file is used to build target studies once HPTs are approved or validated. Generally, target files deal with fixed or semi-fixed targets. This information may be in the form of—

- Data bases.
- Selected imagery.
- Graphics.

Collection Requirements

Throughout the target analysis process, analysts identify targeting intelligence gaps and develop ICRs to obtain needed data. The ICRs must be stated early and clearly in the form of PIRs, IRs, and specific IRs. Analysts and planners have to think beyond the traditional picture (i.e., imagery) and use intelligence sources such as SIGINT, HUMINT (i.e., defectors, refugees, prisoners of war, travelers, aircrew debriefs, and special forces), and other sensor data that can provide indications of a target's status. Gaining a familiarity with collection system capabilities is critical. Requesters should recognize the various intelligence sources' strengths and limitations and understand how to best exploit them.

Target or Objective Studies

Once the commander approves a target, intelligence sections develop target or objective studies to support mission planning. These studies are focused, detailed intelligence products that aid in the application of fires or the maneuver of forces against a specific target set or area. Smaller MAGTFs and units use these studies for mission preparation and execution.

Target or objective studies are graphically oriented and may use many of the graphics derived during the IPB process, such as a target folder. Depending on the specific mission, the study may contain the following information:

- Orientation graphic.
- Time-distance graphic.
- Weather forecast.
- Hydrographic forecast and astronomical data.
- Intelligence briefing notes for mission.
- Graphic intelligence summary.
- Objective area graphic enhancements, such as—
  - Orientation graphic (10–20 km around objective).
  - Mission planning graphic (5 km around objective).
- Objective area imagery.
- Imagery and graphics of insertion points.
- Survival, evasion, resistance, escape plan.
- Challenge and reply passwords.
- Mission-specific data as required.

SECTION II. COMBAT ASSESSMENT

The final step of the targeting cycle, combat assessment is the determination of force and weapons system employment effectiveness during military operations. The combat assessment objective is to identify recommendations for the course of military operations. A G-3/S-3 responsibility, combat

assessment is performed as a coordinated effort by the operations, intelligence, and fires staffs. Conducted at strategic, operational, and tactical levels of war and MOOTW, the combat assessment process is used by analysts to—

- Provide the commander with information on the status of an operation.
- Help formulate subsequent battle plans.
- Serve as a benchmark for validating objectives.
- Collect data on weapons and weapons system performance.

The three components of combat assessment are BDA, munitions effects assessment (MEA), and reattack recommendations (RR). Intelligence analysis has a major role in determining BDA, which includes physical damage, functional damage, and target assessment (see fig. 8-3).

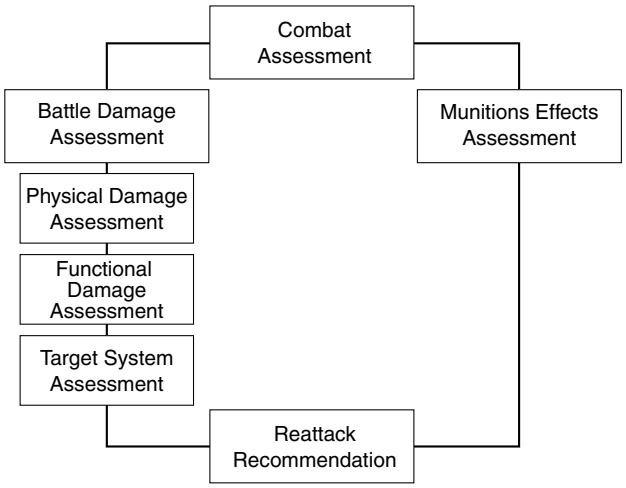

Figure 8-3. Combat Assessment Process.

Battle Damage Assessment

A key component of the combat assessment process, BDA is the timely and accurate estimate of damage resulting from the application of military force, either lethal or nonlethal, against an objective or target. Primarily an intelligence responsibility, BDA requires extensive coordination with operations and fires elements. The BDA is munitions-independent (air, ground, naval, and special forces weapon systems) and is target-independent (fixed strategic and mobile or movable tactical targets).

Munitions Effects Assessment

Munitions effects assessment is analysis of the friendly military force in terms of the weapons system, munitions, and weapon delivery parameters to increase force effectiveness. While the operations and fires staffs are responsible for MEA, the MEA is conducted concurrently and interactively with BDA, which is conducted by the intelligence staff.

Reattack Recommendations

Based on results of BDA and MEA, the operations and intelligence team make RRs for the target nomination and development process. The RRs should address operational objectives relative to the target, target critical elements, and enemy combat forces. When making RRs, the operations and intelligence team considers the—

- Current level of achieved operational and tactical objectives.
- Weapons systems and munitions.
- Target and aimpoint selection.
- Attack timing.

Battle Damage Assessment Components

Physical damage assessment (PDA), functional damage assessment (FDA), and target system assessment (TSA) are three subcomponents of BDA.

Physical Damage Assessment

Referred to as Phase I BDA, the PDA is a quantitative estimate of physical damage that occurs to a target through munitions blast, fragmentation, and fires. This assessment is based on observed or interpreted damage.

The unit controlling the weapons system and the intelligence collection observers develop Phase I BDA reports. Figure 8-4 illustrates the flow of Phase I BDA.

For example, visual observation of an enemy artillery battery (the target) verifies four self-propelled howitzers with shattered and dislodged tubes, recoil mechanisms, and turrets. Track damage to one howitzer is noted. Another

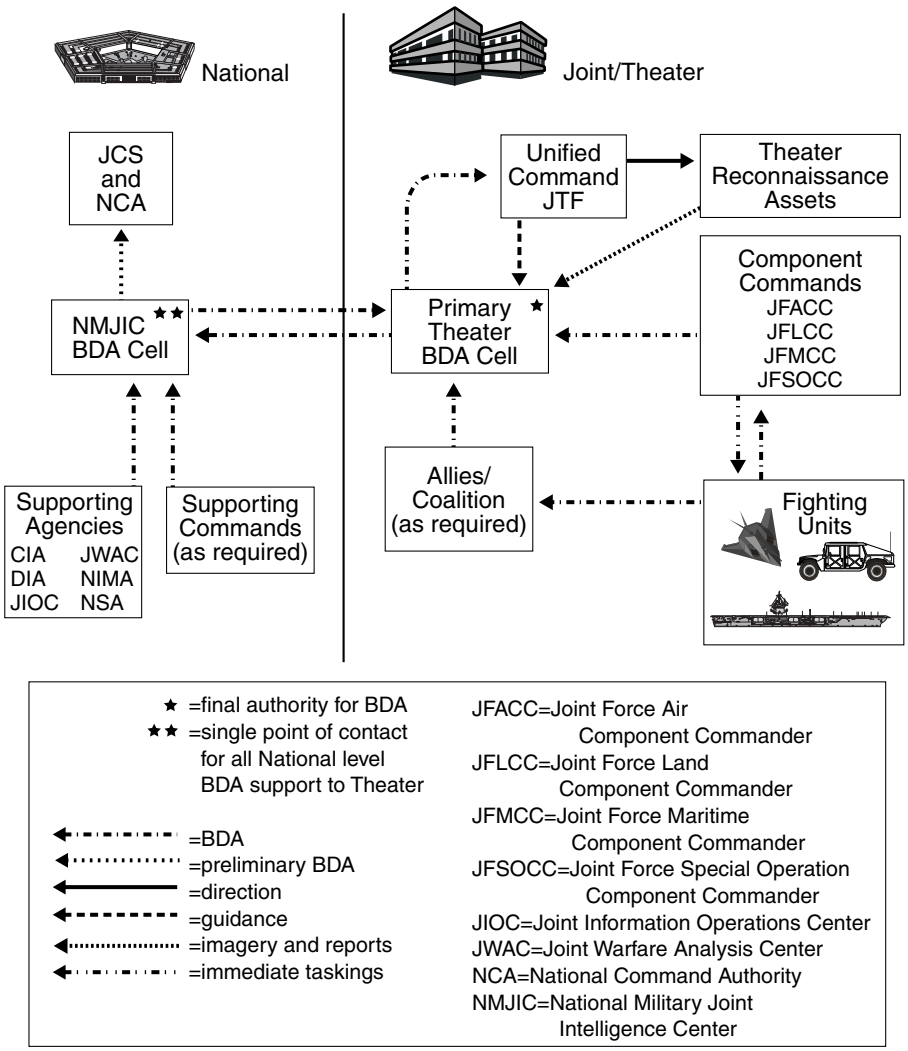

Figure 8-4. Phase I BDA or PDA Information Flow.

howitzer has no visible damage. The PDA of the battery is 65 percent destroyed. The PDA for large, complex targets is keyed to specific aimpoints and critical elements.

Combat Strength Assessment

When dealing with threat ground combat units, the more common term for Phase I BDA or PDA is combat strength assessment. Combat strength is the actual strength on hand of a ground unit in terms of operational tanks, armored vehicles, and artillery. This strength is expressed as either a count of generic type equipment or as a percentage of the T/O and T/E. Threat combat strength is a critical factor to commanders preparing for combat. During operations, commanders rely on combat strength assessment to account for enemy losses and to assess remaining enemy strength.

Combat Strength Baseline

Prior to operations, analysts establish the combat strength baseline of beginning strength numbers. These numbers remain constant for the duration of combat and serve as a benchmark against which losses or gains are measured (see table 8-1). The baseline combat strength represents the maximum amount of equipment possible for a unit, while combat losses represent verified losses.

Table 8-1. Example of Combat Strength Assessment.

105th Mechanized Infantry Division	Tanks	Armored Vehicles	Artillery
T/E	102	135	45
Beginning Strength	98	135	42
Combat Losses	17	22	4
Replacements	6	3	0
Combat Strength	87	116	38
Percent of T/E	85	85	84
Current Combat Strength = 85%			

Combat Strength Computation

Combat strength for each type of equipment is computed by subtracting the confirmed losses from the beginning strength and adding the replacements to that total. The percent of T/O and T/E is calculated by dividing the combat strength by T/O and T/E numbers. The T/O and T/E percentages are totaled and divided by the number of equipment types to determine the current combat strength for the assessed system. Note that while the baseline combat strength represents the maximum amount of equipment possible for a unit, combat losses represent only verifiable losses. Current combat strength can be viewed as a worst-case estimate since it only takes into account confirmed losses. Replacements are included when known. Equipment categories are limited to generic types.

Personnel Losses

Personnel are not normally included in determining combat strength. Acquiring accurate casualty figures and accounting for replacements is extremely difficult, and past experience has shown that body counts are often misleading. A more appropriate and meaningful assessment of the impact of personnel losses can be made as part of combat effectiveness assessment. In MOOTW, however, where personnel may be the threat's principal strength, personnel losses may have to be tracked and combat strength assessed accordingly.

Functional Damage Assessment

The FDA is an estimate of the friendly military force's effect on degrading or destroying the functional or operational capability of the target and an evaluation of the friendly force's operational objective success level. This assessment is based on all-source intelligence and includes an estimate of the time required for reconstitution or replacement of the target function. The FDA is also referred

to as Phase II BDA. Figure 8-5 illustrates the Phase II BDA information flow.

Target System Assessment

The TSA is a broad assessment of the friendly military operations impact and effectiveness against a target system capability. This assessment may be used to measure the threat's combat effectiveness. Based on the commander's operational objectives, a TSA may address significant target system subdivisions.

Analysts compile individual target FDAs to produce TSAs, which are applied to the current system analysis or OOB. For example, the threat's fire support system is known to have 21 artillery battalions. Partial destruction of one battery has minor impact on the effectiveness and capability of the threat's overall fire support system. A complex and resource intensive process, TSA is generally performed at the theater level. The TSA is also referred to as Phase III BDA. Figure 8-6 illustrates the Phase III BDA information flow.

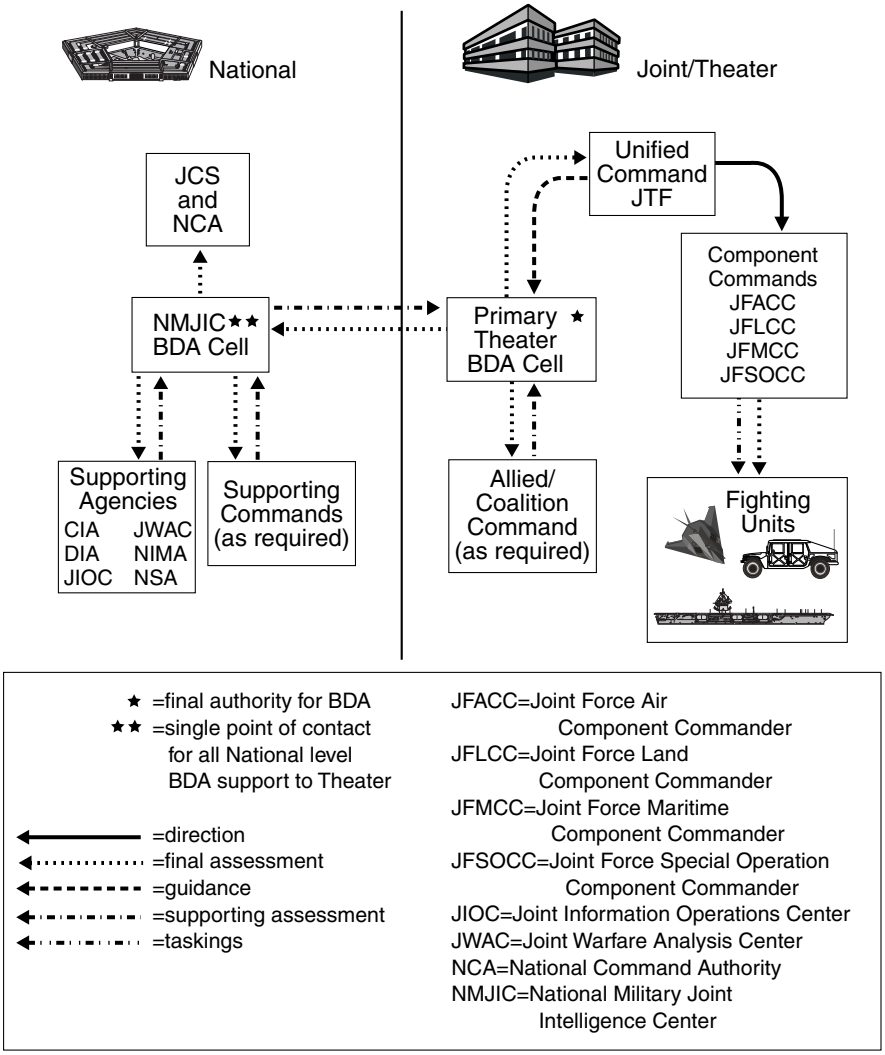

Figure 8-5. Phase II BDA or FDA Information Flow.

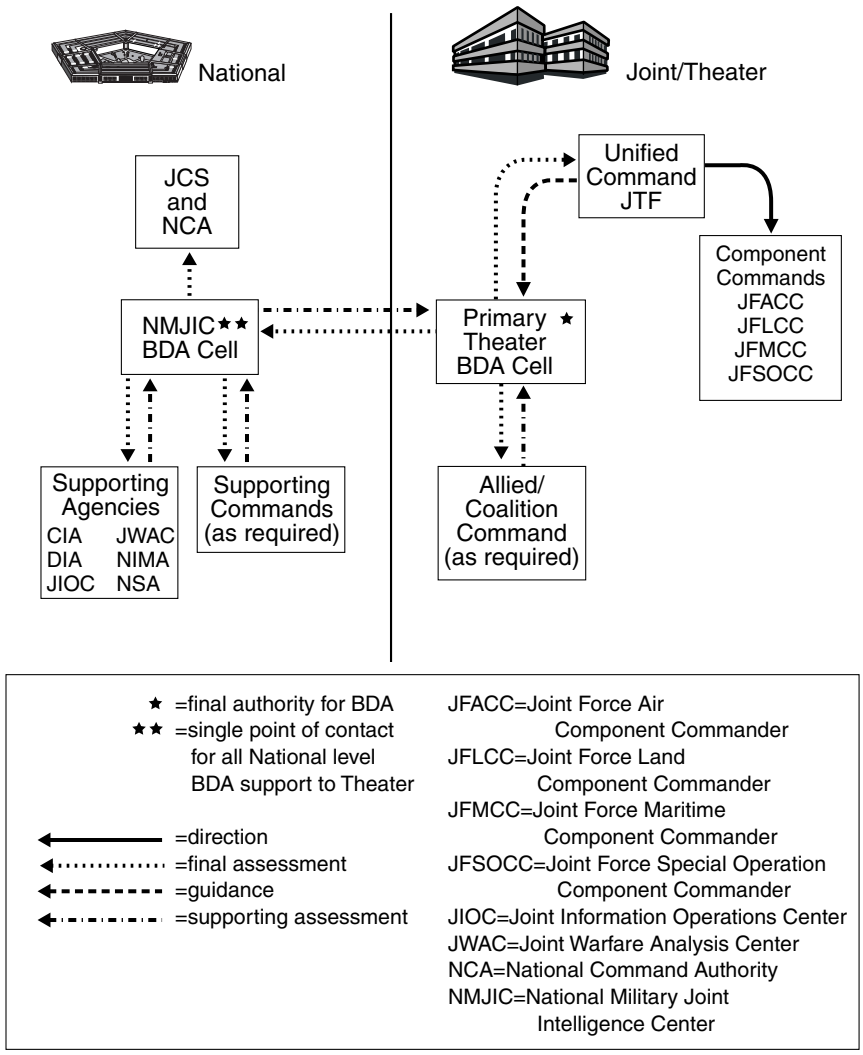

Figure 8-6. Phase III BDA or TSA Information Flow.

Responsibilities

The intelligence officer and the MEF ISC integrate intelligence and operational weapons system and munitions effects data provided by the G-3/S-3 to determine the effects of an executed COA on threat strength and combat effectiveness. In coordination with the G-3/S-3, the intelligence officer or ISC—

- Recommends HVTs.
- Develops and recommends IRs to include those for targeting and BDA.
- Coordinates with the G-3/S-3, air officer, and fire support coordinator to develop coordinated targeting, intelligence, BDA, MEA, and RR plans.
- Develops integrated collections, production, and dissemination plans to answer the commander's IRs.
- Requests collection and production support for intelligence required to satisfy targeting objectives and BDA.
- Establishes procedures to ensure observation reports from forward observers, reconnaissance, pilots, etc., are readily available to BDA analysts.

- Matches BDA against the commanders objectives to determine targeting success and refines intelligence estimates of the threat's situation and capabilities, recommends target reattack, develops and maintains historical BDA data bases, and disseminates hard and soft copy intelligence and BDA products.
- Uses the results of BDA and combat assessment in determining the need to further develop enemy COAs.

Battle Damage Assessment Methodology

After the commander identifies PIRs, IRs, and targeting priorities, the intelligence officer or MEF ISC tasks intelligence collection assets to locate, identify, and track designated targets and directs production assets to plan and prepare needed intelligence products. The ISC, fire support coordinator, and air officer coordinate to identify the appropriate attack system to capture, destroy, degrade, suppress, or neutralize the target.

Based on targets and conditions set by the commander, the ISC refines the commander's BDA-related requirements and integrates them into the intelligence operation plan. These BDA requirements are answered through execution of the intelligence cycle.

As targets are attacked, the ISC coordinates P&A cell's BDA through execution of the intelligence cycle. The commander uses BDA to decide if the target should be reattacked or if the objectives have been met. Once a BDA-related PIR is satisfied, the commander decides if there is a need to establish a new BDA-related PIR or if limited intelligence assets will be used to support another aspect of the mission. The BDA-related PIRs should only address the commander's most critical requirements.

Tactical-level BDA provides a series of timely and accurate snapshots of the effect operations are having on the threat. The BDA helps commanders determine when or if their targeting effort is accomplishing goals and objectives and provides commanders the information needed to quickly allocate or redirect forces.

Battle Damage Assessment Principles

The intelligence officer must work closely with the commander and staff to ensure they know the characteristics and limitations of BDA, which is viewed in terms of objectivity, reliability, and accuracy.

Objectivity

The BDA must be objective and supported by the most reliable data available. Generally, data collected through objective means (imagery) are more reliable than data collected through subjective means (pilot reports). The intelligence officer and ISC should strive to verify conclusions and resolve discrepancies in BDA reporting. It is particularly important to maintain BDA objectivity when BDA becomes the deciding factor for determining and executing a specific COA or decision. When disseminating intelligence, the ISC must make a distinction between facts and estimates.

Reliability

The quantity and quality of available collection and production assets impact BDA reliability. The degree of reliability and credibility of the assessment relies on the resources employed for BDA collection. Collection and production assets must be properly balanced, managed, and supervised to produce reliable reports that are concrete, quantifiable, and precise.

Accuracy

To obtain accurate BDA information, the AO must be frequently and adequately covered by a combination of national, theater, and tactical collection and production assets. Frequent coverage is necessary to accurately determine pre- and post-strike damage.

Battle Damage Assessment Reporting

The intelligence officer or ISC ensures BDA reports conform to the operational plan, reports target damage and destruction, and assesses the degree of mission success. When possible, BDA reporting includes the visual verification of physical damage and an analysis of the damage effects on the threat unit. The MAGTF and subordinate elements are primarily concerned with reporting Phase I BDA or PDA.

Reports

Reports used in BDA include—

- Mission reports and in-flight reports.
- Aircraft cockpit video or weapons system video.
- Imagery and IMINT (e.g., national, theater, and tactical imaging systems, UAVs).
- SIGINT.
- HUMINT.
- Open source intelligence (e.g., television broadcasts, radio broadcasts, newspapers).
- Visual reports from combat units, air controllers, or forward observers.

Reporting Methods

The intelligence officer compiles, refines, and validates the various sources of BDA and develops consolidated PDA or combat strength assessments. The MSCs and major subordinate elements forward consolidated BDA reports to the MEF, usually covering set time periods. See appendix D for an example of a consolidated BDA report format.

At the MEF level, P&A company, intel bn, is responsible for compiling MEF Phase I BDAs or PDAs and for adjusting master OOB data bases to reflect threat combat losses. The BDA cell also prepares and disseminates formal Phase I BDA reports according to theater and national policies and procedures. Defense Intelligence Report, DI-2820-2-99, *Battle Damage Assessment (BDA) Reference Handbook (U)*, provides detailed joint procedures and formats regarding BDA analysis, reporting formats, standard terminology, and resources. This final draft document is available on-line via INTELINK and INTELINK-S.

CHAPTER 9. INTELLIGENCE PRODUCTION

Intelligence production is the conversion of information into intelligence through the integration, analysis, evaluation, interpretation, and synthesis of all-source data and the preparation of intelligence products in support of known or anticipated user requirements. Production involves translating the results of analysis into usable intelligence products that are timely and tailored to the unit, subordinate units, and other supported commands' missions and IRs. The analyst must strive to provide knowledge and understanding that the decisionmaker can visualize and absorb. If possible, that knowledge and understanding should be presented in the form of coherent, meaningful images rather than in the form of accumulated lists, texts, or data fields. During the production phase of the intelligence cycle, information is—

- Evaluated to determine pertinence, reliability, and accuracy.
- Analyzed to isolate significant elements.
- Integrated with other relevant information and previously developed intelligence.
- Interpreted to form logical conclusions, which bear on the situation and support the commander's decisionmaking process.
- Applied to estimate possible outcomes.
- Placed in a product format that will be most useful to the user.

During MAGTF CE deliberate planning, production normally entails the development of detailed, all-source intelligence estimates and studies through the combined efforts of several intelligence and reconnaissance operation elements. During tactical execution, time constraints and ongoing battle demands require rapid processing and production with an emphasis on development of simple, mission-focused intelligence products (e.g., annotated image, target description, overlay depicting current and future threat dispositions). The value of intelligence production is measured in terms of time or resources expended and how well it places information into context, converts it into knowledge and understanding through analysis and synthesis, answers the PIRs and IRs, and applies that knowledge to the decisionmaking process.

There is an inherent friction between the desire to provide as complete and accurate an intelligence product as possible and the continuous requirement to support the time-sensitive urgency of tactical decisionmaking. In practice, these conflicting demands must be balanced by using both stated direction, such as the commander's intent and PIRs, and knowledge of the operational situation to determine when to finish and disseminate a product. To provide a framework to make these determinations, intelligence production is viewed as occurring on deliberate and immediate levels.

Production Categories

In the MAGTF, the primary categories of production are deliberate and immediate.

Deliberate Production

Deliberate production is employed when there is sufficient time to thoroughly evaluate, analyze, and synthesize available information and intelligence. The results of deliberate production efforts are formal, comprehensive intelligence products. Intelligence products that fit into this category include—

- Contingency intelligence studies.
- Detailed, fully developed IPB studies.
- Intelligence estimates.
- Target or objective studies.

Immediate Production

Immediate production is a time-limited, highly focused effort that satisfies an immediate tactical requirement. This type of production involves the rapid processing, analysis, production, and dissemination of intelligence to influence tactical decisionmaking. Often, immediate production is facilitated by, and builds on, a previously completed deliberate production effort.

Elements of data are subjected to a compressed version of the production cycle, and the resulting product is rapidly disseminated to those who are affected. Immediate production is normally conducted during execution and results in simple, mission-specific intelligence products (e.g., situational assessments or answers to specific, individual intelligence requirements).

The nature of the situation and pertinent intelligence requirements dictate the amount of time available to complete each production effort. Intelligence products that fit into this category include—

- Intelligence reports that provide alarm or warning information.
- Reconnaissance and surveillance data related to decision points for branches or sequels.
- Reactive targeting intelligence or hastily prepared intelligence briefings for initiation of small unit action.

Principles

Whether deliberate or immediate, intelligence production is guided by the following principles.

Purpose and Use of Intelligence

To understand the needs of the consumer and to answer the IRs, the producer must know the user's command level, mission, IRs, time sensitivity, responsibilities, and purpose of the intelligence products.

Objectivity

Producers must be objective and unbiased to avoid any tendency toward preconceived ideas. When conflicting information exists, efforts should be made to resolve the difference. If time and resources are inadequate to provide explicit intelligence, the commander must be made aware of the uncertainty. Commanders need pertinent intelligence, including conflicting or contradictory information and opinions.

Provision of Integrated and Tailored Products

Intelligence analysts integrate and tailor information from multiple sources to provide decisionmakers with a clear picture of the battlespace.

Coordination Among Echelons

Intelligence production should be coordinated between national, theater/operational, and tactical-level echelons. The JTF intelligence officer directs and coordinates production activities to ensure they are mutually supporting and not duplicative. Forces at every echelon accomplish joint and combined operations intelligence production, which includes Service-unique products at component commands and operating forces. Higher echelons use organic collection assets and production capabilities to produce intelligence and to refine and compile intelligence received from subordinate units and external organizations. Subordinate units use intelligence products sent to them by the senior command to determine or adjust their mission and operations.

Responsibilities

Higher echelons are responsible for ensuring subordinates are provided the required intelligence exceeding the subordinate's organic capabilities. To provide subordinate commands with required intelligence products and services, higher echelon commanders and intelligence officers identify and task organizations

that can contribute to resolution of subordinate commanders' IRs.

Management

Production management ensures effective and efficient intelligence production in support of operations. Intelligence personnel must receive, review, validate, prioritize, and coordinate production requirements to determine the task, producer, forms, and production schedule.

Production Cycle

The goal of the intelligence cycle is to produce timely, usable intelligence. The production cycle is in essence the intelligence cycle, with the constituent parts of directing, collecting, processing and exploiting, analyzing, and finally producing, disseminating, and using the intelligence. The production cycle spans months or minutes, depending on the level of command conducting production and the nature of the IRs. During the production cycle process, intelligence section personnel must focus on delivering the product in a timely, tailored, complete, and usable manner.

Define Intelligence Requirements

Properly articulated, mission-oriented requirements focus the intelligence effort and define IPRs. The commander, staff, and subordinate commanders play a role in developing the command's IRs. The intelligence officer formulates most of the initial requirements during IPB step 1 by identifying gaps in current intelligence holdings and by defining the scope and detail of production required for IPB support.

As IPB and staff planning progresses, analysts identify additional IRs, which are generally linked to proposed COAs, potential decisions, and targeting. Analysts working to satisfy the command and supported units' IRs also generate new IRs.

Based on the commander's intent and the current phase of the PDE&A cycle, the intelligence officer validates, refines, and prioritizes these additional requirements and converts them into integrated ICRs, IPRs, and IDRs. This is not a one-time effort, but instead a dynamic process of new, existing, and satisfied or no longer relevant requirements. The relative importance of each requirement changes as the PDE&A cycle progresses and as phases of the operation are executed. The intelligence officer must periodically confirm the assignment of priorities with the commander to ensure the intelligence effort is focused on the commander's desires.

Define and Prioritize Intelligence Production Requirements and Tasks

Once IRs have been clearly stated and properly defined, analysts define and prioritize IPRs and tasks by answering the following questions:

- What do I need and where can I obtain the information? The analysts must determine research needs and information sources. The tactical intelligence analyst may have access to a wide range of information and intelligence sources and documents. The product required may have been produced by another source or agency. This requirement may generate ICRs to provide the necessary information.
- When is the product required and in what form? Determination of production assets is based on time and final product requirements (e.g., document, report, supporting study, briefing).
- Who can produce the intelligence product? A small intelligence section does not have the assets to complete a large, detailed study in a short period of time.
- Who will get the product?

- Is this a product that can or must be shared with multinational allies? The intelligence product's classification and releasability must be considered.
- Does this product require supporting work? The analyst must determine the need for supporting requirements (e.g., imagery exploitation, topographic analysis).

Develop Intelligence Production Plan and Schedule

When dealing with large or complex IRs and IPRs, development of an intelligence production plan and a supporting schedule aids in effectively applying resources to accomplish the task. Production plans and schedules are particularly important at higher echelon commands and intelligence centers where numerous long-term projects are managed and coordinated. At lower echelons, production plans and schedules may consist of the intelligence officer conducting a quick mental assessment of the task and developing a time line for its completion.

Considerations

When developing a production plan and schedule, the first consideration is always priority. The requester's needs drive the due date. Once priority and time available are established, factors to be considered include—

- Research required.
- Time available to collect new information and data.
- Coordination needs.
- Review and quality control procedures.
- User's format requirements.
- Graphic preparation.
- Reproduction or conversion requirements.
- Dissemination requirements.

Preparation Methods

For large, long-term products, the production schedule is time lined with various milestones, due dates, and completion projections annotated. In large organizations with distinct collection, exploitation, editing, graphics, and dissemination assets, this time line synchronizes those assets to ensure efficient and timely project completion.

Plans and Tools

The principal planning vehicle for a MAGTF is tab B, (Intelligence Production Plan), to appendix 16 (Intelligence Operations Plan), to annex B (Intelligence), to an OPLAN or OPORD. Other tools that may be used by intelligence officers and their production leaders are the intelligence production matrix and the periodic intelligence production status report. Appendix E to this publication provides guidance and suggested formats for use of these plans and tools within a MAGTF. Specific instructions and formats are specified in unit SOPs.

Allocate Resources

The availability of the following organic and external resources required to produce the intelligence product must be determined:

- Intelligence production personnel.
- Time.
- Ongoing analysis.
- Preprocessed information sources.
- Collection assets.
- Automated information systems.
- CIS.

Assign Tasks

Specific tasks are assigned to the various collection and production resources that assist in the production process. The priority of tasks is

based on the priority of the IR, the time available, and the production schedule.

Prepare the Product(s)

During this step, existing information, data, and intelligence is researched and integrated with new information derived from collection operations and other all-source intelligence reporting. The resulting information set is analyzed and synthesized to develop conclusions and estimates. A final intelligence product(s) draft is produced based on the analysis performed.

Review and Quality Control

Procedures must be established for product review and quality control before final product approval and dissemination. A balance must be achieved between timely delivery and proper review.

Approve and Distribute the Product(s)

Responsibility for final approval of the intelligence product normally rests with the producing unit intelligence officer. At the MEF level, product approval responsibility is generally delegated to the ISC; however, time and the situation may dictate delegating this authority to lower levels. The intelligence product is only of value if it is distributed to the requester in time for proper use.

Follow Up

The final and most critical step in the production cycle is to follow up with commanders and other intelligence product users to—

- Ensure the product is understood.
- Determine whether PIRs and IRs are satisfied.
- Determine if the intelligence product generated new PIRs or IRs.

Production Management

Efficient management of the production cycle ensures effective military intelligence production in support of MAGTF and joint operations. Production management satisfies established PIRs and IRs in a complete, timely, and efficient manner; helps prioritize competing requirements to ensure timely response; and ensures the most effective use of limited intelligence resources.

Functions

Management of the production cycle encompasses the following functions:

- Determining the scope, content, and format of each product.
- Developing a plan and schedule for the development of each product.
- Assigning priorities among the various IPRs.
- Allocating processing, exploitation, and production resources.
- Integrating production efforts with collection and dissemination.

Production Managers

While intelligence production centers and agencies have separate production managers, management of the production cycle at other command levels is conducted by—

- Intelligence battalion commanding officer, serving as ISC under the staff cognizance of the MEF AC/S G-2, at the MEF CE level.
- Intelligence operations officer or air combat intelligence officer at the MSC level.
- Intelligence staff officer at lower tactical echelons.
- Officer in charge of an intelligence direct support team supporting a lower unit.

Production Management Elements

The following elements are essential for production management:

Production Requirements Development

Each IR must be validated through the chain of command and examined to determine scope, form, and content of the request. These validated and examined IRs are IPRs. A well-developed IPR includes—

- Point of contact and best way to communicate.
- Priority of the requirement.
- Date required and latest time the intelligence is of value.
- Classification, releasability, and format desired.
- Mission background.
- Brief description of the desired requirement.
- Justification for the requirement.
- Sources and documents previously consulted.
- Dissemination instructions (e.g., primary and alternate communications means or channels, designated recipients, quantities required).

Prioritization of Requirements

Production requirements are prioritized for limited intelligence resource use.

Asset Allocation

The intelligence officer and intel bn production manager consider internal or organic and external resources (e.g., JTF, theater, and national) for intelligence production tasking. Although internal resources should be considered first, production managers forward requirements for large, complex products to higher command levels. For example, IPB is an inherent function of staffs at every level; however, the production of detailed terrain analysis products may be more appropriately performed by the MEF intel bn or other supporting agencies.

Scheduling

Production managers must schedule and synchronize task elements in the time allotted to successfully complete intelligence production.

Integration with Collection and Dissemination

Production management starts in the planning and direction phase of the intelligence cycle where IRs are determined. The PIRs and IRs are either answered by intelligence products that are readily available or they become a collection or production requirement. Ultimately, products are disseminated to individuals and organizations that need them. Although collection, production, and dissemination involve their own unique internal procedures and cycles, they must be synchronized to provide a timely, pertinent, and usable intelligence product.

Intelligence Products

Intelligence products may be in graphic, written, or oral form and may be as simple as an answer to a question or as complex as a contingency intelligence study. Although they may be used to produce warnings or to identify opportunities, intelligence products are intended to facilitate planning and decisionmaking.

Graphics are the preferred product form because intelligence products should convey an accurate image of the battlespace or threat to the decisionmaker in a form that facilitates rapid understanding. The use of automated information systems is increasing the capability to develop graphic products that can be disseminated and displayed over web-based systems. Graphics developed by the MEF P&A cell may be pulled via the MAGTF tactical data network from the MEF SIPRNET web site or shared via IAS. Use of these graphics reduces or eliminates MSC production.

In time-sensitive situations, the verbal report or short text message may be the most expeditious and useful intelligence product form. For more complex or precise planning needs, graphics reinforced with detailed supporting text is usually required.

Whether oral, text, or graphic, intelligence products should use standard formats. Baseline formats may be modified to suit unit needs, but format modifications may impact interoperability so they must be thoroughly coordinated with all users. The following intelligence products are the principal intelligence products developed and used in the MAGTF.

MAGTF Contingency Intelligence Study

This baseline intelligence study is prepared in advance for standing OPLANs and likely contingencies. In written form, this study is based on the intelligence estimate format and can be converted to an intelligence estimate when a contingency becomes a reality. Many of the products created in steps 1 through 4 of the IPB process (e.g., MCOO, weather effects charts, threat models, doctrinal templates) can be prepared either as supporting graphics or as standalone products.

Intelligence Estimate and Supporting Studies

The intelligence estimate provides basic and current intelligence and mission-specific IPB results. Normally prepared by echelons of battalion or squadron size and larger during the planning phase, estimates are frequently disseminated to other units to keep them current on intelligence. Supporting studies may cover particular aspects of the enemy situation or the AO. See appendix A for the intelligence estimate format and discussion of the relationship between IPB and the intelligence estimate.

Target or Objective Study

This intelligence product provides mission-specific intelligence in support of small unit execution. There is one basic form, but many variations can be used. The study is used to support attack aviation as well as MEU(SOC) and regular combat operations. See chapter 8 for a discussion of the basic target or objective study.

Intelligence Summary

The intelligence summary (INTSUM) provides a synopsis of the intelligence situation covering a specified period prescribed by the unit intelligence SOP or annex B (Intelligence) to the OPORD. Used to report threat activities, threat capabilities changes, and P&A results, the summary is designed to update original and subsequent intelligence estimates.

At lower tactical echelons, INTSUMs are prepared according to the unit SOP or annex B to the OPORD. At higher commands, a daily INTSUM (DISUM) is published every 24 hours. Using the basic format, units tailor the INTSUM to fit the situation. Automated information systems facilitate graphic production of INTSUMs and DISUMs, which are posted on networks with links to detailed supporting intelligence products, reports, and data bases. See appendix F for the INTSUM format.

Intelligence Report

The intelligence report (INTREP) is a standardized report that is disseminated as rapidly as possible based on its importance to the current situation. This report is the primary means for transmitting new and significant information and intelligence when facts influencing threat capabilities have been observed or when a change in threat capabilities has taken place. Generally, a separate report is prepared for a single item of information by the first intelligence element acquiring the information. When time permits, the INTREP should include the

originator's interpretation of the information or intelligence being reported. See appendix G for the INTREP format.

Briefings

Intelligence briefings should always convey mission-essential intelligence and other pertinent information tailored to the audience and current IRs. Intelligence personnel must be able to prepare and orally convey relevant intelligence in a clear, concise manner to brief commanders, staffs, and subordinate units.

Briefings should be supported with graphics to enhance understanding in the least amount of time. Graphics may be as simple as a sketch or acetate overlay or as complex as a multimedia presentation delivered via video teleconferencing. Intelligence personnel must ensure graphics are clear, legible, simple, visible, and focused on relevant information.

At lower tactical levels, briefings are generally informal and often called on short notice. At higher levels, briefings may be structured and scheduled on a recurring basis. The intelligence brief is usually part of a staff briefing coordinated by the chief of staff, executive officer, or the operations officer. Intelligence briefings can be in the form of an information, decision, or confirmation brief.

Information Brief

This is the most common form of brief intended to enhance situational awareness and understanding. The commander's morning update is an example of an information brief. See appendix H.

Decision Brief

The second type of brief is for the purpose of obtaining a decision from the commander. A briefing conducted to convey wargaming results and to gain the commander's preferred COA is an example of a decision brief.

Confirmation Brief

This brief is a final review of a planned action to ensure participants are certain of the objectives and are synchronized with each other.

Organic MAGTF Intelligence Production

In the MAGTF, deliberate production of detailed, all-source intelligence products supports planning. While deliberate production draws heavily on external national, theater, and Service-level production sources, organic MAGTF intelligence sections tailor products to the MAGTF mission and needs. Small unit intelligence sections, intelligence watches at the regiment or Marine aircraft group and battalion or squadron levels, and intelligence direct support teams conduct primarily immediate production.

Unit Intelligence Sections

The MAGTF CE and MSC intelligence sections primarily conduct deliberate production to satisfy planning requirements. They produce the contingency intelligence studies that lower-level commands tailor to their needs.

Units conduct IPB and prepare estimates and target or objective studies that are tailored and focused on their mission and level of command. The IRs that are beyond a unit's production capability are normally forwarded via the chain of command to the MEF G-2 or intel bn. A well-prepared IPB is the basis for rapid and effective immediate intelligence production.

Small unit intelligence sections (e.g., regiment or battalion and Marine aircraft group or squadron) primarily conduct immediate production to satisfy tactical decisionmaking and operations. Immediate production conducted at higher echelons focuses on alarms or triggers associated with the commander's decision points or reactive targeting against identified HPTs. As units

and sensors collect data related to NAIs, TAIs, decision points, and HPTs, this information is rapidly assessed, placed in context, and disseminated as intelligence to the commander and appropriate agencies for immediate action. Often the product is a verbal report or short INTREP sent via electronic means.

Intelligence Direct Support Teams

Two direct support teams are organic to the P&A company, intel bn, and one each for the division, MAW, and FSSG headquarters. They are designed to allow the MEF or MSC commander and their G-2s to focus intelligence support to designated subordinate units. These teams tailor higher and external intelligence products to the needs of the supported unit and assist the supported unit in the production of IPB and other intelligence products to support detailed mission planning and execution.

Production and Analysis Company, Intelligence Battalion

The P&A company produces and disseminates all-source fused tactical intelligence, IMINT, and GEOINT products in support of the MAGTF, MSCs, and other commands as directed. As the focus of the deliberate production effort, P&A company satisfies IPRs for the entire MAGTF. The P&A company has the personnel and equipment resources and CIS connectivity to national, theater, and Service-level organizations' intelligence products and production resources for augmenting organic capabilities. See chapter 9 for additional information.

External Production Support

Marine Corps intelligence assets are optimized for the production of tactical intelligence in support of MAGTF operations. While organic assets are generally sufficient to meet MAGTF requirements, national, theater, and Service intelligence agencies and centers provide unique intelligence production capabilities. The MAGTF has the ability to exploit external intelligence assets to enhance its organic capabilities. The following key external capabilities are employed to support MAGTF operations:

- National, theater, and Service-level intelligence P&A.
- Geospatial information and services.
- P&A of target intelligence and target materials.
- National imagery collection, exploitation, and production.
- Collection and production support from the U.S. SIGINT System.
- National and theater-level CI and HUMINT collection and production.
- Liaison elements from national and theater intelligence agencies.

To exploit external intelligence support resources, the MAGTF must have—

- Trained personnel experienced with external intelligence assets.
- Sufficient, reliable, CIS connectivity and interoperability with national, theater, and Service intelligence architectures to receive, process, and disseminate information.
- Integration of Marine intelligence specialists into national, theater, and Service intelligence organizations to articulate Marine Corps capabilities and requirements, to influence decisions, and to optimize intelligence support to expeditionary forces.
- Established liaison between the MAGTF and supporting intelligence agencies through dedicated communications and exchange of officers.

Department of Defense Support

Within the Department of Defense (DOD) intelligence production community, the DOD Intelligence Production Program (DODIPP) provides the analytical and production resources to support

operational forces. The DODIPP incorporates basic principles that minimize duplication of effort and make the specialized expertise of its analytical personnel available to support DOD customers. The DOD intelligence production community is comprised of the following agencies, centers, and activities:

- DIA.
- Service production centers (e.g., MCIA).
- Unified command JICs or joint analysis centers, components, and Reserves.
- Allied production activities participating in the shared production program (SPP) or during crisis surge situations.
- National Security Agency, which produces SIGINT.
- National Imagery and Mapping Agency, which produces geospatial information and GEOINT.

National Production Support

The DIA and its supporting agencies (Armed Forces Medical Intelligence Center and Missile and Space Intelligence Center) are responsible for intelligence production in the following areas:

- Foreign national military policy, doctrine, strategy, and planning, including—
  - National military leadership.
  - Mobilization process and potential.
  - Strategic or large scale military operations.
  - Integrated, combined, or joint forces on military net assessments and assessments or estimates focusing on military issues at the national, regional, and global levels.
- Current indications and warning intelligence and strategic targeting and planning by the joint staff.
- Integrated force trends and projection assessments.
- Nuclear weapon programs and doctrine.
- Intelligence on proliferation and technology transfer.
- Technological capabilities of antitank guided missiles, surface-to-air missiles, short-range ballistic missiles, and antiballistic and antitactical ballistic missiles.
- Medical and biological warfare intelligence.
- Global topics, such as military geography, industrial resources, transportation systems, demographics, military industrial and resource bases, and military economics.
- Intelligence production programs on counterterrorism, counterdrug intelligence support to law enforcement agencies, foreign intelligence and security forces, and deception analysis.
- Intelligence programs fulfilling DOD-wide responsibilities of common concern, such as targeting and foreign materiel.
- OOBs and associated facilities and installations assigned under the SPP, to include assessing the general military capabilities of those forces.

Unified Command Production Support

A unified command's intelligence production is performed by a production center or JIC, which is assigned to the unified command in support of theater or specialized forces. The JICs fulfill intelligence requirements of unified command CINCs and subordinate commanders by providing tailored, finished intelligence products to support theater mission planning and execution. Regional and functional unified command JICs' production responsibilities vary.

Centers

Unified command intelligence production JICs include—

- U.S. Joint Forces Command's Joint Forces Intelligence Command.
- U.S. Central Command's JIC.

- U.S. European Command's Joint Analysis Center (JAC).
- U.S. Pacific Command's JIC.
- U.S. Special Operations Command's JIC.
- U.S. Southern Command's JIC.
- U.S. Space Command's Combined Intelligence Center.
- U.S. Strategic Command's JIC.
- U.S. Transportation Command's JIC.

Responsibilities

The JICs' intelligence production responsibilities include—

- Operational intelligence, current intelligence, and indications and warning for forces deployed within the command's area of responsibility.
- OOBs and associated facilities and installations assigned under the SPP, to include assessing the general military capabilities of those forces.
- Foreign military forces unit-level training and/or operational readiness.
- Physical environment of deployed or committed forces, including terrain analysis and IPB.
- Targeting support, including target materials, bomb damage assessments, tactical BDAs, and special operations forces targeting support.
- Support to command-sponsored joint planning and exercises.
- Tailored and focused intelligence produced elsewhere to meet the specific requirements of command customers.
- Background and tactical intelligence to customers within the theater, including operational and allied forces.

Services Production Support

The Service production centers are responsible for Service-specific intelligence production and for production relative to U.S. Military Forces assigned for the SPP.

Centers

The Service production centers are—

- Army—National Ground Intelligence Center (NGIC).
- Navy—National Maritime Intelligence Center (NMIC).
- Marine Corps—Marine Corps Intelligence Activity (MCIA).
- Air Force—National Air Intelligence Center (NAIC).

Responsibilities

The centers' intelligence production responsibilities include—

- Weapon system technical data, characteristics, performance, system vulnerabilities, and capabilities to support Service and defense acquisition activities and force developers and to support Service operational training and preparation for contingencies or conflicts.
- Basic ground, naval, and aerospace intelligence and foreign intentions and capabilities.
- Service-unique doctrine, force structure, force modernization, training and education, and acquisition.
- Support to Service schools and commands relative to training, exercises, predeployment, or crisis responsibilities or activities.
- OOB and associated facilities and installations assigned under the SPP, to include assessing the general military capabilities of Services.

Service-Unique Responsibilities

The following Service production centers have unique intelligence production responsibilities:

- NGIC produces ground-related systems and develops intelligence on—
  - Armor.
  - Infantry.
  - Field artillery.
  - Air defense guns.
  - Landmines.
  - Chemical warfare.
  - Helicopters.
  - Munitions.
  - Engineering and transport or logistic equipment.
  - Associated technologies.
- NMIC, Office of Naval Intelligence, produces naval-related systems and develops intelligence on—
  - Surface and subsurface combatants.
  - Antisubmarine or surface auxiliary and support naval ships and programs.
  - Weapons, merchant shipping, and ocean science information.
  - Associated technologies.
- NAIC produces aerospace-related systems and develops intelligence on—
  - Intercontinental ballistic missiles.
  - Intermediate-range ballistic missiles.
  - Medium-range ballistic missiles.
  - Bombers.
  - Fighters.
  - Special mission aircraft.
  - Munitions.
  - Space launch systems and satellites.
  - Associated technologies.
- MCIA produces amphibious and expeditionary warfare intelligence on—
  - Shallow water mines.
  - Coastal artillery.
  - Foreign marine and naval infantry forces.
  - Antilanding capabilities.
  - Expeditionary studies.

Non-Department of Defense Intelligence Production Support

Intelligence production in support of military forces is available from agencies outside DOD (e.g., Central Intelligence Agency). Generally, DIA serves as the focal point for tasking these agencies; however, theater and JTF intelligence staffs can access support through their national agency's liaison office or an assigned national intelligence support team (NIST).

A NIST is a nationally sourced, task-organized team composed of intelligence and communications experts from DIA, Central Intelligence Agency, National Security Agency, NIMA, or any combination of these. A NIST provides the supported command with increased IR management, production and dissemination capabilities, and a direct conduit to national agencies. The size and composition of the NIST varies according to the size and nature of the crisis and the mission and intelligence needs of the supported command.

Production Support Requests

A PR begins as an IR levied on the unit intelligence section. Before requesting production support, the unit intelligence officer must determine if the—

- Intelligence request or request for intelligence (RFI) is most appropriately answered by intelligence resources.
- Information or intelligence is already available in unit intelligence files, data bases, or information resources.
- Intelligence can be obtained by organic collection assets and developed into intelligence by its production assets.
- Intelligence request can be answered from other unit or component intelligence elements.

Once the unit intelligence officer determines that the requirement cannot be met with local resources, the requirement is forwarded up the chain of command for satisfaction. The intelligence officer determines whether to submit the requirement as RFIs, ICRs, IPRs, or PRs. (The acronym IPR is currently unique to the Marine Corps, while the acronym PR, established in joint doctrine, is chiefly applicable to intelligence operations at the MEF CE level and above.)

Generally, an RFI is submitted if the requirement is a fairly straightforward question. In a noncombatant evacuation operation, a RFI may be, "How many personnel require evacuation?" In this case, no extensive collection or production is required because the intelligence is generally available.

A PR is more appropriate when the IR is complex or substantial, for example, "What is the capability of country X to defend its coastline against an amphibious assault?" This requirement may result in an IPR for the MEF CE or a PR to the JTF headquarters because the answer will require the collection and analysis of a large amount of information ranging from hydrographic conditions to available threat weapon systems. Such analysis may be beyond the capabilities of a small unit intelligence section and more appropriately performed at the theater or Service level where access to information and ability to task collection resources are greater.

A PR is also appropriate to satisfy a requirement that may be recurring in nature or in a denied area, for example, "How many aircraft are maintained on alert status at airfield Y?" The unit intelligence officer submits a request for theater and national production assets, because the airfield will need to be monitored for a period of time to determine the answer and the requesting unit probably does not have the collection resources to monitor the airfield.

As an RFI travels up the chain of command, it is satisfied (from available information or intelligence or by collecting new data), converted into a PR, or forwarded to the next higher level for satisfaction. Each unit in the chain of command validates the PR and either satisfies it from within or passes the requirement to the next higher authority for action. Figure 9-1 illustrates the generic flow of PRs.

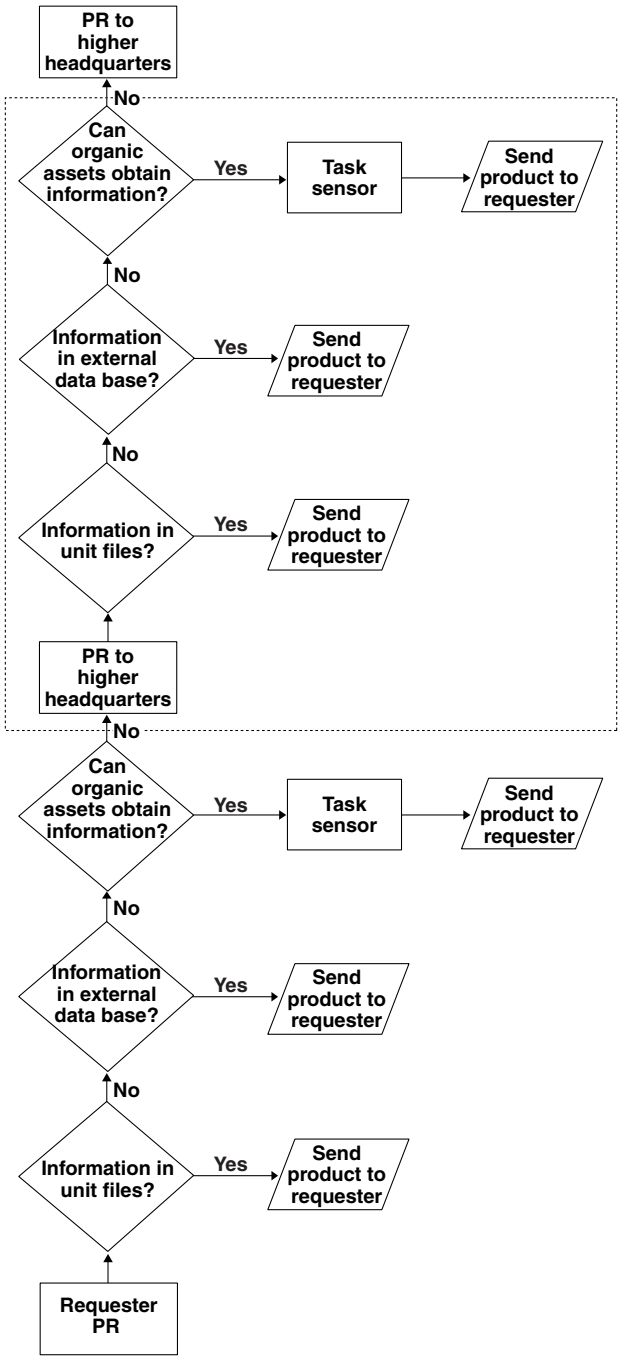

Figure 9-1. IPR Flow.

Request Process

Most IPRs are levied on the intel bn, P&A company's P&A cell, which is the MAGTF's principal deliberate production asset. Based on the commander's guidance and the G-2/S-2's direction, the intel bn commander or ISC—

- Plans, manages, and conducts MAGTF IPR management.
- Exercises staff cognizance over MEF collection and production elements to fulfill PRs.
- Determines which PRs are produced locally and which PRs are forwarded to the appropriate theater, Service, or national DODIPP production center validation office (VO).

The VO reviews the PR, determining whether to accept and satisfy the PR, forward the PR to another production center, or invalidate the PR. The combatant commander, the JFC, or the MAGTF commander directs PR and RFI procedures, which vary from theater to theater. For example, a MAGTF preparing to deploy submits PRs through the normal Service chain of command to the MCIA VO. However, a MAGTF operationally assigned to a combatant commander submits PRs through the established operational chain of command to the VO supporting that theater. A theater intelligence directorate (J-2) may delegate validation authority to a JTF J-2 during a crisis, providing the JTF J-2 a streamlined path for JIC production support and priority over other non-crisis production requirements. For most crises and contingencies, annex B to the joint force commander's OPLAN or OPORD specifies policies and procedures for requesting intelligence production support.

Request Format

The same basic format is generally used for RFIs and PRs. This facilitates conversion of an RFI into a PR at a later time. A basic level production request must include—

- Organization(s) and specific office(s) or individual(s) requesting the product.
- Statement describing the—
  - Required information and intelligence.
  - Sources consulted by the requester and source shortcomings relative to the request.
- Latest time information of value.
- Product form (e.g., hard copy text, electronic file on disk) and total quantity of each.
- Requirements prioritization for multiple elements.

The basic format provided above is sufficient at lower tactical levels; however, at higher levels the format becomes more structured. Defense Intelligence Management Document 0000-151C-95, *Department of Defense Intelligence Production Program (DODIPP): Production Procedures (U),* stipulates the format for PRs, which ultimately will be forwarded to a DODIPP VO and production center. See appendix I for PR format. Each combatant command defines formats and procedures in their applicable intelligence TTP documents. The MEF CE and MSC headquarters SOPs defines formats for their headquarters subordinate elements.

Automated Production Request Procedures

Community On-line Intelligence System for End Users and Managers (COLISEUM) provides an automated capability for the preparation, submission, validation, and assignment of PRs within the DOD intelligence production community. With this system, the requester researches existing requirements and responses to reduce the submission of duplicate requirements. Commands and production centers with access to COLISEUM have immediate visibility of existing and new requirements validation and production status and product completion notification.

Designed to function as an application under the Joint Deployable Intelligence Support System (JDISS) program, COLISEUM is currently available on JDISS 1.01 and JDISS 2.0. The IAS also provides access through JDISS. In addition, the COLISEUM is available on INTELINK sensitive compartmented information (SCI) under

DIA, Directorate of Intelligence Production. The principal inject sites for Marine Corps operating forces PRs are the MEF and Marine Corps forces (MARFOR) G-2s. The MEF, MARFOR, CINC, and DOD policy documents govern procedures for submitting PRs via COLISEUM.

CHAPTER 10. OPERATIONS

Intelligence enables the planning and execution of successful operations. Unity of effort, high tempo, timely decisionmaking, rapid execution, and the relentless exploitation of decisive opportunities characterize MAGTF operations. Intelligence P&A must have the flexibility, agility, and sustainability to support MAGTF operations. This chapter discusses intelligence P&A planning and execution considerations for various MAGTF operations and phases.

Expeditionary in nature, MAGTF operations are conducted according to the following Marine Corps maneuver warfare and emerging operational concepts, which present unique challenges and considerations for intelligence support:

- Operational Maneuver From The Sea—The maneuver of operational-level naval forces projects sea-based power ashore to deal a decisive blow at a place and time of our choosing. Operational maneuver from the sea (OMFTS) focuses on operational objectives and embodies the application of the principles of maneuver warfare to a maritime campaign.
- Sustained Operations Ashore—Those campaigns in which MAGTFs fight as sea-based operational maneuver elements. Embracing the tenets of OMFTS, sustained operations ashore (SOA) envisions a series of operational-level missions designed to enhance the joint force campaign and exploit weaknesses exposed in the opposing force. Normally, SOA involve a MEF assigned to a larger joint or combined force.
- Military Operations Other Than War—The conduct of Marine and naval expeditionary operations across the range of military operations short of war. MOOTW encompass a wide variety of activities intended to deter war, resolve conflict, promote peace, and support civil authorities.

SECTION I. OPERATIONAL MANEUVER FROM THE SEA

Success in OMFTS depends on the ability to seize fleeting opportunities and quickly take advantage of enemy vulnerabilities. Emphasis is placed on deception, surprise, speed, and battlespace preparation to create delay, uncertainty, and ineffectiveness in enemy actions. Intelligence provides the knowledge and understanding that enables the effective conduct of OMFTS. Operational maneuver from the sea relies on intelligence to drive planning, COA development, wargaming and selection, and execution by—

- Identifying the enemy's COG(s), strengths, and weaknesses.
- Exposing critical vulnerabilities to be exploited by naval forces operating from the sea.
- Assessing the potential for maneuver offered by the battlespace, to include identifying entry points where the force can establish ashore.
- Providing the foundation for effective force protection and C2W efforts, which facilitate the preservation of surprise and the employment of deception to disrupt and disorient the enemy during OMFTS.

Requirements

Key OMFTS intelligence P&A support requirements include—

- IPB and situation development covering a broad air, sea, and land maneuver space.

- Threat analysis focused on determining COGs and critical vulnerabilities.
- Detailed terrain and hydrographic analysis, which identify suitable entry points and support maneuver of widely dispersed combat and CSS elements.
- Responsive processing, analysis, and production capabilities that can rapidly develop the critical intelligence required to shape operational and tactical decisionmaking and to provide the intelligence segment of the common operational or tactical picture.
- Indepth intelligence support of force protection and C2W activities.
- Detailed information regarding local resources (e.g., petroleum, oils, lubricants, water) to reduce MAGTF ashore sustainment requirements.

Considerations

Although the requirements appear similar to the traditional amphibious operations intelligence support requirements, OMFTS presents the following unique considerations:

- The large potential AO may extend 200 nautical miles or more from the sea base.
- Points of entry may be widely dispersed instead of being grouped into a single force beachhead.
- The sea space becomes a maneuver area for LCACs and advanced amphibious assault vehicles transiting to the shore from over the horizon, requiring extensive and detailed hydrographic analysis over a larger area.
- The OMFTS forces rely on rapid maneuver for maximum effectiveness and survivability, necessitating detailed and accurate terrain analysis.
- The vision of dynamic, precision fires at maximum engagement ranges requires precise targeting data and BDA.
- Analysis must occur in real or near-real time and must be available simultaneously to every MAGTF unit and element.
- Intelligence products must be in a format that can be rapidly updated and displayed in graphic form on automated information systems to be used by units, staffs, and decisionmakers.

Support During Planning

Initial production efforts are directed at providing an extensive description of the battlespace and threat required to focus the planning effort. Under the direction of senior Navy and Marine intelligence officers, the MAGTF, MSC, naval expeditionary force, amphibious staff, and ship's intelligence sections engage in a collaborative effort to plan and execute intelligence and reconnaissance operations necessary to support development of intelligence products that support the force.

Individual intelligence sections normally concentrate on their particular areas of expertise, satisfying their units' requirements while contributing a broad-scope product to the general production effort. The MAGTF G-2 CIC or P&A cell may focus on describing the battlespace and enemy C2, logistics, and reserves; while the ground combat element's intelligence section studies the enemy ground forces. The amphibious force and the aviation combat element's intelligence sections both look at air and air defense threats, and the amphibious task force (ATF) intelligence staffs concentrate on the naval, sea mine, and coastal defense threat.

Intelligence personnel access national, theater, and adjacent component resources via reach back to augment organic resources of the force. The integrated Navy and Marine amphibious force intelligence center provides a comprehensive IPB analysis, intelligence estimate, HVT list, and supporting intelligence studies by coordinating amphibious force efforts. As the

planning phase continues, production efforts are concentrated on identifying enemy vulnerabilities to be exploited, providing IPB products, HPTs, and intelligence estimates to support specific COAs under consideration.

In the final stages of the planning process, the production effort shifts to development of mission-specific intelligence products focused on the selected COA(s). These products include IPB graphics, point of entry studies, and target or objective studies. In addition, an extensive all-source intelligence effort supports deception, operations security, psychological operations, and electronic warfare planning according to the commander's information operations or C2W strategy. The production effort becomes increasingly decentralized as MSC and subordinate element intelligence sections focus on their units' specific requirements. The MAGTF CE intelligence section continues to provide products to support the entire force, concentrating on elements designated as the main effort.

Support During Execution

During the execution phase, emphasis is placed on rapid processing and production of intelligence that supports timely decisionmaking, enhanced situational awareness, and engagement of HPTs. Because OMFTS depends on decisive action and operational tempo to break the enemy's cohesion and ability to resist, intelligence personnel must be able to—

- Demonstrate flexibility, agility, and responsiveness to recognize threat vulnerabilities and identify opportunities as they develop during battle.
- Demonstrate an awareness of ongoing operational and tactical activities and potential threat actions or reactions.
- Integrate rapidly all-source intelligence information with sensor data and combat reporting to develop a coherent, timely, and tailored picture of enemy dispositions and an assessment of its intentions and capabilities.
- Convey rapidly the developed picture and assessment to commanders in time to exploit identified opportunities.
- Engage fully in planning for future operations by continuing IPB analysis, delivering BDA results, satisfying new intelligence requirements, and participating in the decisionmaking process.

SECTION II. SUSTAINED OPERATIONS ASHORE

Sustained operations ashore require broad-based intelligence support that bridges the operational and tactical levels. Tactical plans are based on operational-level intelligence assessments, which identify the enemy's COG(s) and critical vulnerabilities across the entire theater.

In SOA, MAGTF intelligence operations contribute to the operational level assessments while translating the conclusions from those assessments into relevant tactical intelligence.

While OMFTS focuses on operations from a sea base, SOA entails large-scale, potentially long-term, land operations supported from the sea. Critical aspects of SOA include a large AO and rapid operational tempo. While P&A in OMFTS is heavily tasked with identifying points of entry, SOA focus on infrastructure related to sustaining a large force. Analysis of threat COGs and vulnerabilities, detailed terrain studies, precise targeting data, and BDA remain requirements under SOA.

Considerations

Considerations for the development of intelligence in support of SOA are similar to those for OMFTS. Intelligence support during the execution of SOA requires the same agility and responsiveness as in OMFTS, with the focus on providing critical intelligence to support tactical decisionmaking. However, SOA are normally conducted over a greater area and with a larger size force than in OMFTS, creating the requirement for a larger and more widely distributed intelligence operation support structure. The potential for integration with theater, allied, and other Service intelligence assets are also greater than in OMFTS.

Support During Planning

P&A efforts in support of SOA parallel those for OMFTS. Initial production is broad in scope, with the focus narrowing as particular COAs are selected and a concept of operations is developed. In SOA, GEOINT production takes on added importance; opportunities for ground and air maneuver as well as LOS profiles for observation, weapons employment, and communications-electronic equipment operations are major considerations. Mapping enhancements, LOC studies, and IPB graphics (e.g., cross-country mobility, weather effects, and COOs) are key products.

Threat analysis must be comprehensive and generally deals with large ground and air formations. This analysis covers reserves as well as committed forces and must take into account factors that impact the enemy's ability to fight at the operational and tactical levels (e.g., leadership, doctrine, training, readiness, and sustainability).

An extensive production effort is devoted to supporting logistic operations. The main components of this effort are studies of the local climate, infrastructure, and resources as well as the rear area threat. Products from national, theater, and joint force intelligence agencies contribute to the production effort, but many of these products will be tailored by the intel bn's P&A company, other intelligence producers, and the MSCs' intelligence sections to satisfy particular MAGTF requirements.

Support During Execution

During execution, emphasis is placed on rapid processing and production of tactical intelligence to support operational decisionmaking in the current battle, while at the same time providing detailed intelligence to shape plans for future operations.

SECTION III. MILITARY OPERATIONS OTHER THAN WAR

Military operations other than war include the following missions and tasks, which present unique intelligence requirements:

- Humanitarian assistance and disaster relief.
- Noncombatant evacuation operations.
- Maritime intercept operations.
- Show of force.
- Strikes and raids.
- Peace operations, including peace enforcement and peacekeeping.
- Support to counternarcotics operations.
- Recovery operations.

Requirements

Intelligence shapes operations during MOOTW as it does during other types of MAGTF operations. However, in addition to understanding the physical environment and the threat, the commander must have intelligence on political, economic, and sociological conditions to develop sound military plans that will accomplish the assigned mission. To support MOOTW, MAGTF intelligence personnel must be able to—

- Focus on areas with the greatest potential for the execution of contingency operations.
- Respond with minimal warning and preparation.
- Adapt to a wide variety of potential missions and possess expertise and specialized capabilities to provide MOOTW intelligence.

Considerations

Intelligence P&A activities in MOOTW are generally characterized by—

- The initial lack of detailed data bases on the AO and threat forces.
- An extensive list of nonstandard intelligence requirements that must be satisfied to support planning and execution (e.g., uncertain force protection requirements).
- Analysis of nonmilitary related data.
- A rapidly changing situation resulting from crisis conditions in the AO.
- Compressed timeframe for intelligence development.
- Restrictions on collection operations and the dissemination of intelligence, particularly with multinational military forces, NGOs, and PVOs.
- Increased likelihood of participation by coalition partners.

Support During Planning

Intelligence P&A requirements in MOOTW are normally focused on nontraditional subject areas and IRs. For example, more detailed knowledge of the host nation's economic, transportation, medical, and public works infrastructure will be required to develop plans for humanitarian assistance operations. A threat study to support a peacekeeping mission must encompass an extensive treatment of political, cultural, and sociological factors related to various insurgent or paramilitary factions in addition to the conventional military capabilities of the opposing sides.

Collaboration and coordination with area specialists and expertise from external intelligence organizations, non-DOD agencies (e.g., State Department, Office of Foreign Disaster Assistance, U.S. Agency for International Development) and NGOs or PVOs are crucial to satisfying MOOTW requirements. In turn, the requirement to share information and intelligence with those same agencies, as well as host-nation and allied forces, has a significant impact on analysis, production, and dissemination. While the goal is to provide necessary information and intelligence to participants in the operation, some information must remain releasable only to U.S. forces or allies with long-standing intelligence exchange agreements.

Production formats generally must be adapted to the requirements of a particular situation (e.g., normal IPB products must be modified to highlight factors critical to the specific MOOTW mission). In addition, P&A in MOOTW must be responsive to the unique needs of a large number of small elements conducting independent activities throughout the AO. Production in support of these elements must be tailored to specific mission requirements and provide details pertinent to the small unit level. Intelligence that increases the situational awareness of individual Marines (e.g., information on local customs,

language, health and sanitation) is an important part of this effort.

MOOTW IPB Requirements

The principal difference between IPB for conventional war and MOOTW activities is the focus and the degree of detail required to support the commander's decisionmaking process. Another major difference is the enormous demand for demographic analysis, since the population often is the focus in MOOTW. Typically force protection IRs take on greater priority. The four steps of the IPB process and sample aspects and considerations for various MOOTW activities, are discussed below. (See FM 34-130/FMFRP 3-23.2 for a discussion of each type of operation.)

Define the Battlespace Environment

Intelligence personnel define the MOOTW battlespace environment by expanding the AOI, assembling data on terrain and infrastructure, and compiling data on the host nation.

Expand the AOI

To expand the MOOTW AOI, intelligence personnel must—

- Identify potential sources of assistance to friendly force operations from outside the country or AO.
- Identify military, paramilitary, governmental, nongovernmental, and private volunteer organizations that may interact with the friendly force.
- Identify and locate external influences on the operation.
- Consider media, political, and third nation support or interference.
- Identify the geographic boundaries of the operation, applicable legal mandates or terms of reference, and other limitations or constraints that may impact on the operation.

Assemble Data on Terrain and Infrastructure

To assemble data on MOOTW terrain and infrastructure, analysts must—

- Identify existing infrastructures that have the potential for use by either threat or friendly forces in the operational area.
- Include sources of basic sustenance and energy, as well as transportation and communication networks.
- Identify facilities in adjacent or intermediate countries that could support the introduction of friendly forces or the delivery of necessary materials.
- Compile data on the geography and climate of the area, to include unusual or violent weather patterns or natural disturbances.

Assemble Data on the Host Nation

To assemble data on a MOOTW host nation, intelligence personnel must—

- Identify the existing government and military infrastructure.
- Pay particular attention to their capabilities and limitations with regard to support for or interference in the operation.
- Begin compiling demographic data on the population, to include age, education, religious beliefs, cultural distinctions, ethnic makeup, allocation of wealth, political affiliations and grievances, languages, values, and practices.

Describe the Battlespace Effects

Intelligence personnel describe MOOTW battlespace effects by identifying legal aspects, conducting terrain and weather analysis, evaluating the threat, and determining threat COAs.

Identify Legal Aspects

The MAGTF staff judge advocate should fully explain the impact of legal mandates, terms of references, or other diplomatic agreements. Intelligence personnel should include legal mandates in place that will have a major effect on friendly COAs, particularly rules of engagement and use of force.

Conduct Terrain Analysis

To conduct terrain analysis for MOOTW, intelligence personnel must—

- Use military aspects of terrain or KOCOA.
- Pay attention to routes and areas that offer good observation for friendly security forces.
- Depict potential obstacles, choke points, and ambush sites.
- Ensure that air and ground AAs are included.
- Include analysis of the urban terrain.

Conduct Weather Analysis

To conduct a standard weather analysis for the MOOTW AO, intelligence personnel must consider the effects of weather on—

- Displaced persons or refugees.
- Hostile groups.
- Trafficability.
- Air operations.
- Seaborne operations.
- Night operations.
- Communications.
- Threat tactics and civil disturbances (e.g., rallies and demonstrations).

Evaluate the Threat

Doctrinal templates for typical types of threats faced in the MOOTW environment are rare because there are many threats. Intelligence personnel must evaluate the threat according to the specific mission.

Weather

In missions involving humanitarian assistance and disaster relief, where the environment is the threat, intelligence personnel should—

- Evaluate the environmental impact on the population and friendly operations by determining, for example, if continued rains and flooding could trigger mudslides isolating portions of the population and inhibiting relief operations.
- Prepare climatic studies showing historical paths and frequencies of destructive weather (e.g., hurricanes or typhoons), which can serve as a sort of doctrinal template to determine if earthquake aftershocks could collapse fragile water and sewage treatment facilities leading to an increase in waterborne diseases and environmental hazards.

Competing Factions

In missions involving competing factions, some critical information and intelligence may exist in coalition, host nation, or U.S. data bases, which could be used to begin building a threat model for the operation. Intelligence personnel should recognize differences in threats, strategy, procedures and tactics, as well as weapons, equipment, material, and personnel.

Environment

When evaluating the threat, intelligence personnel must—

- Determine if the environment is permissive, uncertain, or hostile to U.S. forces entering with or without host nation approval.
- Determine if the population supports U.S. forces and if that support is contingent on some type or form of material compensation from U.S. forces (e.g., food, water, shelter, weapons).
- Determine if the population is organized to oppose U.S. forces and if the people are

armed and at what level (e.g., weapons, mines, vehicles).

- Identify dissident groups among the population that may publicly support but clandestinely oppose U.S. forces.
- Identify which terrorist groups are present, thought to be present, or have access to the AO, and if they are supported or directed.
- Identify leaders, trainers, and key staff members and develop psychological profiles on key personnel.

Determine Threat Courses of Action

This step in the IPB process is the culmination of battlespace environment analysis and threat evaluation. The success of U.S. operations in MOOTW depends on the combined efforts of state department officials, numerous government agencies, a unified command and its component Services, special operations forces, and the National Security Council. These organizations work together to accomplish foreign policy objectives of the United States and foreign allies. To determine threat COAs, intelligence personnel must—

- Template or describe the actions of the threat that would interfere with friendly operations (e.g., in peacekeeping operations any violations of the existing legal mandates by either belligerent could adversely effect friendly operations and security).
- Develop COA models depicting the reactions of the threat to friendly operations within the AO and AOI.
- War game each COA.
- Analyze reactions of local populace, multinational partners, NGOs, PVOs, and other key third or neutral parties to friendly COAs.
- War game terrorist and sabotage actions and other activities where the threat could reasonably avoid claiming responsibility, which could jeopardize friendly operations or security.

MOOTW IPB Products

The IPB products that may be useful in the MOOTW environment include (but are not limited to) population status, logistics sustainability, LOC, and key facilities and target overlays, as well as coordinates registers and pattern analysis plot sheets.

Population Status Overlay

To construct a population status overlay encompassing areas in the operation, intelligence personnel should, at a minimum, depict the population by political affinity or regional majority sentiment (e.g., progovernment, anti-American, neutral). If unable to ascertain some root causes of regional unrest (e.g., religious, ethnic, racial, or economic differences), intelligence personnel may display the population in terms of demographic differences. Points where demographic differences intersect often pose the greatest potential for conflict and possible disruption of friendly operations. See figure 10-1.

Logistics Sustainability Overlay

To construct a MOOTW logistics sustainability overlay, intelligence personnel should identify sources of food, potable water, fuel, etc. that could be used by the population, threat, or friendly forces. See figure 10-2.

Lines of Communications Overlay

To construct a MOOTW LOC overlay, intelligence personnel should—

- Identify routes into and out of the operational area.
- Include major streets, highways, railways, subways, waterways, etc.
- Analyze and depict the communication systems in place that could be used to support the operation (e.g., telephones, radio, television, satellite, and microwave systems). See figure 10-3 on page 10-10.

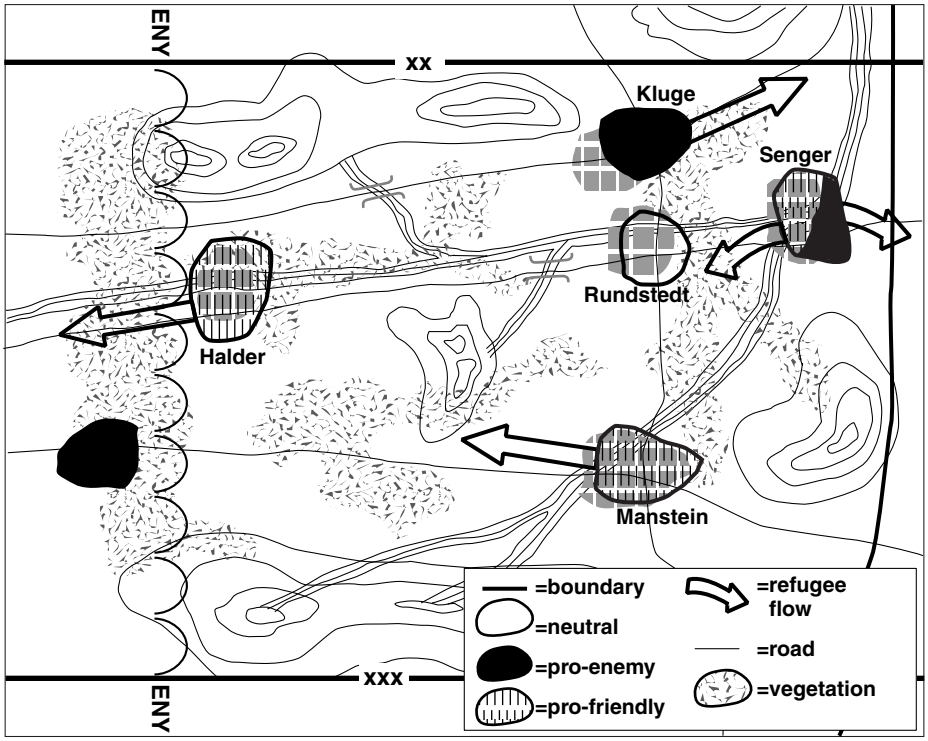

Figure 10-1. Population Status Overlay.

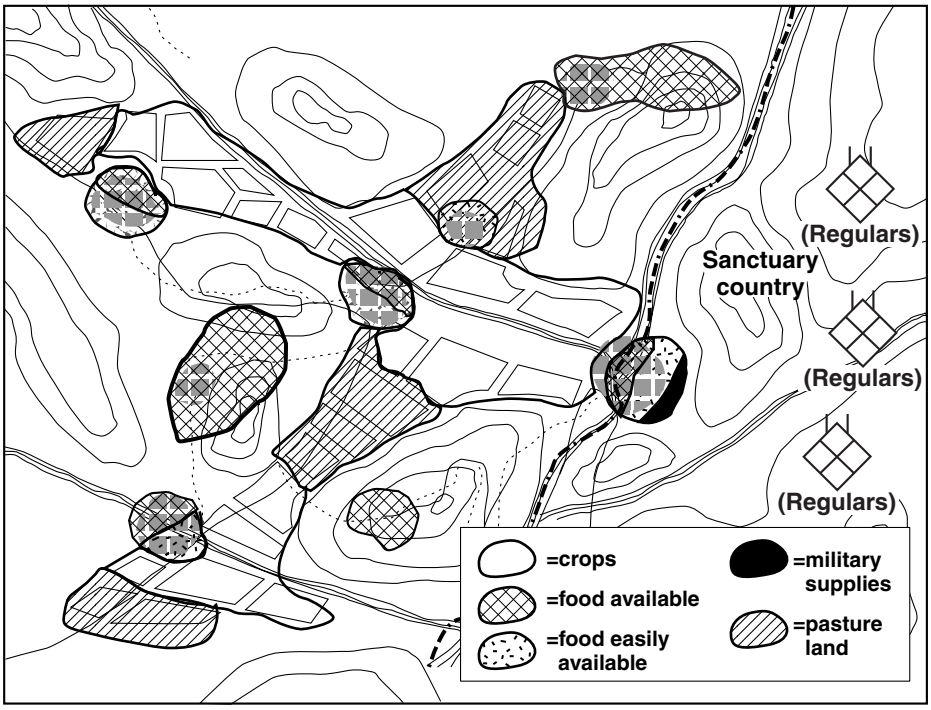

Figure 10-2. Logistics Sustainability Overlay.

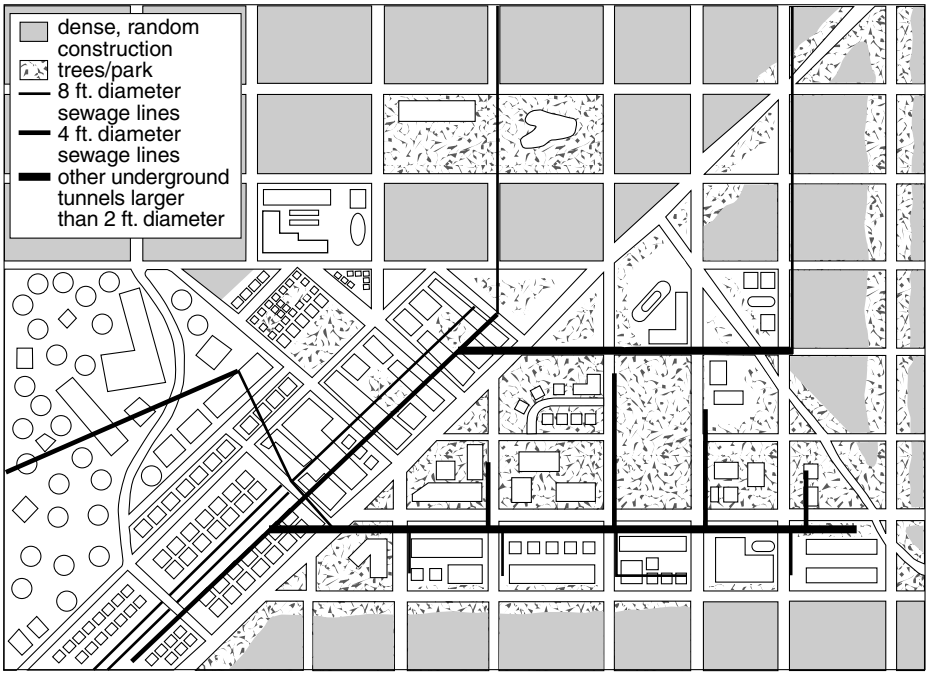

Figure 10-3. Sewers and Subterranean Overlay.

Key Facilities and Target Overlay

Intelligence personnel construct a key facilities and target overlay to depict mission-essential facilities and potential threat targets (e.g., embassies, religious or cultural facilities, military installations, television and radio facilities, government buildings, airports, port facilities, medical facilities, public utilities).

In a noncombatant evacuation operation, the U.S. embassy or the evacuation control center would be considered a mission-essential facility, but it would also be considered a potential target for belligerents.

Coordinates Register and Pattern Analysis Plot Sheet

Because intelligence data bases and doctrinal templates are often limited for many MOOTW situations, intelligence personnel use tools such as the coordinates register and times pattern analysis plot sheets (discussed in chapter 7) to conduct pattern analysis and to rapidly gain an understanding of threat TTP and methodologies.

SECTION IV. JOINT OPERATIONS

Marine Corps forces participate in full partnership with other Services in joint operations, either as a component or as the nucleus of a joint force. A coordinated intelligence effort makes a critical contribution to the success of joint operations. During joint operations, Marine intelligence P&A must be fully integrated with joint intelligence activities to ensure unity of effort, mutual support, and effective employment of limited intelligence resources. Effective intelligence support in joint operations depends on—

- Agreement on policies and procedures.
- Mutual intelligence support.
- Sharing of intelligence capabilities and assets.

- Full interoperability and connectivity among participants.
- Robust liaison.

Responsibilities

The JFC is responsible for intelligence support within the joint command and has responsibility and authority to determine, direct, and coordinate mission-related collection, production, and dissemination activities through centralized or apportioned intelligence requirements management efforts. Component commanders remain responsible for the intelligence function within their commands and employ organic intelligence capabilities to support their assigned missions. The JFC makes national, theater, and joint force intelligence assets available to support the efforts of component commanders. At the same time, component capabilities must be available to assist the joint intelligence effort.

Marine Corps Component Production and Analysis

When assigned as a joint force component, Marine Corps intelligence personnel at each level of command perform the P&A required to support their planning and decisionmaking based on prioritized information requirements; requirements unsatisfied with organic resources are forwarded up the chain of command. Each level of command also disseminates intelligence products to subordinate and adjacent units. Because these higher, adjacent, supporting, and subordinate units may be from a different Service, Marine Corps intelligence sections and units participating in joint operations must—

- Operate according to joint intelligence doctrine, theater TTP, and individual joint force procedures.
- All-source intelligence P&A to satisfy JFC and component IRs.
- Participate in joint intelligence mechanisms for the coordination of IR management (i.e., collection, production, and dissemination requirements).
- Provide P&A support to the joint force headquarters and other component commanders, as required.
- Employ joint or component P&A assets in support of Marine component operations.
- Ensure complete and reliable CIS connectivity within the joint intelligence architecture.
- Exchange liaison elements with the JTF intelligence directorate (J-2), joint intelligence support element (JISE), and/or other joint force component P&A entities as required.

Joint Task Force Headquarters Production and Analysis

A MAGTF may be designated as a JTF with the MAGTF CE forming the nucleus of the JTF headquarters. In this case, the G-2/S-2 must be prepared to function as the JTF J-2 with the MEF CE's intelligence section serving as the base for the establishment of a J-2 section and JISE. The JISE provides intelligence support to the JFC and the entire JTF.

Key Functions

When serving as a JTF J-2, MAGTF intelligence sections must operate according to joint doctrine and theater TTPs. The MAGTF G-2/S-2 must ensure that the P&A portion of the JISE is appropriately augmented or supported by specialists from national agencies, the theater JIC, and other Services possessing the necessary skills to satisfy the force requirements. Key functions performed in the JISE include—

- Centralized collection, production, and dissemination management for joint force and supporting intelligence and reconnaissance assets.

- Development and maintenance of intelligence data bases which support planning, operations, and targeting.
- Production of target studies and materials and intelligence support to force protection.
- Access to supporting national and theater intelligence assets.

Support During Planning

Intelligence product formats, standards, and dissemination means must be defined early to ensure JTF elements can exchange and use intelligence products. When possible, these definitions and standards should be planned for in advance and published in an SOP or TTP that is available to other Service units that may be assigned as part of a Marine-led JTF. The TTP or SOP should be exercised whenever possible to refine procedures and ensure unity of effort.

Support During Execution

The JFC, through the J-2, exercises complete coordination and some specified control over the P&A efforts of the joint force. Often, the J-2 is delegated direct IR validation, prioritization, and tasking authority for intelligence production by the supporting theater JIC. Incumbent with that authority, the J-2 is responsible for managing the force IRs and associated PRs.

SECTION V. COMBINED OPERATIONS

Marine Corps forces may participate in a variety of combined operations, ranging from routine bilateral exercises to coalition warfare in major regional contingencies. Instances of unilateral U.S. military operations are becoming less frequent, particularly in MOOTW. Joint doctrine serves as the doctrinal basis for combined or multinational operations. Each coalition or alliance must develop its own TTP for each operation. The coalition commander determines standardized procedures for coalition forces. NATO STANAGs and quadripartite standing agreements between U.S., British, Canadian, and Australian forces provide standards and guidance for the conduct of military operations by forces in these alliances. See STANAG 2936, *Intelligence Doctrine-AIntP-1(A)*, which governs intelligence operations.

Principles

Successful combined intelligence operations are based on the following principles and considerations.

Adjustment of National Differences Among Nations

Effective combined operations require minimizing the differences in national concepts and TTP for intelligence support. Commanders and their intelligence officers must be prepared to make adjustments to U.S. TTP to facilitate the sharing of intelligence and the integration and interoperability of intelligence and reconnaissance operations.

Unity of Effort Against Common Threat

Intelligence operations must be directed at the common threat. A threat to one alliance member must be considered a threat to all.

Intelligence Determination and Planning

Combined force's IRs and procedures should be identified, planned for, coordinated, and exercised prior to execution of operations.

Special Arrangements

Special arrangements should be considered for developing, communicating, and using intelligence where there are differences in nations' language, culture, doctrine, terminology, organization, as well as intelligence and CIS equipment.

Full Exchange of Intelligence

Each coalition member should share intelligence that supports planning and execution of coalition operations. Intelligence personnel should obtain authorization for foreign disclosure and outline procedures for disclosure and release of intelligence as part of the planning process. During execution, intelligence personnel should monitor the exchange of intelligence and adapt requirements to ensure coalition partners' needs are satisfied.

Complementary Intelligence Operations

Intelligence personnel should integrate and employ each nation's intelligence assets to capitalize on their strengths and offset their weaknesses, providing the coalition with the most effective blend of intelligence and reconnaissance capabilities.

Combined Intelligence Centers

A combined command headquarters should be supported by a combined intelligence center. The center should be manned by personnel from each nation and include appropriate linguist and translator support. This center—

- Develops coalition IRs.
- Validates and establishes priorities.
- Develops integrated intelligence plans.
- Commands and controls intelligence operations.
- Fuses intelligence received from alliance members.
- Disseminates this intelligence to the combined force.

Liaison Exchange

Exchange of intelligence liaison personnel between alliance partners bridges national differences and facilitates the exchange of intelligence and intelligence support.

Foreign Disclosure and Releasability

An important consideration for intelligence P&A in combined operations is the ability to release or disclose intelligence to non-U.S. members of the combined force in a timely manner.

Releasability involves the conveyance of information in documentary form to a foreign national. The document may be a publication, map overlay, imagery, computer disk, or any media that is physically provided to the foreign national.

Disclosure is the conveyance of classified information to a foreign national through either oral or visual means. Disclosure covers classified information that is retained by the United States but is discussed, briefed, or viewed by a foreign national. Often, regardless of whether information and intelligence is released or disclosed, the source(s) of that information and intelligence must not be revealed. Although the members of a coalition are united toward a common goal, it must be assumed that members' intelligence services will attempt to gather information on U.S. capabilities.

Policies and Procedures

The Director of Central Intelligence, DOD, Service, and theater policies and procedures govern foreign disclosure and releasability. The theater CINC is ultimately responsible for establishing policy regarding disclosure and releasability. During crises or contingencies, the CINC may choose to delegate authority to subordinate U.S. joint, combined, or component commanders. When so delegated, each recipient of that authority is responsible for publishing releasability and

disclosure guidance and procedures for their subordinate elements.

During combined operations, MAGTF CEs may be required to act as either a functional or Service component headquarters or as a combined task force headquarters, performing foreign disclosure oversight and guidance. Even when operating as an element of a combined force, every unit and individual Marine must be aware of foreign releasability and disclosure guidance.

Based on the established guidance and procedures, intelligence analysts must pay particular attention to the sources of information and the releasability of the information and intelligence derived from each of those sources. Often one version of an intelligence product must be produced for U.S. forces (and some standing alliance or quadripartite partners), and one version must be releasable to the multinational force.

Security

A balance must be struck between safeguarding classified information and intelligence and ensuring coalition partners are adequately informed and protected. One method for enhancing dissemination while providing necessary security of threat intelligence is to use the tear-line technique in the production process. This process ensures that intelligence and other information below the tear line is releasable to the combined force while simultaneously providing for the protection of U.S. collection intelligence sources and methods. Ultimately, the commander has the final authority to authorize foreign disclosure of information and intelligence directly related to a threat to any coalition partner.

Product Format Considerations

In combined operations, the form in which intelligence is conveyed is critical. Many potential coalition partners lack the technological and functional sophistication to collect, produce, and disseminate intelligence and exercise C2 over intelligence operations. Access to networks using SIPRNET or JWICS is generally not possible due to the inability to restrict the user from accessing unauthorized intelligence and friendly information. Language barriers may affect less sophisticated forms of intelligence dissemination such as text documents or briefings. The ability to exchange and use intelligence may vary from partner to partner.

Solutions for these challenges must be addressed early in planning. Generally, production requirements increase as a result of the need to tailor intelligence for multiple recipients. Increased IRs should be matched with increased analysis, production, and dissemination resources to ensure the timely provision of intelligence throughout the force. Where possible, coalition intelligence personnel should assist in the production of intelligence tailored to support their forces.

Information Sources

The intelligence analyst in a combined operation has the increased burden of assessing the reliability and credibility of non-U.S. information and intelligence sources. While foreign militaries may lack the sophisticated technical means available to the United States, they often enjoy superior capabilities in HUMINT, particularly if they are ethnically or linguistically related to the population of the AO. The analyst may need time to establish the reliability of the source or the accuracy of the information. In addition, the analyst must be aware that foreign forces may withhold, filter, or distort the information provided to the United States to safeguard their intelligence sources and methods. The analyst should apply the techniques and procedures for assessing reliability and accuracy and be conscious of biases that may develop due to preconceived notions regarding the source.

SECTION VI. PRE-CRISIS PHASE

The MAGTF pre-crisis intelligence P&A efforts center on data base management, ongoing production activities, and training.

Data Base Management

The key to effective intelligence and CI P&A is the identification and maintenance of hard copy and electronic intelligence sources and data bases. Intelligence personnel should attempt to develop and maintain relevant data bases during day-to-day operations in garrison. Without the necessary pre-crisis P&A, the ability to provide needed support in a crisis will be diminished. Key sources of intelligence data include the intelligence reference library, statement of intelligence interest, and intelligence data bases.

Intelligence Reference Library

Although intelligence is produced and disseminated increasingly in electronic form, each intelligence section is required to maintain a basic intelligence library in support of command and intelligence functioning. The library should include publications which are tailored to the unit's mission and echelon and are necessary to support day-to-day intelligence planning, operations, and contingency operations. Publications should include maps, charts, imagery, graphics, pertinent finished intelligence, and key supporting documents. Intelligence library publications are categorized as required and nonrequired.

Required Publications

As higher headquarters-directed holdings, these publications represent the minimum required material needed to support intelligence and command functioning. The intelligence officer is responsible for reviewing and validating the command and subordinate command's required holdings to ensure that they meet the minimum intelligence operation support requirements. Requests for additions or deletions of publications will be submitted via the chain of command according to the guidance contained in current directives.

Nonrequired Publications

Intelligence sections maintain nonrequired publications to supplement minimum required holdings, to conduct planning and training, or to use as reference material. The intelligence officer is responsible for ensuring nonrequired publications are available to support intelligence requirements.

National, Service, and unified commands produce intelligence publications that provide intelligence and guidance for intelligence functioning. Procurement procedures are contained in current directives and local SOPs. The manpower or personnel staff officer (G-1/S-1) is responsible for the procurement of doctrinal and tactical publications (e.g., JPs, MCDPs, MCWPs, MCRPs, FMs); however, the intelligence officer is responsible for identifying requirements for these publications.

Statement of Intelligence Interest

The statement of intelligence interest (SII) is the vehicle by which commands register requirements for all-source finished intelligence. Each command must establish an SII with DIA to receive automatic distribution of intelligence publications in support of command requirements. The intelligence officer is responsible for coordinating with the appropriate Dissemination Program Manger (DPM) to ensure the commands's SII is up to date. Statements of intelligence interest are requested through DIA's online Joint Dissemination System (JDS) via INTELINK/INTELINK-S under the Director of Information Systems and Services.

Accounts can be applied for online and are forwarded to the appropriate DPM, which is

Marine Forces, Atlantic, Marine Forces, Pacific, or MCIA, respectively. Once the account is established, it may be modified online. The appropriate MARFOR headquarters or MEF CE intelligence officer determines specific policies governing echelons that may apply for JDS accounts. The Defense Intelligence Production Schedules list DOD planned general intelligence production. Most intelligence producers maintain some type of production forecast on their INTELINK and INTELINK-S web sites.

Intelligence Data Bases

The establishment of intelligence data bases allows the intelligence section to manage and use the large volume of available information and intelligence. Intelligence agencies have established various data bases suited to their needs, resulting in different systems available to support intelligence operations at various levels. The intelligence officer at each command echelon must be aware of relevant intelligence agencies' data bases and plan for their use to support operations. In addition, the intelligence officer should maintain access to appropriate national, theater, and Service data bases.

Data bases are available to Marine Corps commands equipped with the JDISS and the IAS, either as applications or through access to INTELINK and INTELINK-S. As modern information systems technologies mature, the structure and titles of the data bases change frequently. The MCIA 1586-001-96, *MAGTF Contingency Reference Guide*, is a compendium of agencies, products, data bases, and INTELINK sites of potential interest. This publication is available in hard copy, disk, and on-line via both INTELINK and INTELINK-S. In addition, national, theater, and Service producers have created electronic links from their INTELINK web sites to other pertinent sites.

Each intelligence section should create local data bases to support their contingency planning and the development of contingency intelligence support products. Most current intelligence files can be maintained on automated data base systems. Finished intelligence products, imagery, maps, and graphics are available on-line to facilitate data search, access, and retrieval. When assembled, a pre-crisis data base should consist of—

- Current target country intelligence and CI estimates.
- Intelligence reference publications (e.g., intelligence TTP for combatant commands the unit may support, intelligence TTPs or SOPs for other Services with which the unit may operate).
- Standard intelligence data base segments (i.e., modernized integrated data base).
- Mapping, charting, geodetic, and other geospatial holdings.
- Imagery library and related holdings.
- Current intelligence files.
- Open source publications.

Production

Pre-crisis intelligence production includes contingency intelligence production, IPB, exercise intelligence, and other intelligence requirements.

Contingency Intelligence

The main pre-crisis P&A effort of MAGTF and MSC intelligence sections is contingency intelligence production in support of potential missions. The intelligence section must review standing contingency plans and tasking in conjunction with staff operations and plans sections. Intelligence personnel should coordinate with operations and plans personnel to define the mission, scope, and tasks using the following methodology.

Define the Intelligence Requirements

The IRs should be well defined after coordination with commanders and their staffs. Properly focused IRs save time and valuable intelligence assets.

Research Data Bases

Available intelligence data bases should be reviewed before submitting RFIs, ICRs, IPRs, IDRs, or PRs.

Analyze and Synthesize Data

Intelligence personnel must consider data, information, and intelligence from all available sources for analysis and synthesis.

Prepare the Products

Products must be prepared in user-friendly formats and delivered in a timely manner.

Intelligence Preparation of the Battlespace

Pre-crisis IPB is conducted to develop basic and current intelligence needed to support the planning and execution of contingency operations. The extensive and detailed nature of intelligence required to support expeditionary operations demands that a comprehensive research, analytical, and production effort be undertaken far in advance of the initiation of such operations. This demands that commanders and staff principals conduct detailed contingency planning across functional areas and command echelons to identify specific detailed IRs. The pre-crisis period offers the opportunity to carry out a thorough, measured study of potential areas of MAGTF employment. Driving contingency planning efforts, the pre-crisis IPB is the principal contribution of intelligence to combat readiness.

Pre-Crisis Products

The IPB products that can be generated in pre-crisis analysis and production include—

- Battlespace characteristics analysis.
- Terrain and weather analyses and templates.
- Weather effects matrices for various seasons and conditions.
- Threat models.
- Threat capabilities assessments.
- Threat COAs, when possible.

Results

The completed pre-crisis IPB process provides the following products for each potential contingency area:

- Tailored intelligence data base(s).
- Contingency intelligence study.
- Intelligence and counterintelligence estimates.
- Validated intelligence collection, production, and dissemination requirements.
- Integrated intelligence operations plan (collection, production and dissemination).
- Tentative tasks for supporting intelligence and reconnaissance units.

Additional Purposes

In addition to the primary purpose of supporting contingency planning and execution, pre-crisis IPB—

- Develops an intelligence data base for selected areas.
- Educates personnel on potential missions and AOs.
- Identifies intelligence collection, production, and dissemination shortfalls (e.g., IRs, key personnel, and equipment).
- Trains intelligence personnel in the IPB process and the development of intelligence in support of actual contingency missions.

Exercise Intelligence

Exercise intelligence production should follow the same procedures as contingency intelligence production and should result in products that mirror image what will be used in an actual operation. The intelligence section should use real-world data bases, IPB, and scenarios whenever possible to enable realistic training of intelligence personnel and staff and to provide solid area and threat familiarization training for unit Marines and Sailors.

When conducting field training exercises, the intelligence section must provide the same quality of GEOINT, IMINT, SIGINT, CI or HUMINT, and other intelligence support as would be provided in an actual operation. Weather conditions and terrain will factor heavily into the success and safety of an exercise involving the actual maneuver and movement of air, land, and seaborne forces.

Other Intelligence

In garrison, the intelligence section is expected to provide indications and warning information and promote threat awareness. The intelligence section must keep the commander and staff, as well as those of subordinate units, informed on items of interest in the unit's assigned or potential contingency areas. This can be accomplished by providing periodic current intelligence briefings, affording access to intelligence publications, and/or preparing current intelligence read boards for commanders and staff members. With increased access to web technologies, the commander, staff, and subordinate units can review daily pertinent information posted on a web site. The intelligence section should always be prepared to field impromptu requirements as directed by the commander or staff.

Production and Analysis Training

While in garrison, intelligence P&A training is accomplished through individual training, element training, unit training, and MAGTF training.

Individual Training

The intelligence analyst receives an introduction to P&A topics at formal intelligence military occupational specialty training courses. However, to develop P&A proficiency, the intelligence section must have a continuing training program to enhance P&A skills.

Skills Development

The Marine intelligence analyst must train to further develop—

- Comprehensive study and understanding of threat forces' doctrine, operational and functional methodologies, and TTP.
- Familiarity with potential operating areas' cultural, ethnic, sociological, and religious orientations, organization, perspectives, values, and issues.
- IPB skills, which cover analysis of contingency AOs, threat COGs, critical vulnerabilities, tactical practices, capabilities, and COAs.
- Intelligence research methods (e.g., information and intelligence sources, agencies, functions, capabilities, limitations, automated information systems, data base availability and procedures).
- Methods of collecting and reporting information.
- Processing, recording, and filing information methods (e.g., manually and electronically preparing overlays and posting situation maps).

- Integration, analysis, evaluation, interpretation, and information synthesis skills to rapidly produce tailored intelligence products.
- Skills in the use of automated information systems to manage data, analyze information, and produce and disseminate GENSER and SCI intelligence products, using all means of presentation (e.g., briefings, text reports, graphics, overlays).

Exercises

Wargaming and command post exercises (CPXs) are the best vehicles for analytical training and must be done independently of major exercises to enhance analytical skills before they are needed. Normally, the majority of training comes as a result of practical application (i.e., preparation of IPB and other products in response to exercise or contingency requirements). Each product must be evaluated and critiqued with the analyst who developed it to improve their skills. The intelligence officer's wargaming goals should include—

- Providing participants with a thorough area and situation orientation.
- Validating the scope and area coverage of the initial IPB.
- Determining gaps in existing intelligence.
- Identifying areas for additional study.
- Developing new collection, production, and dissemination requirements.
- Developing an initial intelligence concept of operations and supporting contingency collection, production, and dissemination plans.

Element Training

Intelligence sections and elements must have an integrated training program to develop the individual, team, and unit skills and capabilities necessary to execute intelligence and reconnaissance operations during MAGTF operations. Section training should first emphasize building specialized individual production skills. Once individual skills are mastered, cross-training and development of depth should be emphasized. A building block approach is used, starting with small group or team training (e.g., watch section, country team, or production element) and working up to exercises employing the entire G-2/S-2 section and those of subordinate commands.

While a command staff exercise, CPX, or field exercise normally provides the best environment for the conduct of intelligence section training, independent G-2/S-2 section training should be conducted in advance of a major command training event. This allows the section to develop and test SOPs, cross train personnel in a variety of functions, and conduct indepth instruction in intelligence P&A. Each production requirement or exercise is a training opportunity and should have specific training objectives associated with it.

Unit Training

Intelligence units conduct training according to their unit's specific mission and functions. As intelligence specialty units are often employed as small, independent subelements, the majority of their training should be targeted at the team, subteam, or detachment level. Intelligence unit training should also emphasize the planning and execution of operations in response to the supported unit's requirements.

Each unit training evolution is an opportunity to enhance P&A training by requiring the development of objectives for each exercise. In addition, unit training must encompass specific, detailed intelligence objectives for commanders and other staff section personnel. Unit training for P&A should—

- Train intelligence sections in meeting tactical requirements by exercising deliberate and immediate tactical production.
- Exercise the IR management process and intelligence cycle between consumers and producers.
- Test and improve standard product formats and content.

- Critique and provide P&A effort feedback.
- Evaluate the effectiveness of integrating intelligence production operations with those of collection and dissemination.

MAGTF Training

This training combines MAGTF units and trains on a larger scale, which provides intelligence personnel the opportunity to exercise the production management function as well as integrate collections and dissemination with P&A. The MAGTF training provides the opportunity to—

- Test requirement priorities and procedures.
- Test the integrated production between the MEF CE CIC, other intelligence and reconnaissance units, and MSCs.
- Determine if the resulting test products meet the commander and staff's needs.

SECTION VII. WARNING AND DEPLOYMENT PHASE

Warning and deployment sets the intelligence foundation for the entire operation. During this phase, intelligence is expected to produce a high volume of critical planning and decision-making support in a short period of time. This phase is further complicated by the need to prepare P&A elements for deployment within the MAGTF. The IPB and contingency intelligence study prepared in the pre-crisis period and the knowledge and skills gained by intelligence personnel, commanders, and other staff personnel during training exercises is the key to the ability to deliver intelligence support and products early in the warning or deployment phase. Initial P&A efforts, production management, and standardization of products frame the warning and deployment intelligence phase of operations.

Initial Production and Analysis

Determine Initial Requirements

Key to the success in determining initial IRs is a clear understanding of the command's mission, assigned tasks, commander's intent and guidance, and a defined AO. Command and staff element requirements should be integrated so that comprehensive products can be developed to meet as many needs as possible.

The P&A goal should be to produce a product only once to avoid duplicating effort and wasting time and assets. Time is the driving factor in determining the amount of detail that can be put into the P&A effort in the warning and deployment phase.

Assemble and Focus Data Bases

With an understanding of the mission and AO, intelligence personnel can refine data bases and other intelligence holdings. Units should agree on standardization of products and data bases early on in this process. Product and data base standardization should be a minor effort if SOPs or TTPs exist and units have worked and coordinated together previously in IPB contingency intelligence study preparation and training. This effort is more complicated in a joint or combined force.

Develop Initial Estimate and Supporting Studies

Preparing the intelligence estimate is easier if the contingency intelligence study is prepared and IPB is in progress. The initial IPB provides the baseline descriptive intelligence to initiate planning and, when paired with the contingency

intelligence study, supports the preparation of an initial estimate and supporting studies.

Develop Collection, Production, and Dissemination Requirements

Shortfalls identified during preparation of the initial intelligence and CI estimates become the basis for development of new collection, production, and dissemination requirements beyond organic capabilities. New requirements must be turned into collection, production, and dissemination plans, necessitating support requests to component, JTF, and/or theater commands for action. The MAGTF intelligence section is responsible for developing these requirements and for coordinating with the planning section to ensure requirements are focused on operations.

Production Management

Production management validates and prioritizes IPRs among competing requirements to determine which ones have the most impact on the mission's outcome. Production must be managed ruthlessly during this phase to ensure that limited assets are properly focused. The commander must be actively involved in—

- Directing intelligence operation efforts.
- Setting priorities.
- Providing the intelligence officer with guidance on where to focus the effort and what requirements are most important.
- Evaluating the effectiveness of operations.

Continuous interaction with staff planners and subordinate commanders and intelligence officers is required to ensure ongoing production supports the development of friendly COAs. Requirements typically change frequently during this phase as COAs are identified, refined, or rejected. Production management must ensure flexibility and responsiveness. Time is the critical element in production during this phase, because requirements must be met on time, even at the expense of detail.

Standardization of Products

The use of standard products simplifies production and dissemination. To provide a cut-and-paste or fill-in-the-blank capability, products should be standardized and automated. Establishing standard products and a regular update schedule is an effective way of managing production and dissemination during this phase. Product standardization can head off constant requests for updates by organizations, which can drain production and dissemination resources and detract the focus from essential requirements. A system of standard products should be developed during training and carried over with only minor modifications.

SECTION VIII. EXECUTION PHASE

In addition to production management, MAGTF intelligence P&A during the execution phase of operations involves support to current operations, future operations, future plans, and targeting.

Production Management

Production management remains critical during the execution phase, as requirements tend to change rapidly. P&A resources must be focused on the main effort according to the commander's guidance and intent, the PIRs, and the unit's operations and intelligence concepts. The commander must balance the production effort between support to current operations and future operations planning. Usually, the higher the echelon, the greater the focus is on future operations and planning; the lower the echelon the greater the focus is on current operations. Normally, at

higher command echelons, commanders and intelligence personnel must remain responsive to their own and lower echelon commanders' tactical needs. During execution, the time element is even more critical, because execution often depends on timely receipt of intelligence required for decisionmaking.

Support to Current Operations

Support to current operations consists primarily of immediate tactical production that is keyed to the commander's decision points, PIRs, and location of HPTs. Each piece of data, information, or intelligence received undergoes immediate tactical processing and assessment to determine if it is pertinent to the ongoing operation. If deemed pertinent, the information is quickly analyzed, impacts are determined, intelligence estimates are prepared, and results are disseminated. Intelligence personnel must maintain situational awareness and understand the operational situation, current PIRs and IRs, and likely enemy reactions to anticipate and meet the needs for immediate tactical production.

Support to current operations must include P&A in support of deep and rear operations and resist focusing on the close battle. Intelligence support to current operations must be balanced against the need to support future operations and plans. Assets cannot be devoted to current operations at the expense of supporting planning for future operations. In addition to short, tailored, mission-focused products in response to an immediate tactical need, production includes regularly scheduled update briefs and intelligence summaries that help maintain a common picture of the battlespace supporting situation development.

Support to Future Operations

Depending on the timeframe of the operation, scope of the operation, and level of command, support to future operations consists of a mix of immediate and deliberate production. Future operations focus on the deep battle, which is defined either by distance or time. Intelligence products in support of future operations must focus on that same planning window and seek to provide the future operations team with a coherent projection of the battlespace and threat within that window.

The future operations cell focuses on a rolling or near-continuous IPB process by generating new COAs, ICRs, IPRs, IDRs and targeting priorities, DSTs, and synchronization matrixes as the battle or operation unfolds. Intelligence production supporting the future operations cell is focused on products generated during IPB, which have been constantly modified by the results of friendly and threat actions. Daily situation update briefings are necessary to ensure the future operations team remains aware of current actions that may impact future operations.

The primary intelligence P&A contributions are the BDA results and the estimate of the situation focused on the appropriate planning horizon. The BDA provides input into combat assessment, which in turn helps determine the nature of future operations. Derived from the continuous IPB effort, the situation estimate provides the basis for planning.

During future operations planning, IPB and estimates draw on and extend previous work rather than generating new production. The intelligence P&A effort requires continuous interaction with the future operations cell. As decisions are made concerning future operations, integrated collection, production, and dissemination requirements are developed and prioritized, missions are assigned, and mission-specific products are prepared. Management of the time element is critical to ensure that products reach the future operations cell, mission planners, and executers in a timely manner.

Support to Future Plans

The MEF CEs, components, and JTF headquarters often require an additional planning cell focused on the next campaign or major phase change within the CINC's campaign plan. This cell, or operational planning team, in the MEF CE looks into the future and deals more in assumption than fact. Production in support of future planning tends to be deliberate and generalized but still encompasses the basic elements of IPB.

Often, the future plans cell is located out of the immediate operations area and may locate in close proximity to the CINC headquarters to facilitate communication and collaboration. Given the timeframe and location of potential future operations, the supporting theater intelligence center may be more suited to produce required intelligence products, with MAGTF intelligence personnel tailoring these products to support the needs of the future plans cell.

Support to Targeting

Intelligence support to targeting requires a continuous, integrating support effort to current and future operations. This support consists of target development (generated through IPB), immediate tactical production of new intelligence related to particular targets, and BDA of the mission execution results. At higher command echelons, the targeting cycle can span days, while at lower echelons it may span hours or minutes. In MAGTFs with organic fixed-wing aviation, the intelligence support to targeting is driven by the ATO cycle. An important goal is the synchronization of the collection and production phases with the appropriate phases of the PDE&A and ATO cycles to ensure the provision of relevant and timely target intelligence.

APPENDIX A. INTELLIGENCE ESTIMATE FORMAT

An intelligence estimate can be prepared at any level, from the battalion or squadron through the Marine expeditionary force command element and Marine Corps forces headquarters levels. The intelligence estimate should be succinct, yet provide the commander and staff the necessary information for decisionmaking. The scope and detail of an intelligence estimate are governed by the—

- Level of command preparing it.
- Nature of the operation it is intended to support.
- Current availability of intelligence.
- Prior contingency planning.
- Time and resources available.

Whenever possible, the intelligence estimate should clearly present the analysis and conclusions developed during intelligence preparation of the battlespace (IPB). The finished estimate may be in written, graphic, or verbal form, but should always follow the general five-paragraph structure presented in the following pages. Subparagraphs and tabs may be added and omitted based on their relevance to the stated mission. For topics that require a large amount of data, information, and intelligence (i.e., beaches, weapons capabilities, technical characteristics), the salient facts and conclusions should be summarized in the body of the estimate and the detailed data included as a tab.

For a discussion of IPB and the intelligence estimate, see chapter 4. Chapter 5 provides a discussion of the various factors that constitute paragraph 2 of the estimate. Chapter 6 provides a discussion of the factors that constitute paragraph 3.

The sample on page A-2 is the format for an intelligence estimate in support of conventional combat operations. The sample on page A-10 is the format for an intelligence estimate in support of military operations other than war (MOOTW).

4. (U) Capabilities and Analysis. (List separately each enemy capability that can affect the accomplishment of the assigned mission. Each enemy capability should contain information on what the enemy can do, where they can do it, when they can start it and get it done, and what strength they can devote to the task. Analyze each capability in light of the assigned mission, considering applicable factors from paragraphs 2 and 3, and attempt to determine and give reasons for the estimated probability of adoption by the enemy. Examine the enemy's capabilities by discussing the factors that favor or militate against its adoption by the enemy. The analysis of each capability should also include a discussion of enemy strengths and vulnerabilities associated with that capability. Also, the analysis should include a discussion of any indications that point to possible adoption of the capability. Finally, state the estimated effect the enemy's adoption of each capability will have on the accomplishment of the friendly mission. The term "capabilities" includes not only the general courses of action open to the enemy (e.g., attack, defend, withdraw), but also the particular courses of action possible under each general course of action. These courses of action should correspond exactly to enemy course of action models developed during step 4 of IPB.)

CLASSIFICATION

5. (U) Conclusions and Vulnerabilities. (State conclusions resulting from discussion in paragraph 4 to include: enemy centers of gravity, critical and other vulnerabilities and estimated exploitability of these by friendly forces, enemy courses of action beginning with the most probable and continuing down the list in the estimated order of probability, and the estimated effects adoption of each capability would have on the friendly mission.)

TABS: (as necessary)

APPENDIX B. WEATHER CRITICAL VALUES

Establishing weather critical values is essential to weather effects analysis on threat and friendly operations. Critical values provide the parameters for assessing the exact impact of particular weather conditions. Critical values can be established for personnel, specific types of equipment, and types of military operations and tailored to the echelon of command, the composition of the force, and the likely operations the force will be expected to conduct. For example, a MEF may be concerned with general categories such as amphibious operations, fixed-wing aviation operations, and visual reconnaissance operations. A battalion may be concerned with foot mobility, line-of-sight restrictions, and effects on indirect fire support, while an unmanned aerial vehicle unit might be more concerned with visibility, cloud cover, precipitation, and temperatures aloft. Each level of command should focus on the unit mission-essential functions and specific equipment categories.

For each category or function, only weather elements that may have an impact are listed. For example, troops operating in a desert environment (depending on the desert and time of year) are generally not affected by snowfall. Similarly, windchill is not a critical factor when assessing fixed-wing aviation operations, but windchill may affect ground crews.

For each weather element selected, critical values are established that define impact levels. In table B-1, the levels of impact are defined as favorable, marginal, and unfavorable or as unrestricted, restricted, and severely restricted. An effective technique is to assign each level a color-code, such as green, yellow, or red, that can be transferred easily to a graphic weather effects matrix.

The companion weather effects matrix lists the same functions. If a weather element falls within the unfavorable or severely restricted range, the weather effects matrix is color-coded red for that function during the period of time the unfavorable element is forecast to occur. Weather elements that result in a marginal or unfavorable assessment are noted on the weather effects matrix (see chapter 6, figure 6-3).

The MEF command element intelligence section personnel, assisted by the G-2 section's staff weather officer, the intelligence support coordinator, and intelligence battalion personnel, usually compile the weather critical values chart. The commander, operations staff, and friendly force's functional elements define selected functions, weather elements, and critical values. Within a MAGTF, for example, the air officer and aviation combat element should establish weather elements that may impact aviation operations and platforms and define the values that constitute impact levels. Within an infantry battalion, the artillery liaison officer is the best source for effects on supporting fires and artillery delivered munitions.

Regardless of who compiles the list, the commander defines weather intelligence elements that are critical to decisionmaking. The identified weather elements and their established critical values are tracked closely and serve as the basis for weather effects graphics and updates. Like other intelligence requirements, the weather elements and their critical values must be reevaluated as the mission or season changes.

Unit intelligence section personnel develop mission, type unit, and equipment-focused critical values lists during peacetime operations, to include those equipment types and units which will normally be attached or in direct support during operations. Upon receipt of an alert or execute order, these critical values lists can then be refined and tailored to the forces, mission,

and environment assigned. See MCWP 3-35.7, *MAGTF Meteorological and Oceanographic Support,* and FM 34-81-1, *Battlefield Weather Effects*, for additional doctrine and tactics, techniques, and procedures guidance.

Weather critical values are established for threat as well as friendly forces. Due to differences in weapons and personnel characteristics, the same weather may have differing effects on the threat. For example, threat tanks without thermal sights will be severely restricted during periods of reduced visibility, while friendly tanks may be only marginally affected. Comparing the varying effects of weather on friendly and threat forces helps to identify advantages and vulnerabilities that may be exploited by either side.

Table B-1. Weather Critical Values Chart.

Function	Weather Element	Favorable (Unrestricted)	Marginal (Restricted)	Unfavorable (Severely Restricted)
Maneuver: Mobility (track vehicles, day)	visibility rainfall snow depth	> 1.5 km < 0.1 in/hr < 12 in	0.8 to 1.5 km > 0.5 in/hr > 12 to 20 in	< 0.8 km > 0.5 in/hr > 20 in
Maneuver: Mobility (track vehicles, night)	visibility rainfall snow depth	> 0.2 km < 0.1 in/hr < 12 in	0.1 to 0.2 km 0.1 to 0.5 in/hr 12 to 20 in	<0.1 km > 0.5 in/hr > 20 in
Maneuver: Mobility (dismounted infantry)	visibility rainfall snow depth temperature windchill	> 0.3 km < 0.1 in/hr < 3 in < 89.6 °F/32 °C > 32 °F/0 °C	0.1 to 0.3 km 0.1 to 0.5 in/hr 3 to 6 in > 89.6 °F/32 °C 32° F/0 °C to -22° F/-30° C	< 0.1 km > 0.5 in/hr > 6 in ---------- < -22 °F/-30 °C
Fire Support (155mm)	visibility ceiling surface wind snow depth	> 5.0 km > 800 ft < 35 knots < 4.0 in	1.5 to 5.0 km 500 to 800 ft 35 to 50 knots 4.0 to 6.0 in	< 1.5 km < 500 ft > 50 knots > 6 in
Fire Support (close air support)	visibility ceiling	> 8.0 km > 3000 ft	5.0 to 8.0 km 500 to 3000 ft	< 5.0 km < 500 ft
Aviation (rotary wing)	visibility ceiling surface wind precipitation	> 1.5 km > 500 ft < 20 knots none	0.4 to 1.5 km 300 to 500 ft 20 to 30 knots light	< 0.4 km < 300 ft > 30 knots freezing rain or hail
Aviation (air defense)	visibility ceiling rainfall	> 5.0 km > 5000 ft < 0.5 in/hr	3.0 to 5.0 km 3000 to 5000 ft 0.5 to 1.0 in/hr	< 3.0 km < 3000 ft > 1.0 in/hr

°C=degree Celsius °F=degree Fahrenheit ft=feet in/hr=inches per hour km=kilometer

APPENDIX C. TACTICAL INDICATORS

Indicators are any positive or negative evidence of threat activity or any characteristic of the operations area that points toward threat capabilities, vulnerabilities, or intentions. Each indicator is integrated with other factors, indicators, information, and intelligence before patterns are detected and threat intentions are established. Intelligence analysts develop indicators to—

- Assist in discerning answers to a commander's priority intelligence requirements and intelligence requirements.
- Correlate particular events or activities with probable threat courses of action.
- Determine what events or activities must occur for a threat to follow a particular course of action (COA).

As named areas of interest and the event template are developed during intelligence preparation of the battlespace (IPB), analysts develop corresponding indicators which, when detected, will assist in rapidly identifying the particular COA the threat may adopt. While some indicators may apply to most or all of the possible threat courses of action, other indicators may be unique to a particular COA. Well-developed indicator lists also aid in detecting threat deception operations. By comparing indicators, intelligence, and operations reporting, the analyst arrives at an accurate picture of the battlespace and intelligence estimates.

Indicators may be present for more than one COA in the same threat force. For example, a threat division forced to withdraw (and providing indicators accordingly) may employ a subordinate unit (brigade, regiment, or battalion) in a delaying action to cover the withdrawal. Units in contact with the delaying force may characterize the indicators as delaying in nature, but the threat force overall is withdrawing. Indicators from all sources must be analyzed to assess the threat's true intentions.

The tables on the following pages provide some intelligence indicators commonly associated with operations. These lists are intended to provide a basis from which intelligence personnel can develop indicators specific to the threat and environment they are faced with. No one indicator can stand alone; indicators must be examined within the context of the doctrine, tactics, and structure of the specific threat force.

OFFENSIVE INDICATORS

Activity	Explanation
Massing of maneuver elements, armor, artillery, and logistical support.	May strengthen the main effort by weakening areas of secondary importance.
Deployment of combat elements on a relatively narrow frontage (not forced by terrain).	May provide maximum combat power at the point of attack by reducing frontages.
Massing of indirect fire support assets.	May indicate initiation of a main attack.
Extensive artillery preparation of up to 50 minutes in duration or longer.	Indicates preparation preceding an attack.
Dispersal of tanks and self-propelled or towed artillery to forward units.	Can indicate formation of combined arms assault formations with tanks accompanying the leading maneuver elements and artillery following in bounds.
Surface-to-surface missile units located forward.	Provides depth to threat offensive operations; places friendly support and rear areas in range. May also indicate, when employed alone, harassing or special weapons delivery.
Antiaircraft artillery and mobile surface-to-air missiles located well forward with maneuver elements.	Provides increased protection to massed forces prior to attack; extends air defense umbrella forward as units advance.
Demonstrations and feints.	May precede an attack; may deceive actual point of attack.
Establishment and strengthening of counter-reconnaissance screen.	Covers assembly and preparation of forces for attack.
Concentration of mass toward one or both flanks within the forward area.	May indicate intent for single or double envelopment, particularly if massing units are armor-heavy.
Increased patrolling (ground reconnaissance).	May indicate efforts to gather detailed information regarding friendly dispositions prior to attack.
Command posts located well forward; mobile command posts identified.	Enhances command and control during offensive operations.
Movement of noncombatants out of the combat zone.	Removes noncombatants, which hinder rapid forward movement of follow-on forces.
Extensive conduct of drills and rehearsals in rear areas.	Often indicates major attacks, particularly against fortified positions or strongly defended natural or man-made barriers, which require rehearsal of specialized tactics and skills.
Increased activity in supply, maintenance, and motor transport areas.	May indicate movement of additional forces to the front to sustain major attack.
Increased aerial reconnaissance (including unmanned aerial vehicles).	Refines threat's intelligence picture prior to operations.
Establishment of forward arming and refueling points, auxiliary airfields, or activation of inactive airfields.	Increases sortie rate and turnaround time by forward basing aircraft and aviation sustainment.
Clearing lanes through own obstacles.	Facilitates forward movement and grouping of assault units, particularly at night, usually immediately precedes an attack.
Reconnaissance, marking, and destruction of opponent's obstacles.	Facilitates movement of assault echelons through opposing obstacles.
Gap-crossing equipment (e.g., swimming vehicles, bridging, ferries, boats) located in forward areas (provided there is a water or large gap obstacle).	Maintains tempo of the assault echelons when faced with significant gap obstacles, normally concentrated with main effort.
Staging of airborne, air assault, or special forces with modes of transportation/insertion.	Such elements are used to provide depth to the assault and target friendly centers of gravity.
Increased signals traffic or radio silence.	May indicate intent to conduct offensive operations. (Increased traffic may be an attempt to deceive. Radio silence denies information derived from opponent's signals intelligence.
Signals intelligence and electronic warfare assets located forward.	Provides enhanced electronic attack and electronic warfare support for assault forces.

DEFENSIVE INDICATORS

Activity	Explanation
Preparation of battalion and company defensive areas consisting of company and platoon strong points.	Indicates intent for holding terrain with defense in depth, normally supported by armored counterattack forces.
Extensive preparation of field fortifications, obstacles, and minefields.	Indicates strong positional defense.
Attachment of additional antitank assets to frontline defensive positions.	Indicates intent to contest friendly armor in forward positions, and attempts to attrite and channel friendly armor into engagement areas for armor counterattack forces.
Formation of antitank strong points in depth along avenues of approach.	May allow penetration of friendly armor into rear engagement areas.
Preparation of alternate artillery positions.	Increases survivability of artillery in the defense.
Concentration of armor units in rear area assembly areas.	Indicates holding armor units in reserve for possible counterattack or counteroffensive.
Presence of concentrated antitank reserves.	Provides quick reaction capability against armor penetrations.
Displacement of logistics and medical units towards the rear.	Facilitates maneuver defense and counterattack.
Prestocking of ammunition, supplies, and engineer or pioneer equipment in forward positions.	Reduces the burden on logistics during the battle, reduces vulnerability of interdiction of supplies, and ensures strong points can survive for reasonable periods if bypassed or cut off.
Increased depth from the forward line of troops of artillery and surface-to-surface missile units.	Allows continued employment of artillery during maneuver defense without significant rearward displacement.
Increased use of land line communications.	Implies intent to remain in position because landlines are less vulnerable to electronic warfare.
Presence of dummy positions, command posts, and weapons.	Complicates friendly targeting and analysis of actual threat locations and strengths.
Air defense more concentrated in rear areas.	Indicates location of numerous high-value targets (e.g., armor, logistics, artillery, command posts) that dictates strong air defenses in rear areas.

DELAYING INDICATORS

Activity	Explanation
Withdrawal from defensive position(s) before becoming heavily engaged.	Indicates units' delaying actions to avoid decisive engagements.
Numerous local counterattacks with limited objectives; counterattacks broken off before position is restored.	Assists in disengaging units in contact, rather than restoring positions.
Units leapfrogging to new defensive positions.	Indicates units engaging then conducting local withdrawals to new positions while another force takes up the engagement
Maximum firepower located forward; firing initiated at long ranges.	Intends to inflict casualties, slow advance, and provide sufficient combat power to avoid decisive engagement.
Extremely large unit frontages as compared to normal defense.	Indicates delaying actions to economize force, allowing larger formations to withdraw.
Chemical or biological agent weapons in forward areas.	Causes significant delays to the advancing force when employed as barriers or in minefields.
Identification of dummy positions and minefields.	Causes delays by forcing the advancing force to determine whether minefields are active or inert.

WITHDRAWAL INDICATORS

Indications of threat intent to withdraw are often the same as those for delaying actions, with the addition of the following indicators.

Activity	Explanation
Systematic destruction of bridges, communications facilities, and other assets.	Denies the advancing force the use of infrastructure and installations in withdrawal areas.
Establishment of a covering force or rear guard.	Covers the withdrawal of the main body; usually consists of a sub-element of the main force; and usually engages only the rear guard element.
Increased rearward movement noted at night, particularly during inclement weather.	Attempts to withdraw units under the concealment of darkness and weather.
Minimal presence of logistic and medical units. Destruction of dumps and depots.	Indicates withdrawal of nonessential logistic and medical elements and the inability to move depots and dumps.
Establishing and marking withdrawal routes and traffic control points.	Facilitates the rapid movement of forces rearward.
Preparation of new defensive positions beyond supporting range of present positions.	Indicates attempt to establish new positions along suitable terrain prior to the arrival of deliberately withdrawn forces.
Increased engineer activity and stockpiling of explosives in the threat rear area near bridges, tunnels, built-up areas, etc.	Facilitates maintenance of lines of communications for own forces; indicates demolition of infrastructure in front of opposing force.
Rearward movement of long-range artillery.	Positions long-range artillery before withdrawal takes place.
Activation of command posts well removed (beyond doctrinal norms) from the present battle area.	Creates command and control nodes in the new position or assembly area to command and control arriving forces.

MILITARY OPERATIONS OTHER THAN WAR INDICATORS

Given the wide range of military operations other than war (MOOTW), the possible indicators of various activities can be enormous. However, most MOOTW evolutions still involve the requirement to identify risks to friendly forces. By their nature, MOOTW are generally concerned with indigenous populations, regardless of the nature of the mission. The following indicators focus on those indicators associated with possible threats emerging from indigenous populations. These lists provide the analyst with a point of departure for developing case specific indicators.

THREAT POPULATION INDICATORS

General Activities
Identification of agitators, insurgents, militias or criminal organizations, their supporters, and sympathizers who suddenly appear in, or move out of, an area.
New faces in a rural community.
Unusual gatherings among the population.
Disruption of normal social patterns.
Mass urban rural migration or vice versa.
Massing of combatants of competing power groups.
Increase in the size of embassy or consulate staffs from a country or countries which support indigenous disaffected groups, particularly those hostile to the United States and/or the current intervention.
Increase in neighboring countries of staff and activities at embassies or consulates of countries associated with supporting indigenous disaffected groups.
Increased travel by suspected subversives or leaders of competing power bases to countries hostile to the United States or opposed to the current intervention.
Influx of opposition resident and expatriate leaders into the operations area.
Reports of opposition or disaffected indigenous population receiving military training in foreign countries.
Increase of visitors (e.g., tourists, technicians, businessmen and businesswomen, religious leaders, officials) from groups or countries hostile to the United States or opposed to the current intervention.
Close connections between diplomatic personnel of hostile countries and local opposition groups.
Communications between opposition groups and external supporters.
Increase of disaffected youth gatherings.
Establishment of organizations of unexplained origin and with unclear or nebulous aims.
Establishment of a new organization to replace an existing organizational structure with identical aims.
Appearance of many new members in existing organizations such as labor unions.
Infiltration of student organizations by known agitators.
Appearance of new organizations stressing grievances or interests of repressed or minority groups.
Reports of large donations to new or revamped organizations.
Reports of payment to locals for engaging in subversive of hostile activities.
Reports of the formation of opposition paramilitary or militia organizations.
Reports of lists of targets for planned opposition attacks.
Appearance of “professional” agitators in gatherings or demonstrations that result in violence.
Evidence of paid and armed demonstrators’ participation in riots.
Significant increase in thefts, armed robberies, and violent crime in rural areas; increase in bank robberies in urban areas.

Opposition-Directed Activities
Refusal of population to pay or unusual difficulty to collect rent, taxes, or loan payments.
Trends of demonstrated hostility toward government forces and/or mission force.
Unexplained population disappearance from or avoidance of certain areas.
Unexplained disappearance or dislocation of young people.
Reported incidents of attempted recruitment to join new movements or underground organizations.
Criminals and disaffected youth who appear to be acting with and for the opposition.
Reports of extortion and other coercion by opposition elements to obtain financial support from the population.
Use of fear tactics to coerce, control, or influence the local population.
Reports of host nation government and/or mission force facilities and personnel surveillance.
Activities Directed Against the Government/Mission Force
Failure of police and informer nets to report accurate information, which may indicate sources are actively supporting opposition elements or are intimidated.
Decreasing success of government law enforcement or military infiltration of opposition or disaffected organizations.
Assassination or disappearance of government sources.
Reports of attempts to bribe or blackmail government officials, law enforcement employees, or mission personnel.
Reports of attempts to obtain classified information from government officials, government offices, or mission personnel.
Classified information leaked to the media.
Sudden affluence of certain government and law enforcement personnel.
Recurring failure of government or mission force raids on suspected opposition organizations or illegal activities apparently due to forewarning.
Increased hostile or illegal activity against the government, its law enforcement and military organizations, foreigners, minority groups, and/or competing political, ethnic, linguistic, or religious groups.
Demonstrations against government forces, minority groups, or foreigners designed to instigate violent confrontations with government or mission forces.
Increased antigovernment or mission force rhetoric in local media.
Occurrence of strikes in critical areas intended to cast doubt on the government's ability to maintain order and provide for the people.
Unexplained loss, destruction, or forgery of government identification cards and passports.
Recurring unexplained disruption of public utilities.
Reports of terrorist acts or extortion attempts against local government leaders, businessmen, and/or businesswomen.
Murder or kidnapping of government, military, and law enforcement officials or mission force personnel.
Closing of schools.

PROPAGANDA INDICATORS

General Propaganda Activities
Dissident propaganda from unidentified sources.
Increase in the number of entertainers with a political message.
Increase of political themes in religious services.
Increase in appeals directed at intensifying general ethnic or religious unrest in countries where ethnic or religious competition exists.
Increase of agitation on issues for which there is no identified movement or organization.
Renewed activity by dissident or opposition organizations thought to be defunct or dormant.
Circulation of petitions advocating opposition or dissident demands.
Appearance of opposition slogans and pronouncements by word-of-mouth, graffiti, posters, leaflets, etc.
Propaganda linking local ethnic groups with those in neighboring countries or regions.
Clandestine radio broadcasts intended to appeal to those with special grievances or to underprivileged ethnic groups.
Use of bullhorns, truck-mounted loudspeakers, and other public address equipment in “spontaneous” demonstrations.
Presence of nonmedia photographers among demonstrators.
Rallies to honor “martyred” opposition personnel. Mass demonstrations honoring local dissident heroes or dates significant to the opposition.
Nationwide strikes called to demonstrate the strength of the opposition movement(s).
Propaganda Activities Directed Against the Established Government
Attempts to discredit or ridicule national or public officials.
Attempts to discredit the judicial and law enforcement system.
Characterization of government leaders as puppets and tools of foreign intervention forces.
Agitation against government projects and plans.
Radio propaganda from foreign countries that is aimed at the target country’s population and accuses the target country’s government of failure to meet the people’s needs.
Propaganda Activities Directed Against the Mission Force and Host Nation Military and Law Enforcement
Spreading accusations that the host nation military and police are corrupt and out of touch with the people.
Spreading accusations that mission force personnel will introduce customs or attitudes that are in opposition to local cultural or religious beliefs.
Character assassinations of mission, military, and law enforcement officials.
Demands to remove strong anti-opposition or anticrime military and law enforcement leaders from office.
Calls for the population to cease cooperating with the mission force and/or host nation military and law enforcement.
Deliberate incidents to provoke mission, military, or police reprisals during demonstrations or strikes.
Widespread hostile media coverage of even minor criminal violations or incidents involving mission force personnel.
Accusations of brutality or ineffectiveness or claims that mission or government forces initiated violence following confrontations.
Publication of photographs portraying repressive and violent acts by mission force or government forces.
Refusal of businessmen, businesswomen, and/or shop owners to conduct business with mission force personnel.

Propaganda Activities Directed Against the Education System
Appearance of questionable doctrine and teachings in the educational system.
Creation of ethnic, tribal, religious, or other interest group schools outside the government educational system, which propagate opposition themes and teachings.
Charges that the educational system is only training youth to do the government's bidding.
Student unrest manifested by new organizations, proclamations, demonstrations, and strikes against authority.

COMMODITIES INDICATORS

Food-Related Activities
Diversion of crops or meat from markets.
Unexplained shortages of food supplies when there are no reports of natural causes.
Increased reports of foodstuffs pilfering.
Sudden increase in food prices, possibly indicating an opposition-levied tax.
Unwillingness of farmers to transport food to population centers, indicating a fear of traveling highways.
Spot shortages of foodstuffs in regions or neighborhoods associated with a minority group or weaker competing interest group, while food supplies are generally plentiful in other areas. Conversely, sudden local shortages of foodstuffs in rural areas may indicate the existence of an armed opposition group operating in that region.
Sudden increase of meat in markets, possibly indicating slaughtered livestock because of a lack of fodder to sustain them.
Appearance of emergency relief supplies for sale in black markets, possibly indicating diversion from starving population.
Appearance of relief supplies for sale in normal markets in a country or region recently suffering from large-scale hunger, which may indicate the severity of the food crisis is diminishing.
Arms and Ammunition-Related Activities
Increased loss or theft of weapons from military and police forces.
Discovery of arms, ammunition, and explosives being clandestinely manufactured, transported, or cached.
Attacks on patrols resulting in the loss of weapons and ammunition.
Increased purchase of surplus military goods.
Sudden increase in prices for arms and ammunition on the open market.
Reports of large arms shipments destined for neighboring countries, but not intended for that government.
Reports of known arms traffickers establishing contacts with opposition elements.
Increase in armed robberies.
Reports of thefts or sudden shortages of chemicals, which could be used in the clandestine manufacture of explosives.
Reports of large open-market purchases of explosives-related chemicals without an identifiable industrial user.
Appearance of manufactured or smuggled arms from noncontiguous foreign countries.
Clothing-Related Activities
Unusual, systematic purchase or theft of clothing materials, which could be used for the manufacture of uniforms or footwear.
Unusual scarcity of clothing or material used in the manufacture of clothing or footwear.
Distribution of clothing to underprivileged or minority classes by organizations of recent or suspect origin.
Discovery of caches of uniforms and footwear or the materials which could be used to manufacture uniforms and footwear.
Increase of males in the streets wearing military style clothing or distinctive markings.

Medicine-Related Activities
Large-scale purchasing or theft of drugs and medicines or the herbs used to manufacture local remedies.
Scarcity of drugs and medical supplies on the open or black markets.
Diversion of medical aid donations.
Discovery of caches of medical supplies.
Communications-Related Activities
Increase in the purchase and use of radios.
Discovery of caches of communications equipment.
Unusual increase in amateur radio or cellular telephone communications traffic.

ENVIRONMENT-RELATED INDICATORS

Rural Activities
Evidence of increased foot traffic in the area.
Increased travel within and into remote or isolated areas.
Unexplained trails and cold campsites.
Establishment of new, unexplained agricultural areas, or recently cleared fields.
Unusual smoke, possibly indicating the presence of a campsite or a form of communication.
Concentration of dead foliage in an area, possibly indicating use of camouflage.
Presence of foot traps, spikes, boobytraps, or improvised mines along routes and trails.
Urban Activities
Apartments, houses, or buildings being rented, but not lived in as homes.
Slogans written on walls, bridges, and streets.
Defacement of government and mission force information signs.
Sabotage of electrical power network; pollution of urban area's water supply.
Terrorist acts against physical targets such as bridges, dams, airfields, or buildings.
Change of residence of suspected agitators or opposition leaders.
Discovery of message dead-drops.
Increased smuggling of currency, gold, gems, narcotics, medical supplies, and arms into urban centers.
Appearance of abnormal amounts of counterfeit currency.
Increase in bank robberies.
Work stoppages or slowdowns in essential industries.
Marked decline in product quality in essential industries.
Marked increase in equipment failures in essential industries.
Unexplained explosions in essential utilities and industries.
Establishment of roadblocks or barricades around neighborhoods associated with opposition elements.
Attempts to disrupt public transport through sabotage.
Malicious damage to industrial products or factory machinery.

APPENDIX D. BATTLE DAMAGE ASSESSMENT REPORT FORMAT

The periodic summary battle damage assessment (BDA) report on page D-2 is an example format that may be used by MEF major subordinate command intelligence personnel to provide consolidated Phase I BDA, physical damage assessment, to the intelligence battalion's production and analysis cell. The report is a compilation of BDA reporting from subordinate elements as well as BDA obtained at the MSC level during the designated time period. The theater intelligence tactics, techniques, and procedures or the joint task force commander establishes BDA reporting formats for the joint task force, theater, and national level.

Normally, the aviation combat element is responsible for providing BDA on any air tasking order-related missions, while the ground combat element focuses on their subordinate elements' engagement results, to include observed close air support effects.

The target intelligence and BDA team, production and analysis company, intelligence battalion, is responsible for—

- Consolidating, deconflicting, and refining BDA reports.
- Introducing additional information and intelligence obtained from other sources.
- Preparing the Phase I BDA, physical damage assessment, for the MEF commander.
- Preparing Phase II BDA, functional damage assessment, based on the consolidated reporting from subordinate, higher, and adjacent commands.
- Adjusting the MEF order of battle data bases to reflect combat losses.
- Developing the combat strength assessment for each unit.

BATTLE DAMAGE ASSESSMENT REPORT FORMAT EXAMPLE

SUBJECT: 6 HR BDA REPORT (SUBMIT TO INTELLIGENCE BATTALION'S TARGET INTELLIGENCE/ BDA TEAM, P&A CELL, AT SPECIFIED TIMES.)

REPORTING UNIT:

REPORTING PERIOD: (FROM/TO)

ENEMY UNIT OR FACILITY #1: (DOWN TO BDE NAME FOR MANEUVER, BN FOR FIRE SUPPORT, OR AS DIRECTED IN UNIT SOP OR OPORD. REPEAT THIS SECTION FOR EACH UNIT OR FACILITY.)

UIC OR BE#: DHGKNXXXXX

DAMAGED/DESTROYED:

	LOC	TYPE	#DEST	#DMGD/EXTENT
1. ARMOR:				
2. FIRE SUPPORT:				
3. TRUCKS:				
4. AIR DEFENSE:				
5. C2 SYSTEMS:				
6. MOB/CNTRMOB: (ENGINEERS ASSETS, BRIDGES, LINES OF COMMUNICATIONS, MINES, ETC.)				

7. CSS:

	LOC	WIA	KIA
8. PERSONNEL:			

REMARKS:

IF UNIT NAME IS UNKNOWN, INCLUDE TIME OF REPORT (TOR), UNDER HEADING "ENEMY UNIT: UNKNOWN". DO NOT SUMMARIZE; LIST EACH REPORT. FOR EXAMPLE:

ENEMY UNIT: UNKNOWN

UIC: UNKNOWN

DAMAGED/DESTROYED: LIST ALL UNKNOWN UNIT BDA REPORTS BY TIME

	TOR*	LOC	TYPE	#DEST	#DMGD/EXTENT
1. ARMOR:					
2. FIRE SUPPORT:					
3. TRUCKS:					
4. AIR DEFENSE:					
5. C2 SYSTEMS:					
6. MOB/CNTRMOB: (ENGINEERS ASSETS, BRIDGES, LINES OF COMMUNICATIONS, MINES, ETC.)					

7. CSS:

	TOR*	LOC	WIA	KIA	EPW
8. PERSONNEL:					

REMARKS: *TOR: TIME OF REPORT. (NOTE: REMARKS ARE A MEANS OF REPORTING INFORMATION THAT DOES NOT FIT INTO THE TABLES DESCRIBED ABOVE. SPELL IT OUT IN A REMARKS SECTION, FOR EACH UNIT IF NECESSARY OR IF YOUR ASSESSMENT GOES BEYOND NUMBER COUNTS.)

APPENDIX E. MAGTF INTELLIGENCE PRODUCTION PLAN FORMAT

Tab B (Intelligence Production Plan) to Appendix 16 (Intelligence Operations Plan) to Annex B (Intelligence) should explain how intelligence production elements under the command or supporting the MAGTF would be used to support this plan. Additionally, it provides basic guidance and direction to subordinate commanders and intelligence officers for the conduct of MAGTF intelligence production operations and the support of intelligence elements and personnel identified to fulfill the intelligence requirements (IRs) in support of this plan.

CLASSIFICATION

Copy no. __ of __ copies

TAB B TO APPENDIX 16 (INTELLIGENCE OPERATIONS PLAN) TO ANNEX B (INTELLIGENCE) TO OPERATION ORDER (Number) (Operation CODEWORD) (U)
INTELLIGENCE PRODUCTION PLAN (U)

(U) REFERENCES**:** (The annex B originator must ensure that all receiving units and executing units have cited references.)
(a) Unit standing operating procedures (SOP) for intelligence, counterintelligence, reconnaissance, and others as appropriate.
(b) Joint task force, naval task force, other components, theater and national intelligence plans, orders and tactics, techniques, and procedures; and multinational agreements pertinent to intelligence operations.
(c) Documents, products, and online intelligence data bases that provide intelligence required for planning.
(d) Appropriate Marine Corps, naval, joint, and other doctrine publications.
(e) Others as appropriate.

(U) Time Zone: Zulu

1. (U) Situation**.** (May refer to Appendix 11 [Intelligence Estimate] as appropriate.)

   a. (U) Definition of the Area of Operations and Area of Interest. (Describe the limits of the area of operations [AO] and area of interest [AOI]. Summarize pertinent

CLASSIFICATION

weather, terrain, and other area characteristics and conditions that may influence MAGTF production operations.)

b. (U) Enemy. (Refer to annex B and current intelligence estimates for threat capabilities, limitations, vulnerabilities, and order of battle pertinent to intelligence production operations.)

c. (U) Assigned MAGTF Organic and Supporting Production Assets. (Identify organic and supporting forces available to perform intelligence production and related functions.)

d. (U) Facts and Assumptions. (State facts and assumptions derived during the mission analysis step of the Marine Corps Planning Process.)

e. (U) MAGTF Intelligence Production Considerations. (List key production and intelligence or other considerations, which impact this operation plan [OPLAN] or contingency plan [CONPLAN].)

(1) (U) Current Priority Intelligence Requirements (PIRs), Unit Concept of Operations, Unit Main Effort's PIRs, and Other Commander's Guidance

(2) (U) Availability of Intelligence

(3) (U) Intelligence Production Support to and from Joint Task Force (JTF) and Other Component Headquarters

(4) (U) Subordinate Units' Production Capabilities and Needs. (Include necessary establishment and manning of forward production elements.)

2. (U) Mission. (State concisely the MAGTF intelligence production mission as it relates to the command's planned operation.)

3. (U) Execution

a. (U) Concept of Operations. (Reference the unit's intelligence SOP and the basic Appendix 16 to Annex B. Restate as appropriate the commander's intent and pertinent aspects of the unit's overall concept of operations as they relate to production operations. Outline the purpose and concept of MAGTF production operations and specified priorities. Summarize the means and agencies to be employed in planning and directing, collection, processing and exploiting, analyzing and producing, disseminating, and using intelligence during execution of the operation order [OPORD]. Address the integration of JTF, other components, theater, national, and allied forces' production operations.)

CLASSIFICATION

b. (U) Tasks for Production and Related Units and Organizations, Subordinate Units, and Task Force Commanders or Officers in Charge (OICs)

(1) (U) Orders to Subordinate, Attached, and Supporting Units. (Use separate numbered subparagraphs to list detailed instructions for each unit conducting production operations, including the originating headquarters, subordinate commands, and separate intelligence support units with critical support to production roles. Some or all of the below units and sections may be addressed here; specific major subordinate commands [MSCs] and other intelligence producers will be tasked according to the unit SOP and mission, enemy, terrain and weather, troops and support available, and time available [METT-T].)

(a) (U) Major Subordinate Commanders

(b) (U) Commanding Officer, Intelligence Battalion

1 (U) OIC, Support Cell

2 (U) OIC, Production and Analysis (P&A) Cell

a (U) Analysis Teams

b (U) Order of Battle Teams

c (U) Target Analysis and Battle Damage Assessment Teams

d (U) Intelligence Preparation of the Battlespace Teams

e (U) Platoon Commander, Imagery Intelligence Platoon

f (U) Platoon Commander, Topographic Platoon

g (U) Staff Noncommissioned OICs, Direct Support Teams

h (U) Weather Analysis Element (if assigned)

3 (U) OIC, Surveillance and Reconnaissance Cell

4 (U) Commanding Officer, Counterintelligence (CI)/Human Intelligence (HUMINT) Company

(c) (U) Commanding Officer, Radio Battalion

(d) (U) Commanding Officer, Force Reconnaissance Company

(e) (U) Commanding Officer, Marine Unmanned Aerial Vehicle Squadron (VMU)

CLASSIFICATION

(f) (U) Commanding Officer, Marine Tactical Electronic Warfare Squadron (VMAQ)

(g) (U) Commander, Marine Corps Imagery Support Unit (if tasked to provide support to the MAGTF)

(h) (U) Others (as appropriate)

(2) (U) Requests to Higher, Adjacent, and Cooperating Units. Provide separate numbered subparagraphs pertaining to each unit not organic, attached, or supporting from which production support is requested, including other components, JTF headquarters, allied or coalition forces, as well as theater and national operational and intelligence elements.

c. (U) Coordinating Instructions. (Reference Appendix 16, and command and other pertinent forces and organizations intelligence SOPs. Detail here or in supporting enclosures, key changes to SOPs. Include or emphasize additional topics [e.g., requesting production support; intelligence production requirement [IPR] numbering and other management issues; direct liaison among subordinate commanders and production elements' leaders, staff officers, and pertinent external organizations and agencies; routine and time-sensitive reporting procedures and formats; releasability to non-U.S. military organizations; security guidance].)

4. (U) Administration and Logistics

a. (U) Logistics. Reference Annex D (Logistics). (Identify production-unique logistic requirements and concerns [e.g., unique combat service support requirements, procedures, and other guidance to support MAGTF production units and operations; or procedures for specialized technical logistic support necessary from external organizations].)

b. (U) Personnel. (Identify unique production personnel requirements and concerns [e.g., critical personnel shortages, global sourcing requirements, security clearance issues, contractor support].)

5. (U) Command and Control

a. (U) Command Relationships. Reference Annex J (Command Relationships). (Provide necessary instructions regarding MAGTF command relationships that will influence production operations.)

CLASSIFICATION

b. (U) Information Management. Reference Annex U (Information Management), Annex C (Operations), Appendix 16, and Tab C (Intelligence Dissemination Plan) to Appendix 16. (Provide any instructions necessary regarding information management [e.g., time-sensitive and routine reporting criteria, intelligence data base administration and authorities, periodic production status reporting from production elements, reports formats and changes] that will influence MAGTF production operations.

c. (U) Communications and Information Systems. Reference Appendix 16 and Annex K (Communications and Information Systems). (Provide any instructions necessary regarding communications and information systems [CIS] that will influence MAGTF production operations and its effective integration with MAGTF collection and dissemination operations.

d. (U) Intelligence Command and Control Nodes and Facilities. Reference the unit's intelligence SOP and Appendix 16. Provide necessary guidance and instructions regarding the establishment, relationships, and operations of MAGTF intelligence production nodes and facilities (e.g., P&A cell, the radio battalion operations control and analysis center, CI/HUMINT company command post).

INTELLIGENCE PRODUCTION MATRIX
INSTRUCTIONS AND FORMAT

The intelligence production matrix is a tool used by MAGTF intelligence officers, the intelligence support coordinator (ISC), and production leaders to effectively plan, direct, and manage intelligence production operations. Making the matrix accessible to subordinate units' intelligence officers and intelligence producers will improve overall collaborative intelligence planning and execution.

The sample below is one format for the intelligence production matrix. The unit specifies the particular format for a given operation. The complexity of the operation and other METT-T factors will determine which format is used.

PIR, IR, or IPR Number	Date Requested	Production Requirement	Event/ Operation/ Exercise	Requesting Unit/POC	Tasked Unit(s)	Tasked Unit(s) POC	Due Date or DTG	First Review Date or DTG	First Review Remarks	Second Review Date or DTG	Second Review Remarks

Third Review Date or DTG	Third Review Remarks	Status	Feedback	Estimated Man-Hours	Actual Man-Hours*	Estimated Cost*	Actual Cost*	Quality and Distribution	Distribution Follow-ups & New IRs/ IPRs	Additional Remarks
*Garrison use only										

PERIODIC INTELLIGENCE PRODUCTION STATUS REPORT INSTRUCTIONS AND FORMAT

The periodic intelligence production status report is used by designated MAGTF units with all-source or other significant intelligence production capabilities to keep commanders, intelligence officers and sections, and other staff elements apprised of the status of current and future intelligence production operations. For the effective management of unit production activities, intelligence officers or their production leaders may require that this report be used by designated production elements under their staff cognizance to report their production status.

The example report on page E-8 is only one format (refer to the unit's SOP for specific format and direction). Normally, variations of the SOP format will be established for text, voice, and record message traffic purposes. Changes for a particular operation will be clearly identified in Annex B.

The unit SOP or Annex B also establishes the timeframe covered by each report and identifies routine and nonroutine recipients. The report may be disseminated by various methods. Interim reports, when required, generally will be disseminated via either briefings or via the tactical data network (TDN). Principal dissemination methods for the production status report include—

- Intelligence section's homepage on the MAGTF SECRET-TDN (S-TDN), with necessary sensitive compartmented information (SCI) production status posted on the SCI-TDN intelligence section homepage.
- Stand-alone record message.
- Production data bases accessible via the S-TDN or SCI-TDN (or SECRET Internet Protocol Router Network [SIPRNET] and Joint Worldwide Intelligence Communications System [JWICS] for external commands).
- Separate paragraph within the daily intelligence summary.

CLASSIFICATION

b. (U) PIR/IR MEF 002-99

PIR/IR #	Intelligence Product	Requester; Other Recipients	Date Received	Latest Time Information of Value
MEF 002-99; Division 002-99, MAW 003-99, and FSSG 002-99 relate	OPLAN Support	III MEF G-2/3/5; copies to MSCs	031645Z NOV 99	230700Z NOV 99

(1) (U) Task Production Element(s). MEF lead P&A cell developing, in coordination with JFT joint intelligence support element (JISE) and the joint force land component commander intelligence section.

(2) (U) Remarks. Production in support of contingency planning. (Provide template locations and dispositions of estimated enemy command and control [C2] headquarters, maneuver, and logistic elements down to the brigade and regiment level, and fires elements down to battalion level, in support of the five locations specified to support MEF course of action development.) Product is currently in work. Current intelligence is available on the MEF G-2 SCI-TDN homepage. Spreadsheet will be forwarded to staff sections and MSCs upon completion.

c. (U) MEF 003-99

PIR/IR #	Intelligence Product	Requester; Other Recipients	Date Received	Latest Time Information of Value
MEF 003-99	expeditionary support product (phase 1)	Originator, III MEF G-2/3/4/5/6; copies to Division, FSSG, MAW	062207Z NOV 99	240700Z NOV 99

(1) (U) Task Production Element(s). P&A cell; imagery intelligence platoon (IIP), topographic platoon, and MCISU assist as directed.

(2) (U) Remarks. Expeditionary support product in support of phase 1 scheme of maneuver and course of action analysis. Product is 75 percent complete. Completed helicopter landing zone study, which is posted on MEF G-2 S-TDN homepage. Targets within G-2 designated priority areas are 95 percent scanned.

CLASSIFICATION

d. (U) PIR/IR Division 005-00

PIR/IR #	Intelligence Product	Requester; Other Recipients	Date Received	Latest Time Information of Value
Division 005-99	map update and reproduction	Division; copy to FSSG	080423Z NOV 99	Initial 10, 140100Z NOV 99; remainder, 270001Z NOV 99

(1) (U) Task Production Element(s). Topographic platoon lead; IIP assist as required.

(2) (U) Remarks. Production in support of division planning and C2. Integrating current geographic intelligence (GEOINT) products with current external imagery in order to update 1993 edition maps. Initial distribution requirement made; remainder 85 percent complete. Anticipate full IR satisfaction by 230001Z NOV 99.

e. (U) PIR/IR MAW 003-99

PIR/IR #	Intelligence Product	Requester; Other Recipients	Date Received	Latest Time Information of Value
MAW 003-99	CIB graphics	1st MAW G-2; Division, MEF G-5 and FFC	101457Z NOV 99	011000Z DEC 99

(1) (U) Task Production Element(s). IIP assisted by P&A cell, red team, and force fires cell (FFC) future operations personnel as required.

(2) (U) Remarks. Production to support MAW target development and planning. Produce kill boxes using controlled image base (CIB) imagery. Product will be a 5-meter CIB overview of indicated areas, including a graphic reference grid with kill boxes annotated. Product is 80 percent completed.

f. (U) PIR/IR Division 007-99

PIR/IR #	Intelligence Product	Requester; Other Recipients	Date Received	Latest Time Information of Value
Division 007-99; FSSG 004-99	LOC study	Division G-2; III MEF G2, FSSG	120937Z NOV 99	140200Z DEC 99

CLASSIFICATION

(1) (U) Task Production Element. Topographic platoon assisted by IIP and P&A cell.

(2) (U) Remarks. Production in support of wargaming and planning. Produce a detailed lines of communications (LOC) intelligence study. Product must maintain a classification level of unclassified. The bridge portion of this product can only be completed 45 percent due to lack of data sets and imagery.

g. (U) PIR/IR MEF 010-99

PIR/IR #	Intelligence Product	Requester; Other Recipients	Date Received	Latest Time Information of Value
MEF 010-99; Division 009-99	target area/objective studies	MEF G-3 and FFC; Division and MAW	072103Z DEC 99	100400Z DEC 99

(1) (U) Task Production Element(s). P&A cell; IIP and topographic platoon support as required.

(2) (U) Remarks. Production of imagery products and supporting all-source intelligence reports for six specified areas within the division's area of operations. Production is completed; final dissemination ongoing and will be completed by 191000Z Nov 99. Follow-up conference call between MEF G-3/G-2 (P&A cell lead), division G-3/G-2 and MAW G-3/G-2 to verify fully satisfied IR and new IRs scheduled for 191600Z Nov 99.

h. (U) PIR/IR FSSG 016-99

PIR/IR #	Intelligence Product	Requester; Other Recipients	Date Received	Latest Time Information of Value
FSSG 016-99	elevation/slope tint	FSSG; Division	130303Z NOV 99	050600Z DEC 99

(1) (U) Task Production Element. Topographic platoon.

CLASSIFICATION

(2) (U) Remarks. Production in support of FSSG site locations assessments and rear area security planning. Produce elevation and slope tint at 1:50,000 scale for defined areas. Slope tint will be provided in place of comprehensive cross-country movement study for two areas because there is no terrain data; possible new information from yesterday's JTF imagery collection missions. Product is 80 percent complete.

i. (U) PIR/IR MEF 012-99

PIR/IR #	Intelligence Product	Requester; Other Recipients	Date Received	Latest Time Information of Value
MEF 012-99	enemy C2 and CIS template	MEF G-5/G-3; MAW and Division	071457Z DEC 99	140100Z DEC 99

(1) (U) Task Production Element(s). Radio battalion operations control and analysis center; P&A cell, MAW G-2, and VMAQ tactical electronic reconnaissance processing and evaluation system assist as required.

(2) (U) Remarks. Production in support of MEF C2 warfare and targeting planning. Provide template locations and dispositions of estimated enemy C2 headquarters, maneuver, and logistic elements down to the brigade and regiment level, and fires elements down to battalion level, with estimated key CIS emitters in support of the five locations specified to support MEF COA development and wargaming. IR modified 071800Z DEC 99 to incorporate specified enemy radars and other noncommunications emitters to support MAW suppression of enemy air defenses planning. Product is 75 percent complete. Final product dissemination will be restricted to U.S. and designated multinational intelligence and operations elements.

2. (U) Production Problems. (Identify and describe significant production problems [e.g., anticipated delays meeting the latest times information of value for validated PIRs and higher priority IRs; CIS difficulties; releasability issues].)

CLASSIFICATION

3. (U) Production Detachments. (In initial report, identify intelligence detachments in support of MAGTF subordinate units that have a production capability. In subsequent reports, identify detachment name and annotate "NO CHANGE," if applicable, and new detachments deployed since the last status report. Other supporting information will be according to unit SOP and may include: period of support; detachment's intelligence support purpose; personnel and military occupational specialty information; anticipated near-term detachments support.)

Who	Dates/Period	Supported Unit	Purpose
Intelligence Battalion 1-99 (P&A cell)	01 Nov 00–(to be determined)	JTF J-2/ JISE	one 0202, two 0231s, and one 0241 for liaison and targeting support
Intelligence Battalion 2-99 (P&A Company, Direct Support Team #1)	10 Nov 99–(to be determined)	Division G-2	MEF main effort support
Intelligence Battalion 3-99 (P&A Company, Direct Support Team #2)	15 Nov 00–(to be determined)	FSSG G-2	rear area security support
Intelligence Battalion 4-99 (HUMINT Support Team #1)	19 Nov 99–(to be determined)	Division G-2	CI force protection support
Intelligence Battalion 5-99 (HUMINT Support Team #2)	22 Nov 99–(to be determined)	FSSG G-2	CI force protection support
Intelligence Battalion 6-99 (HUMINT Support Team #3)	22 Nov 99–(to be determined)	MAW G-2	CI force protection support
Intelligence Battalion 7-99 (Topographic Platoon, Geographic Intelligence Support Team #1)	19 Nov 99–(to be determined)	Division G-2	GEOINT support
Intelligence Battalion 8-99 (Topographic Platoon, Geographic Intelligence Support Team #2)	1 Dec 99–(to be determined)	FSSG G-2	GEOINT support
Radio Company Command Element (Signals Support Unit lead echelon element)	1 Dec 99–(to be determined)	Division G-2	Signals Intelligence support
Intelligence Battalion 9-99 (Topographic Platoon, Geographic Intelligence Support Team #3)	5 Dec 99–(to be determined)	MAW G-2	GEOINT support

CLASSIFICATION

4. (U) Miscellaneous. (Detail other information pertinent to ongoing collaborative intelligence production planning, direction, and operations. This may include items such as anticipated CIS problems, intelligence data base changes, nonscheduled cells or other intelligence briefings, critical intelligence collection and production issues, key external intelligence production items, security, and dissemination issues.)

APPENDIX F. INTELLIGENCE SUMMARY FORMAT

The intelligence summary (INTSUM) provides a synopsis of the reporting unit's intelligence situation covering a specified period of time. It is used to report threat activities, changes to threat capabilities, and results of further collections, analysis, and production to higher, adjacent, and subordinate forces. The INTSUM updates the current intelligence estimate and provides a continual intelligence assessment of threat actions and estimated capabilities and courses of action.

The theater intelligence directorate (J-2) provides guidance on INTSUM reporting periods and submission deadlines. Theater tactics, techniques, and procedures (TTP) and the specific operations plan or operation order (OPORD) designate INTSUM reporting requirements for subordinate joint task forces (JTFs) or Service and functional components. Based on those requirements, MAGTF intelligence officers (G-2/S-2) establish INTSUM reporting requirements for their major subordinate commands (MSCs) or elements; at the MEF CE level, the intelligence support coordinator establishes reporting requirements.

Established deadlines allow the intelligence battalion's production and analysis cell sufficient time to incorporate subordinate INTSUMs into intelligence products. The MAGTF MSCs and elements' G-2/S-2s determine INTSUM requirements for their headquarters and subordinate elements. The MEF TTP and standing operating procedures (SOP), which reflect anticipated theaters of operations TTP, should establish standard INTSUM reporting requirements.

Although any unit can produce INTSUMs, normally they are generated by major subordinate or higher level commands. An abbreviated INTSUM format focused on significant threat actions and anticipated future actions may be more appropriate for lower tactical echelons.

Higher command levels, particularly JTFs and unified commands, usually publish a daily intelligence summary (DISUM) every 24 hours. While INTSUMs generally provide a fine-grained tactical perspective, the DISUM encompasses more aspects of a threat country's elements of national power and focuses on operational-level intelligence analysis and estimates. Generally, MAGTF command elements tasked as JTF headquarters are required to submit DISUMs to the combatant command's commander in chief. The combatant command's TTP provides for the DISUM format, which may vary from theater to theater.

Generally based on the intelligence estimate format, the INTSUM should be tailored and focused on the mission, type of unit, and information and intelligence needs of the commander. Formats for INTSUMs can be in written or graphic and text formats.

WRITTEN INTELLIGENCE SUMMARY FORMAT

The sample below provides a written INTSUM format that may be posted on a website. This format is representative of an INTSUM format used at the MAGTF or MSC level for conventional military operations. Generally, this format is modified to meet the unique needs of military operations other than war (MOOTW).

Note: Paragraphs not applicable to the reporting unit are annotated "NA" or the paragraph may be skipped (paragraph numbering should remain the same). If no significant information or intelligence is available for a particular paragraph, the notation "NSTR" (nothing significant to report) may be used. The annotation "( )" reflects classification of that information line.

CLASSIFICATION/RELEASABILTY
INTSUM #: (Sequentially numbered such, as "DD-001-97")
DTG: DDHHMM (time zone) (month) YY
INFO cutoff DTG
PERIOD: DDHHMM TO DDHHMM (month) YY

I. (U) Highlights:

A. (U) Ground: Highlights of the current ground situation, usually divided by area or sector.

B. (U) Air: Highlights of the current air situation.

II. (U) Summary of Enemy Situation: (Each category should use the commander's related priority intelligence requirements [PIRs] as the basis for the analysis and assessment. For MOOTW operations, separate paragraphs for each category of threat or significant power group may be created to supplement or replace the below categories.)

A. (U) Ground: Detailed analysis of the battlefield by area or sector with comments on projected activity in the next 12 hours.

B. (U) Air: Detailed analysis of the air and air defense situation with comments on projected activity in the next 12 hours.

C. (U) Naval: Detailed analysis of the naval situation with comments on projected activity in the next 12 hours.

D. (U) Surface-to-Surface Missile and Weapons of Mass Destruction: Detailed analysis of the surface-to-surface missile and weapons of mass destruction situation with comments on projected activity in the next 12 hours.

E. (U) Special Operations Forces: Detailed analysis of the special operations forces, force protection, and rear area security situation with comments on projected activity in the next 12 hours.

F. (U) Other: May be used for detailed analysis of paramilitary, insurgent, terrorist, or other significant threat categories not discussed elsewhere.

III. (U) MEF or MSC Assessment:

A. (U) Most Likely Course of Action:

B. (U) Most Dangerous Course of Action:

C. (U) Others: (as necessary)

IV. (U) Enemy Movement During the Reporting Period: Major enemy units (to include at least two levels below that of the reporting command) and universal transverse mercator [UTM] coordinates of the new position.

V. (U) PIRs: The commander's PIRs and current satisfaction level (i.e., partially satisfied, satisfied, not satisfied) assessment for each requirement.

VI. (U) Intelligence Plans, Missions, and Systems Status: Key intelligence collection, production, and dissemination plan updates; information on planned intelligence and reconnaissance missions; and intelligence systems status (generally only those systems that are less than fully operational). (The unit SOP or annex B to the OPORD prescribes the period covered by this paragraph.)

GRAPHIC INTELLIGENCE SUMMARY INSTRUCTIONS

In an effort to enhance the understanding of the INTSUM and to save dissemination time, the INTSUM is graphically portrayed as a single or set of map overlays. Intelligence summaries can be posted in graphic and text formats on web-based automated information systems, which provides MAGTF intelligence users with access to the web site the option of pulling intelligence and products.

There are limitations to electronically generated graphic INTSUMs. Graphics can require large bandwidth and processing power to be pulled over a web-based system, with possible degradation of the overall MAGTF tactical data network. Lower-level tactical units and allied nation forces may not possess the means to access and use the information, which generally requires graphic and text INTSUMs to be disseminated using other electronic transmission methods and hard copy delivery.

Graphic INTSUMs must convey essential intelligence and other information in a clear, concise, and easy to understand visual format. Because of the volume of detail to be presented, most graphic INTSUMs, particularly at higher commands, have evolved into digital slide shows. The unit SOP or Annex B to the OPORD establishes graphic INTSUM formats, which are tailored to the level of command, type of operation, and the commander's intelligence requirements. Generally graphic INTSUMs contain the same elements. The following are examples of common graphic INTSUM elements:

- Weather Graphics—Composite graphics, based on satellite imaging, showing area weather fronts, cloud coverage, high and low pressure areas, etc. May include forecast graphics for specified future periods.
- 5-Day Forecast—Similar to television weather forecasts, showing forecast weather conditions (e.g., cloudy, partly cloudy, rainy), high and low temperatures, winds, normal temperatures based on climatology, and any other elements that may be of interest to the commander; should also include light data for the same period.
- Weather Impacts Graphics—Normally presented in green, yellow, and red colored chart format; should include those forces, types of operations, or critical items of equipment that are essential to friendly and enemy unit mission performance.
- PIRs—Current and new PIRs, and may include a satisfaction level (i.e., not answered, partially answered, answered) assessment for each requirement.
- Activities and Assessments—Consists of a graphical situation map denoting locations of threat forces of interest and, if possible, graphically indicating status or combat effectiveness using color coding or other symbology. Depending on the level of command and information needs, separate graphics for categories of threat forces (i.e., ground, air, air defense) may be created to increase clarity. Each graphic should—
  - Note significant threat activity over the reporting period with text comment boxes tied to locations or an event numbering system with marginal text comments.
  - Provide an assessment based on the commander's PIRs.
  - Use supporting graphics to examine items in detail, such as aircraft sortie analysis or the location and status of a particular category of force or equipment (e.g., heavy equipment transporter systems, specialized units).

- Collection, Production, and Dissemination Plans and Status of Planned Missions and Tasks—Graphically presents locations of organic collection assets (e.g., reconnaissance teams, radio battalion assets, unmanned aerial vehicle tracks, sensor strings) and/or provides a time line showing daily projected availability windows and mission tracks (as applicable) of nonorganic supporting assets (e.g., Airborne Warning and Control System, RC-135, U2); also identifies changes to previous production and dissemination plans and any new plans.
- Outlook or Assessment—Provides an overall assessment of estimated threat courses of action (at a minimum, the threat's most likely and most dangerous courses of action). The assessment may be broken into estimate time periods, such as 24-48 hours, 48-96 hours, or whatever periods of time are applicable to the commands requirements to plan future actions. Courses of action should be graphically portrayed. In prehostilities or MOOTW, these graphics may be used to address anticipated political or societal actions or events that may impact the force.

APPENDIX G. INTELLIGENCE REPORT FORMAT

An intelligence report (INTREP) is a standardized report that is used to disseminate important intelligence without regard to a specific schedule. The first intelligence element acquiring the information prepares and disseminates the INTREP as rapidly as possible to units requiring the information. Generally, each report will concern only a single item.

An INTREP is generally required whenever an event occurs that is likely to result in a change in the friendly plan or when a change to the current or future analytical assessment is made. The intelligence element generally initiates an INTREP when facts influencing threat capabilities have been observed or when a change in threat capabilities has taken place. The commander's priority intelligence requirements serve as the basis for determining what information warrants an INTREP.

Whenever possible, the INTREP should include the originator's significant intelligence assessment as well as a source reliability and accuracy evaluation. The format below is a sample INTREP that would be posted on a web site or forwarded via SECRET internet protocol router network (SIPRNET) or MAGTF tactical data network (TDN) electronic mail.

CLASSIFICATION/RELEASABILITY

INTREP#: DD-001-97 (Sequentially numbered by originating unit)

DTG: DDHHMM(Time Zone) (Month) YY

I. ( ) Significant Event(s): Summarize the significant event(s) or developments that initiated the INTREP. Answer either the 5Ws (i.e., who, what, where, when, and why) or the SALUTE (i.e., size, activity, location, unit, time, equipment) formats.

II. ( ) Assessment: Describe the effect of the current activity on threat capabilities or courses of action.

III.( ) Evaluation of Source: State the original information source and evaluate the accuracy and reliability of that source.

Note: ( ) Reflects classification of that information line.

APPENDIX H. INTELLIGENCE INFORMATION BRIEF

The intent of the intelligence information brief is to enhance situational awareness and impart understanding. Intelligence information briefings may be as simple as a quick verbal update to a commander in front of a situation map or as complex as a Marine expeditionary force or joint task force level daily update to the commanding general and staff. At lower tactical levels, briefings are generally less formal and often short-notice. Higher commands generally employ regularly scheduled daily update briefings, which include intelligence. Regardless of the degree of formality or the level of command, a standard briefing format or outline can help intelligence personnel to rapidly and effectively organize for the brief.

To develop and deliver an effective intelligence information brief, intelligence personnel should—

- Know the audience. Is the audience the commander, the staff, or subordinate commanders? Who is the focus of the brief? What is audience's level of knowledge concerning the subject? Does the commander have any briefing preferences?
- Know the purpose and intent of the briefing. Is the brief a critical events update, or is it intended to describe in detail the threat and area of operations prior to crisis action planning?
- Concentrate on essential information and intelligence; prepare to provide details or expand intelligence should questions arise.
- Use clear, concise, readable graphics; ensure graphics can be seen from the rear of the room.
- Know the information; anticipate questions on unfamiliar subjects and arrange to have a subject matter expert present or take questions for follow-up research; never make up an answer.
- Distinguish between known facts and gaps or estimates.

The most common type of intelligence information briefing is the boardwalk. The boardwalk is an informal, on-demand brief conducted using the combat operations center map boards or screen displays from automated systems. Generally, the brief only presents significant changes to threat capabilities or courses of action. This brief also provides the commander an opportunity to ask direct questions.

At higher command echelons, the most common type of intelligence information brief is the commander's morning or evening update brief. Usually more formal and detailed, these briefs are scheduled for set times either once or twice per day. The planning, decision execution, and assessment cycle or unit standing operating procedure determines the schedule. In addition to briefing the current situation and significant events, this brief may address the commander's priority intelligence requirements (PIRs); collection, production, dissemination plans and status; weather; and estimates of future threat actions. Often briefings are presented using graphics software.

By focusing on intelligence and events that correspond to the commander's PIRs, the briefer can quickly organize information and intelligence as well as ensure that the commander is given the most essential information in the shortest amount of time. The brief is also used to present significant occurrences affecting current or future plans.

The following are examples of update briefing elements:

- Weather Forecast.
- Weather Effects Assessment.
- PIRs and Intelligence Requirements (IRs).
- Situation (e.g., ground, air, air defense) Keyed to PIRs.

- Collection, Production, and Dissemination Plan Status.
- Intelligence Estimate (at a minimum, the most likely and most dangerous enemy courses of action).

These elements closely follow the elements of the web-based intelligence summary (INTSUM) graphic. See appendix F. Because the INTSUM and the update provide the same intelligence and other information, using the same format and graphics can save time and resources. To save more time, elements that have not changed since the last briefing can be briefed as "no change." However, the weather forecast, PIRs, plans status, and intelligence estimate should always be briefed.

APPENDIX I. PRODUCTION REQUIREMENT AND REQUEST FOR INTELLIGENCE FORMAT

An intelligence production requirement (IPR), production requirement (PR), or request for intelligence (RFI) begins as an intelligence requirement (IR) levied on a unit's intelligence section. If the unit cannot satisfy the requirement with the available resources, the requirement must be forwarded up the chain of command for satisfaction. The requirement then becomes either an intelligence collection requirement (ICR), an RFI, or an IPR. Single or multiple requests for information may be combined into one PR.

A requirement must contain the following four basic elements:

- Who—Organization and specific office or individual that submitted the original requirement.
- What—Statement describing the intelligence required.
- When—Latest time information of value.
- How—Requested product format (e.g., hard copy, soft copy, verbal report), quantities, all receiving units.

Most theater tactics, techniques, and procedures (TTP) combine the three forms of requirements into one basic PR or RFI format. The joint task force headquarters intelligence directorate or combatant command joint intelligence center receiving the requirement determines whether collection or product development is necessary.

Defense Intelligence Agency also has an established basic PR or RFI format. This format is used in the Community On-Line Intelligence System for End Users and Managers (COLISEUM), which has become the standard medium for requirements submission throughout the Department of Defense intelligence production community. The following COLISEUM format is from Defense Intelligence Management Document (DIMD) 0000-151C-95, *Department of Defense Intelligence Production Program (DODIPP): Production Procedures.* Although theater TTP formats generally follow the same elements, they are modified according to the specific theater needs. Marine air-ground task forces and Marine Corps forces headquarters must follow the procedures established in their theater of operation.

Item 1. PR Number—A 12-space number with 10 alphanumeric characters and 2 separation dashes (e.g., C610-94-0001). The unit intelligence section requesting the information or production enters this number, which is unique to the unit. The first four characters are the customer's statement of intelligence interest (SII) account number or in a crisis, the customer's unit identification code (UIC). The second two numbers are the fiscal year. The last four numbers are the customer's sequence number for PRs or RFIs submitted in the fiscal year.

Item 2. Subject—A short descriptive, unclassified (if possible) title. Clarity is more important than keeping the subject unclassified.

Item 3. Customer's Organization—This line should include the end user's name, organization, mailing address, electronic-mail address (clearly identify Joint Worldwide Intelligence Communications Systems [JWICS] or Secret internet protocol router network [SIPRNET]), naval message address, and if possible, the customer's commercial and DSN phone numbers.

Item 4. Date of Request—Entered by the supporting intelligence office in YYMMDD format.

Item 5. Date Product Required—The latest date the product or information will be of value to the customer. Also referred to as latest time information of value (LTIOV).

Item 6. Form and Frequency of Response—This item is key to getting the desired response to the requirement. Sub items should be narrative with an emphasis on clarity:

- **Media—**Identify the preferred product form and second and third alternatives. Examples are message, floppy disk, CD-ROM, on-line data base, data base printout, bound hard copy report, study, or handbook. In addition to the media requested, the production element often disseminates intelligence and pertinent information in other media to increase access to a wider number of potential users.
- **Frequency**—Specify request for scheduled, non-crisis-related production as one-time, as required, or recurring. Crisis or immediate production requests are normally handled as one-time requests unless otherwise specified.
- **Revision or New Product**—Specify the existing product requiring update as completely as possible, or specify as a new PR.
- **Classification and Releasability**—Provide the desired classification and the highest classification that can be used by the customer. If the product needs to be releasable to foreign forces, specify which forces, if known, and justify the release.

Item 7. Statement of Requirement—The first paragraph should provide a summary of the requirement in 50 words or less. If the requirement supports an operation plan or contingency plan, the first sentence should identify which plan. Subsequent paragraphs should provide greater detail, specific intelligence and information elements, and a justification. The justification should specify what intelligence and other information sources have been consulted and why they were not sufficient to answer the requirement. If the requirement addresses separate questions, or multiple countries or topics, they must be prioritized. If all requests carry the same priority, list them by time urgency.

Item 8. Comments—Additional comments as necessary.

Item 9. Security Classification—The highest classification of the question and information contained in the requirement. The lower the classification, the easier it will be to process and use; however, clarity should not be sacrificed for lower classification. Codeword or special access program requirements will be submitted through appropriate channels and may require additional time to transmit and process.

APPENDIX J. GLOSSARY

SECTION I. ACRONYMS AND ABBREVIATIONS

AA . . . . . avenue of approach
ACE . . . . . aviation combat element
AC/S . . . . . assistant chief of staff
ADA . . . . . air defense artillery
AFP . . . . . all-source fusion platoon
AI . . . . . air interdiction
AIntP . . . . . allied intelligence publication
AO . . . . . area of operations
AOA . . . . . amphibious objective area
AOI . . . . . area of interest
ATARS . . . . . advanced tactical airborne reconnaissance system
ATF . . . . . amphibious task force
ATO . . . . . air tasking order
AWACS . . . . . Airborne Warning and Control System

BDA . . . . . battle damage assessment
BDE . . . . . brigade
BE . . . . . basic encyclopedia
BP . . . . . battle position

C2 . . . . . command and control
C2W . . . . . command and control warfare
CA . . . . . combat assessment
CAS . . . . . close air support
CATF . . . . . commander, amphibious task force
CATK . . . . . counterattack
CCIR . . . . . commander's critical information requirements
CD-ROM . . . . compact disc read only memory
CE . . . . . command element
CG . . . . . commanding general
CHATS . . . . . CI/HUMINT automated tool set
CI . . . . . counterintelligence
CIA . . . . . Central Intelligence Agency
CIB . . . . . controlled image base
CIC . . . . . combat intelligence center
CINC . . . . . commander in chief
CIS . . . . . communications and information systems
CNTRMOB . . . . . countermobility
COA . . . . . course of action
COC . . . . . combat operations center
COG . . . . . center of gravity
COLISEUM . . . . . Community On-Line Intelligence System for End Users and Managers
CONPLAN . . . . . contingency plan
COO . . . . . combined obstacle overlay
CP . . . . . command post
CPX . . . . . command post exercise
CSS . . . . . combat service support

D3A . . . . . decide, detect, deliver, assess
DDHHMM . . . . . day, hour, minute
DEST . . . . . destination
DIA . . . . . Defense Intelligence Agency
DIMD . . . . . defense intelligence management document
DISUM . . . . . daily intelligence summary
DMGD . . . . . damaged
DMS . . . . . Defense Message System
DOD . . . . . Department of Defense
DODIPP . . . . . Department of Defense Intelligence Production Program
DON . . . . . Department of the Navy
DP . . . . . decision point
DPM . . . . . Dissemination Program Manager
DSN . . . . . Defense Switched Network
DST . . . . . decision support template
DTG . . . . . date-time group
DZ . . . . . drop zone

EA . . . . . electronic attack
e.g. . . . . for example
EPW . . . . . enemy prisoner of war

FARP . . . . . forward arming and refueling point
FDA . . . . . functional damage assessment
FFC . . . . . force fires cell
FFIR . . . . . friendly force information requirements
FLIR . . . . . forward-looking infrared
FM . . . . . field manual (Army)
FMFRP . . . . . Fleet Marine Force reference publication
FSSG . . . . . force service support group

G-1 . . . . . manpower or personnel staff officer/organization

G-2 . . . . . intelligence staff officer/organization
G-3 . . . . . operations staff officer/organization
G-4 . . . . . logistics staff officer/organization
G-5 . . . . . plans officer/organization
GCE . . . . . ground combat element
GENSER. . . . . general service
GEOINT . . . . . geographic intelligence

HF . . . . . high frequency
HLZ. . . . . helicopter landing zone
HN. . . . . host nation
HPT. . . . . .high-payoff target
HPTL . . . . . .high-payoff target list
HQ. . . . . .headquarters
HUMINT . . . . . .human intelligence
HVT . . . . . high-value target

i.e. . . . . that is
I&W . . . . . .indications and warning
IAS . . . . . .intelligence analysis system
ICR . . . . . intelligence collection requirement
IDR . . . . intelligence dissemination requirement
IIP . . . . . imagery intelligence platoon
IMINT. . . . . .imagery intelligence
IMO. . . . . .imagery and mapping officer
intel bn . . . . . intelligence battalion
INTELINK . . . . . intelligence link
INTELINK-S . . . . . intelligence link-SECRET
INTREP . . . . . intelligence report
INTSUM. . . . . .intelligence summary
IOC . . . . . intelligence operations center
IPB . . . . . .intelligence preparation of the battlespace
IPR . . . . . intelligence production requirement
IR . . . . . .intelligence requirement
ISC . . . . . intelligence support coordinator
ISM . . . . . .intelligence synchronization matrix
ISS. . . . . .intelligence synchronization sheet

J-2 . . . . . .intelligence directorate
JAC . . . . . joint analysis center
JCS . . . . . .Joint Chiefs of Staff
JDISS . . . . . Joint Deployable Intelligence Support System
JDS . . . . . .Joint Dissemination System
JFC . . . . . .joint force commander
JFIC. . . . . .Joint Forces Intelligence Command
JIC . . . . . joint intelligence center
JISE. . . . . joint intelligence support element
JOG-A. . . . . joint operations graphic-air

JP. . . . . .joint publication
JSIPS. . . . . .Joint Services Imagery Processing System
JSTARS . . . . . joint surveillance, target attack radar system
JTF . . . . . joint task force
JWICS. . . . . .Joint Worldwide Intelligence Communications System

KIA . . . . . killed in action
km . . . . . kilometer
KOCOA . . . .key terrain, observation and fields of fire, cover and concealment, obstacles, and avenues of approach, and mobility corridors

LCAC . . . . . .landing craft air cushion
LOA . . . . . limit of advance
LOC . . . . . line of communications
LOS. . . . . line of sight
LTIOV . . . . . .latest time information of value
LZ . . . . . .landing zone

MAGTF . . . . . Marine air-ground task force
MARFOR . . . . . .Marine Corps forces
MAW . . . . . .Marine aircraft wing
MCDP . . . . . Marine Corps doctrinal publication
MCIA . . . . . Marine Corps Intelligence Activity
MCISU . . . Marine Corps Imagery Support Unit
MCOO . . . modified combined obstacle overlay
MCRP . . . . .Marine Corps reference publication
MCWP . . . . . Marine Corps warfighting publication
MEA . . . . . mission effectiveness assessment
MEF . . . . . Marine expeditionary force
METT-T . . . . . .mission, enemy, terrain and weather, troops and support available-time available
MEU(SOC) . . . . . Marine expeditionary unit (special operations capable)
MIDB . . . . . .modernized integrated database
mm . . . . . millimeters
MOB . . . . . mobility
MOOTW. . . . military operations other than war
MOS . . . . . military occupational specialty
MSC . . . . . major subordinate command
MSE . . . . . .major subordinate element
MTI. . . . . moving target indicator
MTW. . . . . major theater war

NA. . . . . .not applicable

NAI . . . . . named area of interest
NAIC. . . . . National Air Intelligence Center
NATO . . . . .North Atlantic Treaty Organization
NBC . . . . . .nuclear, biological, and chemical
NEF. . . . . .naval expeditionary force
NEO . . . . . noncombatant evacuation operation
NGIC. . . . .National Ground Intelligence Center
NGO . . . . . .nongovernmental organization
NIMA . . . . . .National Imagery and Mapping Agency
NIPRNET . . . . . nonsecure internet protocol router network
NIS . . . . . .national input segment
NIST . . . . . .national intelligence support team
NMIC . . National Maritime Intelligence Center
NOE . . . . . .nap of the earth
NSA . . . . . National Security Agency
NSTR . . . . . .nothing significant to report
NVG . . . . . .night vision goggles

obj . . . . . .objective
OCAC . . . . . operations control and analysis center
OIC . . . . . .officer in charge
OMFTS . . . operational maneuver from the sea
OOB . . . . . .order of battle
OPCON . . . . . .operational control
OPLAN. . . . . .operation plan
OPORD. . . . . .operation order

P&A . . . . . production and analysis
PDA . . . . . physical damage assessment
PDE&A. . . . . planning, decision, execution, and assessment
PIR . . . . . priority intelligence requirement
POC. . . . . point of contact
POL. . . . . .petroleum, oils, and lubricants
PR . . . . . production requirement
PVO . . . . . .private voluntary organization

RAG . . . . . regimental artillery group
RC. . . . . reconnaissance capable
recon . . . . . .reconnaissance
rep . . . . . .representative
RFI . . . . . .request for intelligence
RR. . . . . .reattack recommendation
RRS. . . . . remote receive station

S-1. . . . . .manpower or personnel staff officer/organization
S-2. . . . . intelligence staff officer/organization
S-3. . . . . operations staff officer/organization
SALUTE. . . . . .size, activity, location, unit, time, equipment
SAM . . . . . surface-to-air missile
SARC . . . . surveillance and reconnaissance cell
SATCOM . . . . . satellite communications
SCI . . . . . sensitive compartmented information
SCR. . . . . single channel radio
SIDS . . . . . secondary imagery dissemination system
SIGINT . . . . . .signals intelligence
SII . . . . . .statement of intelligence interest
SIPRNET . . . . . .SECRET Internet Protocol Router Network
SOA . . . . . sustained operations ashore
SOP. . . . . .standing operating procedure
SPMAGTF . . . . . special-purpose Marine air-ground task force
SPP . . . . . shared production program
STANAG . . . . . standardization agreement (NATO)

TAA . . . . . .tactical assembly area
TAI . . . . . targeted area of interest
TCAC . . . .technical control and analysis center
TDN . . . . . tactical data network
T/E . . . . . table of equipment
TEG. . . . . tactical exploitation group
TERPES . . . . tactical electronic reconnaissance processing and evaluation system
T/O . . . . . table of organization
topo . . . . . topographic
TOR . . . . . time of report
TPC. . . . . topographic production capability
TPL . . . . . time phase lines
TRSS. . . . . .tactical remote sensor system
TSA. . . . . target system assessment
TTP . . . . . tactics, techniques, and procedures

UAV . . . . . .unmanned aerial vehicle
UIC . . . . . unit identification code
U.S. . . . . United States
UTM . . . . . .universal transverse mercator

VHF . . . . . very high frequency
VMAQ . . . . . .Marine tactical electronic warfare squadron
VMU. . . . . .Marine unmanned aerial vehicle squadron
VO. . . . . validation office

WIA . . . . . wounded in action
YYMMDD . . . . . .year, month, day

SECTION II. DEFINITIONS

***a priori*—**Probabilities, in the absence of other information; presupposed by experience.

all-source intelligence—Intelligence products and/or organizations and activities that incorporate all sources of information, including, most frequently, human resources intelligence, imagery intelligence, measurement and signature intelligence, signals intelligence, and open source data, in the production of finished intelligence. (JP 1-02)

amphibious force—An amphibious task force and a landing force together with other forces that are trained, organized, and equipped for amphibious operations. (Proposed by JP 3-02 for inclusion in JP 1-02)

amphibious objective area—A geographical area, delineated in the initiating directive, for purposes of command and control within which is located the objective(s) to be secured by the amphibious task force. This area must be of sufficient size to ensure accomplishment of the amphibious task force's mission and must provide sufficient area for conducting necessary sea, air, and land operations. Also called AOA. (JP 1-02)

amphibious task force—A Navy task organization formed to conduct amphibious operations. The amphibious task force, together with the landing force and other forces, constitutes the amphibious force. Also called ATF. (Proposed by JP 3-02 for inclusion in JP 1-02)

analysis—In intelligence usage, a step in the processing phase of the intelligence cycle in which information is subjected to review in order to identify significant facts for subsequent interpretation. See also intelligence cycle. (JP 1-02) The sifting and sorting of evaluated information to isolate significant elements with respect to the mission and operations of the command. (MCWP 2-1)

area of interest—That area of concern to the commander, including the area of influence, areas adjacent thereto, and extending into enemy territory to the objectives of current or planned operations. This area also includes areas occupied by enemy forces who could jeopardize the accomplishment of the mission. Also called AOI. (JP 1-02)

area of operations—An operational area defined by the joint force commander for land and naval forces. Areas of operation do not typically encompass the entire operational area of the joint force commander, but should be large enough for component commanders to accomplish their missions and protect their forces. Also called AO. (JP 1-02)

aviation combat element—The core element of a Marine air-ground task force that is task-organized to conduct aviation operations. The aviation combat element provides all or a portion of the six functions of Marine aviation necessary to accomplish the Marine air-ground task force's mission. These functions are anti-air warfare, offensive air support, assault support, electronic warfare, air reconnaissance, and control of aircraft and missiles. The aviation combat element is usually composed of an aviation unit headquarters and various other aviation units or their detachments. It can vary in size from a small aviation detachment of specifically required aircraft to one or more Marine aircraft wings. The aviation combat element may contain other Service or foreign military forces assigned or attached to the Marine air-ground task force. The aviation combat element itself is not a formal command. Also called ACE. (Approved for inclusion in next version of MCRP 5-12C)

basic intelligence—Fundamental intelligence concerning the general situation, resources, capabilities, and vulnerabilities of foreign countries or areas which may be used as reference material in the planning of operations at any level and in evaluating subsequent information relating to the same subject. (JP 1-02)

battle damage assessment—1. The timely and accurate estimate of damage resulting from the application of military force, either lethal or non-lethal, against a predetermined objective. Battle damage assessment can be applied to the employment of all types of weapon systems (air, ground, naval, and special forces weapon systems) throughout the range of military operations. Battle damage assessment is primarily an intelligence responsibility with required inputs and coordination from the operators. Battle damage assessment is composed of physical damage assessment, functional damage assessment, and target system assessment. Also called BDA. (JP 1-02) **2**. In Marine Corps usage, the timely and accurate estimate of the damage resulting from the application of military force. BDA estimates physical damage to a particular target, functional damage to that target, and the capability of the entire target system to continue its operations. (MCWP 5-12C)

battlespace—All aspects of air, surface, subsurface, land, space, and electromagnetic spectrum which encompass the area of influence and area of interest. (MCRP 5-12C)

battlespace dominance—The degree of control over the dimensions of the battlespace which enhances friendly freedom of action and denies enemy freedom of action. It permits force sustainment and application of power projection to accomplish the full range of potential operational and tactical missions. It includes all actions conducted against enemy capabilities to influence future operations. (MCRP 5-12C)

branch(es)—A contingency plan or course of action (an option built into the basic plan or course of action) for changing the mission, disposition, orientation, or direction of movement of the force to aid success of the operation based on anticipated events, opportunities, or disruptions caused by enemy actions. See also sequel(s). (MCRP 5-12C)

centers of gravity—1. Those characteristics, capabilities, or localities from which a military force derives its freedom of action, physical strength, or will to fight. Also called COG. (JP 1-02) **2**. A key source of strength without which an enemy cannot function. (MCDP 1-2)

centralized control—In military operations, a mode of battlespace management in which one echelon of command exercises total authority and direction of all aspects of one or more warfighting functions. It is a method of control where detailed orders are issued and total unity of action is the overriding consideration. (MCRP 5-12C)

collate—1. The grouping together of related items to provide a record of events and facilitate further processing. **2**. To compare critically two or more items or documents concerning the same general subject; normally accomplished in the processing phase in the intelligence cycle. (JP 1-02)

collection—Acquisition of information and the provision of this information to processing and/or production elements. (JP 1-02) In Marine Corps usage, the gathering of intelligence data and information to satisfy the identified requirements. (MCWP 5-12C)

collection agency—Any individual, organization, or unit that has access to sources of information and the capability of collecting information from them. (JP 1-02)

collection asset—A collection system, platform, or capability that is supporting, assigned, or attached to a particular commander. (JP 1-02)

collection management—The process of converting intelligence requirements into collection requirements, establishing priorities, tasking or coordinating with appropriate collection sources or agencies, monitoring results, and retasking, as required. (JP 1-02)

collection manager—An individual with responsibility for the timely and efficient tasking of organic collection resources and the development of requirements for theater and national assets that could satisfy specific information needs in support of the mission. (JP 1-02)

collection plan—A plan for collecting information from all available sources to meet intelligence requirements and for transforming those requirements into orders and requests to appropriate agencies. (JP 1-02)

combat assessment—The determination of the overall effectiveness of tactical force employment during military operations. Combat assessment is composed of three major components, (a) battle damage assessment (BDA), (b) munitions effects assessment, and (c) future course-of-action (COA) or reattack recommendation. Also called CA. (Proposed by JP 3-60 for inclusion in JP 1-02.)

combat data—Data derived from reporting by operational units. (MCWP 5-12C)

combatant command—A unified or specified command with a broad continuing mission under a single commander established and so designated by the President, through the Secretary of Defense and with the advice and assistance of the Chairman of the Joint Chiefs of Staff. Combatant commands typically have geographic or functional responsibilities. (JP 1-02)

combined operation—An operation conducted by forces of two or more allied nations acting together for the accomplishment of a single mission. (JP 1-02)

command and control—The exercise of authority and direction by a properly designated commander over assigned and attached forces in the accomplishment of the mission. Command and control functions are performed through an arrangement of personnel, equipment, communications, facilities, and procedures employed by a commander in planning, directing, coordinating, and controlling forces and operations in the accomplishment of the mission. Also called C2. (JP 1-02) Also in Marine Corps usage, the means by which a commander recognizes what needs to be done and sees to it that appropriate actions are taken. (MCRP 5-12C)

command and control warfare—The integrated use of operations security, military deception, psychological operations, electronic warfare, and physical destruction, mutually supported by intelligence, to deny information to, influence, degrade, or destroy adversary command and control capabilities, while protecting friendly command and control capabilities against such actions. Also called C2W. (Excerpt from JP 1-02)

command element—The core **element** of a Marine air-ground task force that is the headquarters. The command element is composed of the commander, general or executive and special staff sections, headquarters section, and requisite communications support, intelligence and reconnaissance forces, necessary to accomplish the MAGTF's mission. The command element provides command and control, intelligence, and other support essential for effective planning and execution of operations by the other elements of the Marine air-ground task force. The command element varies in size and composition and may contain other Service or foreign military forces assigned or attached to the MAGTF. Also called CE. (Approved for inclusion in next version of MCRP 5-12C)

commander's critical information requirements—Information regarding the enemy and friendly activities and the environment identi-

fied by the commander as critical to maintaining situational awareness, planning future activities, and facilitating timely decisionmaking. Also called CCIR. NOTE: CCIRs are normally divided into three primary subcategories: priority intelligence requirements; friendly force information requirements; and essential elements of friendly information. (MCRP 5-12C)

commander's intent—A commander's clear, concise articulation of the purpose(s) behind one or more tasks assigned to a subordinate. It is one of two parts of every mission statement which guides the exercise of initiative in the absence of instructions. (MCRP 5-12C)

commander's planning guidance—Directions and/or instructions which focus the staff's course of action development during the planning process. (MCRP 5-12C)

communications intelligence—Technical and intel-ligence information derived from foreign communications by other than the intended recipients. (JP 1-02)

communications security—The protection resulting from all measures designed to deny unauthorized persons information of value which might be derived from the possession and study of telecommunications, or to mislead unauthorized persons in their interpretation of the results of such possession and study. (Excerpt from JP 1-02)

coordination—The action necessary to ensure adequately integrated relationships between separate organizations located in the same area. Coordination may include such matters as fire support, emergency defense measures, area intelligence, and other situations in which coordination is considered necessary. (MCRP 5-12C)

counterintelligence—1. Information gathered and activities conducted to protect against espionage, other intelligence activities, sabotage, or assassinations conducted by or on behalf of foreign governments or elements thereof, foreign organizations, or foreign persons, or international terrorist activities. (JP 1-02) **2.** Within the Marine Corps, counterintelligence constitutes active and passive measures intended to deny a threat force valuable information about the friendly situation, to detect and neutralize hostile intelligence collection, and to deceive the enemy as to friendly capabilities and intentions. Also called CI. (MCRP 5-12C)

crisis action planning—The time-sensitive planning for the deployment, employment, and sustainment of assigned and allocated forces and resources that occurs in response to a situation that may result in actual military operations. Crisis action planners base their plan on the circumstances that exist at the time planning occurs. (JP 1-02)

critical information—Specific facts about friendly intentions, capabilities, and activities vitally needed by adversaries for them to plan and act effectively so as to guarantee failure or unacceptable consequences for friendly mission accomplishment. (JP 1-02)

critical intelligence—Intelligence which is crucial and requires the immediate attention of the commander. It is required to enable the commander to make decisions that will provide a timely and appropriate response to actions by the potential/actual enemy. It includes but is not limited to the following: **a**. strong indications of the imminent outbreak of hostilities of any type (warning of attack); **b**. aggression of any nature against a friendly country; **c**. indications or use of nuclear-biological-chemical weapons (targets); **d**. significant events within potential enemy countries that may lead to modification of nuclear strike plans. (JP 1-02)

critical node—An element, position, or communica-tions entity whose disruption or destruction immediately degrades the ability of

a force to command, control, or effectively conduct combat operations. (JP 1-02)

critical vulnerability—An aspect of a center of gravity that if exploited will do the most significant damage to an adversary's ability to resist. A vulnerability cannot be critical unless it undermines a key strength. (MCRP 5-12C)

daily intelligence summary—A report prepared in message form at the joint force headquarters that provides higher, lateral, and subordinate headquarters with a summary of all significant intelligence produced during the previous 24-hour period. The "as of" time for information, content, and submission time for the report will be as specified by the joint force commander. Also called DISUM. (JP 1-02)

data—Representation of facts, concepts, or instructions in a formalized manner suitable for communication, interpretation, or processing by humans or by automatic means. Any representations such as characters or analog quantities to which meaning is or might be assigned. (JP 1-02)

data base—Information that is normally structured and indexed for user access and review. Data bases may exist in the form of physical files (folders, documents, etc.) or formatted automated data processing system data files. (JP 1-02)

database replication—Process by which like databases reflect commonality in information and timeliness of that information. (MCRP 5-12C)

debriefing—Interviewing of an individual who has completed an intelligence or reconnaissance assignment or who has knowledge, whether through observation, participation, or otherwise, of operational or intelligence significance. (MCRP 5-12C)

decentralized control—In military operations, a mode of battlespace management in which a command echelon may delegate some or all authority and direction for warfighting functions to subordinates. It requires careful and clear articulation of mission, intent, and main effort to unify efforts of subordinate leaders. (MCRP 5-12C)

deception operation—A military operation conducted to mislead the enemy. A unit conducting a deception operation may or may not make contact with the enemy. Deception operations include demonstrations, diversions, displays, feints, ruses, actions, events, means, and objectives. (MCRP 5-12C)

decision point—An event, area, or point in the battlespace where and when the friendly commander will make a critical decision. Also called DP. (MCRP 5-12C)

deliberate planning—A planning process for the deployment and employment of apportioned forces and resources that occurs in response to a hypothetical situation. Deliberate planners rely heavily on assumptions regarding the circumstances that will exist when the plan is executed. (JP 1-02)

deliberate targeting—The methodical identification, compilation, and analysis of potential fixed or semifixed targets followed by the decision of which potential targets will be attacked, when, and/or by what weapon and ordnance. It is practiced primarily during the planning phase of an operation, when planning for an attack, or when the tempo of combat is slow. (MCRP 5-12C)

descriptive intelligence—Class of intelligence which describes existing and previously existing conditions with the intent to promote situational awareness. Descriptive intelligence has two components: *basic intelligence*, which is general background knowledge about established and relatively constant conditions; and *current intelligence*, which is concerned with describing the existing situation. (MCRP 5-12C)

detachment—1. A part of a unit separated from its main organization for duty elsewhere. **2.** A temporary military or naval unit formed from other units or parts of units. (JP 1-02)

direction finding—A procedure for obtaining bearings of radio frequency emitters by using a highly directional antenna and a display unit on an intercept receiver or ancillary equipment. (JP 1-02)

direct support—A mission requiring a force to support another specific force and authorizing it to answer directly the supported force's request for assistance. (JP 1-02)

dissemination—Conveyance of intelligence to users in a suitable form. (JP 1-02)

dissemination management—Involves establishing dissemination priorities, selection of dissemination means, and monitoring the flow of intelligence throughout the command. The objective of dissemination management is to deliver the required intelligence to the appropriate user in proper form at the right time while ensuring that individual consumers and the dissemination system are not overloaded attempting to move unneeded or irrelevant information. Dissemination management also provides for use of security controls which do not impede the timely delivery or subsequent use of intelligence while protecting intelligence sources and methods. (MCRP 5-12C)

effective damage—That damage necessary to render a target element inoperative, unserviceable, nonproductive, or uninhabitable. (JP 1-02)

effectiveness—The measurement of the results of military action against a target by lethal or nonlethal means. (Proposed by JP 3-60 for inclusion in JP 1-02.)

effects—The result of military action against a target by lethal or nonlethal means. (Proposed by JP 3-60 for inclusion in JP 1-02.)

effects assessment—A determination of the overall effectiveness of force or weapon system employment during military operations and recommends future courses of action. Effects assessment is conducted at the strategic, operational, and tactical levels-of war or MOOTW. Effects assessment is the assessment of all execution effects, and includes steps commonly associated with combat assessment. (Proposed by JP 3-60 for inclusion in JP 1-02.)

electromagnetic spectrum—The range of frequencies of electromagnetic radiation from zero to infinity. It is divided into 26 alphabetically designated bands. (JP 1-02)

electronic attack—That division of electronic warfare involving the use of electromagnetic, directed energy, or antiradiation weapons to attack personnel, facilities, or equipment with the intent of degrading, neutralizing, or destroying enemy combat capability. Also called EA. (JP 1-02)

electronic intelligence—Technical and geolocation intelligence derived from foreign noncommunications electromagnetic radiations emanating from other than nuclear detonations or radioactive sources. (JP 1-02)

electronic protection—That division of electronic warfare involving actions taken to protect personnel, facilities, and equipment from any effects of friendly or enemy employment or electronic warfare that degrade, neutralize, or destroy friendly combat capability. (JP 1-02)

electronic reconnaissance—The detection, identification, evaluation, and location of foreign electromagnetic radiations emanating from other than nuclear detonations or radioactive sources. (JP 1-02)

electronic warfare—Any military action involving the use of electromagnetic and directed energy to control the electromagnetic spectrum or to attack the enemy. The three

major subdivisions within electronic warfare are electronic attack, electronic protection, and electronic warfare support. Also called EW. (Excerpt from JP 1-02)

electronic warfare support—That division of electronic warfare involving actions tasked by, or under direct control of, an operational commander to search for, intercept, identify, and locate sources of intentional and unintentional radiated electromagnetic energy for the purpose of immediate threat recognition. Thus, electronic warfare support provides information required for immediate decisions involving electronic warfare operations and tactical actions such as threat avoidance, targeting, and homing. Electronic warfare support data can be used to produce signals intelligence (SIGINT), communications intelligence (COMINT), and electronic intelligence (ELINT). (JP 1-02)

essential elements of friendly information—**1.** Key questions likely to be asked by adversary officials and intelligence systems about specific friendly intentions, capabilities, and activities so they can obtain answers critical to their operational effectiveness. Also called EEFI. (JP 1-02) **2.** Specific facts about friendly intentions, capabilities, and activities needed by adversaries to plan and execute effective operations against our forces. (MCRP 5-12C)

estimative intelligence—Class of intelligence which attempts to anticipate future possibilities and probabilities based on an analysis of descriptive intelligence in the context of planned friendly and assessed enemy operations. See also **descriptive intelligence**. (MCRP 5-12C)

evaluation—In intelligence usage, appraisal of an item of information in terms of credibility, reliability, pertinence, and accuracy. Appraisal is accomplished at several stages within the intelligence cycle with progressively different contexts. Initial evaluations, made by case officers and report officers, are focused upon the reliability of the source and the accuracy of the information as judged by data available at or close to their operational levels. Later evaluations by intelligence analysts, are primarily concerned with verifying accuracy of information and may, in effect, convert information into intelligence. Appraisal or evaluation of items of information or intelligence is indicated by a standard letter-number system. The evaluation of the reliability of sources is designated by a letter from A through F, and the accuracy of the information is designated by numeral 1 through 6. These are two entirely independent appraisals, and these separate appraisals are indicated in accordance with the system indicated below. Thus, information adjudged to be "probably true" received from a "usually reliable source" is designated "B-2" or "B2," while information of which the "truth cannot be judged" received from a "usually reliable source" is designated "B-6" or "B6."

Reliability of Source

A - Completely reliable
B - Usually reliable
C - Fairly reliable
D - Not usually reliable
E - Unreliable
F - Reliability cannot be judged

Accuracy of Information

1 - Confirmed by other sources
2 - Probably true
3 - Possibly true
4 - Doubtful
5 - Improbable
6 - Truth cannot be judged (JP 1-02)

fires—The effects of lethal or nonlethal weapons. (JP 1-02)

force protection—Security program designed to protect Service members, civilian employees, family members, facilities, and equipment, in all locations and situations, accomplished through planned and integrated application of combatting terrorism, physical security, operations

security, personal protective services, and supported by intelligence, counterintelligence, and other security programs. (JP 1-02)

force reconnaissance company—A unit whose mission is to conduct preassault and deep postassault reconnaissance operations in support of a landing force and its subordinate elements. (MCRP 5-12C)

friendly force information requirements—Information the commander needs about friendly forces in order to develop plans and make effective decisions. Depending upon the circumstances, information on unit location, composition, readiness, personnel status, and logistics status could become a friendly force information requirement. Also called FFIR. (MCRP 5-12C)

functional damage assessment—The estimate of the effect of military force to degrade/destroy the functional or operational capability of the target to perform its intended mission and on the level of success in achieving operational objectives established against the target. This assessment is based upon all-source information, and includes an estimation of the time required for recuperation or replacement of the target function. (Upon approval of JP 3-60, this term and its definition will be included in JP 1-02.)

fusion—In intelligence usage, the process of examining all sources of intelligence and information to derive a complete assessment of activity. (JP 1-02)

fusion center—In intelligence usage, a physical location to accomplish fusion. It normally has sufficient intelligence automated data processing capability to assist in the process. (JP 1-02)

future operations section—1. In MAGTF operations, a section normally under the staff cognizance of the G-3 which focuses on planning/producing new fragmentary orders or the next change of major subordinate command mission; this section forms and leads the integrated planning effort with a planning horizon of 72-120 hours out. It develops branch plans and sequels. **2.** In Marine aviation, that portion of the tactical air command center and aviation combat element commander's battlestaff responsible for the detailed planning and coordination of all future air operations conducted by the aviation combat element in support of the Marine air-ground task force. The future operations section plans for and publishes the next air tasking order(s) (normally a 48/72-hour period). (MCRP 5-12C)

general military intelligence—Intelligence concerning the (1) military capabilities of foreign countries or organizations or (2) topics affecting potential US or allied military operations, relating to the following subjects: armed forces capabilities, including order of battle, organization, training, tactics, doctrine, strategy, and other factors bearing on military strength and effectiveness; area and terrain intelligence, including urban areas, coasts and landing beaches, and meteorological, oceanographic, and geological intelligence; transportation in all modes; military materiel production and support industries,; military and civilian C4 systems; military economics, including foreign military assistance; insurgency and terrorism; military-political-sociological intelligence; location, identification, and description of military-related installations; government control; escape and evasion; and threats and forecasts. (Excludes scientific and technical intelligence.) (JP 1-02)

general support—That support which is given to the supported force as a whole and not to any particular subdivision thereof. (JP 1-02)

geographic coordinates—The quantities of latitude and longitude which define the position of a point on the surface of the earth with respect to the reference spheroid. (JP 1-02)

geographic intelligence—The process of collecting, organizing, analyzing, synthesizing, disseminating and utilizing geospatial information and services (GI&S) with regards to the military aspects of the terrain. Also called GEOINT. GEOINT is the integration and analysis of all-source geospatial information in support of specific Marine Corps operations. The analysis is focused on a specific mission and includes intensification of information detail and resolution to meet tactical requirements. GEOINT analysis is focused on the intelligence preparation of the battlespace (IPB) process and addresses key terrain, observation & fields of fire, cover & concealment, obstacles, avenues of approach & mobility corridors. This analysis is commonly referred to as KOCOA for easy reference.

geospatial information and services—The concept for collection, information extraction, storage, dissemination, and exploitation of geodetic, geomagnetic, imagery (both commercial and national source), gravimetric, aeronautical, topographic, hydrographic, littoral, cultural, and toponymic data accurately referenced to a precise location on the earth's surface. These data are used for military planning, training, and operations including navigation, mission planning, mission rehearsal, modeling, simulation and precise targeting. Geospatial information provides the basic framework for battlespace visualization. It is information produced by multiple sources to common interoperable data standards. It may be presented in the form of printed maps, charts, and publications; in digital simulation and modeling data bases; in photographic form; or in the form of digitized maps and charts or attributed centerline data. Geospatial services include tools that enable users to access and manipulate data, and also includes instruction, training, laboratory support, and guidance for the use of geospatial data. (JP 1-02)

global sourcing—A process of force provision or augmentation whereby resources may be drawn from any location/command worldwide. (MCRP 5-12C)

ground combat element—The core element of a Marine air-ground task force that is task-organized to conduct ground operations. It is usually constructed around an infantry organization but can vary in size from a small ground unit of any type, to one or more Marine divisions that can be independently maneuvered under the direction of the MAGTF commander. It includes appropriate ground combat and combat support forces and may contain other Service or foreign military forces assigned or attached to the Marine air-ground task force. The ground combat element itself is not a formal command. Also called GCE. (Approved for inclusion in next version of MCRP 5-12C)

helicopter landing zone—A specified ground area for landing assault helicopters to embark or disembark troops and/or cargo. A landing zone may contain one or more landing sites. Also called HLZ. (JP 1-02)

high-payoff target—A target whose loss to the enemy will significantly contribute to the success of the friendly course of action. High-payoff targets are those high-value targets, identified through wargaming, which must be acquired and successfully attacked for the success of the friendly commander's mission. Also called HPT. (JP 1-02)

high-value target—A target the enemy commander requires for the successful completion of the mission. The loss of high-value targets would be expected to seriously degrade important enemy functions throughout the friendly commander's area of interest. Also called HVT. (JP 1-02)

human intelligence—1. A category of intelligence derived from information collected and provided by human sources. (JP 1-02) **2.** In Marine Corps usage, human intelligence operations cover a wide range of activities encompassing reconnaissance patrols, aircrew debriefs,

debriefing of refugees, interrogations of prisoners of war, and the conduct of counterintelligence force protection source operations. Also called HUMINT. (JP 1-02)

humanitarian assistance—Programs conducted to relieve or reduce the results of natural or manmade disasters or other endemic conditions such as human pain, disease, hunger, or privation that might present a serious threat to life or that can result in great damage to or loss of property. Humanitarian assistance provided by US forces is limited in scope and duration. The assistance provided is designed to supplement or complement the efforts of the host nation civil authorities or agencies that may have the primary responsibility for providing humanitarian assistance. (JP 1-02)

hydrography—The science which deals with the measurements and description of the physical features of the oceans, seas, lakes, rivers, and their adjoining coastal areas, with particular reference to their use for navigational purposes. (JP 1-02)

imagery exploitation—The cycle of processing and printing imagery to the positive or negative state, assembly into imagery packs, identification, interpretation, mensuration, information extraction, the preparation of reports, and the dissemination of information. (JP 1-02)

imagery intelligence—Intelligence derived from the exploitation of collection by visual photography, infrared sensors, lasers, electro-optics, and radar sensors such as synthetic aperture radar wherein images of objects are reproduced optically or electronically on film, electronic display devices, or other media. Also called IMINT. (JP 1-02)

imagery interpretation—The process of location, recognition, identification, and description of objects, activities, and terrain represented on imagery. (JP 1-02)

immediate targets—Targets upon which are detected too late to be included in the normal targeting process, therefore, effects have not been scheduled. Immediate targets have three subcategories: unplanned, unanticipated, and time-sensitive. (Upon approval of JP 3-60, this term and its definition will be included in JP 1-02.)

indications and warning—Those intelligence activities intended to detect and report time-sensitive intelligence information on foreign developments that could involve a threat to the United States or allied military, political, or economic interests or to US citizens abroad. It includes forewarning of enemy actions or intentions; the imminence of hostilities; insurgency; nuclear/non-nuclear attack on the United States, its overseas forces, or allied nations; hostile reactions to United States reconnaissance activities; terrorists' attacks; and other similar events. Also called I&W. (JP 1-02)

indirect effects—Result created through an inter-mediate effect or mechanism to produce the final outcome, which may be physical or psychological in nature. Indirect effects tend to be delayed, and may be difficult to recognize. (Proposed by JP 3-60 for inclusion in JP 1-02.)

information—1. Facts, data, or instructions in any medium or form. **2.** The meaning that a human assigns to data by means of the known conventions used in their representation. (JP 1-02)

information exchange requirement—The requirement for information to be passed between and among forces, organizations, or administrative structures concerning ongoing activities. Information exchange requirements identify who exchanges what information with whom, as well as why the information is necessary and how that information will be used. The quality (i.e., frequency, timeliness, security) and quantity (i.e., volume, speed, and type of information such as data, voice, and video) are attributes of the information exchange included

in the information exchange requirement. (MCRP 5-12C)

information report—Report used to forward raw information collected to fulfill intelligence requirements. (JP 1-02)

information requirements—Those items of information regarding the enemy and his environment which need to be collected and processed in order to meet the intelligence requirements of a commander. (JP 1-02)

integration—A stage in the intelligence cycle in which a pattern is formed through the selection and combination of evaluated information. (JP 1-02)

intelligence—1. The product resulting from the collection, processing, integration, analysis, evaluation, and interpretation of available information concerning foreign countries or areas. **2.** Information and knowledge about an adversary obtained through observation, investigation, analysis, or understanding. (JP 1-02) Also in Marine Corps usage, intelligence is knowledge about the enemy or the surrounding environment needed to support decision-making. This knowledge is the result of the collection, processing, exploitation, evaluation, integration, analysis, and interpretation of available information about the battlespace and threat. (MCRP 5-12C)

intelligence annex—A supporting document of an operation plan or order that provides detailed information on the enemy situation, assignment of intelligence tasks, and intelligence administrative procedures. (JP 1-02)

intelligence cycle—The steps by which information is converted into intelligence and made available to users. (Excerpt from JP 1-02)

intelligence data—Data derived from assets primarily dedicated to intelligence collection such as imagery systems, electronic intercept equipment, human intelligence sources, etc. (MCRP 5-12C)

intelligence discipline—A well-defined area of intelligence collection, processing, exploitation, and reporting using a specific category of technical or human resources. There are five major disciplines: human intelligence, imagery intelligence, measurement and signature intelligence, signals intelligence (communications intelligence, electronic intelligence, and foreign instrumentation signals intelligence), and open-source intelligence. (JP 1-02)

intelligence estimate—The appraisal, expressed in writing or orally, of available intelligence relating to a specific situation or condition with a view to determining the courses of action open to the enemy or potential enemy and the order of probability of their adoption. (JP 1-02)

intelligence journal—A chronological log of intelligence activities covering a stated period, usually 24 hours. It is an index of reports and messages that have been received and transmitted, and of important events that have occurred**,** and actions taken. The journal is a permanent and official record. (JP 1-02)

intelligence operations—The variety of intelligence tasks that are carried out by various intelligence organizations and activities. (Excerpt from JP 1-02)

intelligence preparation of the battlespace—1. An analytical methodology employed to reduce uncertainties concerning the enemy, environment, and terrain for all types of operations. Intelligence preparation of the battlespace builds an extensive data base for each potential area in which a unit may be required to operate. The data base is then analyzed in detail to determine the impact of the enemy, environment, and terrain on operations and presents it in graphic form. Intelligence preparation of the battlespace is a continuing process. Also called IPB. (JP 1-02) **2.** In Marine Corps usage, the systematic,

continuous process of analyzing the threat and environment in a specific geographic area. (MCRP 5-12C)

intelligence report—A specific report of information, usually on a single item, made at any level of command in tactical operations and disseminated as rapidly as possible in keeping with the timeliness of the information. Also called INTREP. (JP 1-02)

intelligence requirement—**1**. Any subject, general or specific, upon which there is a need for the collection of information, or the production of intelligence. (JP 1-02) **2**. In Marine Corps usage, questions about the enemy and the environment, the answers to which a commander requires to make sound decisions. Also called IR. (MCRP 5-12C)

intuitive decisionmaking—The act of reaching a conclusion which emphasizes pattern recognition based on knowledge, judgment, experience, education, intelligence, boldness, perception, and character. This approach focuses on assessment of the situation vice comparison of multiple options. (MCRP 5-12C)

joint deployable intelligence support system—A transportable workstation and communications suite that electronically extends a joint intelligence center to a joint task force or other tactical user. Also called JDISS. (JP 1-02)

joint force—A general term applied to a force composed of significant elements, assigned or attached, of two or more Military Departments, operating under a single joint force commander. (JP 1-02)

joint intelligence center—The intelligence center of the joint force headquarters. The joint intelligence center is responsible for providing and producing the intelligence required to support the joint force commander and staff, components, task forces and elements, and the national intelligence community. Also called JIC. (JP 1-02)

joint intelligence support element—A subordinate joint force forms a joint intelligence support element as the focus for intelligence support for joint operations, providing the joint force commander, joint staff, and components with the complete air, space, ground, and maritime adversary situation. Also called JISE. (JP 1-02)

joint operations—A general term to describe military actions conducted by joint forces, or by Service forces in relationships (e.g., support, coordinating authority), which, of themselves, do not create joint forces. (JP 1- 02)

joint targeting coordination board—A group formed by the joint force commander to accomplish broad targeting oversight functions that may include but are not limited to coordinating targeting information, providing targeting guidance and priorities, and preparing and/or refining joint target lists. The board is normally comprised of representatives from the joint force staff, all components, and if required, component subordinate units. (JP 1-02)

joint task force—A joint force that is constituted and so designated by the Secretary of Defense, a combatant commander, a subunified commander, or an existing joint task force commander. Also called JTF. (JP 1-02)

Joint Worldwide Intelligence Communications System—The sensitive compartmented information portion of the Defense Information System Network. It incorporates advanced networking technologies that permit point-to-point or multipoint information exchange involving voice, text, graphics, data, and video teleconferencing. Also called JWICS. (JP 1-02)

large-scale map—A map having a scale of 1:75,000 or larger. (JP 1-02)

line of communications—A route, either land, water, and/or air, which connects an operating military force with a base of operations and along which supplies and military forces move. (JP 1-02)

list of targets—A tabulation of confirmed or suspect targets maintained by any echelon for informational and fire support planning purposes. (JP 1-02)

main effort—The designated subordinate unit whose mission at a given point in time is most critical to overall mission success. It is usually weighted with the preponderance of combat power and is directed against a center of gravity through a critical vulnerability. (MCRP 5-12C)

maneuver warfare—A warfighting philosophy that seeks to shatter the enemy's cohesion through a variety of rapid, focused, and unexpected actions which create a turbulent and rapidly deteriorating situation with which the enemy cannot cope. (MCRP 5-12C)

mapping, charting, and geodesy—Maps, charts, and other data used for military planning, operations, and training. These products and data support air, land, and sea navigation; weapon system guidance; target positioning; and other military activities. These data are presented in the forms of topographic, planimetric, imaged, or thematic maps and graphics; nautical and aeronautical charts and publications; and, in digital and textual formats, gazetteers, which contain geophysical and geodetic data and coordinate lists. (JP 1-02)

Marine air-ground task force—The Marine Corps principal organization for all missions across the range of military operations, composed of forces task-organized under a single commander capable of responding rapidly to a contingency anywhere in the world. The types of forces in the MAGTF are functionally grouped into four core elements: a command element, an aviation combat element, a ground combat element, and a combat service support element. The four core elements are categories of forces, not formal commands. The basic structure of the Marine air-ground task force never varies, though the number, size, and type of Marine Corps units comprising each of its four elements will always be mission dependent. The flexibility of the organizational structure allows for one or more subordinate MAGTFs, other Service and/or foreign military forces, to be assigned or attached. Also called MAGTF. (Approved for inclusion in next version of MCRP 5-12C)

Marine Corps Planning Process—A six-step methodology which helps organize the thought processes of the commander and staff throughout the planning and execution of military operations. It focuses on the threat and is based on the Marine Corps philosophy of maneuver warfare. It capitalizes on the principle of unity of command and supports the establishment and maintenance of tempo. The six steps consist of mission analysis, course of action development, course of action analysis, comparison/decision, orders development, and transition. Also called MCPP. NOTE: Tenets of the MCPP include top down planning, single battle concept, and integrated planning. (MCRP 5-12C)

Marine expeditionary force—The largest Marine air-ground task force and the Marine Corps principal warfighting organization, particularly for larger crises or contingencies. It is task-organized around a permanent command element and normally contains one or more Marine divisions, Marine aircraft wings, and Marine force service support groups. The Marine expeditionary force is capable of missions across the range of military operations, including amphibious assault and sustained operations ashore in any environment. It can operate from a sea base, a land base, or both. It may also contain other Service or foreign military forces assigned or attached to the MAGTF. Also called MEF. (Approved for inclusion in next version of MCRP 5-12C)

Marine expeditionary unit—A Marine air-ground task force that is constructed around an infantry battalion reinforced, a helicopter squadron reinforced, and a task-organized combat service support element. It normally fulfills Marine Corps forward sea-based deployment requirements. The Marine expeditionary unit provides an immediate reaction capability for crisis response and is capable of limited combat operations. It may contain other Service or foreign military forces assigned or attached. Also called MEU. (Approved for inclusion in next version of MCRP 5-12C)

Marine expeditionary unit (special operations capable)—The Marine Corps standard, forward-deployed, sea-based expeditionary organization. The MEU(SOC) is a MEU, augmented with selected personnel and equipment, that is trained and equipped with an enhanced capability to conduct amphibious operations and a variety of specialized missions, of limited scope and duration. These capabilities include specialized demolition, clandestine reconnaissance and surveillance, raids, in-extremis hostage recovery, and enabling operations for follow-on forces. The Marine expeditionary unit (special operations capable) is not a special operations force but, when directed by the National Command Authorities, the combatant commander in chief, and/or other operational commander, may conduct limited special operations in extremis, when other forces are inappropriate or unavailable. It may also contain other Service or foreign military forces assigned or attached to the Marine air-ground task force. Also called MEU (SOC). (Approved for inclusion in next version of MCRP 5-12C)

measurement and signature intelligence—Scientific and technical intelligence obtained by quantitative and qualitative analysis of data (metric, angle, spatial, wavelength, time dependence, modulation, plasma, and hydromagnetic) derived from specific technical sensors for the purpose of identifying any distinctive features associated with the target. The detected feature may be either reflected or emitted. (JP 1-02)

medium-scale map—A map having a scale larger than 1:600,000 and smaller than 1:75,000. (JP 1-02)

meteorological data—Meteorological facts pertaining to the atmosphere, such as wind, temperature, air density, and other phenomena which affect military operations. (JP 1-02)

military operations other than war—Operations that encompass the use of military capabilities across the range of military operations short of war. These military actions can be applied to complement any combination of the other instruments of national power and occur before, during, and after war. Also called MOOTW. (JP 1-02)

modified combined obstacle overlay—A product used to depict the battlespace's effects on military operations. It is normally based on a product depicting all obstacles to mobility, modified to also depict the following, which are not prescriptive nor inclusive: cross-country mobility classifications (such as RESTRICTED); objectives; avenues of approach and mobility corridors; likely locations of countermobility obstacle systems; likely engagement areas; and key terrain. Also called MCOO. (MCRP 5-12C)

multinational operations—A collective term to describe military actions conducted by forces of two or more nations, typically organized within the structure of a coalition or alliance. (JP 1-02)

multi-spectral imagery—The image of an object obtained simultaneously in a number of discrete spectral bands. (JP 1-02)

munitions effects assessment. Conducted concurrently and interactively with battle damage assessment, the assessment of the military force applied in terms of the weapon system and munitions effectiveness to determine and

recommend any required changes to the methodology, tactics, weapon system, munitions, fusing and/or weapon delivery parameters to increase force effectiveness. Munitions effects assessment is primarily the responsibility of operations with required inputs and coordination from the intelligence community. Also called MEA. (Proposed by JP 3-60 for inclusion in JP 1-02.)

named area of interest—A point or area along a particular avenue of approach through which enemy activity is expected to occur. Activity or lack of activity within a named area of interest will help to confirm or deny a particular enemy course of action. Also called NAI. (MCRP 5-12C)

national intelligence support team—A nationally sourced team composed of intelligence and communications experts from either Defense Intelligence Agency, Central Intelligence Agency, National Security Agency, or any combination of these agencies. Also called NIST. (JP 1-02)

near real time—Pertaining to the timeliness of data or information which has been delayed by the time required for electronic communication and automatic data processing. This implies that there are no significant delays. (JP 1-02)

noncombatant evacuation operations—Operations directed by the Department of State, the Department of Defense, or other appropriate authority whereby noncombatants are evacuated from foreign countries when their lives are endangered by war, civil unrest, or natural disaster to safe havens or to the United States. Also called NEO. (JP 1-02)

no-strike target list—A list designated by a commander containing targets not to be destroyed. Destruction of targets on the list would interfere with or unduly hamper projected friendly military operations, or friendly relations with indigenous personnel or governments. (JP 1-02)

open-source intelligence—Information of potential intelligence value that is available to the general public. (JP 1-02)

operational architecture—A description (often graphical) of the operational elements, assigned tasks, and information flows required to support the warfighter. It defines the type of information, the frequency of exchange, and what tasks are supported by these information exchanges. (MCRP 5-12C)

operational control—Transferable command authority that may be exercised by commanders at any echelon at or below the level of combatant command. Operational control is inherent in combatant command (command authority). Operational control may be delegated and is the authority to perform those functions of command over subordinate forces involving organizing and employing commands and forces, assigning tasks, designating objectives, and giving authoritative direction necessary to accomplish the mission. Operational control includes authoritative direction over all aspects of military operations and joint training necessary to accomplish missions assigned to the command. Operational control should be exercised through the commanders of subordinate organizations. Normally this authority is exercised through subordinate joint force commanders and service and/or functional component commanders. Operational control normally provides full authority to organize commands and forces and to employ those forces as the commander in operational control considers necessary to accomplish assigned missions. Operational control does not, in and of itself, include authoritative direction for logistics or matters of administration, discipline, internal organization, or unit training. Also called OPCON. (JP 1-02)

operations control and analysis center—Main node for the command and control of radio battalion signals intelligence operations and the overall coordination of MAGTF signals intelli-

gence operations. Processes, analyzes, produces, and disseminates signals intelligence-derived information and directs the ground-based electronic warfare activities of the radio battalion. Also called OCAC. (MCRP 5-12C)

operational level of war—The level of war at which campaigns and major operations are planned, conducted, and sustained to accomplish strategic objectives within theaters or areas of operations. Activities at this level link tactics and strategy by establishing operational objectives needed to accomplish the strategic objectives, sequencing events to achieve the operational objectives, initiating actions, and applying resources to bring about and sustain these events. These activities imply a broader dimension of time or space than do tactics; they ensure the logistic and administrative support of tactical forces, and provide the means by which tactical successes are exploited to achieve strategic objectives. (JP 1-02)

order of battle—The identification, strength, command structure, and disposition of the personnel, units, and equipment of any military force. Also called OOB. (JP 1-02)

paramilitary forces—Forces or groups which are distinct from the regular armed forces of any country, but resembling them in organization, equipment, training, or mission. (JP 1-02)

physical damage assessment—The estimate of the quantitative extent of physical damage (through munitions blast, fragmentation, and/or fire damage effects) to a target resulting from the application of military force. This assessment is based upon observed or interpreted damage. (Proposed by JP 3-60 for inclusion in JP 1-02.)

planned targets—Targets that are known to exist in an operational area and which effects are scheduled in advance or are on-call. Examples range from targets on joint target lists (JTLs) in applicable campaign plans, to targets detected in sufficient time to list in the air tasking order (ATO), mission-type orders, or fire support plans. Planned targets have two subcategories: *scheduled* or *on call.* (Proposed by JP 3-60 for inclusion in JP 1-02.)

priority intelligence requirements—1. Those intelligence requirements for which a commander has an anticipated and stated priority in his task of planning and decisionmaking. Also called PIR. (JP 1-02) **2.** In Marine Corps usage, an intelligence requirement associated with a decision that will critically affect the overall success of the command's mission. (MCRP 5-12C)

production—The conversion of information into intelligence through the integration, analysis, evaluation, and interpretation of all-source data and the preparation of intelligence products in support of known or anticipated user requirements. Production is a process of synthesis—the most important action in developing usable intelligence for the commander. (MCWP 2-1)

production management—Encompasses determining the scope, content, and format of each intelligence product, developing a plan and schedule for the development of each product, assigning priorities among the various production requirements, allocating processing, exploitation, and production resources, and integrating production efforts with intelligence collection and dissemination. (MCRP 5-12C)

reach back—The ability to exploit resources, capabilities, expertise, etc., not physically located in the theater or a joint operations area, when established. (MCRP 5-12C)

reactive target—The method used for targeting targets of opportunity. It is used when time and situation do not allow for targeting; i.e., during deliberate targeting, during an attack, when defending against an attack, or upon discovery of the location of a target such as a

radio jammer, tank, or antiaircraft weapon. (MCRP 5-12C)

reattack recommendation—An assessment, derived from the results of battle damage assessment and munitions effects assessment, providing the commander systematic advice on reattack of targets and further target selection to achieve objectives. The reattack recommendation considers objective achievement, target, and aimpoint selection, attack timing, tactics, weapon system and munitions selection. The reattack recommendation is a combined operations and intelligence function. (Proposed by JP 3-60 for inclusion in JP 1-02.)

request for information—Any specific time-sensitive ad hoc requirement for intelligence information or products to support an ongoing crisis or operation not necessarily related to standing requirements or scheduled intelligence production. A request for information can be initiated to respond to operational requirements and will be validated in accordance with the theater command's procedures. (JP 1-02)

scheduled targets—Planned targets that are known to exist in an operational area and are located in sufficient time for deliberate planning to meet specific campaign objectives. (Proposed by JP 3-60 for inclusion in JP 1-02.)

scientific and technical intelligence—The product resulting from the collection, evaluation, analysis, and interpretation of foreign scientific and technical information which covers: **a**. foreign developments in basic and applied research and in applied engineering techniques; and **b**. scientific and technical characteristics, capabilities, and limitations of all foreign military systems, weapons, weapon systems, and materiel, the research and development related thereto, and the production methods employed for their manufacture. (JP 1-02)

SECRET internet protocol router network—Worldwide SECRET level packet switch network that uses high-speed internet protocol routers and high-capacity Defense Information Systems Network circuitry. Also called SIPRNET. (JP 1-02)

sensitive compartmented information—All information and materials bearing special community controls indicating restricted handling within present and future community intelligence collection programs and their end products for which community systems of compartmentation have been or will be formally established. Also called SCI. (JP 1-02)

sensitive compartmented information facility—An accredited area, room, group of rooms, or installation where sensitive compartmented information may be stored, used, discussed, and/or electronically processed. SCIF procedural and physical measures prevent the free access of persons unless they have been formally indoctrinated for the particular SCI authorized for use or storage within the SCIF. (JP 1-02)

sensor data—Data derived from sensors whose primary mission is surveillance or target acquisition, such as air surveillance radars, counterbattery radars, and remote ground sensors. (MCRP 5-12C)

sequel(s)—Major operations that follow the current major operations. Plans for these are based on the possible outcomes (success, stalemate, or defeat) associated with the current operation. (MCRP 5-12C)

signals intelligence—1. A category of intelligence comprising either individually or in combination all communications intelligence, electronics intelligence, and foreign instrumentation signals intelligence, however transmitted. **2.** Intelligence derived from communications, electronics, and foreign instrumentation signals. Also called SIGINT. (JP 1-02)

situational awareness—Knowledge and understanding of the current situation which promotes timely, relevant, and accurate assessment of

friendly, enemy, and other operations within the battlespace in order to facilitate decisionmaking. An informational perspective and skill that foster an ability to determine quickly the context and relevance of events that are unfolding. (MCRP 5-12C)

special purpose Marine air-ground task force—A Marine air-ground task force organized, trained and equipped with narrowly focused capabilities. It is designed to accomplish a specific mission, often of limited scope and duration. It may be any size, but normally it is a relatively small force--the size of a Marine expeditionary unit or smaller. It may contain other Service or foreign military forces assigned or attached to the Marine air-ground task force. Also called SPMAGTF. (Approved for inclusion in next version of MCRP 5-12C)

staff cognizance—The broad responsibility and authority over designated staff functions assigned to a general or executive staff officer (or their subordinate staff officers) in their area of primary interest. These responsibilities and authorities can range from coordination within the staff to the assignment or delegation to the staff officer by the commander to exercise authority for a specified warfighting function or sub-function. Staff cognizance includes the responsibility for effective use of available resources and may include the authority for planning the employment of, organizing, assigning tasks, coordinating, and controlling forces for the accomplishment of assigned missions. Marine Corps orders and doctrine provide the notional staff cognizance for general or executive staff officers, which may be modified by the commander to meet requirements. (Draft MCWP 6-2)

surveillance and reconnaissance cell—Primary element responsible for the supervision of MAGTF intelligence collection operations. Directs, coordinates, and monitors intelligence collection operations conducted by organic, attached, and direct support collection assets. Also called SARC. (Change approved for inclusion in next version of MCRP 5-12C)

sustained operations ashore—The employment of Marine Corps forces on land for an extended duration. It can occur with or without sustainment from the sea. Also called SOA. (MCRP 5-12C)

synthesis—In intelligence usage, the examining and combining of processed information with other information and intelligence for final interpretation. (JP 1-02) Note: The piecing of information into a coherent, meaningful picture of the battlespace based on the ongoing or previous analysis of information and events taking place in the area of operations.

tactical intelligence—Intelligence that is required for planning and conducting tactical operations. (JP 1-02) In Marine Corps usage, tactical intelligence is concerned primarily with the location, capabilities, and possible intentions of enemy units on the battlefield and with the tactical aspects of terrain and weather within the battlespace. (MCRP 5-12C)

tactical effect—Result of action(s) at the individual unit, mission, or engagement level. Can be either direct or indirect, and typically acts in concert with other tactical effects to produce results at higher levels of war. (Proposed by JP 3-60 for inclusion in JP 1-02.)

target—A geographical area, complex, or installation planned for capture or destruction by military forces. (JP 1-02)

target analysis—An examination of potential targets to determine military importance, priority of attack, and weapons required to obtain a desired level of damage or casualties. (JP 1-02)

targeted area of interest—The geographical area or point along a mobility corridor where successful interdiction will cause the enemy to either abandon a particular course of action or

require him/her to use specialized engineer support to continue, where the enemy can be acquired and engaged by friendly forces. Not all targeted areas of interest will form part of the friendly course of action; only targeted areas of interest associated with high-payoff targets are of interest to the staff. These are identified during staff planning and war-gaming. Target areas of interest differ from engagement areas in degree. Engagement areas plan for the use of all available weapons. Targeted areas of interest might be engaged by a single weapon. Also called TAI. (MCRP 5-12C)

target complex—A geographically integrated series of target concentrations. (JP 1-02)

target component—A major element of a target complex or target. It is any machinery, structure, personnel, or other productive asset that contributes to the operation or output of the target complex or target. (JP 1-02)

target concentration—A grouping of geographically proximate targets. (JP 1-02)

target critical damage point—The part of a target component that is most vital. Also called critical node. (JP 1-02)

target dossier—A file of assembled target intelligence about a specific geographic area. (JP 1-02)

target folder—A folder containing target intelligence and related materials prepared for planning and executing action against a specific target. (JP 1-02)

targeting—The process to detect, select, and prioritize targets, match the appropriate action, and assess the resulting effects based on the commander's objective, guidance, and intent. (Proposed by JP 3-60 for inclusion in JP 1-02.)

target intelligence—Intelligence which portrays and locates the components of a target or target complex and indicates its vulnerability and relative importance. (JP 1-02)

target materials—Graphic, textual, tabular, digital, video, or other presentations of target intelligence, primarily designed to support operations against designated targets by one or more weapon(s) systems. Target materials are suitable for training, planning, executing, and evaluating military operations. (JP 1-02)

target of opportunity—A target visible to a surface or air sensor or observer, which is within range of available weapons and against which fire has not been scheduled or requested. (JP 1-02)

target priority—A grouping of targets with the indicated sequence of attack. (JP 1-02)

target signature—The characteristic pattern of a target displayed by detection and identification equipment. (JP 1-02)

target stress point—The weakest point (most vulnerable to damage) on the critical damage point. Also called vulnerable node. (JP 1-02)

target system—1. All the targets situated in a particular geographic area and functionally related. (DOD) **2.** A group of targets which are so related that their destruction will produce some particular effect desired by the attacker. (JP 1-02)

target system assessment—The broad assessment of the overall impact and effectiveness of the full spectrum of military force applied against the operation of an enemy target system or total combat effectiveness (including significant subdivisions of the system) relative to the operational objectives established. (Proposed by JP 3-60 for inclusion in JP 1-02.)

target system component—A set of targets belonging to one or more groups of industries and basic utilities required to produce compo-

nent parts of an end product such as periscopes, or one type of a series of interrelated commodities, such as aviation gasoline. (JP 1-02)

technical control—The performance of specialized or professional service, or the exercise of professional guidance or direction through the establishment of policies and procedures. (Proposed USMC definition per MCWP 6-2 and the next revision of MCRP 5-12C.)

tempo—The relative speed and rhythm of military operations over time. (MCRP 5-12C)

terrain analysis—The collection, analysis, evaluation, and interpretation of geographic information on the natural and manmade features of the terrain, combined with other relevant factors, to predict the effect of the terrain on military operations. (JP 1-02)

terrain study—An analysis and interpretation of natural and manmade features of an area, their effects on military operations, and the effect of weather and climate on these features. (JP 1-02)

time-sensitive targets—Those targets requiring immediate response because they pose (or will soon pose) a clear and present danger to friendly forces or are highly lucrative, fleeting targets of opportunity. (JP 1-02)

validation—A process normally associated with the collection of intelligence that provides official status to an identified requirement and confirms that the requirement is appropriate for a given collector and has not been previously satisfied. (JP 1-02)

vulnerability—1. The susceptibility of a nation or military force to any action by any means through which its war potential or combat effectiveness may be reduced or its will to fight diminished. **2.** The characteristics of a system which cause it to suffer a definite degradation (incapability to perform the designated mission) as a result of having been subjected to a certain level of effects in an unnatural (manmade) hostile environment. **3.** In information operations, a weakness in information system security design, procedures, implementation, or internal controls that could be exploited to gain unauthorized access to information or an information system. (JP 1-02)

warfighting functions—The six mutually supporting military activities integrated in the conduct of all military operations are:

1. **command and control**—The means by which a commander recognizes what needs to be done and sees to it that appropriate actions are taken.
2. **maneuver**—The movement of forces for the purpose of gaining an advantage over the enemy.
3. **fires**—Those means used to delay, disrupt, degrade, or destroy enemy capabilities, forces, or facilities as well as affect the enemy's will to fight.
4. **intelligence**—Knowledge about the enemy or the surrounding environment needed to support decision-making.
5. **logistics**—All activities required to move and sustain military forces.
6. **force protection**—Actions or efforts used to safeguard own centers of gravity while protecting, concealing, reducing, or eliminating friendly critical vulnerabilities. (MCRP 5-12C)

weaponeering—The process of determining the quantity of a specific type of lethal or nonlethal weapons required to achieve a specific level of damage to a given target, considering target vulnerability, weapon effect, munitions delivery accuracy, damage criteria, probability of kill, and weapon reliability. (JP 1-02)

CHAPTER 1

INTRODUCTION

Section I. GENERAL

1. Purpose

The purpose of this manual is to present a standard approach to traffic analysis problems of the military type in order to furnish signal intelligence personnel with a knowledge of traffic analysis techniques, capabilities, and applications. It is to be recognized that no text on analytic techniques can be definitive because techniques are subject to continual improvement and change in order to meet changing problems. This text is intended merely as a guide. Specific application is dependent on the ability and ingenuity of the analyst.

2. Scope

This manual is concerned only with traffic analysis of military radio communications, but the techniques covered will also be found of value in the analysis of other kinds of communication networks. Discussion of other means of communication, such as wire or cable, has not been included; in the reconstruction of the radio communication system it should be remembered that often these other means will account for missing portions of the system. Further, the scope is limited to the study of Morse transmissions. Non-Morse transmissions, such as radio-teletype and radio-telephone, are not discussed. The differences, however, are largely technical and procedural and involve the material transmitted only to a limited extent. It is thought, therefore, that this text will serve as a basis for all traffic analysis and that, with some minor modification, the methodology described will be found applicable to all types of transmission.

REF ID:A58489

3. References

A general knowledge of radio theory, Morse code, and radio procedure is assumed. For reference purposes the field and technical manuals listed in the appendix will be found useful.

4. Definition of Traffic Analysis

Traffic analysis is that branch of signal intelligence analysis which deals with the study of the external characteristics of signal communications and related materials for the purpose of obtaining information concerning the organization and operation of a communication system. This information is used (1) as a guide to efficient intercept operation, (2) as an aid to cryptanalysis, and (3) as a basis for drawing deductions and inferences of value as intelligence even in the absence of specific knowledge of the contents of the message.

5. Objectives

To achieve planned and coordinated action, it is necessary for the components of a military force to communicate with each other from the highest headquarters through all intermediary channels to the individual man in the field or the airplane in the air. Much of this communication, for reason of speed and efficiency, is conducted by radio, and radio is vulnerable to intercept. Therefore, disguises are devised to conceal both the traffic passed and the structure of the communication network. Traffic is disguised through the employment of codes and ciphers, and it is the task of cryptanalysis to solve these codes and ciphers. The communications net work is disguised through the use of a number of techniques which relate, for example, to the use of call signs and frequencies, the method of routing messages, and the use of secret procedure signs. These techniques, the means for attacking them, and the resulting reconstruction of the network are the study of traffic analysis. The responsibility of the traffic analyst, however, does not stop with the reconstruction of the communication network. It is also part of his mission to discover practical applications for his knowledge in the associated fields of intercept, cryptanalysis, intelligence, and security. The objectives of traffic analysis, then, fall into two main groups:

a. The acquisition of a detailed knowledge and a complete understanding of a communications network. This involves the reconstruction of the nets, the determination of the features of their operation, the solution of call sign and routing systems, analysis of the components of the message externals, the interpretation of radio procedure, and the use of the various cryptographic systems passed; in

REF ID:A58489

other words, everything about communications except the actual cryptanalysis of the text.

b. The application of this knowledge to—

(1) *Intercept operations.* Traffic analysis contributes to three aspects of the intercept problem. First, by providing the intercept station with certain necessary information, such as call sign and frequency lists, target locations, schedules, etc., it assists the station in the accomplishment of its mission and encourages the best possible results. Second, in coordination with cryptanalytic and intelligence interests, it determines the priorities governing the interception of individual circuits. Third, through a study of intercept, it checks the performance of the station in relation to its mission.

(2) *Cryptanalysis.* Aid to cryptanalysis is furnished in a great variety of ways, largely dependent on the cryptanalytic and traffic analytic peculiarities of the communications under study. *In most instances, traffic analysis and cryptanalysis become so interrelated that it is impossible to determine where one begins and the other leaves off, and it is necessary to set an arbitrary dividing line.* In general, however, assistance takes the following forms: the solution of the routing systems, where disguised, and the placing of the routings in the clear on traffic; the study of the uses of the various cryptographic systems; the reading of chatter for items of cryptanalytic interest; the discovery of crib, or stereotype, texts from message externals; the location of isolog messages; and the application of other traffic analysis data, such as message serial numbers, which may be of value in specific cryptanalytic problems.

(3) *Intelligence.* Military communications, including both the organization of the nets and the traffic passed, reflect the disposition of troops and the intentions for movements and operations. A careful analysis, therefore, of net structure, traffic contacts and patterns, traffic volumes, and similar signals features, assists in the building of the final intelligence picture. The exact techniques to be used are, again, dependent on the individual problem and involve the recruitment, training, organization, and order of battle of the military forces under study as well as characteristics of communications.

(4) *Security.* Because the traffic analyst becomes skilled in probing the weaknesses of communication systems, he is in an ideal position to assist in maintaining high standards of security within our own communication networks. This function of traffic analysis is mentioned merely in passing. It will not be discussed further in this text.

REF ID:A58489

Section II. GENERAL APPROACH

6. The Raw Material

The traffic analyst begins his study of a communications network with three types of raw (basic) data:

a. INTERCEPT DATA. This is the information supplied by the intercept operator. It consists of the frequencies to which he is listening, the times during which he hears signals, and occasional comments such as notes on the quality of the signal or the characteristics of the radio operator.

b. THE TRANSMISSION. The transmission is the sum total of everything sent by the radio operators. It includes the initial call-up, the exchange of call signs, the traffic, servicing, miscellaneous chatter, and signing off. Traffic may be divided into two parts: the message externals (preamble and postamble) and the text. The externals generally contain radio station and message center numbers of a variety of types, routing instructions, addresses, precedence indicators, and file times, all of value in traffic analysis. The text usually exhibits a number of cryptographic features in the clear which are likewise of use.

c. COLLATERAL INFORMATION. Besides the above material, there is a large amount of data which is available or which can be made available for traffic analysis purposes. Some of these are directly related to intercept, such as goniometric bearings. Other items are message decodes, captured documents, and intelligence reports.

7. The Analytic Approach

a. Traffic analysis is partly analytic, partly synthetic. Analysis is performed on each feature of the communications network and then, through exploiting the relationships between these features or within them, traffic analysis synthesizes them into a unified whole. In other words, the types of raw data noted in paragraph 6 are first analyzed until everything possible is known about each item independently, after which, though often seemingly unrelated, they can be pieced together to produce a complete picture of the radio nets. This means that the analyst must pay particular attention to detail and must carry much of this detail in his mind so that he can readily perceive the relationships between discrete items and integrate them to form the whole.

b. The actual approach to a traffic analysis problem is broadly determined by the stage of development of the problem. These stages of development are threefold, but it should be understood that what is represented are not clear-cut divisions in operation, but rather, gradual shiftings of emphasis as the problem matures.

REF ID:A58489

(1) *Initial attack.* (*a*) In the initial period, little is known about the problem and it may first be necessary to identify the radio nets and traffic involved so that they can be distinguished from all other types. When this has been accomplished, the characteristics are furnished to the intercept station which embarks on a large-scale search mission, scanning the entire range of frequencies for transmissions of the desired nature. During this time, it is the task of the traffic analyst to give direction to this mission and to evolve from it a definite assignment. It should be noted here that the search mission, in reduced scale, should always continue until the problem has ceased to exist, in order to cover new net developments.

(*b*) As soon as material begins to accumulate, an elementary study may be conducted on the elements of the transmission, particularly the message externals. The functions of the various preamble components should be observed, the method of routing noted, and in general, the significance of each component determined.

(2) *Development.* During the second period, emphasis is placed on the study of the communications system with a view to learning all its details of organization, operation, and procedure. There are usually two phases to this: the research phase, which involves thorough analysis of every item, such as call signs, procedure signs, message numbers, routing codes, and cryptographic features; and the actual net reconstruction, consisting of the building of the entire radio net complete with call signs, frequencies, schedules, and station locations.

(3) *Application.* When this knowledge has been gained, and even while it is being gained, it can be put to use in the three related fields of control, cryptanalysis, and intelligence. From the very first moment that traffic analysis is performed, it begins contributing to these phases of communications intelligence, but it is not until a substantial amount of information has been gathered that these applications receive full emphasis. The final goal of traffic analysis operations is the reconstruction of the complete radio network against its cryptographic and order of battle background, and the production on a day-to-day basis of items of cryptanalytic application and intelligence importance.

REF ID:A58489

CHAPTER 2

RADIO OPERATIONS

Section I. INTRODUCTION

8. Radio Operations

a. The operation of a radio network requires a set of fixed rules and regulations which define the manner and form of communications. These rules are in part subject to the laws of nature, in part to the necessities of communication itself, and in part to the whim and ingenuity of the personnel formulating them. The first two factors impose some degree of uniformity on radio networks, no matter what the type or nationality. This makes it possible to set down the basic features of communications, e.g., call signs, frequencies, message numbers, and routing instructions. However, the third factor acts to vary those features by determining the way that they are used. This chapter outlines what these basic features are and some of the ways in which they may be manipulated. It is, of course, not possible to include all the types which may be encountered, but it is hoped that what is given will serve to indicate the general patterns the traffic analyst is likely to meet in studying radio operations and will serve to set up general lines of traffic analysis thinking.

9. Phases of Radio Operations

Radio operations for purposes of study may be divided into four main phases:

a. Operating Data. The first considerations in the creation of a communication net relate to the structure or form of the net, the use of frequencies and call signs, and the system of schedules. These are the basic operating data of the net and involve its mechanical functioning. In the case of some nets, the military for instance, attempts are made to conceal these data; in other cases, such as commercial, they can be determined with little effort.

b. The Radio Transmission. Once the operating data have been determined, the next step is to devise the form and language of radio transmission. There must be regulations governing the Morse code to be used (largely dependent on the alphabet concerned), the pro-

REF ID:A58489

cedure signals which make for brevity and speed and which may be encoded for reasons of security, the order of elements in the transmission, the plain-language chatter of the radio operators, and the plain-language and simple cipher messages usually considered part of the traffic analysis task.

c. THE MESSAGE EXTERNALS. The message externals are actually a part of the radio transmission and belong under *b* above, but because of their importance a separate section (sec. IV, this ch.) is devoted to them. They include the preamble and postamble and generally contain serial numbers of various types, group check, file date and time, precedence indicators, and routing instructions.

d. TEXTUAL FEATURES. Some of the cryptographic aspects of the text are in the clear to make possible proper handling of the traffic by message center personnel and to permit decrypting. These features in the clear are often of great assistance to the traffic analyst. They may merely involve whether the text is in letters or numbers, or the length of the code groups, or they may be somewhat more complex as discriminants, indicators, or pad numbers.

Section II. OPERATING DATA

10. General

The operating data enable the network to function. They consist of the frequencies, call signs, and schedules used in communication. Traffic analysis is interested not only in the operating data as used by the network, but also in the general system on which the allocation of operating data to specific nets and radio stations is based. This section is devoted to a discussion of radio nets and of the ways in which the operating data are used and assigned.

11. Definitions

a. A radio network is composed of radio stations organized for the purpose of intercommunication. This organization is not haphazard but follows very definite and detailed patterns. These patterns are based on the order of battle since the lines of communication themselves must coincide with the echelon of command and the military requirements. Before it is possible to enter into a discussion of these patterns, however, it is necessary to define some of the terminology to be used.

(1) *Link:* Any system of telecommunication between two points.

(2) *Group:* One or more links whose stations work together as a communication entity under a common operating control.

REF ID:A58489

(3) *Net:* One group or a number of groups assembled on the basis of common operating characteristics, presumably under the administrative direction of an immediate common superior headquarters.

(4) *Network:* The radio system of a service of a nationality, as United States Army network, United States Naval network, United States Air Force network.

b. These definitions may appear somewhat obscure to the student for the moment, but it should be kept in mind that they are formulated from a traffic analysis point of view, that is, from the outside looking in. These terms must be so categorized in order to be of value analytically and, therefore, they represent the situation as it appears rather than as it actually is. Figure 1 will help to clarify these terms, and it is suggested that the student study the diagram from time to time as its understanding is essential to the proper approach to net reconstruction.

c. Figure 1 illustrates the general organization of the military network, proceeding from Department of the Army Headquarters through theater, army group, army, corps, and division. The equivalent Department of the Air Force organizations are shown in figure 2. (The following pertains equally to the Department of the Air Force.) Each line or connection represents a radio link within the terms of the definition in *a*(1) above—any telecommunication system between two points. It is to be emphasized that only *two* stations are involved in a link, never any more. Thus, the line from Department of the Army HQ to Theater "A" is a link; the line from Department of the Army HQ to Theater "B" is another; the line from 2d Corps to 1st Division is one; as is the connection from 1st Division to 2d Division. The links which form the triangle, 2d Corps, 1st Division, 2d Division, constitute a group; those forming the triangle, 2d Corps, 3d Division, 4th Division, constitute another. These links are placed in groups because they work together as a communication entity under a common operating control (the group control being at the highest headquarters of the group, here the 2d corps), yet do not, in themselves, comprise the complete net. The net is made up of the two groups together and is, in this instance, the 2d Corps net with the 2d Corps headquarters as net control. It should be observed that very often the link and the group may be the same thing, or the link, group, and net may be the same. Each definition of the larger unit enfolds the lesser. For example, the line from Department of the Army HQ to Theater "A" may be termed a link, for it is composed of only two stations, or a group because its stations work as a communication entity under the control of the Department of the Army station; the three links, or groups, however, running out from Department of the Army HQ form the Department of the Army net.

REF ID:A58489

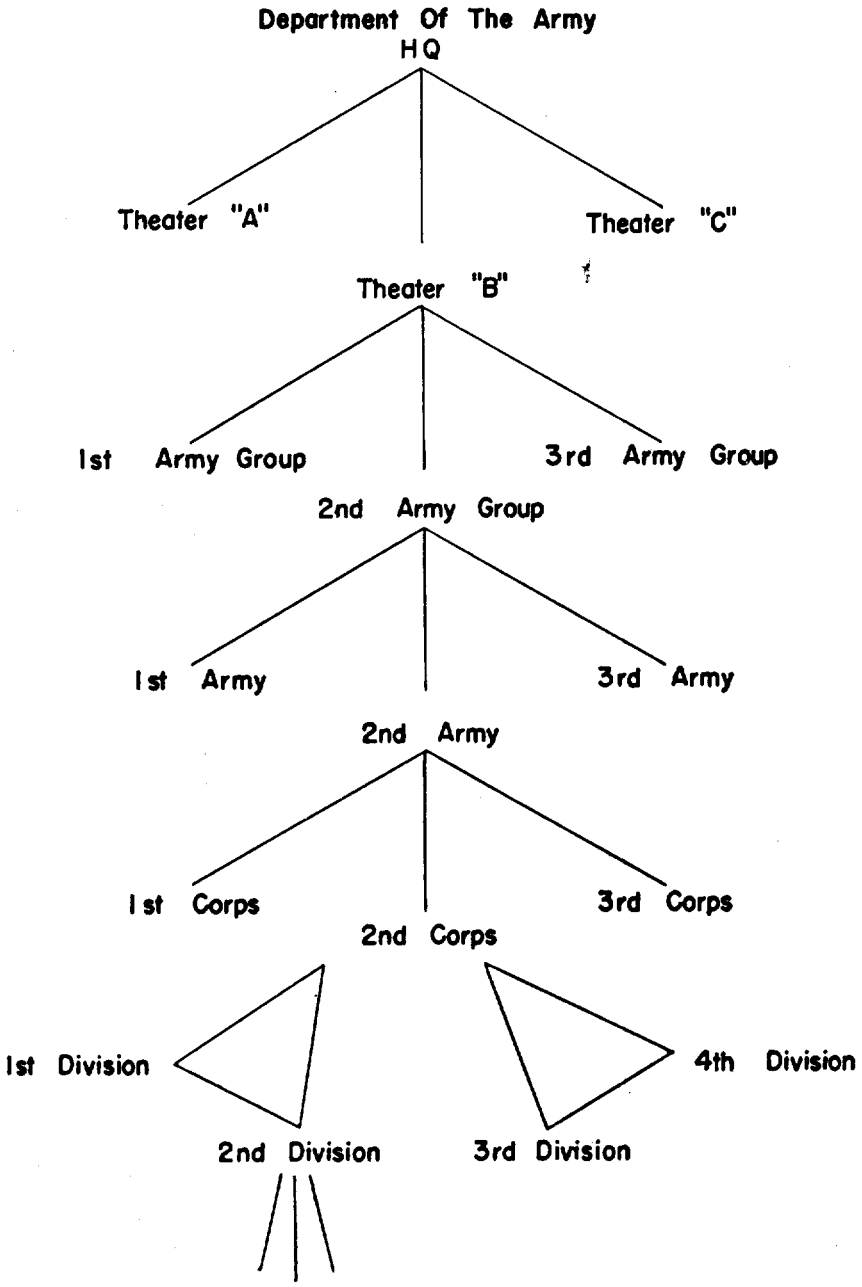

Figure 1. General organization of military network—United States Army.

REF ID:A58489

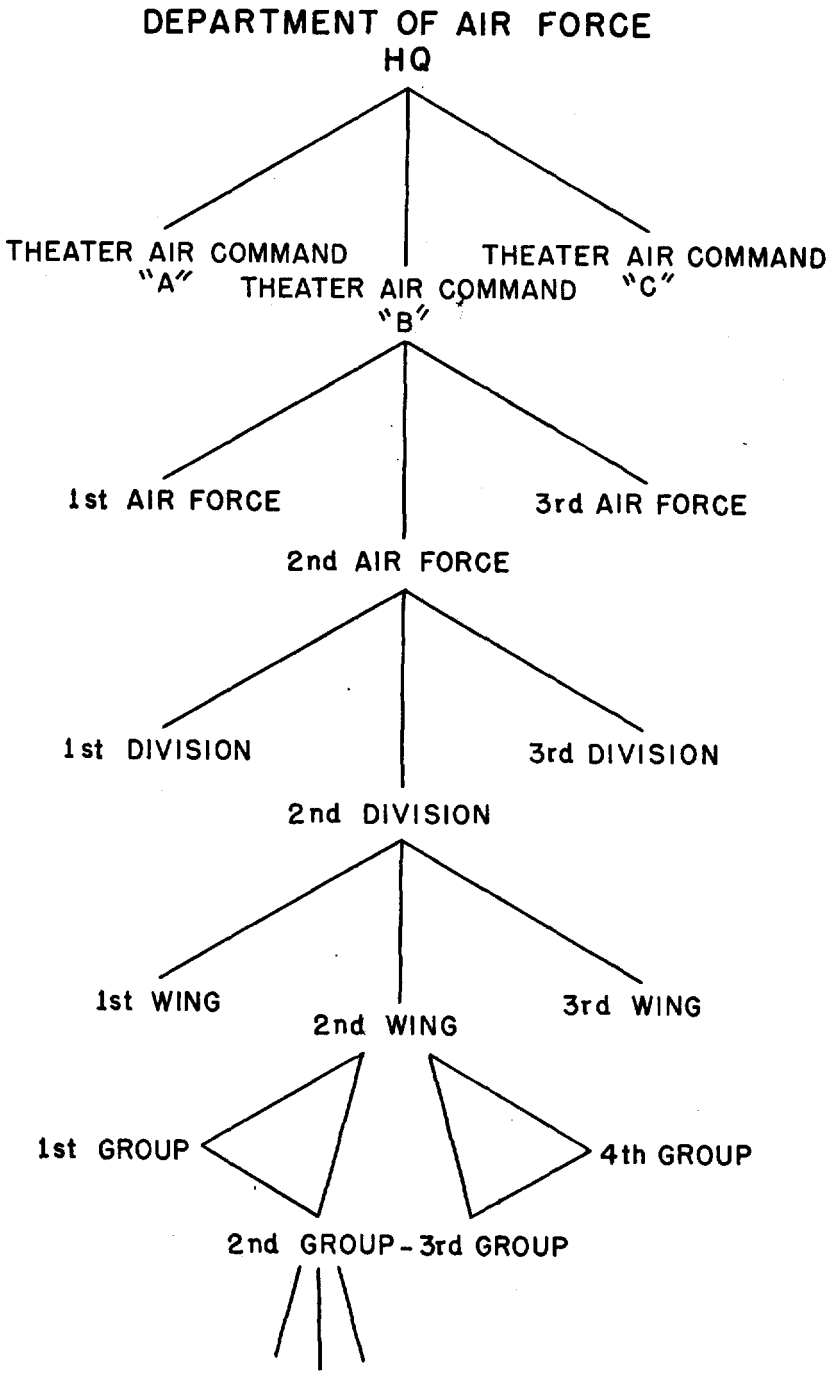

Figure 2. General organization of military network—United States Air Force.

REF ID:A58489

d. It will be recalled that, in discussing these definitions in *b* above, it was stated that they were formulated from an analytic point of view. This is particularly true of the definition of the net. In the reconstruction of the radio network, one of the first problems is the organizing of a number of radio links into groups and nets. In the case of the group, this is fairly simple to accomplish for the group is a communication entity, that is, all of its stations either work each other or have contact with a central operating control. The net, on the other hand, often does not exhibit such cohesive characteristics. A number of groups, apparently unrelated, may eventually fall into a single net when the order of battle is finally derived. There are two touchstones for the association of groups into nets:

(1) *Common operating characteristics.* Since the links and groups of the net all have a common superior headquarters, it may be assumed that certain rules of procedure and operation will be promulgated by this superior and that, therefore, all links and groups of the net will exhibit these in common.

(2) *Administrative direction of an immediate superior headquarters.* When the order of battle is known, it is often possible to associate groups and links through the knowledge that they are controlled by the same unit.

e. The net, the group, and the link, then, are merely units of organization in the radio network, just as armies are broken down into corps, divisions, regiments, companies, and platoons. Likewise, air forces are broken down into divisions, wings, groups, squadrons, and flights. And these nets, groups, and links may be characterized by the unit served and the function performed. For instance, figure 1 represents command channels so that there is a Department of the Army command net, a Theater "B" command net, a 2d Army Group command net, and so on. Radio, however, serves many other military functions than that of command. Military nets, for example, may be organized to contain an antiaircraft artillery group, an artillery air-ground group, an artillery observation group, a reconnaissance group, an air warning group, and others beside the command group.

12. Examples of Radio Nets

Figures 3 through 9 illustrate some of the type nets which may be encountered. These types will vary in individual instances; they serve, however, to indicate some of the possibilities.

13. Frequencies

a. GENERAL. The analysis of the use of frequencies on a network may be divided into two parts:

(1) *Systems of use.* The system of use is concerned with the manner in which frequencies are employed on the net, i.e., whether the entire net uses one frequency, whether each station sends on an individual frequency, etc.

(2) *Systems of allocation.* The system of allocation is the method used to assign specific frequencies for communications so that different stations will not interfere with each other. It also involves the rotation of frequencies for security purposes.

b. SYSTEMS OF USE. (1) *Simplex:* Two stations intercommunicating on the same frequency.

(*a*) A sends to B on 5,000 Kcs.

(*b*) B sends to A on 5,000 Kcs.

(2) *Complex sending* (fig. 10): Two or more stations on different sending frequencies. A different frequency is assigned to each radio transmitter in the net, and each transmitter uses its assigned frequency to contact the other stations.

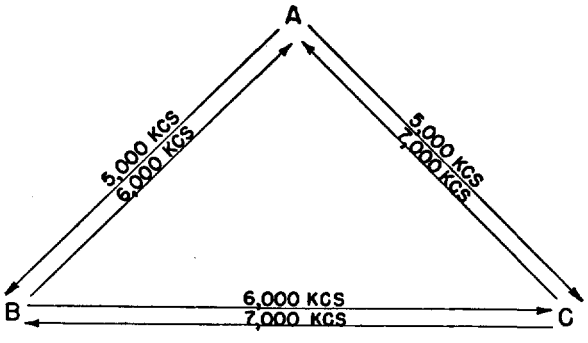

Figure 10.

(*a*) A sends to B and C on 5,000 Kcs.

(*b*) B sends to A and C on 6,000 Kcs.

(*c*) C sends to A and B on 7,000 Kcs.

(3) *Complex receiving* (fig. 11): Two or more stations on different receiving frequencies. A frequency is assigned to each station for receiving transmissions. All stations in the net when sending to a particular station will use the frequency assigned to the receiving station.

REF ID:A58489

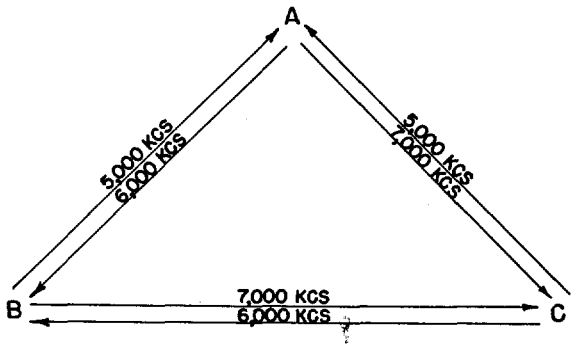

Figure 11.

(*a*) B and C send to A on 5,000 Kcs.

(*b*) A and C send to B on 6,000 Kcs.

(*c*) A and B send to C on 7,000 Kcs.

(4) *Star* (fig. 12): A number of stations on the same frequency with no normal lateral working. This is an extension of the simplex system, as the latter involves only two stations on the same frequency. In the star form, if one outstation wishes to contact another, it must obtain permission from control.

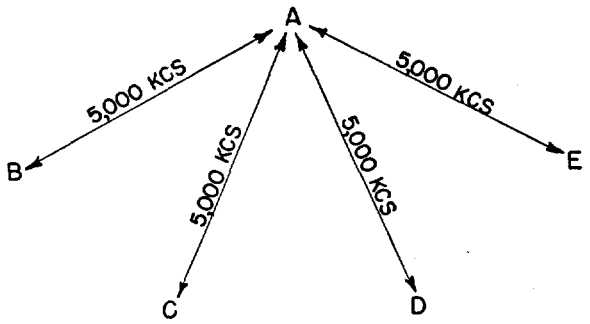

Figure 12.

(*a*) A sends to B, C, D, and E on 5,000 Kcs.

(*b*) B, C, D, and E send to A on 5,000 Kcs. B, C, D, and E may not intercommunicate without express authorization from A. Normally, messages between outstations will be relayed through A (control).

(5) *Star with lateral* (fig. 13): Number of stations on the same frequency with some lateral working. In many of the star nets, lateral working will be a regular procedure between some, but not all, of the outstations.

REF ID:A58489

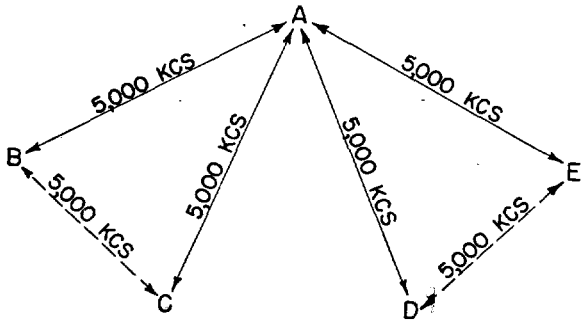

Figure 13.

(*a*) A sends to B, C, D, and E on 5,000 Kcs.
(*b*) B, C, D, and E send to A on 5,000 Kcs.
(*c*) B sends to C on 5,000 Kcs. and C to B on 5,000 Kcs.
(*d*) D sends to E on 5,000 Kcs. and E to D on 5,000 Kcs.

(6) *Free star* (fig. 14): Number of stations on the same frequency with free operation. One frequency is assigned to the entire net and any station in the net may contact any other on the assigned frequency.

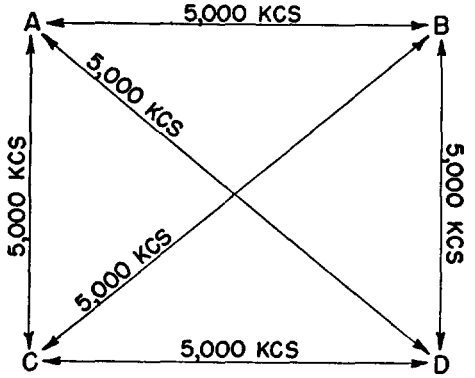

Figure 14.

(*a*) A sends to B, C, and D on 5,000 Kcs.
(*b*) B sends to A, C, and D on 5,000 Kcs.
(*c*) C sends to A, B, and D on 5,000 Kcs.
(*d*) D sends to A, B, and C on 5,000 Kcs.

(7) *Complex star* (fig. 15): Number of stations with control on one frequency, outstations on others. This is similar to the star in its form, but it uses several frequencies instead of only one. Often, a number of the outstations will operate on one frequency, others on another.

REF ID:A58489

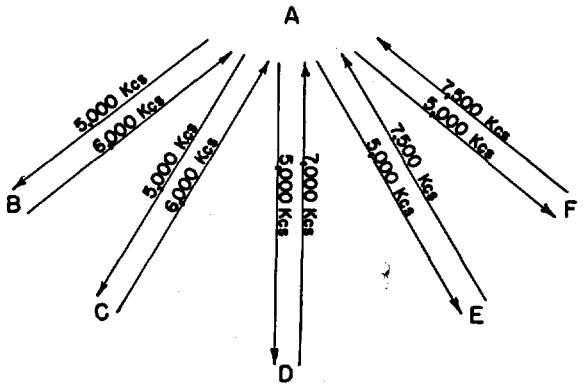

Figure 15.

(*a*) A sends to B, C, D, E, and F on 5,000 Kcs.
(*b*) B and C send to A on 6,000 Kcs.
(*c*) D sends to A on 7,000 Kcs.
(*d*) E and F send to A on 7,500 Kcs.

(8) *Broadcast* (fig. 16): A frequency is assigned to the broadcasting station. Usually no frequency is assigned to the outstations for reply.

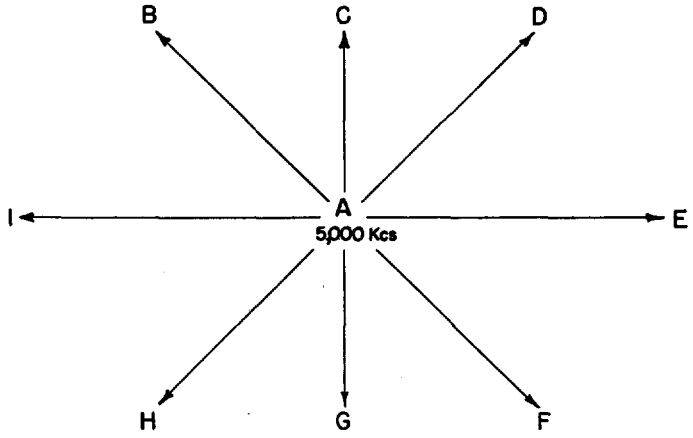

Figure 16.

(*a*) A sends to all stations simultaneously on 5,000 Kcs.

(*b*) Because a broadcast must be heard at so many scattered places, care must be taken in the selection of a frequency in order to choose one that will be heard by all stations. Sometimes, where this has not proved possible, double-keying is resorted to, i.e., the broadcasting station sends on two or more different frequencies at the

REF ID:A58489

same time. Outstations may receipt for traffic on regularly assigned frequencies in the net. In many such nets, however, no receipt is given.

c. SYSTEMS OF ALLOCATION. (1) *General.* Several factors enter into the selection of specific frequencies for use. These involve two basic considerations: readability (the ability of the receiving station to hear) and security. A number of miscellaneous factors, such as the type of power supply available, the nature of the transmitting and receiving equipment, and military and operational requirements, also affect the choice.

(2) *Readability.* The readability of a frequency is dependent on certain factors of wave propagation. These factors involve consideration of the distances between stations, ionospheric conditions, including night and day effects which usually make it necessary to allocate several frequencies to each radio station or net for night and day use, seasonal changes, and the type of terrain, e.g., water, high mountains, and jungle. Furthermore, the possibility of interference between transmitters on approximately the same frequency in the same area must be borne in mind and care taken to avoid such conflict. In any allotment of frequencies, therefore, central control must be established and an over-all plan of allocation devised.

(3) *Security.* One of the methods of attaining security against communications analysis is to hinder the act of intercept. This may be accomplished by changing frequency so that the intercept operator will be forced to "search" the entire frequency range for the desired transmissions. A second effect achieved by these changes is to increase the difficulty of identifying stations or units with frequencies. Maximum effectiveness is obtained by changing call signs along with the frequency. Plans for changes of frequency may operate in a patterned or random fashion, but in any event, such plans must take into consideration the factors noted under (2) above; thus these plans are usually rather detailed and complex.

(4) *Range of frequencies.* Frequencies may range from very low to ultra-high. The latter are not usable for long distance operation and find their chief applications in low echelon, air-ground, and plane to plane communication. Many of the applications of ultra-high frequency transmissions are still in the experimental stage. Low frequencies, such as 300 or 400 kilocycles, may be used for close field contact or air-ground and plane to plane nets. However, the major portion of military transmissions presently falls between 1,500 and 20,000 kcs. In passing, mention should also be made of the use of frequency modulation. FM has found its main application in tank, air, and small combat units where distances are not great and a minimum of noise level is desired for reception.

(5) *Secret frequencies.* As a countermeasure to possible jamming

RET ID: A584489

operations, some nets are provided with secret reserve frequencies These frequencies are not employed except in the case of jamming of the usual frequencies and circumstances demand that communication be kept open The secret frequency, of course, only remains secret for as long as it takes intercept to scan the bands and pick it up, but this interval may be sufficient to complete the transmission

(6) *Example of allocation of frequencies* The following chart illustrates a system which might be used for the allocation and rotation of frequencies

	Jan	*Feb*	*Mar*	*Apr*	*May*	*Jun*	*Jul*	*Aug*		*Dec*
A	1955	2035	2150	1910						
	2035	2150	1910	2305						
	2150	1910	2305	2070						
B	1910	2305	2070	2190						
	2305	2070	2190	2210						
	2070	2190	2210	1940						
C	2190	2210	1940	2350						
	2210	1940	2350	1925						
	1940	2350	1925	2240						
D	2350	1925	2240	1955						
	1925	2240	1955	2035						
	2240	1955	2035							

The months are listed across the top of the chart The squares are divided into three portions representing ten day periods within each month, 1–10, 11–20, 21–31 Each station of the net is assigned a letter and finds its frequency for each period in the square opposite the letter The frequencies which have been selected on the basis of their operational characteristics can be inscribed in the squares at random, in this instance, they are moved up one each month For example, on 1–10 January, A uses 1955 kilocycles, B, 1910 kilocycles, C, 2190 kilocycles On 11–20 January, A uses 2035 kilocycles, B, 2305 kilocycles, C, 2210 kilocycles

14. Call Signs

a General Call signs are actually names for the correspondents in a radio net They are usually composed of letters, numbers, or combinations of both and serve as a convenient means of identification The analysis of call signs falls into the same categories as does the study of frequencies systems of use, and systems of allocation

b Systems of Use (1) *Single station call* One call only is nor-

REF ID:A58489

mally used by the calling station This call may be either the sending station's or the receiving station's call

1 (ABC) _____ 2 (DEF)

Call up	1 to 2	DEF DEF DEF
	2 to 1	DEF DEF DEF
	or	
	1 to 2	DEF DEF DEF
	2 to 1	ABC ABC ABC

Note in this last instance that only one call was used by the calling station This makes the procedure single call even though the reply used a second call

(2) *Double-station call* Both the sending station s and the receiving station's calls are normally used by the calling station

1 (ABC) _____ 2 (DEF)

Call-up	1 to 2	DEF DEF DEF de ABC ABC ABC
	2 to 1	ABC ABC ABC de DEF DEF DEF

(3) *Link call* (fig 17) A common call sign is used for intercommunications between two stations Unlike the previous two types, here the call sign does not belong to an individual station but to a link

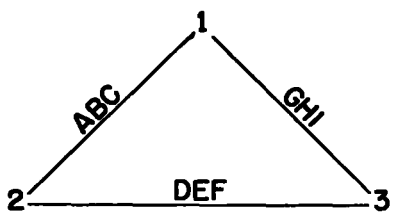

Figure 17

Call up	1 to 2	ABC ABC ABC
	2 to 1	ABC ABC ABC
	1 to 3	GHI GHI GHI
	3 to 1	GHI GHI GHI

(4) *Collective call* In addition to one of the above assignments, a collective call may also be allocated This call is used to alert all stations in the net preparatory to the transmission of broadcast traffic There are also some nets which are maintained only for broadcast purposes and this type of call is usually assigned to such groups The use of "CQ" may be classified under this heading

(5) *Split call working* Usually a single call is assigned to a transmitter or receiver position or to a link However, the use of separate calls for each frequency, one for day, one for night, is also valid This variation may be applied to any of the systems enumer-

REF ID: A684682

ated above and is known as split call working. It has the advantage of dissociating the night and day frequencies, but requires the use of twice as many calls.

(6) *Secondary calls.* In some systems of communication a secondary call is employed in conjunction with link call procedure. These secondary calls are of the station call type and serve as a more definite identification of each station than is supplied by the link call.

(7) *Authenticators.* In order to prevent outside stations from entering a net and confusing its operations, authenticators are sometimes used. They generally consist of a word or a combination of letters and/or digits to which there is a secret, prearranged reply.

c. SYSTEMS OF ALLOCATION. (1) *Composition.* Call signs may be composed of any combination of letters and/or numbers. Usually they are kept as brief as possible and the general range is from 2 to 5 characters. Calls may be composed at random or in some methodical fashion, such as the use of sliding alphabets. An example is included in *d* (2) below.

(2) *Methods of assignment.* Since calls are used as identifying marks, it is necessary to assign them so that two stations operating in proximity or in the same net do not have the same call. Otherwise, confusion would result on call-ups and the passage of traffic hindered. This necessitates some form of over-all control of call sign allocation. This control may be of a very tight nature in which every call is allotted from headquarters down to the smallest unit, or it may be rather loose with considerable discretion left to major subordinate groups whose commands are sufficiently separated geographically to prevent the possibility of confusion. A second consideration in the assignment of calls involves the problem of security since calls are identifications and thereby, if unchanged, furnish continuities for intercept and analysis. Most systems, therefore, cover not only the allotment of calls, but also provisions for change or rotation. These changes may be made daily, weekly, monthly, or at any other interval thought desirable. Calls which change frequently are called "changing calls", those which remain constant for some length of time, are called "fixed".

d. In general, call-sign systems may be divided into two basic groups:

(1) *Book systems.* These systems are founded on a call-sign book from which all calls are taken. These books will usually contain thousands of call signs and some method is provided for the allocation of calls from the book to individual radio stations. The recovery of these books often requires traffic intercept for a period of a year or more.

(2) *Cipher systems.* Call signs may be generated by the use of simple cipher devices such as sliding alphabets and square tables.

REF ID:A58489

The number of call signs available through such systems is usually limited and the method of assigning the call signs to individual radio stations is often bound up with the method for generating the calls. Figure 18 illustrates the use of a cipher system for the allocation and rotation of calls.

1	B	M	A	K	D
2	R	W	C	T	I
3	Z	G	N	O	U
4	H	L	S	X	E
5	V	J	P	F	Y

Figure 18.

The square is filled in random fashion. Station 1 begins with the letter "B" and takes off its calls in diagonal fashion, moving over one diagonal each day. At the end of each line, it drops down one line. Station 2 begins with "R", 3 with "Z", etc. Every 25 days, the calls repeat.

	Station No. ( )				
Date	1	2	3	4	5
1	BWN	RGS	ZLP	HJA	VMC
2	MCO	WNX	GSF	LPK	JAT
3	ATU	COE	NXY	SFD	PKI
4	KIZ	TUH	OEV	XYB	FDR
5	DRG	IZL	UHJ	EVM	YBW
6	RGS	ZLP	HJA	VMC	BWN
7	WNX	GSF	LPK	JAT	MCO

15. Times of Communication

a. GENERAL. An integral part of the operating data of the net is the setting of the times for communication. There are two main systems for accomplishing this: Unrestricted signaling and restricted signaling.

b. UNRESTRICTED SIGNALING. Under the system of unrestricted signaling, the stations of a net are free to contact each other at any time they choose. This method may be implemented either by the stations setting the time for the next schedule at the close of the

REF ID:A58489

previous one or by "alert" operating. In alert operating, which finds its greatest use in tactical and warning nets, all stations are always tuned to receive on certain assigned frequencies.

c. RESTRICTED SIGNALING. Restricted signaling limits the time at which contacts may be made between two radio stations. It is divided into two types: period signaling and priority signaling.

(1) *Period signaling.* The times of communication are assigned by definite schedule and contacts are made only at those specific times.

(2) *Priority signaling.* Priority signaling sets down a definite order in which the stations of a net will send traffic. It differs from unrestricted signaling in that one station may not call another at any time; and from period signaling in that no particular time is set aside for one station to call another. An example of priority signaling is shown in figure 19.

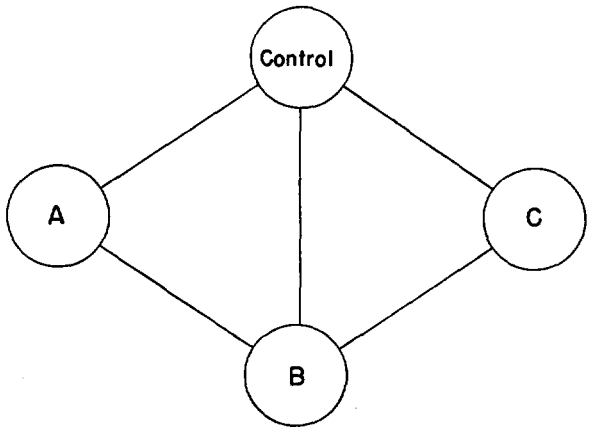

Figure 19.

In this net, "control" is permitted to send first, then stations A, B, and C in order. Schedules may be set up for the hours at which "control" comes on the air.

Section III. ELEMENTS OF RADIO PROCEDURE

16. Morse Code

Morse code is a system of dots and dashes used to transmit letters and numbers by electrical means. In the case of the English alphabet the Morse code is standardized by international convention, is used the world over, and is known as International Morse. In the instance of some nations whose alphabets differ from the English, however, special combinations of dots and dashes have been devised. For

REF ID:A58489

example, in German Morse, the German letters which correspond to the English follow the International, but the umlauted letters and "ch", for which there are no equivalents, are designated by new combinations:

A .—.—
O ———.
U ..——
CH ————

Morse code may be transmitted automatically or manually. In lower-echelon communications, the latter is usually employed, in the higher echelons sending is often automatic. Automatic transmission permits of speeds as high as 400 or 500 words per minute, though generally it averages somewhere between 75 and 200. Manual sending of coded traffic rarely rises above 35 words per minute. Atmospheric conditions, operator abilities, equipment, and similar items are, of course, limiting factors.

17. Procedure Signals

a. In order to facilitate conversation between radio operators, certain signals and signs have been composed. The most common sets of such signals used internationally, are made up of three-letter combinations beginning with "Q" or "Z", and are called "Q Signals" and "Z Signals". The use of these signals saves considerable time and simplifies transmission. Examples are—

QSV Send V's.
QRN I am troubled by atmospherics.
QSA? What is my signal strength?
QSA 4 Your signal strength is 4.

b. Beside these signals, there are a number of standard signs called prosigns which are likewise considered part of international procedure. Some of these are—

AA all after
R received
K go ahead

c. Another type of standard signal is the International Service Code. These signals are made up of five letters in pronounceable form:

UPBAG—for your information

d. Since much information may be derived from a study of chatter, military nets often make up sets of secret procedure signals and, in some cases, may encipher these signals on a periodic basis. For instance, the standard Q signal list may be used, but the last two letters of the signal enciphered by means of a daily changing alphabet.

899152 O - 50 - 5

REF ID:A58489

18. Elements of the Transmission

a. GENERAL. Just as a definite procedure is followed in making a telephone call, so in the normal radio transmission there is also a more or less fixed procedure which covers the basic elements involved. These elements are—

(1) *The call-up.* This embodies the rules of procedure by which one station makes contact with another and prepares for the transmissions of traffic.

(2) *The order of traffic.* After contact has been established, it is necessary to determine which station is to send traffic first.

(3) *Transmission of traffic.* The traffic is transmitted according to a prescribed form.

(4) *Receipting for traffic.* The receiving station acknowledges receipt of the message.

(5) *Corrections and services.* Messages are frequently garbled because of reception difficulties or operators' errors. Thus methods are provided for the efficient and speedy correction of these garbles.

(6) *Signing off.* At the conclusion of the schedule, the two stations follow certain procedures in signing off.

b. If allowance is made for differences in language and procedure signs and signals, it will be found that the above elements are generally standard for most communication systems. The detail, however, may vary somewhat between countries and also within the military of any one country. For instance, different units may observe different rules relative to the transmission of the call or the method of servicing. This often stems from individual requirements arising from strategic or tactical situations, e.g., an air unit as against an infantry unit. Furthermore, the echelon will also alter procedures. The lower echelons will usually abbreviate their procedures as much as possible because of the necessities of time and because they do not require all the data and detail that higher echelons do. Similarly, transmissions on low-echelon nets are liable to be confusing since a number of stations are often on the air at the same time and on approximately the same frequency.

c. THE CALL-UP. The calling station usually comes on the air with a series of V's sent for tuning purposes and the appropriate calls. The calls are generally sent three times, though this number may vary. The called station replies with a series of V's and calls. If the contact between the two stations is quickly made, readability reports are exchanged. Should these reports be unsatisfactory, transmitters and receivers will be adjusted, frequencies changed, etc., until signals are readable. If contact cannot be made, the calling station may hold its traffic for a later schedule, relay it through a third station, or send it blind. In sending blind, messages are generally

REF ID:A58489

transmitted twice and at a slow speed in the hope that the called station can hear although it cannot be heard.

d. THE ORDER OF TRAFFIC. Once contact has been successfully established, it becomes necessary to determine who will send traffic first. Various methods are employed. It may be ordered, for example, that the station of higher echelon send first, or that the calling station have this privilege, or that the highest priority traffic be cleared before all else regardless of which station is involved. One-for-one procedure may be used; i.e., the calling station is permitted one message, then the called station sends one, thus alternating back and forth until one of the stations has cleared all its traffic. Duplex working may be employed when the stations have the available operators and equipment and there is a large amount of traffic to be passed by both. Four operators are required in this type of working. For example, in figure 20, Operator No. 1 at station A sends

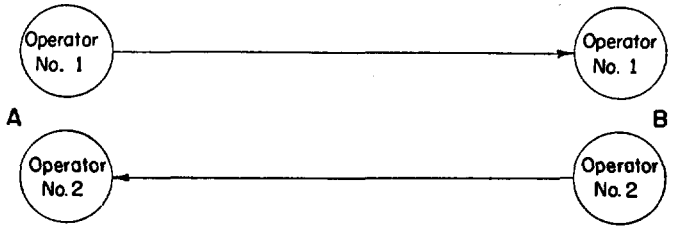

Figure 20

to Operator No. 1 at station B, at the same time that Operator No. 2 at B is sending to No. 2 at A. The chief difficulty with this sort of sending arises when No. 1 at B requires a service on a message from A. Since No. 1 at B is then using the frequency channel of the station, No. 2 at B must stop his transmission.

e. THE TRANSMISSION OF TRAFFIC. Traffic is usually preceded by a commence signal indicating that a message is about to be sent. The traffic itself is composed of the message externals and the text. The message externals contain such items as message numbers, file date and time, group count, addresses, routing instructions, precedences, and similar data. These externals may either precede or follow the text (preamble and postamble) or may be split between the two locations. Most commonly, however, these data appear in the preamble position. The text may be transmitted in code groups of letters, numbers, or both, or in plain text. In the case of coded traffic there are often signals indicating the end of a line and page of text as a check for the receiving operator. Signals usually appear preceding and following the text, the former separating the preamble from the text, the latter indicating the end of the message.

f. RECEIPTING FOR TRAFFIC. After the transmission of a message,

REF ID:A58489

the sending operator waits for a receipt from the receiving operator. This is generally rendered as simply "R". There are also procedures for provisional receipts and other special forms. In some cases, time of receipt may be given following the receipt sign.

g. Corrections and Services. A variety of methods are employed for the servicing of traffic depending on the nature and magnitude of the difficulty. A missed digit, for instance, may be serviced immediately; on the other hand, if a group were omitted this would not be known until the conclusion of the message and might be serviced at that time or might be held until all traffic has been sent. This latter procedure is fairly common, since it is convenient to transmit all traffic without interruption and then to take care of all necessary servicing. Some methods of servicing follow:

(1) *Break-in procedure.* When reception between two stations is good, "break-in" procedure may be used for quick servicing. It is useful only for minor corrections such as garbles caused by a moment of static, is very fast, and calls for alert operating.

A. 6403 3661 9626 - - -
B. 2 — B sends "2" as it is the last number he received correctly.
A. 26 8139 5560 — A picks it up from 2.
or:
A. 6403 3661 9826 - - -
B. (Merely depresses his key)
A. 9826 8139 5560 — A re-sends the last group and continues.

(2) *Correction of error (U. S. Army procedure).*

A. QXTU SRV EEEEEEEE SRWP TSTL — Actually eight or more dots indicating that "V" is in error.

(3) *Repetitions (U. S. Army procedure):*

A. IMI 3–6 to 8 K — Repeat groups 3 and 6 to 8 of last message.
B. 3–LAJY–6 to 8–MUCU KAWC GUXO K

(4) *Verifications and corrections (U. S. Army procedure).*

A. J 271545 Z 3–6 to 8 K — Verify and repeat groups 3 and 6 to 8 of message filed at 271545 Z.
B. C 271545 Z 3–LAJY–6 to 8–MUCU KAWC GUXO K

(5) *RQ's and BQ's.* Services which are more complex than the types noted above are usually sent as short messages. A request for

REF ID:A58489

service in international procedure is preceded by the sign "RQ", the reply by "BQ". Services which relate to cryptographic features, however, are generally sent as regular encrypted messages.

h. SIGNING OFF. When there is no further traffic to be transmitted, or at the end of the schedule time, the two stations will sign off. Usually, each station sends the "I have no more traffic" signal and then the "sign-off" signal. In many nets, the time of the next schedule is included just prior to the sign-off. These times may be enciphered for security purposes. Stations in lower-echelon nets will often sign off in order. An example from U. S. Army procedure follows:

A.	2SN	V	6F2	QNW	K	"2SN" is net call. QNW is the "close down" signal.
B.	6F2	V	G94	R	AR	
C.	6F2	V	KFR	R	AR	

19. Chatter

Radio operators, particularly the lesser-trained and on the lower echelons, exhibit a disposition to chatter amongst themselves. This chatter is the source of much information of value. It does not fall into the categories discussed above as it may relate to anything from discussions of personal problems to mentions of units or cryptographic features. This sort of talk is forbidden since it represents not only idling but a serious breach of security. Nevertheless, depending on the degree of discipline, it will occur in some volume in almost every radio net.

20. Plain-language and Low-grade Cipher Messages

Very often the error is made of transmitting, in plain language or low-grade cipher, messages which are apparently of no analysis value, yet when properly used prove of enormous assistance in the traffic analysis processes. Such messages may involve personal items or routine affairs which serve to reveal such important data as personalities, units, and locations. This type of traffic is particularly prevalent in the lower units where speed may be of the essence and where it is cumbersome to use complex cryptographic devices. Radio station personnel also indulge in this practice for exchange of technical data. They often find it necessary to ask, or reply to, questions of a semi-secret nature relative to their own operations. For this purpose, they may not use a standard system which would involve the delay of the code room and message center, but instead devise their own relatively simple ciphers.

REF ID:A58489

Section IV. THE MESSAGE EXTERNALS

21. Usual Components

a. In order to insure the proper handling of messages in both the message center and the radio station, some information must be sent in the clear or in simple code relative to message routing and accounting. This information is usually embodied in the preamble or postamble although, in some instances, it may be buried in the text. It may include any or all of the following items:

(1) Serial numbers, such as radio station numbers, message center numbers, etc.

(2) Group count.

(3) File date and time.

(4) Routing systems which serve to indicate message centers or units of origin, destination, and sometimes relay points of traffic. Distinction is also often made as to action and informational destinations. Routings may be in plain language, code, and/or cipher.

(5) Addresses and signatures, either in clear or cryptographed.

(6) Priorities, indicating the transmission and delivery precedence of traffic.

(7) Special instructions, as "time of receipt requested," "personal," "service," "repeated message," "relay message."

b. As a general rule, high-echelon traffic will contain most of these items, low-echelon traffic will cut them to a minimum. Their uses, positions, and surrounding procedure vary considerably according to communication system.

22. Serial Numbers

a. Serial numbers appearing on traffic may be enciphered or unenciphered and may represent any of the various stages through which the message passes before it is actually transmitted. The serial number acts as a reference to the message, and generally there are as many numbers in the externals as are necessary for convenient reference. The points at which such numbers may be attached to the message are—

(1) *The writer.* The writer of the message may have a personal series of numbers allotted for his use. Usually, however, numbers of this type, if present, will be included in the text.

(2) *Message center.* The message center of the unit in which the message originates generally assigns it a number. A number of this nature, if used, will usually remain constant through various relays of the traffic as it is the basic reference.

(3) *Signal center.* At large locations, several unit message centers often forward their traffic to a central signal center. The signal

REF ID:A58489

center also gives a number to the message. This number may appear in place of the message center number, along with it (though this is rare), or it may not be included at all. It is often difficult, where only one number is transmitted, to determine whether it is a message center or a signal center number.

(4) *Code room.* The code room, whether located in the message or signal center, may add a number to the traffic. Again this number may replace, or be used along with, the other types.

(5) *Radio station in-desk.* Each radio station maintains some form of in-desk for the handling of incoming messages and their routing to the proper radio positions for transmission. Here, too, a number may be put on the message. There may be several such desks for the forwarding of different types of traffic and this may result in several different series of numbers. In relayed traffic, these numbers (as well as the type included in (6), (7), and (8), below) may accumulate on the message, or a new one may be substituted for the old on each retransmission so that only the latest number appears.

(6) *Transmitter.* A number is often put directly on traffic by the radio operator as his reference. This number may be assigned in different ways. One method is to allot a series of numbers to a transmitter position and regardless of the receiving station this series is continued.

(7) *Link.* A second method is the employment of a link number, i.e., separate series are allocated for each station worked.

(8) *Operator.* A third system is the allocation of a personal series of numbers to each operator. A diagram of the above possibilities is given in figure 21.

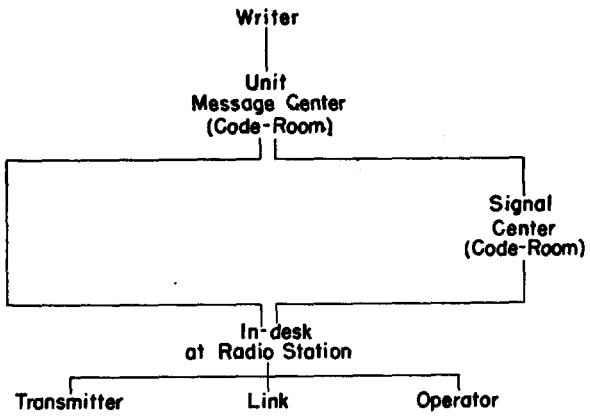

Figure 21

b. As a general rule, not more than two numbers will appear in the message externals, one representing some stage of the message or signal center phase, the other the radio station phase. In the lower

REF ID:A684682

echelons often only one number is used since the whole operation is usually so small that these fine distinctions lose much of their significance.

c. Series of numbers are allotted in some organized fashion, though this fashion may differ from net to net and from unit to unit. The series may be allocated in block form, e.g., 1 to 100 or 501 to 1000, etc. The blocks may be used until completed and then started over again; or the series may begin over on a periodic, such as a daily, basis, but if the prescribed limit is reached within the period, it is likewise recommenced. The series, on the other hand, may be open-end and repeat only at the close of a fixed period as a week, a month, or a year. In some types of series, the date or similar feature may be incorporated in the number.

d. These numbers may be enciphered in order to conceal the volume of traffic passed. It is not likely that this would be done with any of the radio station numbers because of the complexity of the operation, but it may be done at message center or signal center level. In this procedure, the plain text numbers run in serial order and messages are filed in the sending center by it. Another center referring to a specific message would do so by the enciphered number, the sending unit would then decipher same and locate the traffic. Thus, it is not necessary for the receiving center to know the system of encipherment and this permits considerable latitude in the employment of enciphering methods between the various centers.

23. Group Count

The group count may cover only the text of the message or it may include both externals and text. In some types of preamble separate counts are given for each. The group count may represent either the number of cryptographic groups, number of plain language words, or the number of individual letters and/or digits according to the method used.

24. Date Time Group

The date time group appears in the message externals and is expressed in six digits followed by a time zone suffix. It is intended to indicate the time the message was authorized for transmission, but may be used to indicate the time the message was filed at the message center, signal center, or at the radio station for transmission. Time is expressed in terms of the 24-hour clock and may be based on Greenwich Mean Time or on some local time zone. Whatever the base, it is generally kept standard for the entire net, if not for the entire communication system, regardless of the geographical area covered.

RECD 10 : AD684682

25. Routing Systems

a. GENERAL. Some method is required on radio traffic to indicate points of origin and destination and, in many cases, relay points. These methods must be relatively simple as they are designed chiefly as an aid to radio station personnel in the routing of messages. In this respect, it is necessary to understand the distinction between the routing designations and the addresses when both appear. The routing designations usually refer to message or signal centers, the addresses to specific units or persons. (There is nothing to bar the use of routing designations for specific persons but this is not generally the case.) It may be compared with the address on a letter, the routing designation representing the city of address, the address representing the company or person. On high-echelon traffic this difference is generally made, but in low-echelon traffic the routing designation often suffices for both purposes since message centers are small and traffic is almost always intended for the commanding officer. Thus, addresses as such do not usually appear on messages at this level. This distinction similarly holds true for routing designations used to indicate origin and signature.

b. The discussion of routing systems has been divided into two portions, the first dealing with the composition of routing systems, the second with their use.

(1) *Composition of routing systems.* Routing systems may be divided into three main types, plain text, call sign, and code. Plain text is seldom used on military nets because of its insecurity. Thus, generally, either the call signs of the stations are used for routing or a separate code is set up for this purpose. A routing code usually consists of two parts: code and syllabary. The code is composed of short number and/or letter combinations which may represent a location, message center, or unit. The syllabary provides code equivalents for the spelling out of place names or units not provided for in the regular code. These codes are usually rather simple, often being one-part in nature so as to be convenient for application. In some cases they are not used for security reasons, but rather for brevity. Generally, however, they serve both purposes and an encipherment of the code may be a feature of a few of these systems.

(2) *Use of routing systems.* Methods of using routing designations and the placement of these designations on traffic vary to a considerable extent. It may be set forth as a cardinal principle, however, that in most systems routing designations are used only when absolutely necessary. This increases their security and also makes it more difficult for the traffic analyst to determine the origin and destination of a message. On traffic which is point-to-point in nature, therefore, there are usually no routings at all. For example, in figure 22, A has a message for B. This message will be transmitted over

REQ: DD: AD684639

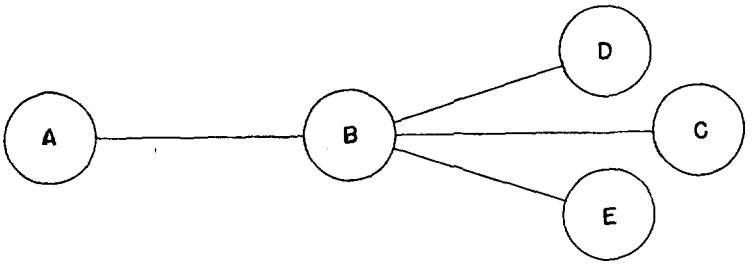

Figure 22

the A-B link and since it has originated with A and is destined for B, routing designations are not required. On the other hand, if A has a message for C, this is generally indicated in the externals so that B knows that it is to be forwarded. (It should be remembered that it is always possible to bury routing instructions in the text, but this is, as a rule, not done since it would necessitate the decoding of the message at each stage of the transmission.) This may be handled in two ways. The message may carry the routing "A to C," or it may only carry "to C" with the originator omitted. When the message is relayed from B to C, it may state "A to C," "from A," or have no routing at all. In some systems the relay point is noted, as "A to C through B."

c. Messages to several addressees can be indicated in several ways. For instance, in figure 22, A may originate a message for B, C, D, and E. All of these destinations could be incorporated in one preamble, "A to B, C, D, and E," or a separate preamble could be added at the end of the message for each location. Thus, the preamble preceding the message may carry no routing since it is being forwarded direct from A to B, but each of the preambles following the text would note "A to C," "A to D," "A to E." When this message reached B, B would transmit a copy with the proper preamble to each of the stations indicated. In this manner each copy would be numbered separately; in the single preamble method, only one message number would appear for all the recipients. It is further to be observed that if various specific addresses at one location, or routing designation, were involved, it would be possible to handle it in either of these ways or to indicate the addresses internally.

d. Distinction also may be made externally as to information and action destinations by the use of appropriate procedure. For example, in U. S. Army procedure, "W" is used to separate action from information addresses, e.g., "ABC W XQR" where ABC is the action addressee, XQR the information.

REF ID:A58489

26. Addresses and Signatures

Addresses and signatures may or may not appear externally on messages. Very often it is standard procedure to conceal them as part of the text. When they do appear externally, however, they are usually encoded and/or enciphered by means of complex cryptographic systems since they contain the specific names of units and persons and thereby are of high intelligence value. The address, unless it is in simple cipher or plain text, is usually considered a cryptanalytic, rather than a traffic analytic problem. Nevertheless, there are some features of the address and signature, such as length and manner of encipherment, which are of interest and use to traffic analysis.

27. Precedence Indicators

a. In order to insure the most expeditious handling of important traffic in both message center and radio station, some means of designating such traffic through the use of precedence indicators is usually devised. The precedences may be in the form of plain text, abbreviations of plain-text words, or number or letter code groups. Furthermore, in some military systems, these code groups may be enciphered.

b. The number of precedences used varies considerably from one nation to another and may range through several classifications of high priority to routine and deferred. There is, very often, no precedence designated "routine" and messages in this category, which are generally the most numerous, carry no marking at all.

28. Special Items

There are a great number of special items which are often included in the message externals. Some of the more common follow.

a. Part Messages. Long messages are usually broken up into several parts for ease of handling or for reasons of cryptographic security. Indications of this may be transmitted in the preamble.

b. Message Type. Indicators may be included to designate the type of message, for example, service, air warning, personal, weather, practice, repeated message, etc.

c. Miscellaneous Items. Procedures may also be provided for the transmission of miscellaneous items such as, "Time of receipt requested," "Each group sent twice," "Message sent blind," "Text in five (5) digit groups," "Relay message."

29. Message Examples

The elements discussed in the preceding paragraphs appear in message preambles and postambles in fixed positions according to the

REF ID: A5384682

procedure prescribed. These procedures differ from country to country and also often from one branch of service to another and from one echelon to another. Examples taken from U. S. Army procedures follow:

a. AB9 V PT3 291155Z GR12
BT Text
BT 291155Z K
AB9—Receiving call and destination.
PT3—Transmitting call and origin.
291155Z—File date and time, repeated as postamble.
GR12—Group count.
BT—Break before and after text.
K—"Go ahead" sign sent after message.

b. 3XF B79 V FR8–O–P B79–T–RST–A–FR8

STX—Transmitting call.
P–A45—Message is priority to A45 only; to others routine.
BR6–T–N–A45—BR6 is to relay to all destinations except A45.
A–79K—Originator of message.
011046Z—File date and time.
A45—Action destination.
W–F2P SLW BR6—Denotes information destinations.
GR 28—Group count.

Section V. TEXTUAL FEATURES

30. General

While textual features and cryptographic systems are chiefly the field of the cryptanalyst, the traffic analyst should also understand

REF ID:A58489

certain aspects, both for the purpose of assisting in his study of communication nets and in the accomplishment of his responsibility to the cryptanalyst. These aspects relate to the distribution, use, and identification of systems, and to the use of indicators.

31. Distribution of Systems

Many cryptographic systems are limited in distribution; this limitation constitutes a cryptonet. For example, a system may be distributed only to the corps headquarters of a theater. These corps then are a cryptonet. Or it may be given only to units along a line of communications. There may be several reasons for the delineation of these nets but the chief ones are security, the nature of the system involved, and the physical problems of distribution. Forward units, for instance, are generally furnished different systems than the rear echelons because first, they are more liable to capture; second, they cannot handle the more complex methods of encipherment; and third, their traffic does not require the same degree of security. Within the higher echelons, divisions are made to prevent the overuse of any one system and thus deny depth. Such divisions also arise from the major break-down in command which allows some latitude in the composition of codes and ciphers to individual services or units. Furthermore, special systems may be prepared for use in particular operations where a high degree of security is desired. The important point, however, for the traffic analyst is to think of cryptonets not in terms of locations, but in terms of order of battle units, and to recognize the exact relationship existing between a system and a unit or group of units. It should also be observed that the existence of cryptonets necessitates the re-encrypting of traffic which passes from one net to another.

32. Use of Systems

Many times cryptonets will exhibit another distinguishing feature. This feature concerns the use of the system. For example, a system may be used only for confidential material, or only for secret material; or it may carry only information about supply, or shipping, or personnel, or operations. Again, this distinction is of high traffic analysis value and provides, as well, assistance to the cryptanalyst.

33. Identification of Systems

Some external feature usually appears in the text of a message to designate the system used. Where only one system of a given external appearance (as 4-letter, 5-digit) is used between two correspondents, this is not necessary, but in most instances, this designation is required and it can be accomplished in two main ways. The first is

REF ID:A5384682

the use of the form of the message itself. For example, the last group of the message may contain a repeat of the group count or the indicators may be peculiar in their formation, or they may be placed in a unique position. Any distinction of this sort will serve. The second method is the addition of a discriminant to the message, generally as a part of the text, most often as the first group. This discriminant is usually composed in a distinctive manner, as five like letters, repeated digraphs, ascending or descending numbers. It may be enciphered. Where a discriminant is lacking, it is often the task of the traffic analyst to determine means of identifying systems and to isolate homogeneous traffic.

34. Use of Indicators

The difference between the discriminant and the indicator should be understood. The discriminant identifies the general system used, while the indicator provides the specific key for decipherment. These indicators are often in the clear and, if they display any peculiarities of use, they become a valuable traffic analysis weapon. The pages of a one-time pad, for example, may be applied in order and the page indicators will thus reflect the number of messages enciphered. The pad numbers themselves will also be of value since each pad will be limited as to its users.

35. Practice Traffic

When new nets are being established, or operators are being trained, practice traffic is often devised for exercise purposes. Sometimes special nets are set up to this end, and they carry nothing but practice material. On the other hand, certain schedules may be set aside on regular links.

36. Control Traffic

In order to mislead enemy traffic analysts, control traffic may be used. Such operations may range from the formation of dummy nets to the passing of dummy traffic over the usual links. Control traffic can be employed merely to hide an operation through maintaining a volume level on all nets, or it can be used deliberately to deceive by creating high volumes at points of slight military activity.

Section VI. COLLATERAL MATERIAL

37. General

Aside from the usual intercept material discussed in the preceding sections, there are many other sources of raw data which are of value to traffic analysis. They may be divided into two groups, the first

REF ID:A58489

directly related to intercept, the second more or less miscellaneous in nature. The first group includes direction finding. The second is concerned with the study of nets other than military, the use of decode material, intelligence reports, prisoner-of-war reports, and captured documents. With reference to this second group, it should be observed that traffic analysis, in both its analytic and applied phases, often involves the fusing of information and material of all types and from all sources toward the production of a complete communication picture. In this respect, traffic analysis touches to some degree upon almost every phase of intelligence, and to a great degree upon every phase of signal intelligence.

38. Direction Finding

a. Direction finding (D/F) is a method of locating radio stations through use of specially constructed receiving antennae. These antennae register the direction along which a radio signal is travelling as it passes on a great-circle path through the D/F location. When the direction of a radio signal is determined at more than one D/F site, the location of the transmitter may be plotted by noting the point at which the bearing lines intersect (fig. 23). A location determined in this manner is called a "fix."

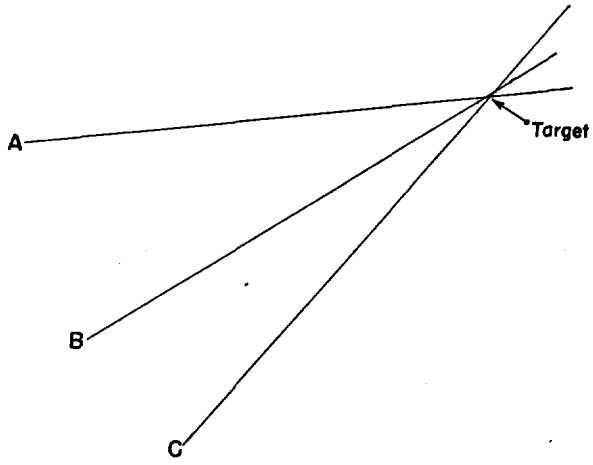

Figure 23

b. Usually, bearings will not yield a perfect fix, but will, depending on a number of factors, give a more or less restricted area. These factors include (1) the distance from the D/F station to the target, (2) the number of D/F stations involved in locating a target and the number of bearings taken, (3) the amount of the signal's deflection as encountered (for example, when the radio wave passes over mountains or shore lines), and (4) the quality of the D/F equipment.

RECD: 10 Jun 1946

Despite these and other limitations, D/F bearings seldom are misleading because the D/F operator is able to recognize whether or not a bearing is reliable and furnishes an evaluation of each bearing as it is forwarded to the plotting unit. The plotting unit also is in a position to make an accurate judgment on the reliability of a fix. An adequate arrangement for accurate direction finding requires a number of D/F stations (at least 3) located along a rather broad base (relative to the distance from the target) and so connected that they can all listen to the same signal and take their bearings simultaneously. It should be noted that D/F is particularly useful in low-echelon traffic analysis, but that over distances running into the thousands of miles it loses much of its effectiveness.

39. Information Derived from Cryptanalytic Results

Cryptanalytic solutions of traffic furnish, very often, the relationship between nets and order of battle. Since this is one of the ultimate goals of traffic analysis, detailed study of all solved messages, against the background of the nets, is a necessity. Study of solved messages should also be carried on for the purpose of relating internal information to external characteristics. This has an application to cryptanalysis for the identification of crib messages and to intelligence for the determination of the significance of traffic contacts and patterns. Message plain texts also yield a certain amount of signal information, as station locations and data concerning calls, frequencies, and schedules.

40. Intelligence Reports

Intelligence reports may vary from predigested order of battle lists to raw materials, such as captured documents or prisoner of war reports. Order of battle is the basis for the entire radio network and for the traffic passed over it. As such, an understanding of the order of battle is the necessary foundation for traffic analysis and its cryptanalytic and intelligence applications. The relationship is a circular one—intelligence added to traffic analysis yields additional intelligence. Aside from the broad phase of relating nets and battle order, this integration has specific applications in the analysis of traffic contacts and patterns and in the study of the uses of cryptographic systems and the transmission of routine messages.

REF ID:A58489

CHAPTER 3

RECONSTRUCTION OF THE RADIO NETWORK

Section I. INTRODUCTION

41. General

This chapter is concerned with the first objective of the traffic analyst, that of the reconstruction of the radio network. There are two phases to this objective, analysis of radio operations and net reconstruction.

42. Analysis of Radio Operations

This phase involves the identification and study of the elements discussed in the preceding chapter. It includes the identification of all components of the transmission, the analysis of their use, and the determination of their operating data.

43. Net Reconstruction

The nets are reconstructed coincidently with the study of radio operations. Each task helps the other; the distinction made here is only for academic purposes. In actual practice, attack must be carried out on all elements simultaneously, so far as possible, because analysis depends on the perception of relationships. Net reconstruction is concerned with the grouping of stations into nets, the determination of the links operating between those stations, and the identification of the stations with geographic locations, culminating in the production of the net diagram. The pertinent features of radio operations, such as calls, frequencies, and serial number blocks, may then be added to this diagram to complete the "pure" traffic analysis picture. The superimposition of the cryptonets and order of battle on the diagram is discussed in later chapters.

Section II. ANALYSIS OF RADIO OPERATIONS

44. Frequency Analysis

The main objectives of frequency study are (1) the determination of the system of use and (2) the solution of the system of allocation,

899152 O - 50 - 7

REF ID: A684682

including the method of original assignment, the pattern of rotation, and the reconstruction of the basic charts involved.

a. ANALYSIS OF THE SYSTEM OF USE. (1) The chief problem in the study of the system of use is the determination of accurate basic data. Once these data have been properly recorded the conclusion will usually be apparent. The basic data consist of who sends to whom and on what frequencies. To simplify study, a rough circuit diagram may be prepared. Two examples of these data and the conclusion to be drawn are given below.

(*a*) In the following example the net is a free star (fig. 24):

A to B on 5,000 KCS.
A to C on 5,000 KCS.
B to A on 5,000 KCS.
B to C on 5,000 KCS.
C to A on 5,000 KCS.
C to B on 5,000 KCS.

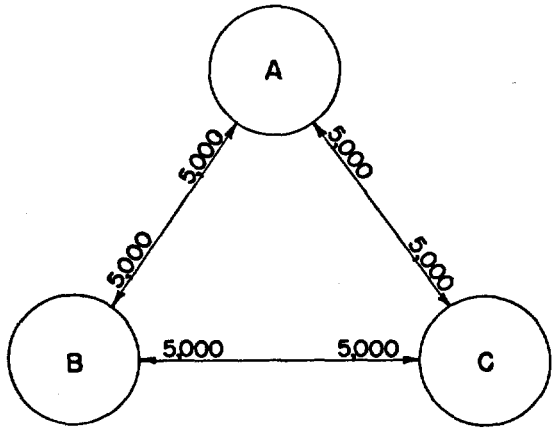

Figure 24. The net is a free star.

(*b*) In the following example the net uses the complex-sending system (fig. 25):

A to B on 5,000 KCS and 10,500 KCS.
A to C on 5,000 KCS and 10,500 KCS.
B to A on 4,000 KCS and 7,500 KCS.
B to C on 4,000 KCS and 7,500 KCS.
C to A on 3,000 KCS and 6,000 KCS.
C to B on 3,000 KCS and 6,000 KCS.

REF ID:A58489

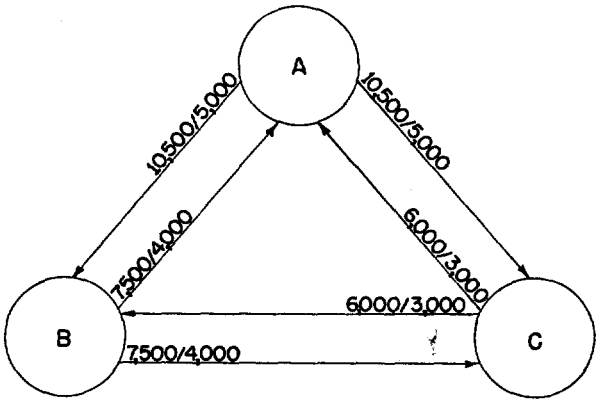

Figure 25. The net uses the complex-sending system.

(2) Arriving at accurate data, however, is often a fairly difficult task. It requires a detailed study of chatter for at least a week's period and usually somewhat longer, depending on the completeness of coverage during the period and the complications involved in the use of the frequencies. It is well to mention that, for the analysis of many features of radio operations, it is often desirable to have complete cover on a net for a limited period, such as a day, than to have spotty cover over a longer time. Generally, however, cover will be incomplete, that being one of the reasons why careful study of chatter is necessary before a decision is reached. A second difficulty arises where the enemy stations drift from the assigned channel. For example, a station allocated 4,650 kcs may vary all the way from 4,600 to 4,700 kcs. In the case of simplex and star working, much of this variation is intentional so that the one station can reply a little off the correspondent's frequency. A third problem is created by the assignment, as sometimes happens, of four or five or more wave lengths to a station. These wave lengths are not restricted to fixed times of day, but the station is at liberty to use whichever one can best be heard. It should be pointed out that there will often be exceptional uses of frequencies which cause the net to vary from its basic form of working. These exceptional uses should be carefully studied and explained, but they should not be considered as changing the net type.

(3) To illustrate some of these problems, assume that a cursory examination of a week's transmissions reveals the following:

A to B on 5,000 KCS, 11,600 KCS.
B to A on 5,000 KCS, 7,000 KCS, 11,590 KCS.
A to C on 5,000 KCS, 5,500 KCS, 11,625 KCS.
C to A on 5,010 KCS, 5,025 KCS, 6,995 KCS.

REF ID: A584682

B to C not heard.
C to B not heard.

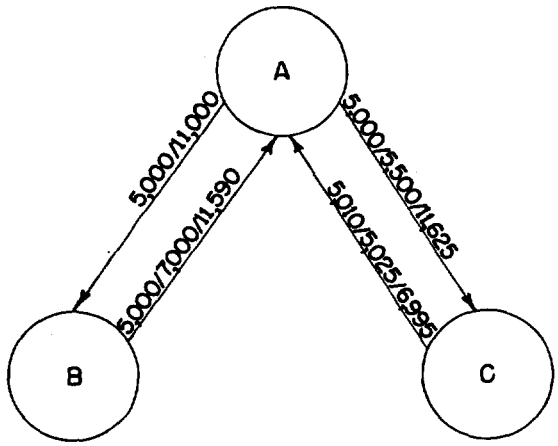

Figure 26.

The net, at first glance, appears to be a star (fig. 26) though there are several discrepancies to be explained. It may be assumed that C's 5,010 and 5,025 kcs are drifts of the base frequency 5,000 kcs, that A's 11,600 and 11,625 and B's 11,590 should all be 11,600 and that B's 7,000 and C's 6,995 are both 7,000. However, A uses 5,500 kcs to C, but neither B nor C have been heard on this frequency. This runs counter to the principle of the star. A check is made of the appearance of 5,500 kcs and it is found to have been used twice during the period under study, both times under the same circumstances. A came up on 5,000 kcs, C reported interference on this frequency, and A switched to 5,500 kcs. It is likely, then, that 5,500 kcs is an extra wave length assigned to the net for emergency purposes and that, in time, the other stations will also make use of it. In this instance the net is not working star since 5,500 kcs at A is corresponding with 5,010 kcs at C, but it is known that A did try to make contact under the established procedure first, so that this becomes the exceptional case and does not contradict the theory as to the star form. The 7,000 kcs at B and C also create a problem since A has never used this frequency. Again reference is made to the chatter logs where it is discovered that this frequency is used during the evening hours and has been heard once from B, twice from C. However, on all three occasions the A end of the circuit was not heard at all. It is possible that A was up on this approximate wave length but, because of some propagation or reception peculiarity, the intercept station was unable to hear it, or that the intercept station, for one reason or another, may only have been

REF ID:A58489

able to cover one end. Whatever the reason, imperfect coverage is apparent and, until A has been monitored on this schedule, nothing can be determined which would affect the star hypothesis. The net picture, as mentioned above, indicates that the star is controlled rather than free since B and C have not been observed in contact. Study of chatter, however, casts some doubt. At one point, A has asked B for a special schedule at 1500. B replies he cannot make it then since he has a schedule at that hour with C. On another occasion, A sends two messages to C for relay to B, A stating he has not been able to contact B. This chatter suggests that B and C work each other and that the net is a free, rather than a controlled, star. The evidence is slim since the schedules mentioned in the chat may only have been emergency ones, but it is sufficient to justify reserving decision and waiting for further developments.

b. Solution of the System of Allocation. Solution of systems of allocation requires at least several months of observation and, if some complex method of rotation is involved, may run into much longer periods. The problem is twofold: (1) the method of basic allocation and (2) the method of rotation, if present.

(1) It should be stated at the outset that usually a method of basic allocation will not be used except as it is tied into a system of rotation. Where frequencies are fixed, they have generally been assigned because they can be heard between two points and because there is no interference from other frequencies. This is particularly true on high-eschelon nets. It is always worthwhile, however, to check the frequencies of the various nets of a radio network for characteristics, if only to be sure. Some pattern may appear, for example, air-ground nets, wherever located, may be restricted to a definite set of frequencies, or divisional nets may be limited to a certain band. Anything in the way of a pattern, naturally, is possible. A tabulation of frequencies against net and the seeking of relationships in frequencies between related nets should serve to reveal most such patterns. Related nets may be so determined on the basis of function, such as air, shipping, line of communications, divisional artillery, by echelon, or by command.

(2) Whether a frequency system is fixed or changing, and if changing what the period of change is, can be discovered merely by observation. If a changing system is used, the first step in analysis is to determine some method of maintaining continuity so that if station A transmits on 4,300 kcs one day and 3,750 kcs the next day, there is some way of knowing that 4,300 and 3,750 are both the same station. Continuities may be established in two main ways:

(*a*) *Characteristics of radio operations.* Almost any item of radio operations may serve the purpose:

RECD 10 : AD684682

1.

Calls. If frequencies change and calls do not, identification is a relatively simple matter.

2.

Schedules. Taken in conjunction with other data, schedules may provide a clue to continuities. They are likely to be characteristic for the stations of a net, but care must be exercised in the use of this technique and supporting evidence should always be present. Also of value is any mention of future schedules at the time of the sign off, for example, "QRX 0100" (next schedule at 0100). It is then possible to relate stations heard at 0100 on the following day back to the stations involved in the chatter.

3.

Serial numbers. If serial numbers do not begin over at the time of each frequency change, they may be utilized. In the case of message center serials, care must be exercised to avoid the use of relayed traffic. For example, in figure 27, A, on the 15th, may

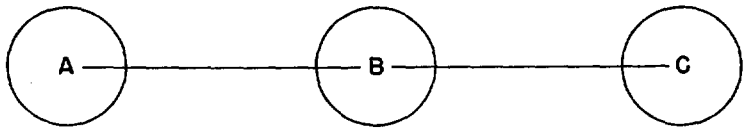

Figure 27.

send a series of messages over the A–B circuit with the message center serial range 1544–1573. On the 16th, the entire net changes frequency, and several messages are intercepted with the routing instructions A to C and the serials 1578–1581. It cannot be assumed that the new frequency heard on this transmission is at A since the traffic might have been passing on the B–C link. If some of the traffic, however, was routed A to B or else carried no routing indicating a local message, then the continuity might tentatively be established. Of far greater value in this respect are the radio station members, and, except in the case of the in-desk number where it is possible for several different circuits to be transmitting the same series, these ranges are reliable. Where serial ranges are fairly distinctive they may also be used in reverse. For example, station A may receive traffic in only a certain message center serial range from a correspondent. This may be caused by the fundamental assignment of the range to a definite service, for example, supply. Station A is at a quartermaster depot; consequently all the traffic to A from the correspondent will be in the one series.

REF ID:A58489

4.

Routings. Routing codes can also be of value when used by nets. It may be assumed that, as a general rule, a radio station will originate and receive more of its own traffic than it will handle on relay for other stations. For example, station A is at Gettysburg. If A changed frequency daily, it could probably still be spotted because of the large amount of Gettysburg correspondence transmitted and taken.

5.

Routines. Because of the requirements of military operations, it is necessary for units to make routine periodic reports. Very often these reports can be identified because of the stereotyped nature of the message externals. For example, a situation report, or a strength report, may be sent from station A to B, C, and D each day at approximately 2000. It would be a relatively easy matter to watch for this report to pass and to identify it purely by these external characteristics. Such routines furnish a trade-mark for the originating station and can be discovered and utilized without any knowledge of the text.

6.

Cryptographic systems. Cryptographic systems which are unique to certain correspondents can likewise be used as identifications. This also holds for some of the cryptographic features such as pad numbers of one-time pad systems. The 10th Division, for example, which sends through station A, is enciphering its traffic in pad number 1234. Usually, only one originator is permitted to encipher messages in a given pad because of its one-time nature. There may be one or several holders who can receive. Thus, until completely used, the pad will identify the originating station and, in some cases, also the recipient. Caution must again be exercised, however, with regard to relay messages and to the possi-

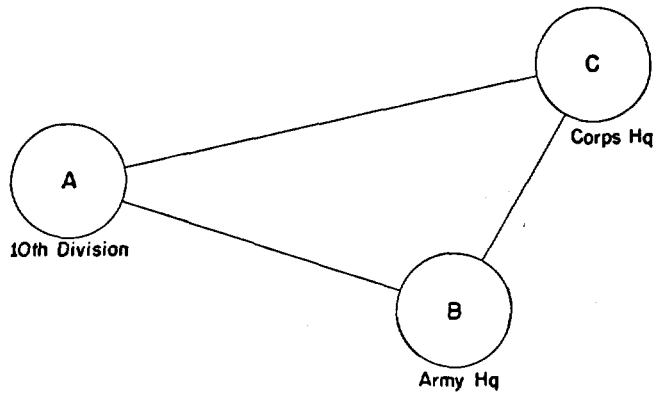

Figure 28.

REF ID:A5384682

bility of this traffic being transmitted over a different circuit of station A. If, for instance, the pad is used between the division and headquarters for some special purpose it could pass by several different paths (fig. 28). According to which route is available or readable, 10th Division's traffic may go directly to Corps or be relayed through Army.

7.

Services. Messages transmitted on one day may be serviced at some later date. If the date span bridges the frequency change, it may be possible to determine continuity.

8.

Chatter. Items of chatter often serve continuity purposes. Names of radio operators, for instance, may be observed in chatter, and, on recurring after a change, act as an identification.

9.

Procedural peculiarities. Some stations and operators develop unique habitual procedures which mark them. A station might, for example, regularly misspell a place name, or transpose the digits of a routing code number because of an error in the chart; an operator might send his call signs four times instead of the three used by others on the net, or send a separator between the hours and minutes of the file time though no one else does. Such peculiarities, which often arise from personal quirks, are usually rather difficult to discover because they involve painstaking attention to detail, but they are well worth the trouble. It is one of the phases to which the intercept operator, through his knowledge of the usual, can make an important contribution.

(*b*) *Use of direction finding.* This identification technique, described in paragraph 38, is a valuable means of providing continuities where efforts to use procedural characteristics have proved inconclusive. It is to be pointed out that, in general, procedural characteristics furnish a faster, less expensive, and more accurate method if they can be so utilized.

(3) Some of the techniques outlined above can stand by themselves, but it will always be found wise to apply several of them in combination so that one checks the other and reinforcing evidence is supplied. For example, the message center serials may indicate a continuity, and a routine message or the use of a restricted cryptographic system serves to confirm it. Incidentally, these methods of determining continuities are applicable to any sort of frequency change, whether periodic or irregular, and will also serve to tie together night and day frequencies and variant frequencies of the same station.

(4) When continuities have been established, the next task is the

REF ID:A58489

listing of the frequencies against the date breaks and the search for patterns of change or rotation. Once the general system has been solved, it will usually not be too difficult to keep abreast of changes. No attempt will be made in this manual to describe actual methods of solution further than to say that the problem, at this point, becomes one of cryptanalytic attack.

45. Call-sign Analysis

The main objectives of call-sign analysis correspond with those of frequency analysis, that is, (1) the determination of the system of use, and (2) the solution of the system of allocation.

a. Analysis of the System of Use. This analysis is conducted through a study of call signs as they are reported in the chatter. The period of call-up furnishes the most fruitful material, but all allusions to calls must be noted. A listing of the call-ups will generally provide sufficient information to identify the system.

(1) *Net using double-station call procedure* (fig. 29):

A calls B	DEF de ABC
B replies	ABC de DEF
A calls C	GHI de ABC
C replies	ABC de GHI
B calls C	GHI de DEF
C replies	DEF de GHI
B calls A	ABC de DEF
A replies	DEF de ABC
C calls A	ABC de GHI
A replies	GHI de ABC
C calls B	DEF de GHI
B replies	GHI de DEF

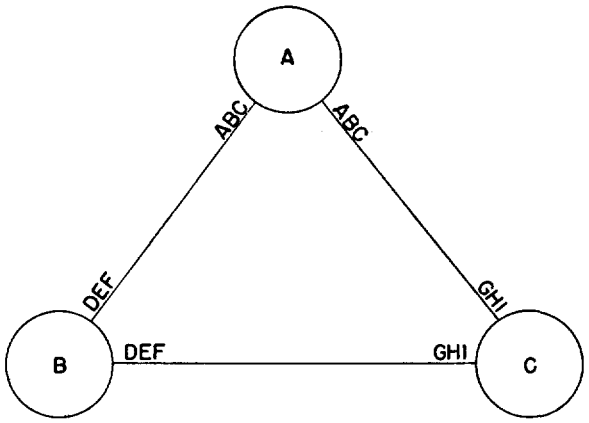

Figure 29.

A calls B	DEF
B replies	DEF
A calls C	GHI
C replies	GHI
B calls C	GHI
C replies	GHI
B calls A	ABC
A replies	ABC
C calls A	ABC
A replies	ABC
C calls B	DEF
B replies	DEF

REF ID:A58489

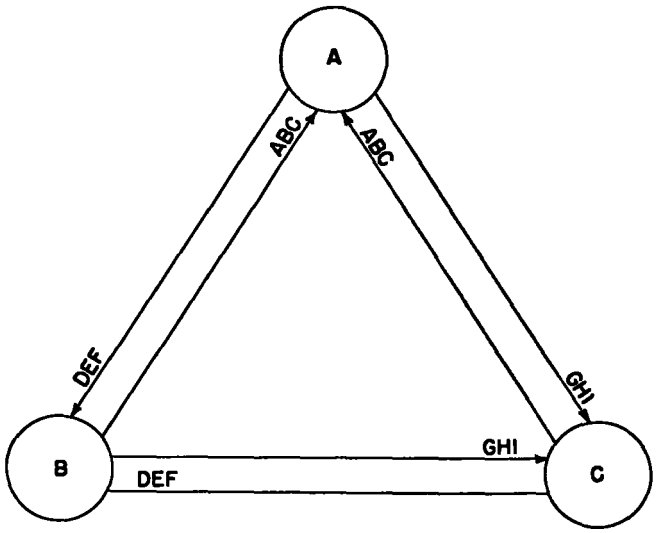

Figure 21

b Solution of the System of Allocation Like the study of frequency systems, the analysis of call sign systems may require anywhere from several months to several years Again like the frequency systems, the problem is twofold (1) the method of basic allocation and (2) the method of rotation, if present

(1) Calls must first be classified as to composition, for example, 3 digit, digit-letter-digit, etc, then these break-downs checked for pattern The allocation of calls may or may not be centralized. In the former instance, there will generally not be more than two or three systems to be solved, e g, Army and Air Force In the latter, however, depending upon the amount of decentralization, there may be a great many small systems Thus, in the initial analysis, calls should be listed by net, and the composition of the calls on each individual net observed If, for example, of all the nets under study, only two nets use 4 letter calls, it may be assumed, for the moment, that these nets employ a common call allocation After nets have been grouped by composition of calls, a search is made on each net for pattern For instance, the calls on three of the nets may carry "T" as a middle letter, indicating a possible grouping for study If a number of other nets also display similar characteristics, one using "R", another "V", etc, it is likely that all of the calls on these nets originate in the same general system The following lists of calls by net will serve to illustrate the general procedure

REF ID: A684682

Net I	*Net II*	*Net III*	*Net IV*
ABD	CDF	V7K	BCE
EFH	GHJ	V8J	KLN
FGI	LMO	X3M	OPR
JKM	MNP	Y4T	
		Y6S	

Net V	*Net VI*	*Net VII*	*NET VIII*
BAO	IJL	DEA	FQR
HIU	NOQ	HOA	JLT
KOE	PQS	JIE	SRM
MEA	STV		VTR
PAE			XOM
			XOA

(*a*) In the first quick grouping, the following division could be made:

Nets I, II, IV, V, VI, VII, VIII—3-letter.
Net III—letter-digit-letter.

(*b*) The first group then splits into three:
Nets V, VII—consonant-vowel-vowel.
Nets I, II, IV, VI—1st and 2d letters are in alphabetic order, 3d letter skips one from 2d.
Net VIII—apparently random.

(*c*) Thus, there are at least four systems of call distribution involved. On the other hand, studies of the calls on a number of nets may reveal no pattern at all. This is usually indicative of a large, general system in which control is highly centralized and the randomization carefully planned.

(2) Other features may also be employed to assist in the establishment of homogeneous call-sign systems for relationships between any of the elements of different nets that indicate possible relationships in other elements. For example, there may be some question as to whether or not the calls appearing on two separate nets can be grouped together. A cryptographic system, found nowhere else, is discovered on circuits of both nets. This suggests that there is some connection between the two nets and increases the possibility of a common call system. Procedural peculiarities of any type may likewise be used to associate nets. Order of battle, if known, furnishes another valuable method. All the nets of a given Army, for instance, will probably use the same call allocation. It may be that, in a highly centralized organization, a dichotomy can be established simply between Army and Air Force.

(3) Once the various systems have been segregated, it becomes possible to attack each separately. If a pattern exists within the call itself (as in Nets I, II, IV, and VI in (1) above), all possible

REF ID:A58489

calls can be listed and this used as a basis for the reconstruction of the allocation chart. If no pattern can be found, however, (as in Net VIII), it becomes infinitely more difficult to reconstruct these charts, and if the system is a large one it may be necessary to collect data over a period of years before a solution can be effected.

(4) Often these allocation charts serve as a base for the change or rotation of calls or for the choice of alternate calls at the same station. In analysis of the system of rotation, the first step is to determine the periodicity, which can usually be done simply by observation, and the second to establish continuities so that the calls related to each station or link and the order of their use are known. The techniques outlined in paragraph 44*b* (2) for the determination of continuities when frequencies change also apply to call signs with one exception (par. 44*b* (2) (*a*)*1*) and need not be further discussed here. In this one exception the reverse is true—if calls change and frequencies remain constant, the frequencies furnish the continuities to the calls. When continuities have been established, the calls may be listed in order for each station, and through the application of cryptanalytic techniques, the system attacked.

(5) In the practical aspects of call-sign system solution, it will be found that garbled and missed calls account for much of the difficulty in the initial stages of attack. Where there is a pattern to the call composition, garbles can be resolved with relative simplicity. In random composition, however, the problem is more complex and care must be taken to eliminate all spurious calls before beginning analysis. Garbles occur with some frequency in calls partly because the enemy makes an attempt to restrict their use, and partly because his operators become so familiar with them that they tend to send them in a quick, sloppy manner. In general, a call should be intercepted several times, preferably at different schedules, before it is accepted as genuine. Garbles can often be corrected by reference to the actual Morse equivalents. For example, if the call "AHV" has been established and the call "ASV" appears once on the same net, the Morse will indicate the possibility of error:

AHV .— ....—
ASV .— ... ...—

the difference being only a dot. Other link characteristics such as frequency, serial numbers, etc., will assist in confirming or disproving the identity of the two calls.

(6) Missed calls also present a problem to the analyst. They arise from imperfect coverage, and there is no remedy except to give more complete coverage and schedule information to the monitoring stations. Since calls are often sent only at the start of each schedule, this time is most important.

REF ID:A584489

(7) The following example, based on the call composition used in Nets I, II, IV, and VI in (1) above, will illustrate the general approach (since these calls have a definite pattern, all possible calls can be listed):

ABD
BCE
CDF
DEG
EFH
FGI
GHJ
HIK
IJL
JKM
KLN
LMO
MNP
NOQ
OPR
PQS
QRT
RSU
STV
TUW
UVX
VWY
WXZ
XYA
YZB
ZAC

(*a*) It is noted that calls change daily on the four nets involved; after the completion of one week, a tabulation by net and station can be made. (Garbled calls have been corrected.)

	1	2	3	4	5	6	7
Net I							
Station A	ABD	PQS	TUW	KLN	BCE	RSU	....
Station B	....	WXZ	BCE	EFH	HIK	....	UVX
Station C	MNP	JKM	MNP	WXZ	NOQ	XYA	CDF
Net II							
Station A	CDF	....	IJL	YZB	....	ABD	JKM
Station B	UVX	LMO	VWY	STV	JKM	GHJ	....
Station C	IJL	STV	OPR	ABD	DEG	MNP	WXZ

REF ID:A58489

Net IV

Station A	TUW	RSU	....	RSU	UVX	FGI	IJL
Station B	....	EFH	....	FGI	IJL	LMO	....
Station C	NOQ	KLN	....	XYA	OPR	YZB	VWY
Station D	HIK	XYA	....	LMO	CDF	STV	DEG

Net VI

Station A	....	ABD	DEG	MNP	PQS	BCE	....
Station B	VWY	....	PQS	TUW	....	HIK	....
Station C	DEG	YZB	JKM	GHJ	EFH	TUW	....

(*b*) Observation of the calls indicates that they are being rotated in a simple manner, and a check against the list of all possible calls shows that the difference of six between calls on the same net is fairly common. For example, on the 1st, MNP is 12 calls away from ABD; IJL is 6 away from CDF; NOQ is 6 away from HIK. It is also noted that the calls QRT and ZAC do not appear, probably to prevent confusion with Q and Z signals. This leaves 24 possible calls, and the periodicity of 6 suggests that the basic table is arranged as follows:

ABD	GHJ	MNP	TUW
BCE	HIK	NOQ	UVX
CDF	IJL	OPR	VWY
DEG	JKM	PQS	WXZ
EFH	KLN	RSU	XYA
FGI	LMO	STV	YZB

and that the calls are taken off across the chart and allotted to Net I, Net IV, Net II, and Net VI in that order. Within each net the calls are assigned to individual stations in what appears to be a random order.

46. Schedule Analysis

Schedule analysis is designed to discover what system is in use, whether the signalling is restricted or unrestricted and, if the former, what the time of each schedule is.

a. Analysis of the System. Analysis involves a tabulation of times of communication together with a study of chatter. Time is correlated with circuit and, if a definite pattern shows up several weeks running, it may be assumed that period signalling is in use. In the preparation of the data, record should be made of such chatter items as, "I have a schedule at 2200 with XYZ." Such information helps to fill in the gaps in cover. Also note must be taken of the very brief schedules where the stations have no traffic and merely call up, say, "I have no traffic," and sign off; or where a station is running over his schedule time and calls his regular correspondent

REF ID: A684682

to say, "I am busy," and then goes back to the first correspondent. If no pattern appears, however, it is then likely that either unrestricted signalling or priority signalling is in use. This can be determined by a check of the tabulation, since in priority signalling the control station will usually come up at regular schedule times. Chatter will also prove characteristic for this type of operating since the order of transmitting is fixed and usually only one message is sent at a time by each station. The type of unrestricted signaling can likewise be identified from chatter. Where arbitrary schedules are used, the stations will arrange for the next schedule at the time of sign-off. Incidentally, in period signaling, the stations also sometimes mention the time of their next schedule so care should be exercised not to confuse the two. The regular pattern of times over a long period will usually distinguish period signaling. In alert operating, no arrangements are made, all stations standing by for transmissions at any time.

b. Determination of Schedules. The tabulations made for the above purpose will also serve to determine the times of regular schedules. Each circuit may be plotted on cross-section paper with hours down the side and days across the top. This will give a month's picture at a glance (fig. 32). The letters in each square indicate

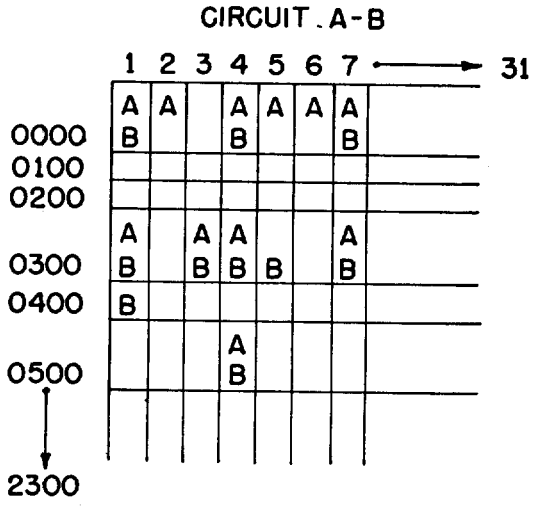

Figure 32.

the end of the circuit that was heard. On the 2d at 0000, for instance, only A was intercepted. Other items may be added to this tabulation if desired. These might include number of messages passed, indication as to which of the alternate frequencies was being used, and special notes from chatter relating to schedules. Two irregulari-

REF ID:A586489

ties will be noted in the pattern in figure 32. On the 1st at 0400 B ran over the regular 0300 schedule. Reference to chatter discloses that B asked A for additional time. On the 4th at 0500, A-B worked a special schedule. A check of chatter on other A circuits shows that A arranged for this schedule through a third station, which could contact both A and B, for the purpose of passing urgent traffic.

47. Procedure Analysis

Analysis of procedure is undertaken (1) to discover characteristics which will assist in identifications and continuities, and (2) to solve any encipherments employed.

a. Study of Characteristics. The normal characteristics of the procedure under study should first be established. This includes the call-up, exchange of readability, order of traffic, message externals, servicing methods, and sign off. In many communication systems, several normal procedures may be apparent, each representing a major division of nets. When this task has been completed, variations from the normal as applied to individual nets, groups, links, and stations must be identified. These variations may be of any sort. For example, one net may use break-in procedure for servicing, or may place the priority of the message in a different preamble position, or may tune up with a letter other than "V"; or a station may regularly place an NR before the link serial number while others do not, or fail to use an RQ before its request for services. These variations arise in several ways. They may be due to an oversight on the part of personnel, such as failing to change to a new method of procedure because of habit or because the station was not included in the distribution of the new instructions. Such situations will usually be corrected in time, or, if distribution is impossible, continue to serve as an important identifying feature. Or they may arise from the latitude permitted nets or stations in compiling their own rules. The only approach to this analysis is through the detailed study of chatter and the recording of the normal and the unusual.

b. Solution of Enciphered Procedures. The solution of enciphered procedures depends on the ability to determine the meaning of procedure signs and signals in context and, where a periodic change is involved, the equating of the same procedure in terms of different encipherments. For example, in the opening minutes of a schedule, procedures such as "Send V's," "How is my readability," "I cannot hear you," "Readability is poor," "Adjust your transmitter," etc., will be common. By study of the context over a period of time, it should be possible to identify the appropriate meaning.

RECD 100 : 2684682

48. Serial Number Analysis

The analysis of serial numbers is directed toward the determination of the type of number, the manner of assignment, the solution of any encipherments, and the identification of the series with units.

a. ANALYSIS OF TYPE. The type of the serial number, that is, indesk, message center, signal center, etc., is determined through a correlation of the numbers with other signal features. The numbers should be tabulated for a period of a week or more as necessary against call signs, file times, intercept times, cryptographic systems, routings, and similar items. The following discussion is not intended to be complete since there are so many possibilities involved in these manifold relationships, but it is hoped to give some general indications on how to think about them.

(1) Serials which run in order by cryptographic systems may be a code room number, a message center number, or a signal center number. It will rarely be a radio station number. The caution to be observed is that the cryptographic system may not be the basic factor and the serial the result, but rather the system, like the serial, may be the effect of something more basic. For example, a series is found which agrees with the cryptographic system and every message in that system is always in that series. It is noted, however, that the system is the only one held by the unit involved. Thus, both the system and the series are representative of the unit, and the number only accidentally follows the system.

(2) Serials which correlate with routings are also usually in the message/signal center phase. Sometimes several series which do not match with other features are observed originating at the same routing. These are often the expressions of several units operating through a single signal center. Such numbers may be put on at the unit message center or they may be added at the signal center, the latter maintaining several series, one for each of the units involved.

(3) Serials which run in order by file time may represent either the message/signal center or radio station stage. Usually, file times are put on at the radio station, but, since the traffic comes to the station direct from the message or signal center, its order is seldom disturbed, so that it could be numbered in one place and time-stamped in another and still demonstrate a relationship. In the case of radio station numbers, it will usually be found that several call signs, used at the same station, will run in a common series.

(4) Transmitter numbers will, as a rule, correlate with the sending call signs and the intercept time. Link serials will be evidenced by the further distinction of a separate series for each station called. Operator numbers are indicated by several series originating at one call, regardless of reply, unless the station works to only one correspondent.

REF ID:A58489

(5) It is just as important in the study of serials to have negative evidence as positive, so note should also be taken of what does not fit the series. If several routings fall in the same series, for instance, the number was not assigned at the message center if that is what the routing represents. Such a series is more likely to relate to the radio station which handles traffic for several different routings.

(6) Many times series will appear which bear a relationship to several items. It is then necessary to determine what is the basic consideration. For example, a tabulation of serial numbers reveals:

Serial	*Crypt. System*	*Routing*		*Call sign*		*File date and time*	*Intercept date and time*
		From	*To*	*From*	*To*		
326	A	A	B	PQR	XYZ	08 1040	08 1215
327	A	A	B	PQR	XYZ	.....	08 1217
328	B	A	C	PQR	XYZ	08 1040	08 1220
335	A	A	B	....	....	09 1230	09 1530
339	C	A	C	PQR	XYZ	09 1210	09 1532
340	A	A	B	PQR	XYZ	09 1235	09 1535
343	B	A	C	PQR	....	09 1300	09 1538
344	C	A	C	PQR	XYZ	09 1300	09 1600
345	C	A	C	PQR	XYZ	09 1250	09 1615
346	A	A	D	PQR	XYZ	09 1310	09 1619
362	C	A	C	PQR	XYZ	11 1240	11 1525
367	C	A	C	PQR	....	11 1500	11 1801
368	C	A	C	PQR	XYZ	.....	11 1820
429	B	A	C	PQR	XYZ	08 1100	08 1223
437	B	A	C	PQR	XYZ	09 1315	09 1623

Except for the last two numbers which are garbled, the serials correlate with origin, calls from and to, and intercept time. File time is slightly off in several places. Since intercept time fits so well, it may be assumed that this is a radio station number. Reference is now made to the circuit diagram and it is noted that PQR is on the edge of the net and that it is connected to it by the single circuit to XYZ. Thus the routing "A" is probably the only message center routing through PQR and, therefore, the relation between "A" and the serials is forced and not the true one. If it were the true one, it is likely that the intercept times would be somewhat out of order because of the routine of processing traffic and the passing of priority messages. But since there is only one link out of the station, the type of radio station number used cannot be defined. It may be an in-desk, a transmitter, or a link number. If the picture is expanded, however, to include an additional link with numbers, it will appear as follows:

REF ID: A584682

Serial	Crypt. System	Routing From	Routing To	Call sign From	Call sign To	File date and time	Intercept date and time
372	B	A	C	PQR	STN	08 0900	08 1025
733	A	A	B	PQR	STN	08 0910	08 1030
734	A	A	B	PQR	STN	08 0910	08 1033
759	B	A	C	PQR	STN	11 1535	11 1911
765	C	A	C	PQR	STN	11 1820	11 1914

The serial is a link number since the numbers run in a separate series for the PQR–STN channel.

Serial	Crypt. System	Routing From	Routing To	Call sign From	Call sign To	File date and time	Intercept date and time
603	B	A	C	PQR	MNO	171441	172010
604	A	A	C	PQR	MNO	171411	172013
605	B	A	C	PQR	MNO	171411	172016
606	B	A	C	PQR	MNO	171415	172021
610	B	B	D	GHI	STN	171430	171810
612	C	B	D	GHI	STN	171430	171812
612	C	B	D	CHI	STN	171430	171812
613	A	B	C	PQR	MNO	171440	172005
634	A	A	C	PQR	MNO	181120	181523
636	A	A	E	GHI	STN	181135	181803
639	A	A	D	GHI	STN	181150	181809
640	B	A	C	PQR	MNO	181155	181520
641	A	A	C	PQR	MNO	181155	181535

Note the correlation with file date and time and the interlocking of the call signs. This is an instance where file date and time are entered at the radio station.

(7) The following tabulation is that of a signal center number:

Serial	Crypt. System	Routing From	Routing To	Call sign From	Call sign To	File date and time	Intercept date and time
020	A	A	C	GHI	PQR	230910	231233
023	A	A	C	GHI	PQR	230910	231230
024	A	A	C	GHI	PQR	230925	231225
026	B	B	D	JKL	STN	230910	231413
029	C	B	D	JKL	STN	230915	231416

REF ID:A58489

Both A and B route through the signal center where a common series is applied to the traffic of both. The possibility of this being an in-desk number is largely ruled out by the failure to correlate with file time.

b. Analysis of Assignment. Study of the manner of assignment of serial numbers is concerned with three phases: (1) composition of the numbers, (2) range of the series, and (3) over-all pattern of assignment.

(1) *Composition.* The numbers may consistently be two-digit, or three, or four, etc. They may incorporate such features as the date. Composition, if sufficiently distinctive, often furnishes a means of quick recognition.

(2) *Range.* The range of the series may be readily determined, or it may take several years. It can be established by observation of the reversion to the lowest number of the range, which will fix its limits in terms of either time or numbers, or both.

(3) *Over-all assignment.* Serial ranges of the same type of number should be checked for pattern of assignment against each other. In the case of message center numbers, for example, it may be found that each division of an army has been given separate blocks, 1–100, 101–200, 201–300, 301–400, etc. Similar patterns may appear with regard to signal center or radio station numbers. These patterns can be analyzed through a comparison of ranges representing groups which bear an order of battle or a net relationship to each other.

c. Solution of Encipherments. The solution of enciphered serial numbers is a matter of cryptanalytic approach. The initial break, however, can often be made by gathering a group of messages on which it is thought that the serials run in order. If, for instance, an in-desk number is involved, messages arranged by file time should assist in attacking the system. It also may be helpful to select the first message of the day, if possible, and use it as No. 1. It will serve as a base even though that may not be its actual number. If the numbers are thought to repeat daily a selection of this message each day may yield different encipherments of the same number. As a rule, these systems should not prove too difficult to solve unless the method is one of complete randomization.

d. Identification of Series. Once the type of series is known, the next step is to determine the actual unit behind each series. In the case of a message center number, for example, what message center is it? Or if there are three series of in-desk numbers out of the same station, what do each of these series represent? These identifications are established by "pure" traffic analysis plus the use of collateral material on the basis of the axiom that things equal to the same thing are equal to each other. For instance, a range of in-desk numbers appears only with codes A and B. Codes A and B are known to be

REF ID: A5384682

transportation systems. Therefore, the serial range represents the transportation unit at the signal center. Care must always be taken, in chaining data of this sort, that the basic assumptions are valid (in this case, that A and B are transportation codes) and that the things compared demonstrate an exact relationship (if A and B were also used on another range of numbers out of the same station, then it is unlikely that the first range represents transportation, but rather that it represents some other type of unit or else a specific transportation unit, these possibly being two at the station). Decode and order of battle material are invaluable in the study of these series. If some of the traffic related to a series can be read, solid evidence for conclusions is provided and often a definite unit can be identified. Order of battle will do much the same. For example, where only one air unit is carried at a given location and a series, tied to the air cryptographic systems, is observed out of that location, it may be assumed that the series represents the air unit.

49. Analysis of Priorities

The analysis of priorities is directed toward determining their order and the solution of any encipherments. The order is determined by comparing file times with intercept times. In general, the shorter the average time lapse, the higher the priority. However, time lapses should be compared within stations not between them since the size of the station and the volume of traffic handled will cause individual differences. Relayed traffic, of course, should not be included in the comparisons. The cryptanalysis of encipherments is naturally dependent on the system used, but it is of assistance to group messages according to expected priority, thus providing isologs.

50. Analysis of Routing Systems

The main objectives of routing system analysis are to discover the manner of use and to solve the routing codes.

a. Analysis of Use. When routings appear on traffic, it is first necessary to determine what they represent in terms of origin and destination. This is done by observation. If necessary a tabulation can be made against call signs which will readily reveal which routing is the originator and which the addressee. The difference where present between information and action addressees may be a little more difficult, but checks, for example against priorities, should assist. Further observation will indicate the manner of handling local and relay traffic and the nature of the routings in these instances. Any peculiar use of routings, as in the readdressing of traffic, can also be determined. Following these routings against the net diagram is often helpful.

REF ID: A584682

b. Solution of Routing Codes. The initial step in the solution of routing codes is to check the code groups for characteristics in composition and range. Once these patterns, if present, have been recovered, the next step is the specific identification of code and syllabary groups. Identifications are chiefly based on cribs from known systems to unknown, on net diagrams, on breaches of security, on decode and order of battle material, and on a number of variations of these. As identifications are produced, it may be possible to ascertain the structure of the code and syllabary, such as alphabetical, geographic, order of battle, etc., and this, in turn, assists in future recoveries. In order to suggest methods of attacking this problem, some of the possibilities are discussed below:

(1) *Tying the code group to a known radio station.* Where the station locations are known, several methods present themselves according to the use of the routing codes. The predominant originator out of a station may ordinarily be assumed to be located there. This also applies to the predominant destination, unless destinations are dropped on local traffic. But, because the identification is made with a location, this identification is a true one only if the routing numbers represent locations. If they represent units, then it is necessary to seek further, and the recovery of the location can only be considered tentative in lieu of something more exact. Along with the use of this technique, the lapse between file and intercept times should be averaged for each originator. Messages originating locally will show a shorter time lapse than those previously relayed. If destinations are habitually dropped on the last, or local, leg of a relay, they may be related to the receiving station. For instance, a message from A to C carries the routing "123–567" on the A–B link (fig. 33), but when B relays to C, it only carries "123", thus matching 567 with C.

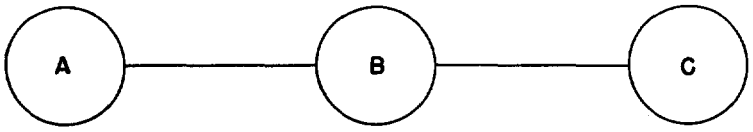

Figure 33.

When the same message is sent to several locations, the local copies may not carry routings while the relayed ones do, making possible the identification of the origin with the sending station. For example, in figure 34, A sends the same message to C and D. The message to C on the A–B channel is marked "123–567", that to D has no routings, thus identifying 123 with A.

(2) *Cribs.* The availability of cribs is chiefly based on the existence of several different routing systems. This may involve checking into networks other than military, such as Naval or domestic, for

REF ID: A684682

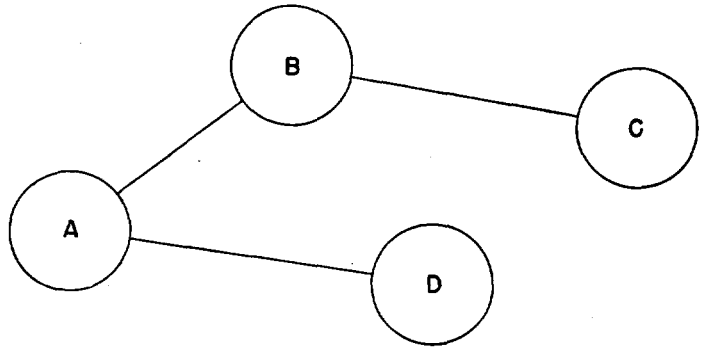

Figure 34.

such data. No possibility should be overlooked. Some of the crib techniques follow.

(*a*) *Relay crib.* If it is necessary for a message to pass over different nets with different routing systems, origins, and destinations can be correlated, and if one system is known, the other can be identified. For example, the message on Net I carries "123–567", on Net II "ABC–JKL", then 123 equals ABC and 567, JKL. One caution here relates to the destination. If this is a book message going to several addressees, there may be a direct correspondence between the originators, but not the destinations, since 567 may be one receiver and JKL another. Sometimes, this can be verified by checking the address and serial numbers.

(*b*) *Book message crib.* Where the same message goes to a number of destinations over different nets employing different routing codes, it is possible to crib originators. This often happens with large centers who work in several nets and may use several routing codes. It also occurs where traffic is relayed out of the net. Naturally, this would also yield a relay crib, but if the first transmission has been missed, the later relay can be used as a book message crib.

(*c*) *Serial number crib.* Serial numbers may be used to crib originators if the serial is a message or signal center number. For example, if a tabulation of serials reveals the following:

Serial	*Routing*	*File date and time*
53	123	092005
54	123	092005
55	123	092005
58	ABC	092005
59	123	092005
60	123	092015
65	ABC	092020
67	ABC	092020

then 123 may be cribbed with ABC.

REF ID:A684682

(*d*) *Error crib.* Where several routing systems are available to a station which works in a number of nets, it may occasionally happen that the wrong system is used. Such errors will generally be corrected yielding a crib between the two codes.

(*e*) *Address and signature cribs.* A unit or person addressed at one routing group in a known system will yield a crib against the same unit addressed at an unknown group. For instance, the 37th Division may be addressed at ABC, known to be Mannheim, on one message, and to 123 on another on the same day; 123 may then be identified with Mannheim. The possibility of unit movement, however, must be considered, and also that of detachments being addressed. The new recovery should be checked against the pattern, if present, of the routing system. In address systems where solution is only partial, but unenciphered code is available, the same address code groups may be used to crib the routing groups. Address code groups, for example, 1234, 5678, may appear with destination group ABC and also with 135. It is not necessary to know the value of 1234 5678 to crib ABC with 135. These same techniques are applicable to signatures and points of origin.

(3) *Operator chatter.* Operator chatter may give away the identity of a code group through the mention of a place name or a unit.

(4) *Address information.* Where addresses are separate from routing codes, use may be made of the address when readable. A unit, whose location is known from other order of battle sources, may be addressed at an unknown routing group thus identifying this group. Consideration must be given in such an instance to the possibility of the unit having moved. If there is some pattern to the composition of the code, the new value should be checked for fit. The recency of the date of the unit's identification and the trustworthiness of the source should also be noted.

(5) *Solved message information.* Solved messages may contain outright assignments of routing code values; more usual, however, is the traffic which permits correlation of internal originators, addressees, or subject matter with externals. All solved messages should be read for clues to routing code identities.

(6) *Miscellaneous sources.* These involve prisoner-of-war reports, captured documents, and similar materials.

(7) *Syllabary solution.* The syllabary to the routing code may be solved by using any of the above methods, but also available is the use of word patterns. If, for example, the routings consist of place names, a list may be constructed of all likely places which will show patterns of repeated or doubled letters, digraphs, etc., within each location, and this may be applied against similar patterns in the encipherments.

REF ID: A5384682

(8) *System change.* If the routing system changes, the continuity techniques discussed in paragraph 44 *b* (2) may be applied. For example, the continuation of a series of serial numbers may serve to identify a new routing designation with an old. Also of value are the contact patterns or associations in which a routing designation may be involved. If, for instance, routing number 123 sends traffic daily to three particular locations, and after the change of system, ABC is discovered following the same pattern, then 123 and ABC may be equated.

c. The above listing of methods of identification is only partial and specific application is dependent on the nature of the communication system under study and on the structure of the routing codes. Identifications, as made, should be evaluated and some sort of validity indicator attached to them as a guide to the reliability of the value. These validities are the result of personal judgment and the peculiarities of evidence and no rules can be laid down for their use on a general basis though in any specific problem definite standards can be set up. Where identifications are based on a crib, however, it should be remembered that the validity of the cribbed value can be no higher than that of the base value.

51. Analysis of Textual Features

The analysis of cryptographic features is concerned with the recognition, use, and distribution of systems, the use of indicators, and the identification of practice and dummy traffic.

a. Recognition. The recognition of cryptographic systems is the first step in their analysis either for traffic analysis or cryptanalytic purposes. Where a discriminant in the clear is present, this becomes a simple matter; encipherment somewhat complicates the problem. But, if there is no discriminant, it is necessary to make use of other features. In the attack, traffic should be sorted down by net and then studied for individual peculiarities. For instance, the following differences may appear as to the type of text:

Net	Type of text	No. of messages
I	4-letter	65
	4-digit	40
	3-digit	29
II	4-letter	48
	5-digit	73
	4-digit	51

Since the net usually represents an order of battle entity it also often represents a crypto-entity. Therefore, all 4-letter traffic passing on Net I (barring the discovery of any further distinction) may be assumed to belong and may be considered for the moment a hemo-

REF ID:A58489

geneous system in itself. Further study is then necessary on the relationships of the two possible systems. Some elemental difference as to form may be apparent which will distinguish them as separate systems, such as the presence of a digit indicator in one. On the other hand, no distinction may be noted and it will be up to the cryptanalyst to determine if the same or different systems are involved. Routings should also be checked in this respect, a relationship between routings (as to echelon, for example) evidencing the likelihood of the same system though passed on different nets. Other factors, beside type of text, are of course also valuable. These include priorities, characteristic serial number ranges, or features of the text such as the nature of the indicators.

c. Analysis of Use. Tabulations of the nets and routings of traffic will often indicate the use of a system. A system, for example, passing only over a water transport net may be identified tentatively as a water transport system, or one used only between intelligence units may be considered a special intelligence system. Caution should always be exercised in making such assumptions because of the ever present possibility that the transmitting of certain traffic over specific nets may result from communications necessity. Peculiarities as to priorities, serial number ranges, and miscellaneous preamble classifications may also assist.

d. Analysis of Distribution. Directly related to the study of use is the analysis of distribution which can be accomplished on the basis of the same tabulation. For instance, a given system may be identified as Air Force and, furthermore, it may be discovered that its distribution is limited to a certain type of Air unit. The tabulation may be as follows:

Net	*Routings*	*Volumes*	*Other characteristics*
I	A–B	354	All traffic uses 5-digit message center numbers.
	A–D	251	
	B–A	240	
	B–D	223	
	C–A	112	
II	A–E	232	5-digit message center numbers.
	A–F	227	
	E–F	116	
	F–E	34	
III	A–G	249	5-digit message center numbers.
	B–G	245	
	G–C	121	
	G–H	112	
	H–G	78	

REF ID: A5384682

Nets I, II, and III are known to be high-echelon Air Force administrative nets. The system under study appears only on these nets and a further check reveals that it composes the bulk of the traffic passed, indicating that it is probably the high-echelon administrative Air system. The 5-digit message center numbers are of interest because numbers of this size appear only on traffic of Air division or higher. Furthermore, most of the routings involved are known to be locations of Air divisions and higher headquarters. Thus, the limits of the distribution of the system are established and now the reasoning may be reversed: any routing appearing with this system may be assumed to be an Air division or above. One-time pads lend themselves to this type of analysis because of their highly restricted distribution. Tabulation of the pad numbers against other features will generally define the users, and since these pads are usually used in only one direction, fix the originator and the one or more recipients.

e. Analysis of Indicators. Where indicators appear in the clear they may be of traffic analysis value. Observation will reveal any peculiarities of the indicators and, if present, they can be correlated with other features.

f. Analysis of Practice Traffic. Practice traffic can often be identified through a study of the text. Messages may be made up at random which generally leads to a patterning and repetition of combinations of letters or digits. Also since there is usually no desire to disguise practice traffic, it may carry a designation in the heading. On the other hand, skillfully designed practice traffic, particularly if an effort is made to conceal it, may be undetectable except for security breaches in operator chatter.

g. Analysis of Control Traffic. Control traffic, if properly handled, may prove very difficult to identify. The usual means of analysis, such as operator chatter, distinctive serial number ranges, etc., are always open. For example, very fast receipting for traffic and few services may indicate that the operators know that the traffic is dummy and are not particularly concerned about it. On the other hand, in an efficient control operation, the operators will not know that they are dealing with dummy traffic and hence will furnish no clues. Another method open to the analyst, however, is the study of traffic volumes and proportions. A level traffic volume on a number of circuits may indicate an attempt to conceal the natural peaks and troughs of a military operation. Moreover, high volumes in areas which other intelligence sources reveal as inactive should be viewed with suspicion. Abnormal rises of certain types of priorities of traffic should be carefully checked for evidences of spuriousness. Control operations carefully planned will take into account the

REF ID:A584489

proper proportions between the various types, but, because of their complexity, breaches of security will often occur.

52. Miscellaneous Items

Every communication system has its own peculiarities in its procedure and traffic. No rules can be given for their analysis except to observe the manner of use and to seek out the relationships between them and other features. It is hoped that the foregoing discussion of certain specific components will not only serve to set the pattern for research on these miscellaneous items, but, more than that, will encourage the traffic analyst to use his ingenuity in the development of new techniques.

Section III. NET RECONSTRUCTION

53. Introduction

The reconstruction of the radio net proceeds simultaneously with the analysis of radio operations. (Furthermore, it is a continuing task since net formations and operating data are seldom static factors.) As noted before, it involves the grouping of stations into nets, the building of the net structure, and the identification of the stations with geographic locations and military units. The resulting net diagram may be drawn in either a schematic or geographic design, according to purpose, and signal features added. This involves, in effect, the reproduction of the radio communications section of the enemy "Signal Operation Instructions" (SOI). These instructions are the orders issued setting up the required signal nets for each military operation and include the assignment of frequencies, call signs, schedules, and miscellaneous data. For a more complete description of the "Signal Operation Instructions," and for United States Army examples of same, see chapter 4, FM 24–16.

54. Grouping of Stations

a. The initial step in analysis is to list all stations and their correspondents. This will yield a rudimentary grouping. For example, the study of a day's chatter reveals—

ABC works DEF
ABC works GHI
ABC works JKL
DEF works MNO
DEF works PQR
MNO works PQR
XYZ works STU
XYZ works ?

REF ID: A384682

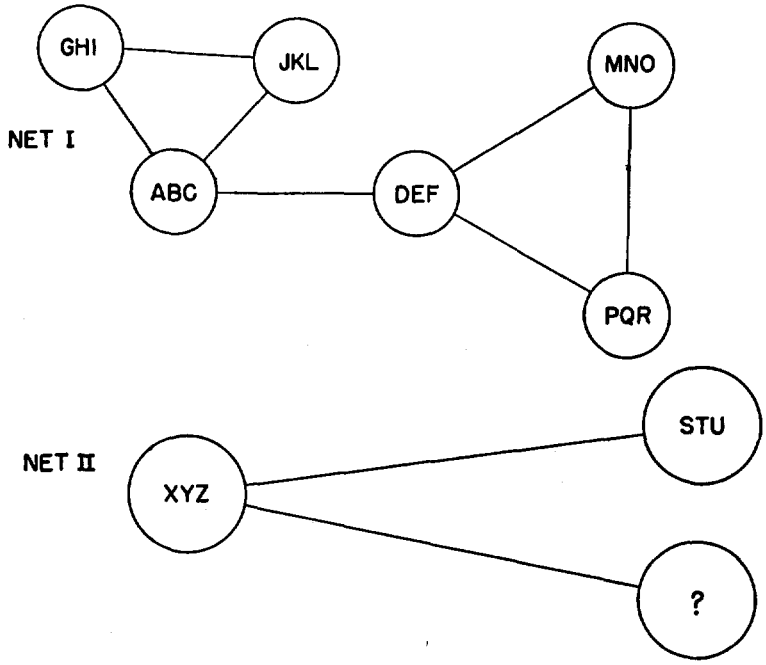

Figure 35.

Thus there are, for the moment, two separate groupings of stations with Net I apparently divided into two groups (fig. 35). It should be remembered that one day's intercept will rarely result in anything as complete as this, and that where daily changing calls are employed, the continuity techniques covered in paragraph 44 must be used. Missed calls present a similar problem. The next task is to study the characteristics of these stations as far as radio operation and procedure is concerned in order to refine the above groupings. It may be found, for example, on the one hand, that the ABC group and Net II exhibit such like characteristics that they appear to belong to the same net and that the connecting link between them has not yet been monitored; and, on the other hand, that the DEF group displays such different characteristics that it must be considered separate and that the DEF call must serve two groups (DEF–MNO–PQR and DEF–ABC).

b. The characteristics to be compared relate to all the features of radio operations:

(1) *Frequencies:*
(*a*) System of use.
(*b*) System of allocation.
(2) *Call signs:*
(*a*) System of use.
(*b*) System of allocation.

REF ID: A584682

(3) *Schedules:*
(4) *Procedure:*
(*a*) Call up.
(*b*) Order of traffic.

(c) Message externals (form and composition of preamble and postamble).

(*d*) Receipting.
(*e*) Corrections and services.
(*f*) Signing off.
(5) *Cryptographic systems.*

c. These items may be used as a check list. Stations, or circuits, do not have to agree in every particular to be grouped, but they should on the major features and, often, on the more characteristic of the minor. What constitutes this latter depends on the net itself. If, for example, strict instructions are issued by the net relative to the order of the preamble components, any deviation, however slight, may be taken as evidence of a separate net. On the other hand, if instructions are rather lax, deviations may not hold any significance. The traffic analyst seldom knows about the nature of the orders on operating procedure, but he can, through careful observance of the net, gain a general impression of how closely it is controlled and how well it is disciplined.

d. The following example illustrates the use of these techniques:

ABC works DEF
ABC works GHI
ABC works ?
XYZ works MNO
XYZ works PQR
STU works ?
? works ?

(1) *The diagrams* (see fig. 36).

(2) *The characteristics:*

(*a*) *Frequencies:*

Net I: Complex-sending Frequency Fixed.
Net II: Star Frequency Fixed.
Net III: Complex-sending Frequency Fixed.
Net IV: Complex-sending Frequency Fixed.

(*b*) *Call signs:*

Net I: Double-station Calls Monthly Changing.
Net II: Double-station Calls Monthly Changing.
Net III: Double-station Calls Daily Changing.
Net IV: Double-station Calls Monthly Changing.

REF ID:A584482

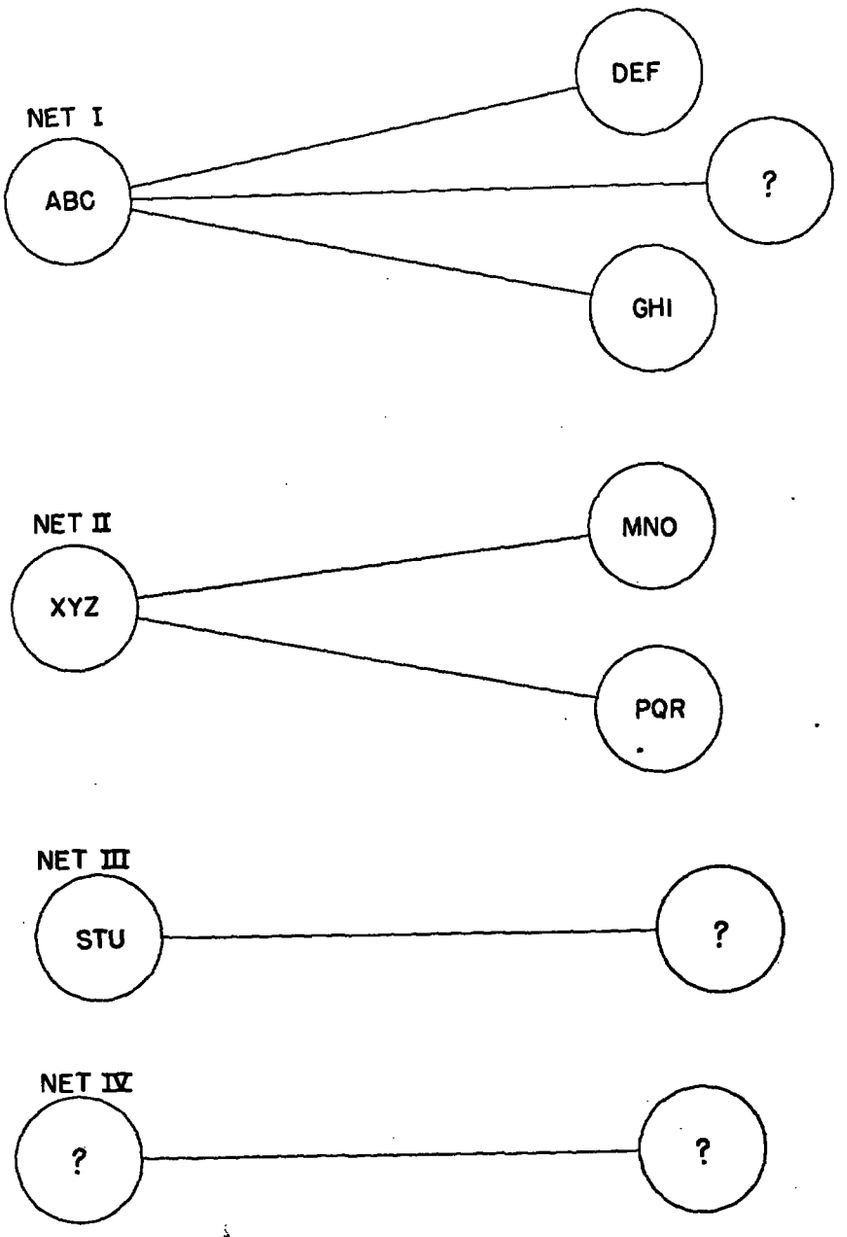

Figure 36.

REF ID:A58489

(*c*) *Schedules:*

Net I: Period.
Net II: Period.
Net III: Unrestricted.
Net IV: Period.

(*d*) *Procedure:*

All Nets: Q signals; International.

1. Call up:

All Nets: Usual.

2. Order of traffic:

All Nets: Precedence traffic first.

3. Message externals:

Net I:
Preamble: Circuit No.; Precedence; Message Center No.; Group Count; File Date and Time; Routings.

Net II:
Preamble: Circuit No.; Message Center No.; Group Count; File Date and Time; Routings.

Net III:
Preamble: In-desk No.; Precedence; Message Center No.; Group Count; File Date and Time; Routings.

Net IV:
Preamble: Circuit No.; Precedence; Message Center No.; Group Count; File Date and Time; Routings.

Separators: Same for all nets.

4. Receipting:

All Nets: Usual.

5. Corrections and services:

All Nets: Usual.

6. Signing off:

Net I: Usual.
Net II: Usual.
Net III: Makes next schedule.
Net IV: Usual.

(*e*) *Cryptographic systems:*

Net I: A, B, C, D.
Net II: A, E, F.
Net III: A, G, H, I, J.
Net IV: A, B, D.

e. It will be observed from the above that Nets I and IV have similar characteristics, and that II and III differ in certain important respects. Net II uses a net frequency. This alone would be insuffi-

REQ# 109:AS84819

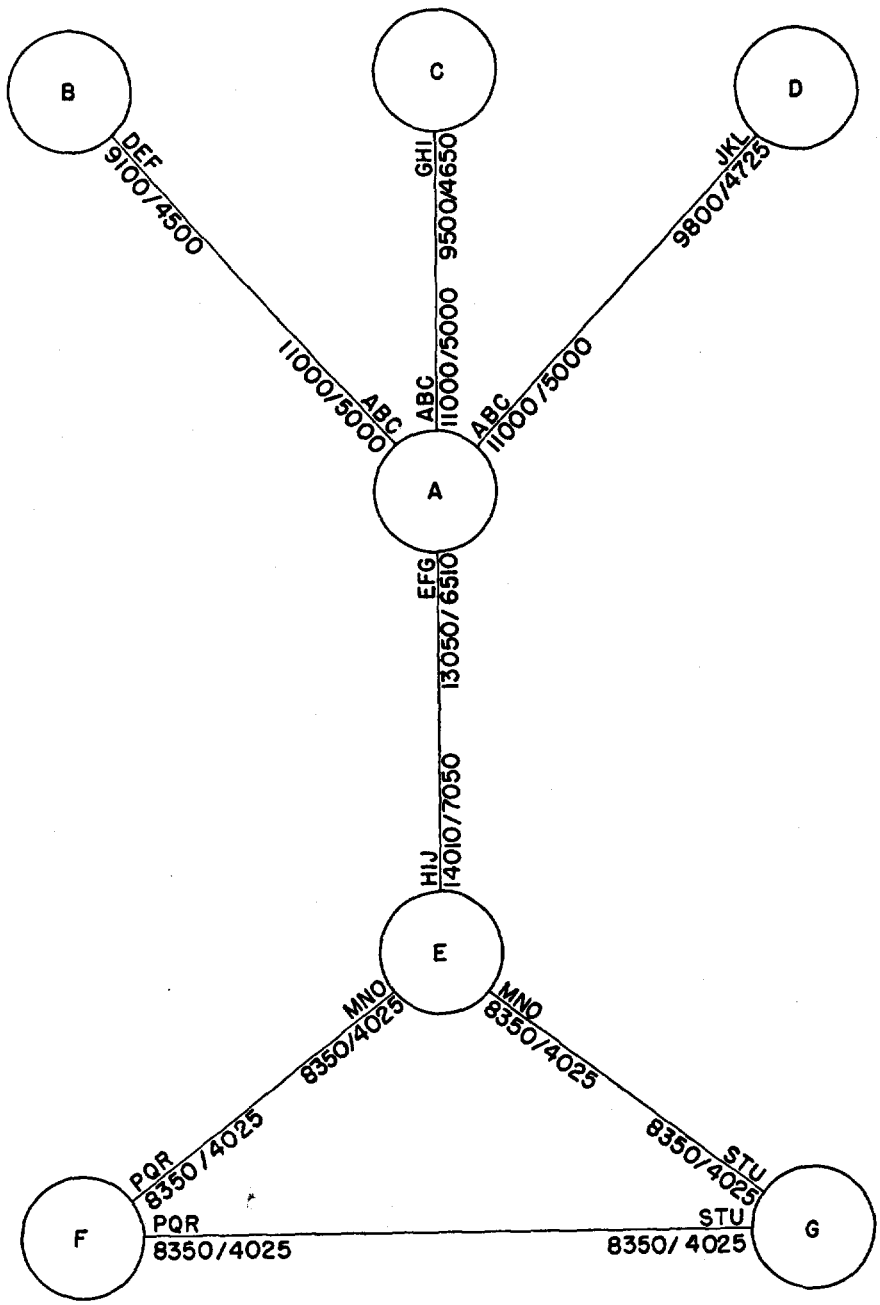

Figure 87.

REF ID: A58489

cient grounds for isolating it, but the position of the precedence in the preamble, and the use of different cryptographic systems furnishes enough additional evidence. Net III employs daily changing calls, usually adequate premise for setting a net apart. In this instance, added weight is given by the use of unrestricted signaling, the in-desk number, and the distinctive cryptographic systems.

55. Building the Net Structure

a. An elementary amount of net building is accomplished in the process of grouping the stations into nets. A number of additional techniques are now brought into play to complete the task. The crux of the problem involves the identification of different frequencies and calls with a station, in other words, that call ABC is at the same station as DEF, or that 11,000 kcs is at the same station as 9,050 kcs. When this has been done, the links and groups will fall into place and the net reconstruction be completed. It is difficult to set down definite methods to be pursued because much depends on the individual characteristics of the network. The following paragraphs discuss some of the principles involved and are suggestive of the general approach. Examples used are based on the diagram in figure 37.

b. Frequencies, Calls, Schedules. As a general rule, like calls or like frequencies may be assumed to be at the same station. Thus, in figure 37, the call ABC on frequencies 11000/5000 kcs was always considered the same regardless of station called. But caution should be exercised in arriving at this decision because it is always possible that no relationship may exist. A check of schedules is helpful. If ABC is heard working two different stations at the same time, it is likely that the two ABC's are separate stations. Other checks are traffic routings, cryptographic systems, etc.

c. Interlocking Serials. Where a radio station in-desk number is used, the serials out of different calls can be interlocked. When the serial is a message or signal center number, the interlocking technique may also be used, but account must be taken of the relay possibility. For instance, in figure 38 A and C are under analysis in an attempt to tie them together. Message center numbers on traffic out of ABC run:

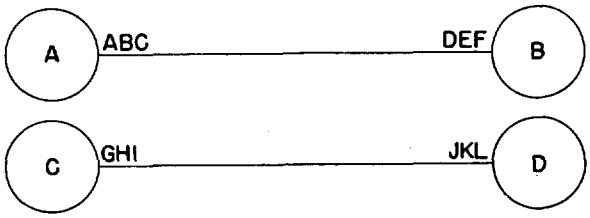

Figure 38.

RHQR 109:AD684682

1578	1607
1579	1608
1585	1609
1586	1610
1587	1629
1588	1630
1589	1631
1603	1641
1605	1642
1606	1643

Message center numbers on traffic out of GHI run:

1581
1582
1583
1584

But, if the latter traffic shows evidence of being relayed and, if there are no other grounds for identification, a conclusion cannot be reached. On the other hand, if it is found that nonrelay traffic on this net carries no routings, but that relay traffic does, and that all the messages listed above under both ABC and GHI have no routings, it may be assumed that ABC and GHI are co-located. Other types of serials, such as link numbers, generally cannot be used for this purpose.

d. Traffic Routings. On the theory that the predominant originator out of a call or frequency and the predominant destination into a call or frequency represent the location of the call or frequency, a tabulation of traffic routings may be used for net-building. For example, tabulations of routings relative to ABC and GHI reveal:

Call	*Routing*	*Volume*
Out of ABC	1234	75
	2345	43
	3456	10
	4567	3
Into ABC	1234	58
	2345	12
	4567	1
Out of GHI	1234	158
	2345	79
Into GHI	1234	101
	2345	39

The similarities in routings suggest their co-location though further proof is necessary for positive identification.

(1) Also useful is the system of omitting routings on local traffic. Calls of the same station will demonstrate similar relay routing lists

REF ID:A584482

with the station's own routing rather low in the tabulation. Book messages can be used as explained in paragraph 50*b* (2) (*b*).

(2) A somewhat different use of routings is in the inferring of links which have not been heard. For example, the routing 1234–6789 is noted on a message from A to B. 1234 has been located at C, but no link from C to A has been observed. Nevertheless, there must be some connection either through another station or directly. It is difficult to determine which is the case; a check of file time against intercept time will sometimes serve to indicate whether, considering the precedence of the message and the usual time lapses on the net, how many prior relays are likely. A tentative diagram could be drawn as shown in figure 39.

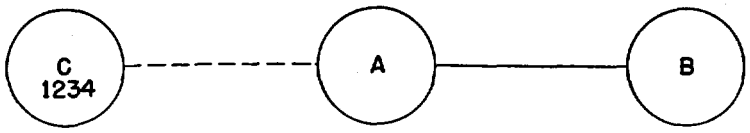

Figure 39.

e. Cryptographic Systems. On locally originated traffic, distinctive cryptographic systems, such as one-time pads, may be used to tie calls or frequencies together. As in the application of all message center features to radio stations, care must be taken to avoid relayed traffic.

f. Chatter. Items of chatter furnish important clues to net-building. In many instances, outright statements are made which relate one link to another. For example, ABC tells DEF, "At 1100 I have schedule with GHI." At 1100, JKL is heard calling GHI, indicating the identity of JKL and ABC. Mention of operators names or other local personalities also assist by the appearance of the same personality on different links.

g. Relayed Traffic. The study of relayed traffic presents one of the most important techniques in net-building. As messages pass from station to station, the net automatically reconstructs itself since it is only necessary to trace the messages' path to determine the structure. The chief caution to be observed is the possibility of having missed a relay, but this can generally be checked by differencing the intercept times. For example, a message is transmitted from ABC to DEF and an hour later from GHI to JKL. The diagram in figure 40 may then be drawn.

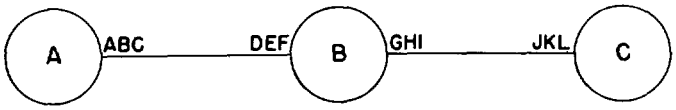

Figure 40.

REF ID:A684682

The possibility of the picture being as shown in figure 41, however,

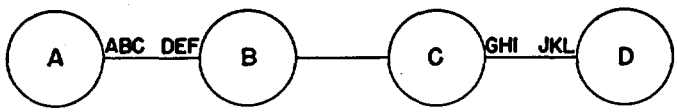

Figure 41.

does exist, but the short time lapse of one hour makes it unlikely that the extra relay took place. Of course, what constitutes a short time lapse is dependent on the habitual lapses and on the precedence of the messages under study.

h. COLLATERAL INFORMATION. Direction-finding is an important technique and, when the radio system is highly secure, may furnish the chief method of net building. Decode material, captured documents, prisoner-of-war reports, when available, should also be used to the fullest extent.

56. Location of Stations

The geographic location of stations is the third step to be performed in the reconstruction of the radio system.

a. IDENTIFICATION WITH A KNOWN ELEMENT. Identification with a known element is one of the chief means of locating the station. For instance, the tying-in of a station to an identified routing number will place the station. Similarly, calls, frequencies, serial ranges, and cryptographic systems which have been matched to locations may serve this purpose. The techniques involved can be derived from those discussed in this section and in section II. A validity should be attached to each station identification dependent on the weight of the identifying evidence.

b. CHATTER. Chatter often furnishes identifications through operator carelessness. Clues to locations, such as mentions of weather, local conditions, and similar items, should be carefully appraised.

c. DIRECTION-FINDING. Direction-finding is here listed separately because of its importance in the locating of stations. Often it is the only means available. This is particularly true in low-echelon nets where movement is liable to be frequent and where message externals are held to a minimum. It may sometimes be necessary to utilize a knowledge of order of battle, geography, and military strategy in connection with direction-finding. Bearings will usually give a general area, larger or smaller according to the distance from the target and the accuracy of the bearings, but seldom will pin-point a location. However, inference as to the most likely location within narrow limits is permissible provided it is backed with sound reasoning.

d. COLLATERAL MATERIAL. Order of battle information, decode

REF ID:A58489

material, captured documents, and similar items are often of great value in placing stations. For example, a division headquarters, whose radio station has been identified, moves to a new location. This new location is revealed by other sources. It may then be assumed that the headquarters radio station is also at this point.

57. Unit Identifications

a. The last step in the reconstruction of the radio system is the imposition of the order of battle. The order of battle underlies the entire net organization and each radio station must be identified with the units which it serves. In the high echelons, the nets are usually composed of large fixed installations which serve a number of units in the vicinity. Generally, however, there will be one major unit which the station represents. In the lower echelons, on the other hand, there will be a close correlation between unit and station. This is partially the result of the customary policy of manning large installations with an independent signal organization, while in the lower echelons the signal sections operate as an integral part of the unit.

b. The techniques of matching units with stations are only outlined below since it is felt that the preceding discussion sets the pattern of reasoning.

(1) *Identification with a known element.* This involves such items as call sign or frequency patterns which may be distinctive for certain commands or echelons, serial number ranges, routing systems, cryptographic systems, and procedural characteristics.

(2) *Chatter.*

(3) *Order of battle.* Beside the usual method of identifying a unit with a location and a location with a station, it is sometimes possible to force identification. For example, the order of battle information given in figure 42 is known, and a net is reconstructed as illustrated in figure 43.

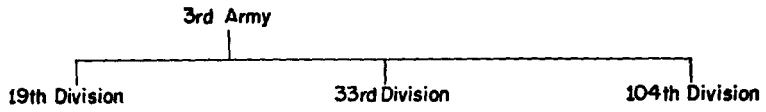

Figure 42.

It becomes apparent that station D is probably the 104th Division. In many cases, the echelon of command can be determined from the structure of the network and this may later lead to the identification with specific units. For example, the network shown in figure 44 is built.

REF ID: A384682

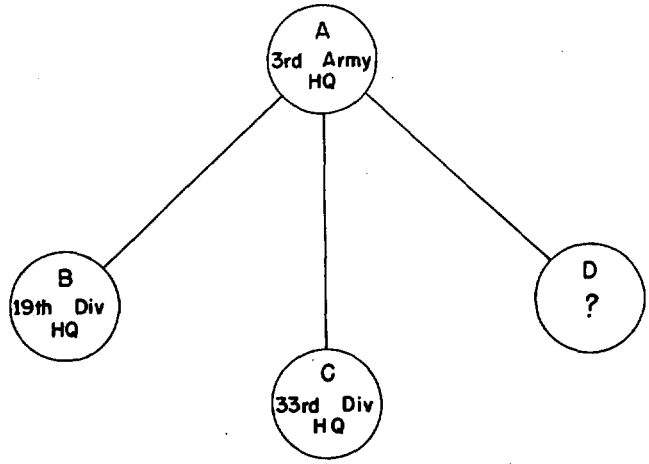

Figure 43.

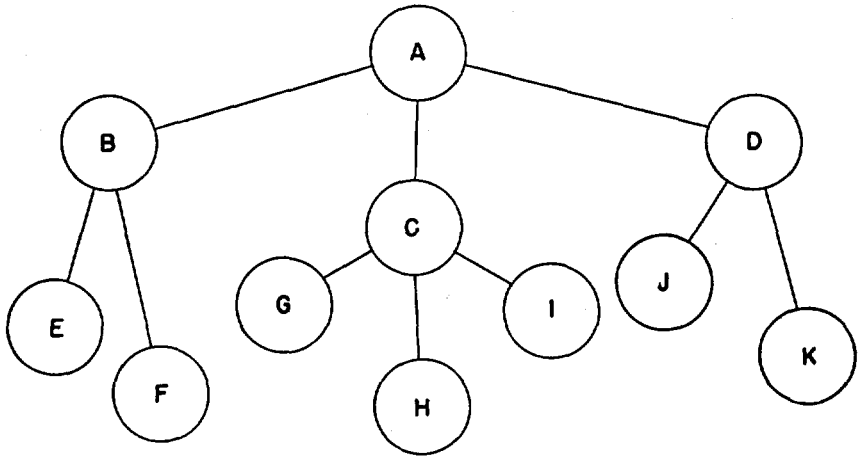

Figure 44.

It will be observed that A is probably the top headquarters, that B, C, and D are lower equivalent units, and that their out-stations are still further down the line. If anything is known of the order of battle in this area, it may be possible to match it with the net diagram.

(4) *Collateral material.*

58. Dummy Nets

Dummy nets and stations may be set up for the same purpose as that served by control traffic. Often when a headquarters is moved, a radio station is left operating at the former location to conceal the redeployment. Similarly, when it is desired to misdirect the

REF ID:A58489

enemy's attention, entire spurious nets may be employed to create the appearance of activity in an inactive area. The detection of such nets and stations may be difficult to accomplish and is largely dependent on the ability to uncover breaches of security resulting from careless chatter or ineptitude.

59. The Integrated Diagram

The immediate objective of the reconstruction of the nets is the production of the integrated network diagram which will serve as a

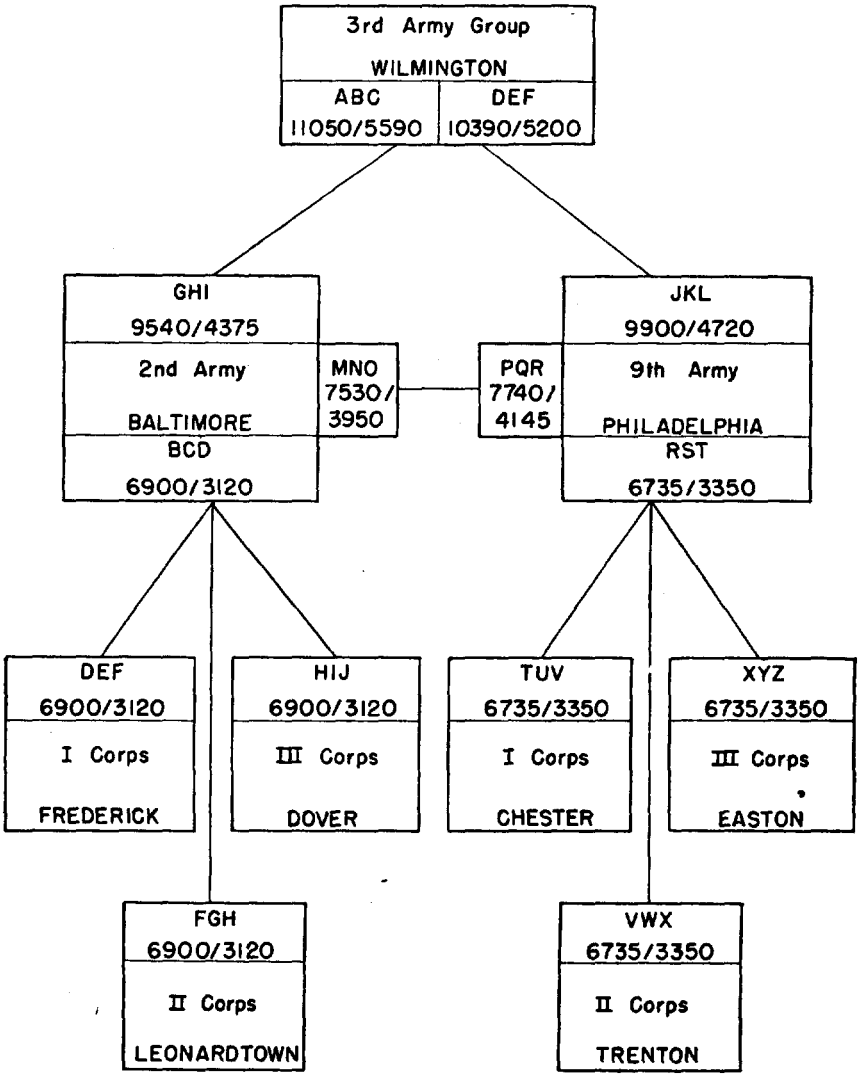

Figure 45.

REF ID: A5384682

backdrop for future study of the nets and for the production of intelligence and cryptanalytic aids. Because of the limitations of space and the complexities of some of the data, however, it is often not possible to include all the information necessary to a complete network picture in diagrammatic form. Therefore, certain basic diagrams may be produced either in schematic or geographic arrangement, and the omitted data supplied in accompanying charts. An example of such a basic diagram is given in figure 45. It will be noted that it contains order of battle units, locations, frequencies, and call signs, and is drawn schematically. Other data, which could be appended in chart form, might include range of serial numbers at each location or on each link, cryptographic systems used, and routings which appear or are identified with units or locations.

Section IV. METHODOLOGY OF ANALYSIS

60. Introduction

The preceding sections of this chapter dealt with the techniques of traffic analysis in regard to the study of radio operations and the reconstruction of the nets. In order to perform this analysis and achieve these ends, the proper machinery for processing raw material must be employed. This section is concerned with this machinery, and includes the processing of the chatter logs and the maintenance of appropriate files. The methods and forms outlined are only suggestive of the possibilities and changes should be made as necessary to meet individual situations.

61. Intercept Operator's Log

a. The raw material of traffic analysis is the chatter log. This is a complete record of the transmission as it is copied by the intercept operator and includes both traffic and chatter. An example of a portion of such a log follows (procedure is Q signals and international):

ABC	(2765 kcs) VVVVVVVVVV	
	DEF DEF DEF de ABC ABC ABC VVV QSV K	2133Z
DEF	(3152 kcs) VVVVVVVVVV	
	VVVVVVVVVVV ABC ABC ABC de DEF DEF	
	DEF VVVVV K	2135Z
ABC	V's QSA ? QSA ? K	2138Z
DEF	QSA4 QSA4 QSA? K	2139Z
ABC	QSA4 QTC 2 OP	
	QTC2 OP K	2140Z
DEF	QRV QRV K	2141Z

REF ID:A58489

ABC	QTC QTC

	6123 8051 6843 2967 1035	
	4114 EEEEEEEEE 4104 5281 7399	2144Z
DEF	3? 3?	
ABC	7399 1211 BT QSL? QSL? K	2145Z
DEF	R	2145Z
ABC	AS5 AS5 K	2146Z
DEF	OK OK OK	
	SAW TOM IN TOWN LAST NITE	2148Z
ABC	WHERE WAS HE GNG?	2149Z
DEF	31 Div They lost 2 ops in raid	2151Z
ABC	TOO BD AS AS	2151Z
ABC	QTC QTC QRV? K	2155Z
DEF	QRV QRV QRV K	2156Z

b. The important items of this chatter log must be extracted and recorded. The usual method to accomplish this is the use of the intercept operator's log on which is entered the significant features of the transmission as they occur. A sample log based on the above chatter is shown in figure 46.

c. The log is the basic analysis recording. Once it has been completed it should not be necessary, except in rare instances, to go back to the chatter logs. Consequently, considerable care should go into its preparation. It should contain all the data required for analysis and for the compilation of files.

62. Files

The contents of files are largely determined by the particular problem. It will generally be found advantageous, however, to maintain files based on the following:

a. Frequency. A master-frequency file containing a record of all frequencies, the time and date when first heard, associated frequencies, location, calls if reasonably fixed, net, etc.

b. Call Signs. A master call-sign file containing a record of all calls, date when first heard, associated calls, location, frequencies, net, etc. The information on the card here or in the frequency file may be kept to a minimum if one is adequately cross-indexed to the other.

c. Serial Numbers. Where practicable, files should be maintained on the various serial number ranges together with related features.

d. Routing System. A file of routing code groups with proofs of identifications.

e. Cryptographic Systems. A file of all cryptographic systems, how they can be identified, by whom used, for what purpose, and net.

REF ID: A584682

Date_____

GMT	Freq.	C/S	No.	Serial	Origin	Dest.	Remarks
2133	3152	ABC					V's DEF de ABC
2135	2765	DEF					V's ABC de DEF
2138		ABC					QSA?
2139		DEF					QSA4
2140		ABC					QSA4
2144		ABC	695				OP GR14 121541 1904 . . . . 7399 1211

2149		ABC					WHERE WAS HE GNG?
2151		DEF					31 DIV. THEY LOST 2 OPs IN RAID

Figure 46. Sample intercept operator's log.

In the case of distinctive features, such as one-time pads, files should also be maintained for each pad together with other pertinent data.

f. PROCEDURE. A file on the meanings of noninternational procedure signs and signals.

g. PERSONALITIES. All personalities appearing in traffic or chatter together with the connection in which they were mentioned. Personalities derived from other sources can be added to this file but they should be so marked.

h. ORDER OF BATTLE. All order of battle identifications originating with traffic analysis plus that available from other sources.

i. NET, GROUP, AND LINK. A running record should be kept on each net or, where necessary, group or link which will act as a history and also include the basic data for station identifications as to location and order of battle.

REF ID:A58489

j. Collateral Materials. Appropriate files should be maintained for all collateral materials. In the case of direction-finding, information must be organized to suit the particular problem. Files, as required, should also be maintained on solved messages, captured documents, and similar items.

REF ID: A5384682

CHAPTER 4

APPLICATIONS OF TRAFFIC ANALYSIS

Section I. INTERCEPT OPERATIONS

63. Introduction

Traffic analysis plays an important role in the direction of intercept. It furnishes the basic information necessary to the intercept station for the performance of its mission; its requirements are coordinated with those of intelligence and cryptanalysis for the purpose of prescribing cover and fixing priorities; and it checks certain phases of station performance. Depending on the nature of the organization, traffic analysis may also be responsible for the specific determination of missions for the intercept stations.

64. Intercept Information

a. The elementary function of traffic analysis in intercept control is the providing of basic net data to the stations. This includes chiefly frequencies, calls, schedules, and station locations. Other information may be added as required. A sample listing follows:

Locations	*Frequencies*	*Call signs*	*Schedules*
Hoboken	10500/5030	ABC	0100; 0300;
Zanesville	11350/6125	DEF	0500; 0700;
			1700; 2100
Hoboken	10500/5030	ABC	even hours
Overton	16400/7625	GHI	
Overton	16400/7625	GHI	0900; 1100;
Zanesville	11350/6125	DEF	1300; 1900; 2300
Star Lake	8430/4175	MNO	0700; 0900;
Ticonderoga	8600/4235	PQR	1800; 2200;
Star Lake	8430/4175	MNO	0400; 0600;
Buffalo	7550/3965	STU	1900

b. Technical reports may also be furnished to the intercept station. Certain items are fundamental. For instance, in the case of a changing-call system, the elements of the system are necessary for con-

REF ID:A58489

tinuity in cover; the same is true of frequency systems, procedure signs and signals, etc. In the determination of the type of materials to be forwarded, a balance must be struck between the requirements of security and those of intercept. All information is of use to the station, but some is more essential. Thus, it should be the policy to furnish everything that is available, consonant with security. Even much data which appear irrelevant may be of value if only to indicate to the intercept station the importance placed upon its product.

65. Types of Coverage

If it were possible to cover all desired nets or links twenty-four hours a day, there would be few problems to intercept control. Because of limited facilities and operators, however, such is not the case, and it becomes necessary to draw a number of fine distinctions with regard to types of cover and the order of priorities. Thus, cover may be divided into several types according to the purpose it serves.

a. FULL TIME. This is the highest of all intercept priorities (except in special instances) and consists of complete daily monitoring of each assigned net or link on all known schedules. The number of missions included in the full time classification should be sufficiently small to permit the monitoring station to cover all of them with ease so that, unless something entirely unforeseen intervenes, intercept is assured. Full time cover should never tax the maximum facilities and personnel of the station except under unusual circumstances, since positions should be reversed for other types of cover. These positions may, of course, be switched to full time if absolutely necessary.

b. SAMPLING. Nets or links which cannot be covered on full time may be put on sampling. The net is checked at regular intervals, the intercept station listening to several missions each day and rotating them until all have been monitored when the list repeats. This method yields some traffic on a variety of nets and enables the traffic analyst to keep abreast of current developments.

c. SEARCH. This mission consists of a search through a frequency band or bands for new transmitters and for changes of wave lengths. In the early stages of traffic analysis, this mission is of first importance since it serves to outline what is on the air.

d. PRELIMINARY CHECK. New frequencies discovered on search must be followed up to ascertain their genuineness and desirability. To accomplish this, they are placed on preliminary check, actually an extension of the search mission. If proved valuable, these links are then transferred to either full time or sampling.

e. SPECIAL CHECK. Special check is the complete cover of a net or link for a limited period of time. The check may serve a variety of

REF ID: A584682

purposes such as whether the link is still active, or what its schedules are, or whether it can be heard at the monitoring station.

66. Factors in Assignment

The main considerations in the assignment of missions to specific intercept stations are:

a. The ability of the station to hear at the times desired.

b. The availability of positions and personnel for coverage at the station.

c. The most economic use of the station's time. This involves the problem of the common transmitter which makes it desirable to assign an entire net, where possible, to one station. For example, in the net shown in figure 47 both the A–B and A–C link should be assigned

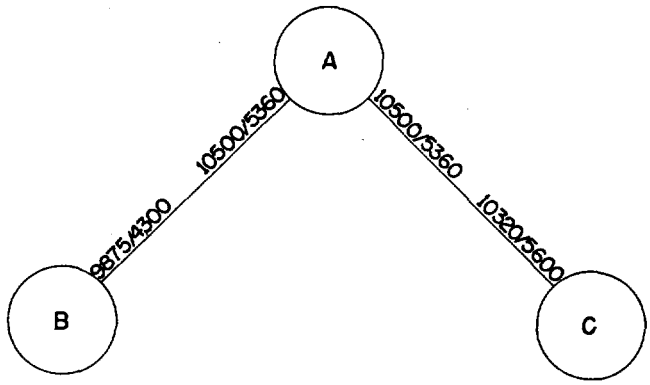

Figure 47.

to the same station, for by covering A throughout the day the activities of the net can be followed. On the other hand, if the intercept unit can hear A and B, but not C, it would become necessary to split the assignment. A second consideration in following this procedure is that the common transmitter arrangements tend to spread out until they include more links than can be handled at a single station. For example, C works another station on 10320/5600, B does likewise on 9875/4300, etc. Thus, a compromise assignment must often be devised.

d. The communication facilities between the station and the central analysis agency. In many instances, it is of prime importance that traffic arrive at a central point for analysis within the shortest possible time. For this reason assignments are sometimes made to the station which, though unable to provide the best cover, can forward the traffic the fastest.

REF ID: A584682

67. Factors in Priorities

The determination of priorities rests on the threefold requirements of intelligence, cryptanalysis, and traffic analysis. The traffic analysis needs are:

a. INTELLIGENCE. Traffic analysis, on its own, contributes to the intelligence picture and consequently is interested in seeing to it that the nets which yield the major portion of traffic analysis intelligence are adequately covered.

b. ANALYSIS OF RADIO OPERATIONS. In the study of certain elements of radio operations, intensive cover may be found valuable for limited periods of time, for example, the defining of schedules on a given net. Special check may be used to this end.

c. NET RECONSTRUCTION. Traffic analysis must maintain an up-to-date picture of all radio nets for the benefit of intercept control personnel regardless of the needs of intelligence and cryptanalysis (because those needs may change from time to time), and information must be available to permit the immediate assumption of coverage. In the reconstruction of nets of little current significance, or where the significance is unknown, special check is useful. Where nets have already been reconstructed and it is merely desired to watch them for changes, sampling cover is satisfactory.

68. Interpretation of Requirements

Besides making its own demands on intercept, traffic analysis frequently interprets the requirements of intelligence and cryptanalysis in terms of links and nets. For example, intelligence expresses interest in a given area; traffic analysis knows what links or nets to monitor in order to blanket the area. Or cryptanalysis wants more traffic in a given system, a certain routine message, or a type of isolog; traffic analysis knows what nets or links carry large portions of this traffic.

69. Station Performance

a. In order to insure proper performance by the intercept station and to check on the fitness of the assignment, coverage results are continually evaluated.

b. If a serial number, relative to the sending station, is available, it may be analyzed for missed traffic. Forms can be devised for the simple maintenance of this data which, in turn, can be obtained from the intercept operator's log. Other features, such as message center serials, may also be employed to check for missed traffic though care must be exercised in making use of them. Incidentally, there is a tendency to place emphasis on the volume of traffic copied at a station as a gauge of its efficiency. This attitude is to be discouraged since

REF ID: A684682

it is often necessary to monitor nets or links which yield little traffic, but do carry cryptographic systems of great cryptanalytic or intelligence value, or possess useful traffic analysis features.

Section II. APPLICATIONS TO CRYPTANALYSIS

70. Introduction

a. The relationship between traffic analysis and cryptanalysis is not easily defined. Often an arbitrary line must be drawn between them when it is desired to keep the functions separate, but it will be found necessary, whatever the distinctions made, for the cryptanalyst to be grounded in traffic analysis and the traffic analyst in cryptanalysis. This arises from the basic concept of traffic analysis and cryptanalysis as closely related processes with traffic analysis furnishing the frame of reference within which cryptanalysis is performed. The material supplied by traffic analysis falls into four main categories:

(1) General background information.
(2) Crib messages.
(3) Isologs.
(4) Chatter.

b. It should be borne in mind by the traffic analyst that the requirements of the cryptanalyst vary according to the stage of solution. At times, for example, an isolog may be of great value, at other times it may be of no use at all, and at still others it may be of potential use pending the development of the problem. Therefore the traffic analyst should gear his production in this field to the needs of cryptanalysis.

71. General Background Information

Traffic analysis furnishes a large amount of routine information relative to communication features which assist the cryptanalyst. Some of the main items are—

a. Routings. The knowledge of the origin and destination of traffic is fundamental.

b. Identification of Systems. Traffic analysis contributes to the identification of cryptographic systems where discriminants do not form an obvious guide and assists in the sorting of traffic into homogeneous groups.

c. Use of Systems. Through discovering the use of systems, and any peculiarities relative to it, traffic analysis aids the cryptanalytic processes. Specific applications, of course, depend on the nature of the system and the externals available.

RECD 10 : 2684682

72. The Crib Message

a. DEFINITION. When it is possible to assume portions of the underlying plain text through the recognition of external characteristics, a message may be termed a crib message. Crib messages may be divided into two main groups.

(1) Messages which display a direct external-internal relationship, as the correlation of an internal signature with the external originator.

(2) Messages which are proforma reports. These arise out of the command function which necessitates the rendering of reports both up and down channel. They are usually formalized to insure completeness and thus present several portions of predictable plain text. Reports are of two types: those periodically filed which are called routines, and those which are forwarded as the situation requires.

b. IDENTIFICATION OF CRIB MESSAGES. (1) *Use of originator or destination.* If traffic contains internal addresses or signatures, they may be assumed by a knowledge of order of battle in relation to the message routings. Thus, messages originating at Dallas, known to be the location of the 14th Division, may contain the "14th Division", its commanding officer, or one of its subordinate units in the signature position. The possibility of several units at a location should not be overlooked.

(2) *Use of serial number range.* The serial number range may be tied to an internal originator, and the signature on all traffic in the series may be predicted.

(3) *Use of other features.* In the study of internal originators and addresses, other features, such as cryptographic system, relationships between preamble originators and destinations, etc., should be correlated with the above. For example, a specific originator may be defined by a combination of routing origin, serial range, and cryptographic system.

(4) *Use of external patterns.* In the case of report messages, these can often be distinguished by the characteristics of the traffic which chiefly include—

(*a*) *Destinations.* Because the report is regularly rendered to specific people, the destinations will furnish one peculiarity of the message. If order of battle is known, the relationship between the originator and the destinations may be explained and it may even be found possible to identify the nature of the report. When the routine pattern has been established, the order of battle must be watched for changes which will result in alterations of the pattern.

Note. Crib messages bear a very direct relationship to the military situation and the order of battle since they are, particularly in the report type, instrument of the command process. Thus, a detailed knowledge of enemy dispositions and movements is essential to the study of crib traffic.

REF ID: A5384682

(*b*) *Cryptographic system.* Reports usually pass in the same system. But, where a change does take place and it can be recognized, the crib may assist in a solution of the new system.

(*c*) *Serial number range.* Because the same unit generally originates the same report, characteristic serial number ranges may be of value.

(*d*) *File date and time.* Reports which are routine in nature often exhibit a periodicity in the file date and time. For example, a ten-day report will be filed every tenth day, or a daily report as of 1700 will usually carry a file time after 1700 of that day.

(*e*) *Message length.* Because of the stereotyped nature of a report, the group count may show some consistency. In many cases, however, the length will be determined by the amount of information to be filled in, so while the message length acts as a guide, lack of regularity in this respect does not rule out the possibility of a genuine crib message existing.

(5) *Use of solved messages.* The reading of messages often produces crib traffic not previously suspected. This traffic should be studied and its characteristics noted to aid in future solution. Furthermore, it may be assumed that, if one unit originates a report, the same report is required of all other similar units. A check with order of battle will reveal the location of these other units and the specific traffic can be studied. For instance, a report may be observed from an oil depot to headquarters. This suggests that other oil depots also originate a similar report. These depots are then located and their traffic examined for the proper external characteristics as indicated on the decode.

73. The Isolog

a. DEFINITION. An isolog exists where the underlying plain text is encrypted in two different systems. There are many types of isologs depending on the nature of the cryptographic system, and it is hardly possible in this text to explore all the likely variations. Isologs arise from the cryptonets which, in turn, bear a close relationship to the order of battle. They are caused in three main ways:

(1) *The relay isolog.* When a message is relayed from one cryptonet to another, an isolog is likely. In figure 48, a message passed from A to C is reenciphered at B who holds both systems I and II. This type of isolog is usually formed by traffic passing up and down channels where reencipherment is necessary into simpler and simpler systems, the more forward the unit.

(2) *The book-message isolog.* Messages which are to be sent to a number of recipients in different cryptonets must be enciphered in different systems. In figure 48, for instance, if B wants to send the same message to A and C, the appropriate system is used for each.

REF ID:A58489

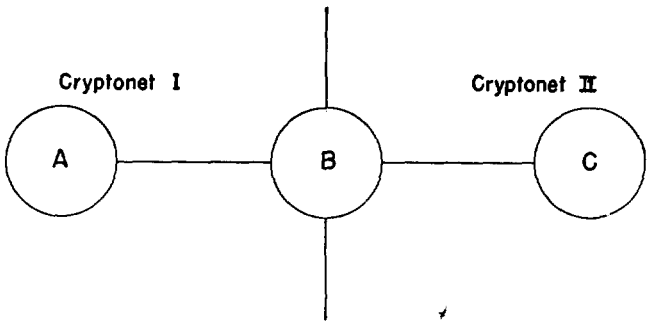

Figure 48.

(3) *Cryptographic error.* At times the code clerk will encipher a message in the wrong system. This will be refused by the receiver and the originator will reencipher in the correct system, yielding an isolog.

b. Identification of Isologs. (1) *Mechanical approach.* Isologs may be found by sorting traffic by originator and then looking for similar group counts and file dates and times. Where the two systems involved are not radically different in makeup, group counts should be close. Likewise, file dates and times, under most circumstances, will be similar.

(2) *Use of cryptonets.* A knowledge of cryptonets often simplifies the search for isologs. Certain locations, because they are in several nets, will be predisposed to the transmitting of this material. For instance, in the group of cryptonets shown in figure 49, the logical

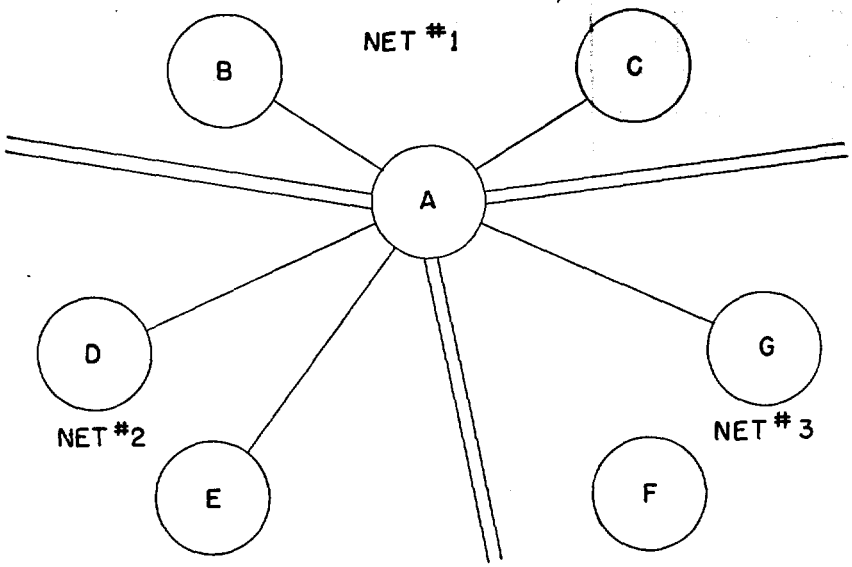

Figure 49.

REF ID:A684682

traffic to study for isologs would be messages received and transmitted by station A. Order of battle changes should be carefully followed for the cryptonets are formed by units, not radio stations, and the movement of a unit often means that a new location must be taken into account.

(3) *Use of refused traffic.* When messages are originally sent in the wrong system they will be refused or serviced, sometimes in the clear. This is a signal to watch for a retransmission of the traffic in its correct version. For this reason alone, it is important for the traffic analyst to be thoroughly familiar with procedure and the methods of servicing both encrypted and plain traffic.

74. Chatter

The study of chatter occasionally produces information of cryptanalytic value. Some of this material may be simply a discussion in the clear of cryptographic features by the radio operators. In other instances, the derivation of information may require some analysis.

Section III. APPLICATIONS TO INTELLIGENCE

75. Introduction

a. It is one of the chief objectives of traffic analysis to produce direct intelligence. Seldom will this be "pure" traffic analysis intelligence, but rather it will represent the fusing of traffic analysis data with material from other sources. In some cases, traffic analysis will furnish the initial indication; in others it will act as confirming evidence. The ability of traffic analysis to contribute to order of battle is based on the necessity for communication between military units and the fact that these communications are expressive of the enemy's dispositions and intentions.

b. The problem breaks down into three parts—

(1) Determination of order of battle relationships.
(2) Determination of movement.
(3) Identification of units.

76. Determination of Order of Battle Relationships

a. NET STRUCTURE. The net structure is one of the chief keys to the study of order of battle relationships. Methods of utilizing this element are covered in paragraph 57.

b. CONTACT RELATIONSHIPS. (1) *Traffic associations.* A study of the traffic contacts of any one point gives some indication of the nature and the echelon of the unit since every message passed implies a relationship between the sender and the recipient. In order to use

REF ID:A58489

this technique, some of the factors must be identified and the general principles of the enemy order of battle known. For example, if the following set of contacts are recorded over a period of time, and B, C, and D are all air transport units, it is likely that A is also—

Location A

To B	43 messages
To C	29 messages
To D	12 messages
From B	38 messages
From C	15 messages
From D	3 messages

Of course, other factors must be considered and these may alter the conclusion. In some orders of battle, for instance, certain of the air transport units may come under the command of an Army unit and A may represent this Hq. Thus, hasty interpretations relative to traffic associations cannot be made, and the use of all available collateral material is necessary. It may be noted, for example, that certain types of traffic associations are characteristic of units at divisional level. These associations may involve heavy traffic with Army Hq., somewhat lighter traffic with Army group, and a little traffic with characteristic points in the homeland. Similar patterns of other locations may indicate the presence of a division. There are so many variations to this type of analysis, and it is so dependent on the order of battle concerned, that it is not possible to develop the problem completely here, but the analyst's ingenuity should suggest the many applications.

(2) *Book messages.* Book messages are of particular interest because it is likely that some relationship exists between the various recipients which causes them to receive the same message. Some inferences can be made if something is known of any of the elements, such as the originator, a few of the recipients, or the use of the cryptographic system. A message, for example, passes from A to B, C, and D. A is an Army Hq., and B and C have been identified as divisional locations. Then it is probable that D is the third division of the Army. On the other hand, if the cryptographic system involved is one used by water transport units, it may be that D is included as a water transport unit which is handling the movement of some men for the two divisions.

c. Cryptographic Systems. If a cryptographic system is associated with a certain type of unit or with a definite unit and its subordinates, it will serve as an identification. For example, a system may be employed only by headquarters of Army or higher. Thus, every location sending in this system is probably Army or higher. Receiving in a system cannot be regarded as good evidence unless

REF ID:A58489

it happens in some volume, because of the possibility of a sender's error. To send in a system it must definitely be held, but receiving in it only implies that it is held. Systems restricted to Air Force, or supply, etc., may similarly be used to infer the nature of the unit at the location under study.

d. PATTERN OF SIGNAL FEATURES. These patterns may be of any type and concern almost any signal item. Three-letter calls, for instance, may only be assigned to Air Force units, or the manner of assignment may reflect the echelon of command. The same holds true for routing codes. Serial numbers which are 5-digit may be used by higher units, while 4-digit are reserved for division or below. Here again the possibilities must be developed to fit the individual case.

e. VOLUME OF TRAFFIC. The volume of traffic originated and received by any one point is indicative of its importance. Consideration, however, must be given to coverage facilities and assignments so that the traffic counts are not unduly weighted.

f. CHATTER. Security breaches involving units or clues to units occur occasionally, and chatter should be carefully scanned for them.

77. Determination of Movement

a. CHANGES IN NET STRUCTURE. It is apparent that most changes in net structure result from a more fundamental change in order of battle. Items to be noted include:

(1) Appearance of new stations on the net which often indicates the addition of a new unit.

(2) Disappearance of old stations which may mean the deactivation or move of an old unit.

(3) Moves of radio stations which usually denote the redeployment of the using unit. In moves of this sort, there is often a period of several days, between the closing of the old station and the opening of the new, when the unit will be off the air.

b. CHANGES IN CONTACT RELATIONSHIPS. (1) *Traffic Associations.* Any change in the traffic associations of a location should be carefully examined as it may indicate a resubordination or the move of a unit. For example, Army HQ at A regularly sends traffic to a division HQ at B. This contact later changes, A to C, indicating the move of Army HQ to C or else the division to a different Army if A continues to show the characteristics of an Army Hq.

(2) *Book messages.* Changes in the pattern of recipients of book messages indicate underlying order of battle changes. This is particularly applicable in the case of routine traffic where a distinguishable message passes regularly to several locations. If, for instance, a routine situation report sent daily from A to B, C, and D, changes to B, C, and E, it may be assumed that the unit at D has shifted to E.

c. CHANGES IN TRAFFIC VOLUMES. Changes in the traffic volumes

REF ID:A58489

handled at a point indicate some sort of activity though other techniques must be employed to determine the nature of the activity. In order to watch for changes, a standard of traffic volume into and out of each location is established as normal. Any rises or drops suggest changes in the situation. For example, a location handling an average of three or four messages per day suddenly jumps to 50. It is apparent that units are moving in the vicinity, that preparations are under way for a move, or that it has assumed a more important role. And the possibility that it may be caused by the use of control traffic for the purpose of deceiving the analyst should not be overlooked. As a corollary to this, changes in the volumes of precedence traffic, or in the usual file times, may also be of significance.

d. Moves of Serial Ranges. A message or signal center serial range, which is sufficiently distinctive, may be used as an indication of unit moves. For instance, an Army located at A is employing message center serials running 563–581 on the 10th. On the 12th, messages with serials 585–593 are observed originating at B, suggesting the Army's move to B.

e. Moves of Cryptographic Systems. Similar to the move of serial ranges, the move of a characteristic cryptographic system often signifies an order of battle change. A one-time pad, for instance, held only by a certain division and appearing on messages out of location A, suddenly is noted out of location B.

78. Identification of Units

The initial identification of units usually does not result from traffic analysis. Rather traffic analysis furnishes the means for following a unit about, once it has been identified. But, through the study of net, contact, and cryptographic associations (and the use of other signals features when applicable) it is often possible to define the nature and the echelon of a unit at a given location, and in some cases to name it. Chatter, also, may furnish the specific designations of units through breaches of security.

79. Conclusion

The traffic analysis techniques discussed in this manual require considerable study. It is difficult to cover a subject of this type, where so many individual bits and pieces must be fitted together, in text form since, in order to convey effectively the concept of traffic analysis, no one part should be presented before the other but rather the whole presented at once. For this reason, the text should be read and re-read. It is further to be noted that this manual is chiefly a theoretical text, that the field is still expanding, and that it is the task of the individual analyst to devise the applications best suited to his specific problems.

This Air Force Handbook (AFH) is the reference guide for conducting intelligence analysis as prescribed by Air Force Policy Directive (AFPD) 14-1, *Intelligence, Surveillance, and Reconnaissance (ISR) Planning, Resources and Operations* and supports the operational requirements and processes outlined under Air Force Instruction (AFI) 14-133, *Intelligence Analysis* and AFI 14-134, *Intelligence Analysis Production and Requirements Management*. This publication provides the definitions, guidelines, procedures and tools for intelligence analysis operations. It has application and use for Regular Component, Air Force Reserve (AFR), Air National Guard (ANG), and Department of the Air Force (AF) Civilians, except where noted otherwise. Ensure that all records created as a result of processes prescribed in this publication are maintained in accordance with (IAW) Air Force Manual (AFMAN) 33-363, *Management of Records*, and disposed of IAW the Air Force Records Disposition Schedule (RDS) in the Air Force Records Information Management System (AFRIMS). Refer recommended changes and questions about this publication to the Office of Primary Responsibility (OPR) using the AF Form 847, *Recommendation for Change of Publication*; route AF Forms 847 from the field through the appropriate functional chain of command. This publication may be supplemented at any level, but all direct supplements are routed to the OPR of this publication for coordination prior to certification and approval. Major Commands (MAJCOMs) need to provide a copy to the OPR upon publication. The use of the name or mark of any specific manufacturer, commercial product, commodity, or service in this publication does not imply endorsement by the AF.

Chapter 1

OVERVIEW

1.1. Purpose.

1.1.1. The responsibilities of the intelligence analyst have never been more important. The increasingly complex global environment demands analyst Airmen be steeped in tradecraft fundamentals, conversant on the Intelligence Community (IC) and other service capabilities, and prepared to tailor their analysis skills to the operational challenge at hand. The purpose of this non-directive publication is to help guide every analyst Airman in answering this call. It provides reference and instructional material for the analyst Airman working in the air, space, and/or cyber domains—whether junior or seasoned; officer, enlisted, or civilian; regular AF, reserve or guard; and serving AF, joint, national, or combined missions. The content of this publication is intentionally broad in nature, ranging from foundational doctrine and tactics, techniques, and procedures (TTPs) to analysis applications and lessons learned.

1.1.2. The long-term intent for this publication is to have it reside as a series of interactive and up-to-date web pages online, with links to IC and AF directives, templates, checklists, and other references. The online version will serve as a useful tool for the analyst Airman to quickly link to their specific analysis topic of interest. Upon publication of this handbook, the AF intends to initiate steps to transition this document to an online, interactive version.

1.1.3. The publication is organized with foundational information in six main chapters followed by useful lists, lessons learned, criteria, forms, guides, and an annotated bibliography in the attachments to aid analyst Airmen in their day-to-day missions. This document also includes links to appropriate websites with additional support material.

1.2. Intelligence Analysis. Intelligence analysis is a cognitive capability—both art and science—applying tools, judgments, processes, and tradecraft to data and information to create and deliver new intelligence, insights, and knowledge, with the goal of providing decision advantage to commanders, decision makers, and intelligence customers. Analysis is foundational to ISR, a key capability of ISR, a core competency in ISR, and integral to Global Integrated ISR (GIISR).

1.2.1. Intelligence as a Foundation. Analysis is a significant capability that extends across all AF ISR Enterprise activities in support of the full range of military operations and assigned national security missions. According to AF/A2's vision for the future of AF Intelligence, *AF ISR 2023: Delivering Decision Advantage*, a "fundamental job of AF ISR Airmen is to analyze, inform, and provide commanders at every level with the knowledge they need to prevent surprise, make decisions, command forces, and employ weapons." AF intelligence analysis provides unique capabilities to focus on and address AF mission requirements. These same unique capabilities, coupled with an Airman's distinctive air/space/cyber perspective, serve to complement and fully integrate with analysis that supports broader defense and national mission requirements.

1.2.2. Intelligence Analysis as a Capability. Analysis is one of four enduring AF ISR capabilities, the other three being Collection Operations, Targeting, and Operations

Integration. **Note**: Refer to the *AF Future Operating Concept: A View of the AF in 2035*. The AF delivers intelligence analysis capability to meet Combatant Command (CCMD) and service needs. As with any other capability area, intelligence analysis is supported by the full range of Doctrine, Organization, Training, Materiel, Leadership and Education, Personnel, Facilities, and Policy (DOTMLPF-P).

1.2.2.1. Doctrine. Doctrinal considerations include analysis fundamental principles; analysis policy and procedures; common lexicon and terminology; recognized TTPs; and shared best practices and lessons learned.

1.2.2.2. Organization. AF ISR organizations range from the tactical to the strategic level, operating in a layered, distributed, and mutually supporting construct. AF initiatives to develop the intelligence analysis capability additionally impact the presentation of analyst Airmen to joint organizations such as combatant commands, joint task forces, and national analysis entities.

1.2.2.3. Training. Considerations include initial, mission, and continuation training; AF Specialty Code (AFSC) entry-, intermediate-, and advanced-level courses; and associated certification.

1.2.2.4. Materiel. Materiel concerns involve tools, technologies, systems, and architectures necessary to equip, operate, maintain, and support analysis activities.

1.2.2.5. Leadership and Education. The attention and priority of leadership is essential to growing the analysis capability. Additionally, undergraduate- and graduate-level education opportunities inside and outside of the AF play a major role.

1.2.2.6. Personnel. Planning and resourcing for qualified personnel are required to effectively conduct analysis missions.

1.2.2.7. Facilities. Cleared and adequately equipped buildings and other structures are required to conduct analysis.

1.2.2.8. Policy. Codified direction and guidance with clearly defined roles, responsibilities, processes, and terminology are fundamental to unity of effort across the AF ISR enterprise.

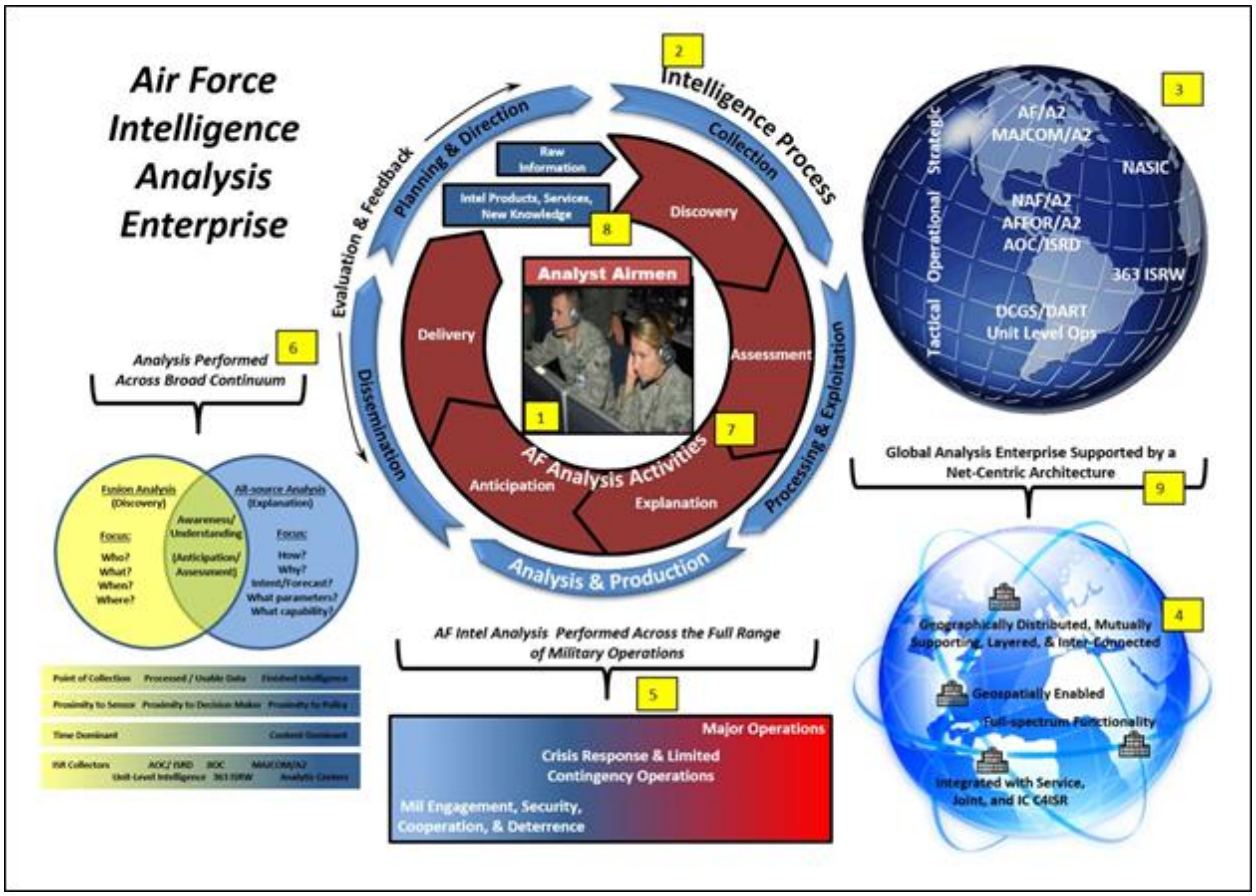
1.2.3. Intelligence Analysis as a Core Competency. ISR core competencies are the primary knowledge, skills, abilities, and behaviors required to perform AF ISR missions and ultimately enable decision advantage. The AF strives to collectively maintain sufficient expertise in its competencies. Because analysis is critical to and a driving factor in the other three enduring capabilities, all AF ISR professionals train in, maintain, and exercise, at a minimum, basic analytical capabilities and critical thinking skills wherever they are assigned. Additional information on this subject can be found in Career Field Education and Training Plan (CFETP) 14NX, Parts I and II, *AFSC 14NX Intelligence Officer Career Field Education and Training Plan* and CFETP 1N0X1, Parts I and II, *AFSC 1N0X1 All Source Intelligence Analyst Career Field Education and Training Plan*.

1.2.4. Intelligence Analysis and Global Integrated ISR (GIISR). As of 2017, GIISR is one of the AF's five enduring core missions as identified in strategic guidance, including the *AF Future Operating Concept* and the *USAF Strategic Master Plan*. A key strategic AF vector is to maintain a robust and flexible GIISR capability, supported by big data analytics. AF

strategic guidance highlights the need for the service to deepen its assessment of potential adversaries, professionalize ISR analysis, and restore analytic competencies. In turn, AF ISR vision and strategic planning establish analysis as one of five priorities for ISR and tie the AF's mandate to deliver decision advantage to its ability to provide world-class, multi- and all-source intelligence across all domains. Accurate, timely, relevant intelligence analysis is not only integral to operations, but in many ways drives military operational decisions.

1.3. Operational Viewpoint-1 (OV-1). Figure 1.1, *AF Intelligence Analysis OV-1*, offers a high-level depiction of AF intelligence analysis. The OV-1 describes analysis operations, capabilities, and activities within the greater AF ISR Enterprise and explains how analysis supports GIISR operations. Together, analyst Airmen and the AF Intelligence Analysis Enterprise (AFIAE) ensure mission success and decision advantage now and into the future. Subsequent chapters of this publication explain in more detail the various elements of the OV-1.

Figure 1.1. AF Intelligence Analysis OV-1.



1.3.1. As indicated by Item 1 in Figure 1.1, at the heart of AF intelligence analysis is the cadre of officer, enlisted, and civilian ISR professionals who are trained in intelligence analysis and production. These analyst Airmen apply critical thinking and advanced analytical skills to turn information and raw data into timely, actionable, and relevant intelligence products and services, leading to improved knowledge.

1.3.2. Analyst Airmen perform their missions within the framework of the overall joint intelligence process of Planning and Direction, Collection, Processing and Exploitation,

Analysis and Production, Dissemination and Integration, and Evaluation and Feedback (PCPAD), as Item 2 of Figure 1.1 illustrates.

1.3.3. Item 3 in Figure 1.1 indicates that AF intelligence analysis is nested within the larger AF ISR Enterprise, a Total Force construct extending from squadron to headquarters level and ranging from tactical to strategic focus.

1.3.4. As depicted in Item 4 of Figure 1.1, analyst Airmen and the AF ISR Enterprise are mutually supporting; unified in policy, authorities, tenets, and strategy; and skilled in employing tools that enable AF, joint, and IC operations.

1.3.5. Analyst Airmen are trained in the art and science of analytical tradecraft and apply common tenets and standards across the full range of military operations, from major theater warfare to humanitarian assistance and disaster relief, as depicted in Item 5 of Figure 1.1.

1.3.6. To support these operations, analyst Airmen engage in various types of analysis, ranging from fusion analysis to all-source analysis (ASA), as shown in Item 6 of Figure 1.1. Fusion analysis entails quickly melding new information with already established baseline knowledge to meet specific operational needs. Comprehensive ASA is often less time sensitive and more focused on studying and understanding long-term trends and maintaining a depth of knowledge on a given subject. Each organization within the AF ISR Enterprise conducts analysis across this continuum - at varying levels based on key intelligence questions and customer requirements - to fill a gap in knowledge, or a need to improve understanding of the threat environment and/or adversary capabilities.

1.3.7. Common analysis activities performed across the AF ISR enterprise include Discovery, Assessment, Explanation, Anticipation, and Delivery, which operate in parallel with the PCPAD process, as depicted in Item 7 of Figure 1.1. Analyst Airmen identify relevant information in support of ongoing operations and requirements, classify and categorize information, and create estimates of capabilities and impacts.

1.3.8. As Item 8 of Figure 1.1 indicates, the derived knowledge is used to create descriptions in greater context to provide indications and warning regarding a specific problem set. Intelligence products and services are developed, tailored, and presented according to key intelligence questions or customer requirements.

1.3.9. As shown in Item 9 of Figure 1.1, the AF intelligence analysis concept and the AF ISR Enterprise are interconnected by both a net-centric architecture and analytic toolsets that ensure critical interface among AF operational elements, Joint, and IC analysts, thereby ensuring access to all relevant data in a geographically-enabled and integrated manner.

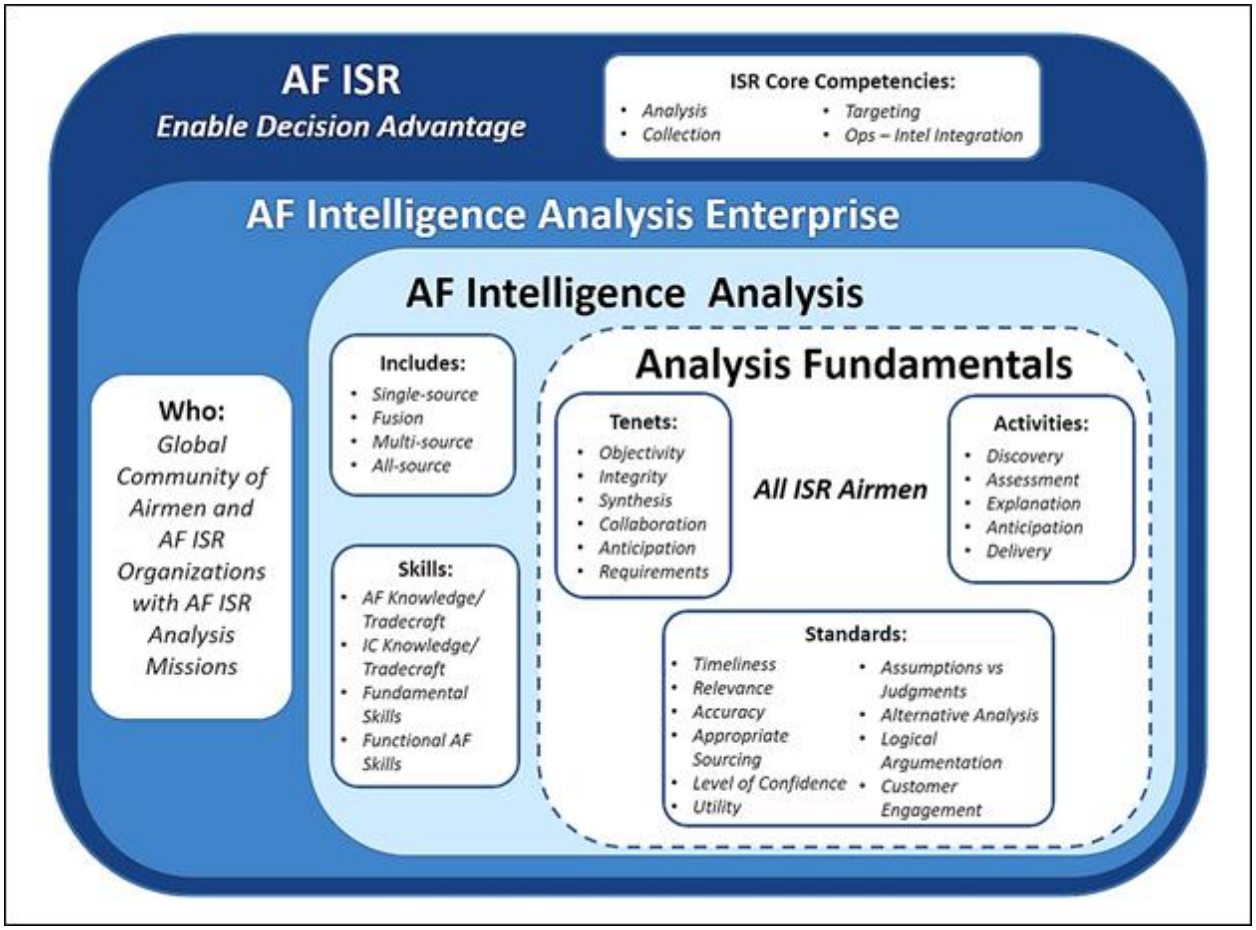
Chapter 2

AF INTELLIGENCE ANALYSIS ENTERPRISE

2.1. Analyst Airmen. An analyst Airman is an AF ISR professional who is skilled and qualified in tradecraft to perform the core competency of intelligence analysis across the air, space, or cyberspace domains. Certification criteria and programs vary based on unit and mission requirements. Analyst Airmen are bound by the professional standards for analysis established by the IC, and supplemented by AF standards and mission qualifications of the assigned ISR unit. Whether ISR professionals are analyst Airmen depends more on what they do than where they sit.

2.2. AF Intelligence Analysis Enterprise (AFIAE) . The enterprise is defined as the global community of analyst Airmen and the AF ISR organizations that employ the core competency of intelligence analysis. Figure 2.1, *AFIAE*, depicts how the AFIAE, intelligence analysis, and analysis fundamentals fit within the larger AF ISR Enterprise. Refer to **Chapter 4** for a detailed explanation of analysis fundamentals. Although not shown in Figure 2.1, the AF ISR Enterprise resides within the IC Enterprise. As a member of the IC, the AF contributes to IC analysis and production and also receives analysis and production support from other IC organizations.

Figure 2.1. AFIAE.



2.3. Analysis Spectrum . Analyst Airmen employ fundamental tenets, standards, and activities to perform analysis across a broad continuum for mission accomplishment. On one end of the analysis continuum are fusion and single-source analysis, with emphasis on timeliness over completeness. On the other end of the spectrum is comprehensive ASA, with less emphasis on rapidity, and greater emphasis on analytic content, depth, trends, technical, and other subject-matter expertise. This spectrum is depicted in Figure 2.2, *AF Spectrum of Intelligence Analysis*.

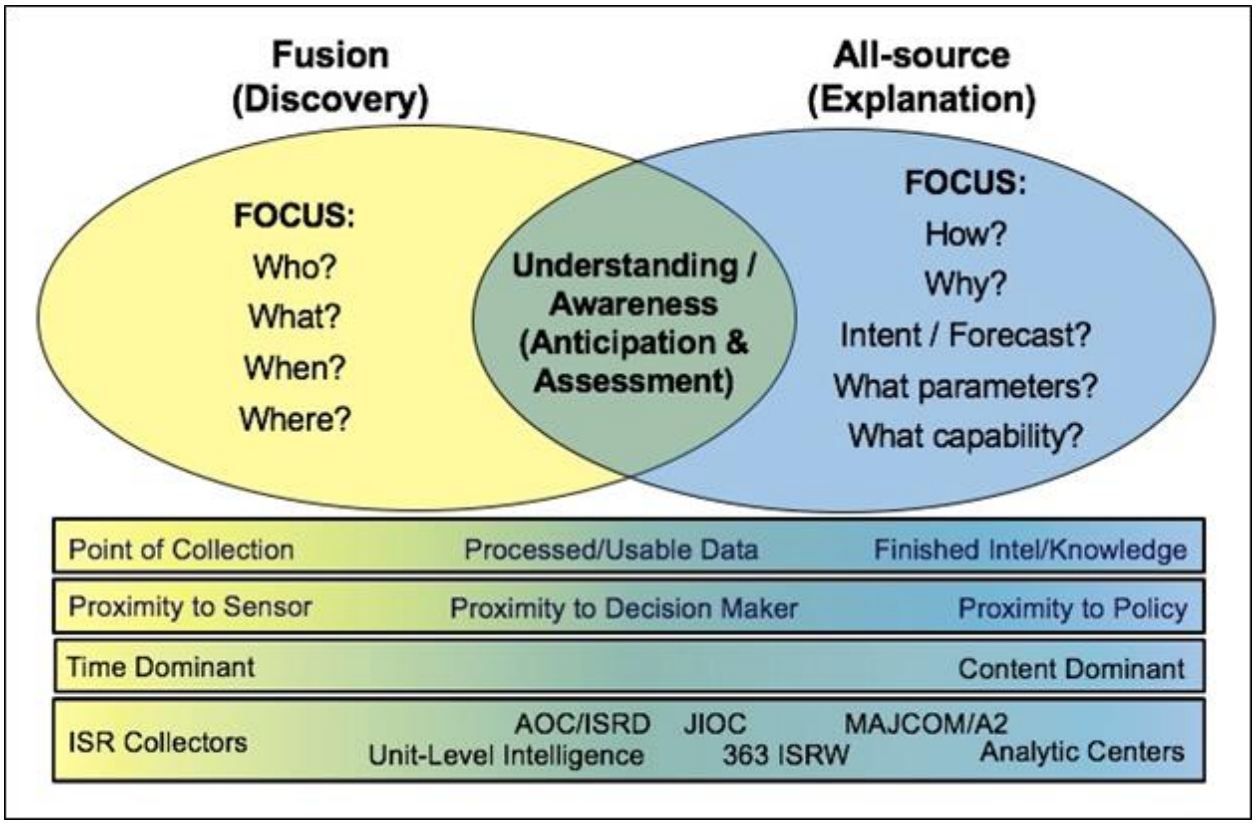
2.3.1. Single-Source Analysis (also called Exploitation). Intelligence analysis that employs a single source or expertise in a functional area to characterize events, people, or things. Such analysis is limited to describing, rather than evaluating, the topic of a particular analysis due to restrictions inherent in single-source intelligence collection, precluding the ability to provide fully contextualized intelligence assessments.

2.3.2. Fusion Analysis. Analysis in a time-sensitive environment in close proximity to the point of collection that entails quickly melding new information with baseline knowledge to meet a specific operational need. **Note:** Proximity does not refer to physical or geographic location but rather functional proximity to the collection step in the intelligence process (for example, a Distributed Common Ground System (DCGS) Analysis and Reporting Team (DART) at Beale AFB may conduct fusion analysis of an operational area on the opposite side of the globe). Emphasis is on the process of managing information and on timeliness over completeness. Fusion analysis generally has three components: 1) it usually includes more than one source; 2) it is time critical; and 3) it is performed to meet a commander's requirements or specific operational need.

2.3.3. Multi-Source Analysis (also called Multi-Intelligence (INT) Analysis). Intelligence analysis that makes use of more than one source when access to additional potential sources is limited by reasons of timeliness, system access, location, or security levels.

2.3.4. All-Source Analysis (ASA). Intelligence analysis that employs all available sources of data and information to enable the creation of new intelligence and knowledge.

Figure 2.2. AF Spectrum of Intelligence Analysis.



2.3.5. At the far left of the graphic, intelligence analysis units, such as AF DARTs, provide near-real-time (NRT), multi-source fusion analysis closest to the point of collection to improve collection, perform dynamic targeting, and support tactical warfighters. Moving to the right across the spectrum, the Air Operations Centers' (AOCs) ISR Divisions (ISRD), Joint Intelligence Operations Centers (JIOCs), and IC organizations provide multi-source and ASA with fewer time constraints and in close proximity to strategic-level commanders and decision-makers to facilitate battlespace awareness, operations planning and sustainment, and policy decisions. Since the late 1990s, changes in technology, operational needs, and CCMD requirements have blurred the once distinct lines of this analysis spectrum. Today AFIAE organizations have evolved to delivery across the spectrum – rather than delivering within any single niche.

2.4. Characteristics of the AF Intelligence Analysis Enterprise (AFIAE).

2.4.1. Layered. Intelligence analysis capabilities reside at multiple levels of command—unit, (squadron, group, wing), Numbered AF (NAF), MAJCOM, and AF-level. Additional levels, including joint and Department of Defense (DoD), exist beyond the AF. Table 2.1, *Layers of Analysis*, identifies the various layers of analysis organizations along with their general analytical focus, typical customers, and timeliness, as modern processes and technologies enable organizations to extend their focus and timelines outside traditional norms. While representative, this table is not a complete listing of all AF analysis organizations.

Table 2.1. Layers of Analysis.

Organization	Focus	Customer	Timeline
CSA (DIA, NSA, NGA, NRO)	Strategic	National leadership, DoD, IC	Days/Months; Mission dependent RT/NRT
CCMD JIOC/JTF	Strategic/Operational	CCMD, Joint forces	Days/Months
Service Intelligence Center (NASIC)	Strategic/Operational/ Tactical	National leadership, CCMD, JTF, DoD, IC, AF all levels, acquisition community	Hours/Days/Months
MAJCOM/A2	Strategic/Operational	MAJCOM staff and supported units	Days/Months
Acquisition Centers	Strategic/Operational	AF/IC leadership, MAJCOMs, acquisition program/project mgrs	Days/Months
NAF/A2, AFFOR/A2, AOC ISR Division	Operational/Tactical	CCMD, JTF/Joint forces, AF NAF and below units	Hours/Days
ISRW	Operational/Tactical	NAF and below units	Hours/Days/Months
DCGS	Operational/Tactical	CFACC, JTF, DoD, IC, AF units	RT/NRT to 72 Hours
Unit Level Intel & RPA SOC	Tactical	AF and other service units	RT/NRT to 72 Hours

AF: Air Force
A2: Director of Intelligence
AFFOR: Air Force Forces
AOC: Air Operations Center
CCMD: Combatant Command
CFACC: Combined Forces Air Component Commander
CSA: Combat Support Agency
DCGS: Distributed Command Ground System
DIA: Defense Intelligence Agency
DoD: Department of Defense
IC: Intelligence Community
ISR: Intelligence, Surveillance & Reconnaissance
ISRW: ISR Wing
JIOC: Joint Intelligence Operations Center
JTF: Joint Task Force
MAJCOM: Major Command
Mgrs: Managers
NAF: Numbered Air Force
NASIC: National Air and Space Intelligence Center
NGA: National Geospatial-Intelligence Agency
NRO: National Reconnaissance Agency
NRT: Near-real-time
NSA: National Security Agency
RPA: Remotely Piloted Aircraft
RT: Real-time
SOC: Squadron Operations Center

2.4.1.1. Starting at the bottom of Table 2.1, unit-level intelligence organizations focus on tactical analysis needs (e.g., location, movement, and readiness of enemy forces) for their tactical-level customers in the AF and other services. Unit-level intelligence organizations typically operate under short timelines from real-time or NRT to several days out.

2.4.1.2. DCGS units are tactically and operationally focused. Within each DCGS unit, the DART conducts analysis for their respective CFACC as well as other IC and DoD customers. DARTs operate in a time sensitive environment but can support the customer up to the operational level of ISR planning. Their main emphasis is fusion analysis.

2.4.1.3. ISR wings provide both operational and tactical level intelligence analysis, with timelines ranging from hours to months. In particular, the 363 ISR Wing (ISRW) is dedicated to providing all-source analysis and targeting intelligence to NAFs and below across the entire AF.

2.4.1.4. NAF/A2s, AF Forces (AFFOR)/A2, and AOC ISRDs are operationally and tactically focused in support of their associated CCMD, their joint task force (JTF), and/or their units. Their typical timelines are hours to days.

2.4.1.5. Intelligence offices within Acquisition Centers, such as the Space and Missile Systems Center (SMC), AF Life Cycle Management Center (AFLCMC) and AF Research Laboratory (AFRL), provide both strategic and operational intelligence for acquisition program managers, project managers, MAJCOMs, and AF/IC leadership, with timelines that range from days to months.

2.4.1.6. MAJCOM/A2s provide strategic and operational analyses for their MAJCOM staff and supported units, usually ranging from days to months. The Air Mobility Command (AMC)/A2 is unique in that its Air Intelligence Squadron (AIS) and the 204th Intelligence Squadron (ANG) provide direct analytic support to 18 AF and subordinate units in the conduct of their rapid global mobility missions. Additionally, U.S. Air Forces in Europe & Air Forces Africa (USAFE-AFAFRICA) and Pacific Air Forces (PACAF) are unique as Component MAJCOMs (C-MAJCOMs) in that they have the responsibility of analytically representing the Joint Force Air Component Commander to the Joint Force Commander.

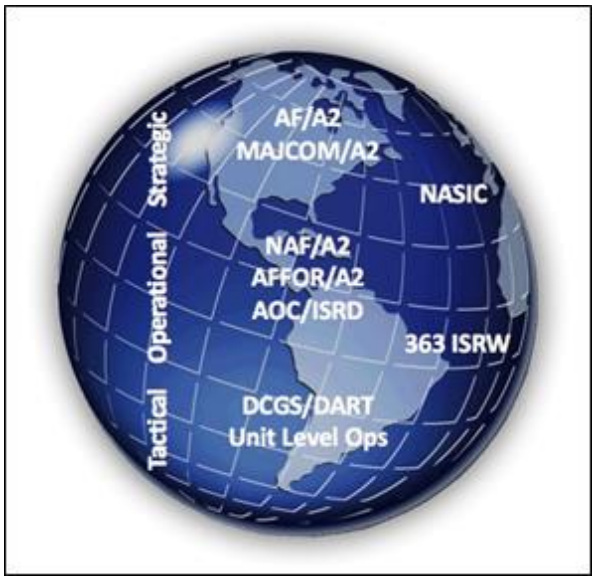
2.4.1.7. The National Air and Space Intelligence Center (NASIC**)** conducts strategic, operational, and tactical analysis for a broad range of customers in the AF, DoD, and IC as well as and including national leadership and the acquisition community. Their timelines extend from short-term to long-term, depending on the customer's needs. Whereas the 363 ISRW is the primary AF organization that conducts tactical intelligence analysis, NASIC is the primary AF organization focused on strategic intelligence. Both the 363 ISRW and NASIC provide significant analysis at the operational level, as well. Further, while other AF layers conduct analysis as part of their mission, analysis is a primary mission of the 363 ISRW and NASIC.

2.4.1.8. Joint intelligence organizations at CCMDs and JTFs conduct strategic and operational analysis in support of their respective regional and functional commands. The timelines of their analysis range from days to months.

2.4.1.9. Combat Support Agencies (CSAs) focus primarily on strategic analysis for national leadership, DoD, and the IC. Although they usually operate on timelines ranging from days to months, they also provide real-time and near-real-time analysis as requirements dictate.

2.4.2. Distributed and Mutually Supporting. In addition to being layered, analysis responsibilities are distributed across geographic regions and functional areas in the AF (see Figure 2.3, *Layered, Distributed, and Mutually Supporting Nature of AFIAE*). Analysis organizations in every layer and every region/function are interconnected and have access to each other. Organizations collaborate and share expertise to ensure the most accurate, timely analysis is provided to answer intelligence requirements. The mutually supporting nature of the AFIAE includes enterprise partners, such as the AF Office of Special Investigations (AFOSI).

Figure 2.3. Layered, Distributed, and Mutually Supporting Nature of AFIAE.



Chapter 3

THE NATIONAL INTELLIGENCE ANALYSIS COMMUNITY AND THE AIR FORCE

3.1. The Intelligence Community. The IC is a coalition of 17 agencies and organizations, including the Office of the Director of National Intelligence (ODNI), within the Executive Branch that work both independently and collaboratively to gather and analyze the intelligence necessary to conduct foreign relations and national security activities. See Attachment 6, Table A6.1, *Members of the IC*, for a complete list of IC organizations.

3.1.1. The Director of National Intelligence (DNI) has overall responsibility for intelligence support to the President and the day-to-day management of the IC. AF analysis falls under the governance and direction of the DNI. The AF is an active participant in governance and oversight forums and follows the analytical priorities, standards, processes, and procedures established by the IC. The DNI issues guidance for analysis and production through IC Directives (ICDs), IC Standards (ICSs), DNI memorandums, and other directive documents. The IC documents that most often impact AF analysis are identified in Attachment 6, Table A6.2, *Common IC and DoD Analysis References*.

3.1.2. DoD Intelligence.

3.1.2.1. The Secretary of Defense (SecDef) is responsible for the DoD portion of the IC. The Under Secretary of Defense for Intelligence (USD(I)) serves as the senior defense intelligence, counterintelligence, and security official below the SecDef and Deputy SecDef. For defense intelligence analysis the USD(I):

3.1.2.1.1. Provides oversight and direction for analysis capabilities to ensure effective support to the DoD mission.

3.1.2.1.2. Ensures analysis is aligned with IC and DoD analytical concepts, methodologies, and priorities.

3.1.2.1.3. Establishes DoD all-source analysis policy and oversees the implementation of DoD all-source analysis plans, programs, and performance.

3.1.2.1.4. Provides strategic guidance to the Defense Intelligence All-Source Analysis Enterprise (DIAAE), the collective set of all DoD organizations that execute all-source analysis activities in production of defense intelligence.

3.1.2.1.5. Develops and maintains the consolidated set of Defense Intelligence priorities that guides DIAAE analysis and reflects the intelligence needs of all Defense Intelligence consumers.

3.1.2.1.6. Establishes the DIAAE Board of Governors (BOG), a body of representatives from the DIAAE organizations that provides a forum for addressing issues, improving transparency, implementing strategies, and making resource recommendations across the DIAAE.

3.1.2.2. The AF participates in the DIAAE BOG and other DoD analysis forums and adheres to DoD analysis-related policies. Within the DoD, the agency with the largest responsibility for promulgating ASA guidance is the Defense Intelligence Agency (DIA).

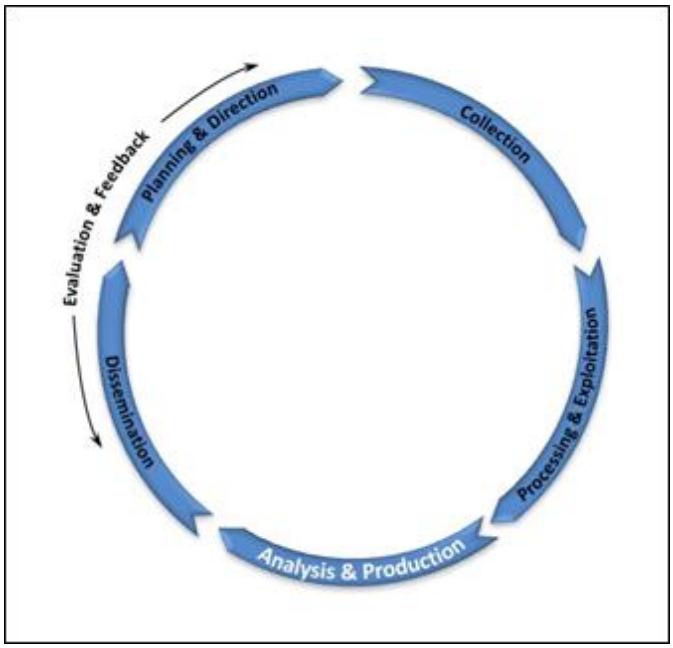
DIA governs ASA responsibilities, policies, priorities, and relationships across the DoD IAW DoD Instruction (DoDI) 3115.17 and as the DoD Functional Manager for ASA. Additionally, DIA manages the Defense Intelligence Analysis Program (DIAP), with the primary goal of maximizing enterprise efficiencies through clearly defined ASA and production responsibilities among DIA, CCMDs, and service intelligence centers.

3.1.2.3. In addition to ASA and production conducted within the DIAP, the AF conducts single-source analysis, e.g., signals intelligence, human intelligence, geospatial intelligence, etc., that is additionally governed by directives established by respective lead DoD agencies. AF production that supports these single-source disciplines adheres to AF guidance as well as standards set forth by the respective DoD lead agencies. Further, the DoD has established overarching policy related to acquisition intelligence, to which the AF adheres. If a conflict arises between the AF and IC agency guidance, IC guidance takes precedence. See Attachment 6, Table A6.2, *Common IC and DoD Analysis References*, for a list of common DoD analysis-related documents.

3.1.3. Military Services. Each military service has a senior intelligence officer (SIO) that oversees intelligence policy, planning, programming, and activities on behalf of the service chief. The AF SIO is the Deputy Chief of Staff (DCS) for ISR, also known as the AF/A2. Each service is authorized one service intelligence center, also called an intelligence analysis center. The AF's service intelligence center is NASIC. The AF has assigned the Air Combat Command (ACC) as its lead MAJCOM for the GIISR capability, which includes intelligence analysis. Similarly, other military services have assigned significant analysis responsibilities to various organizations. All services routinely reach out to each other for service-unique expertise and collaboration in addressing analysis requirements. Refer to Attachment 6, Table A6, *Major Intelligence Analysis Entities of the Military Services*, and Table A6.4, *Common Analysis Organizations*, for a breakdown of the major intelligence analysis entities in each military service and a list of service and other government agencies organized according to the primary analysis they conduct.

3.2. Intelligence Analysis and the Joint Intelligence Process. As highlighted in Joint Publication (JP) 2-0, *Joint Intelligence*, the intelligence process is comprised of six interrelated categories, collectively referred to as PCPAD. Refer to Figure 3.1, *Joint Intelligence Process*, for a graphic depiction of the PCPAD cycle. The PCPAD process is universally recognized throughout the IC and linked to the DoD Joint Capability Area (JCA) of Battlespace Awareness. JCAs provide a common framework for defining needs, analyzing operational gaps, and conducting planning and, by extension, programming for DoD capabilities.

Figure 3.1. Joint Intelligence Process.



3.2.1. Planning and Direction is dependent on the ability to synchronize and integrate the activities of collection, processing, exploitation, analysis and dissemination resources to meet Battlespace Awareness information requirements. Planning and direction activities include, but are not limited to: the identification and prioritization of intelligence requirements; the development of concepts of intelligence operations and architectures required to support the commander's mission; tasking subordinate intelligence elements for the collection of information or the production of finished intelligence; submitting requests for additional capabilities to higher headquarters; and submitting requests for collection, exploitation, or all-source production support to external, supporting intelligence entities. Planning and direction occurs continuously and allows for the prioritization of intelligence support across all ongoing operations and simultaneous planning efforts.

3.2.2. Collection is the ability to gather data and obtain required information to satisfy requirements. Collection is managed by collection managers, whose duties include identifying the most appropriate available assets and then tasking those assets to conduct collection missions. Collection managers also develop and coordinate sensor employment guidance, exercise authoritative control of specific collection operations, revise collection activities as required, monitor the overall satisfaction of requirements, and assess the effectiveness of the collection plan to satisfy the original and evolving intelligence need.

3.2.3. Processing and Exploitation involves the transformation of collected information into formats suitable for further analysis and/or action by man or machine. During processing and exploitation, raw collected data are converted into forms that can be readily used by commanders, decision-makers at all levels, intelligence analysts, and other consumers. Processing and exploitation includes first-phase imagery exploitation, data conversion and correlation, document and media translation, and signal decryption, as well as reporting the results of these actions to analysis and production elements.

3.2.4. Analysis and Production involves the integration, evaluation, and interpretation of information obtained from available sources to develop intelligence and forecast the future state to enable situational awareness and provide new knowledge/actionable information. The AF has identified five activities that occur within this category of the PCPAD process: Discovery, Assessment, Explanation, Anticipation, and Delivery. See **Chapter 4** for a description of each, along with an explanation or how it relates to broader AF ISR activities, and the tenets and standards to which analyst Airmen adhere in order to carry out these five analysis activities.

3.2.5. Dissemination and Integration focuses on the ability to present, distribute, or make available to military and national decision-makers the intelligence, information and environmental content and products that enable understanding of the operational/physical environment. Personal, networked, and database data transfers are all means of dissemination. The diversity of dissemination paths requires a high degree of communications and system interoperability among joint and multinational forces, component commands, DoD organizations, and the interagency community.

3.2.6. Evaluation and Feedback occur continuously throughout the intelligence process. It requires a collaborative dialogue among intelligence planners, collection managers, collectors, analysts, intelligence systems architects, and customers. The intent of evaluation and feedback is to identify potential problems as early as possible to minimize information gaps and mitigate capability shortfalls.

3.2.7. Although “analysis” is specifically identified in the Analysis and Production category of PCPAD, most intelligence analysts agree that analysis takes place in all categories of the joint intelligence process.

3.3. IC Funding. The National Intelligence Program (NIP), administered by the DNI, provides guidance and funding for a broad range of ISR activities within the IC. NIP is divided into sub-programs, including the General Defense Intelligence Program (GDIP) for ASA and other specific intelligence activities, the Consolidated Cryptologic Program (CCP) for signals intelligence activities, and the National Geospatial-Intelligence Program (NGP) for geospatial intelligence activities. Some AF intelligence organizations receive funding through these NIP sources for certain single-source and ASA missions and are required to adhere to the analysis and production guidelines and standards associated with the funding. However, the majority of AF analysis activities, particularly at and below wing level, are funded through the Military Intelligence Program (MIP) for mission execution. For details, refer to ICD 104, *National Intelligence Program (NIP) Budget Formulation and Justification, Execution, and Performance Evaluation* and DoDD 5205.12, *Military Intelligence Program (MIP).*

3.4. Quality Analysis Programs . The IC and AF offer a variety of analyst enrichment opportunities to broaden and deepen an analyst's experience and expertise. Some examples include the AF Quality of Analysis Program, DNI Quality of Analysis Program, National Intelligence University, DIA's Intelligence Community Advanced Analytical Program, and the AF Institute of Technology.

3.5. AF National Tactical Integration (AF NTI) . The AF NTI program integrates U.S. Signals Intelligence (SIGINT) System resources with theater air and space components to ensure seamless support. The AF NTI team shifts the focus of national SIGINT performance from discovering and reporting data to collaboratively generating actionable intelligence for the Joint

Force Air Component Commander. The AF NTI team capitalizes on data acquisition capabilities, existing databases and datalinks of multiple national SIGINT sources, and access to AF analysts in the AOC, National Cryptologic Centers, and AF intelligence production organizations (e.g., NASIC). While the program remains predominately SIGINT focused, the AF NTI enterprise also has the ability to leverage all AF ISR capabilities. **Note**: Refer to AF ISR Agency Instruction (AFISRAI) 14-153 Volume 3, 480 ISRW Supplement, *Air Force Distributed Common Ground System (AF DCGS) Operations Procedure*s.

Chapter 4

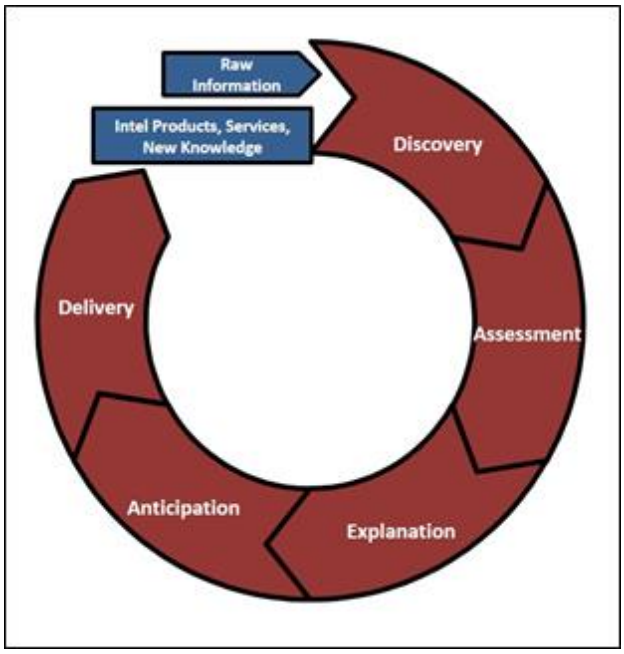
ANALYSIS FUNDAMENTALS–ACTIVITIES, TENETS, & STANDARDS

4.1. AF ISR Capabilities . The AF *GIISR Core Function Concept* highlights five enduring core capabilities (refer to Figure 4.1, *Enduring GIISR Capabilities*) that directly support the JCA of Battlespace Awareness. As previously mentioned, this JCA delineation is key for defining analysis-specific needs, analyzing gaps, and for planning and programming against AF analytic requirements. Similar to the joint PCPAD intelligence process discussed in **Chapter 3**, analysis is an essential and integral component of each of the five enduring GIISR capabilities.

Figure 4.1. Enduring GIISR Capabilities.

4.2. AF Intelligence Analysis Activities . As depicted in Figure 4.2, *AF Intelligence Analysis Activities*, analyst Airmen commonly perform five activities in support of the GIISR enduring capabilities mentioned above.

Figure 4.2. AF Intelligence Analysis Activities.



4.2.1. Discovery is the ability to research, select, manipulate, and correlate data from multiple sources to identify information relevant to ongoing operations and requirements. Discovery is about researching, better organizing, and using the data we already possess; it is also about finding previously hidden patterns and anomalies.

4.2.2. Assessment is the ability to provide focused examination of data and information about an object or an event, to classify and categorize it, and to assess its reliability and credibility in order to create estimates of capabilities and impacts. Assessment is how intelligence determines what our consumers ought to be concerned with.

4.2.3. Explanation is the ability to examine events and derive knowledge and insight from the interrelated data in order to create descriptions and propose significance in greater context. Explanation is how intelligence provides consumers with narrative stories, relates events to broader situations, and identifies the core of "what is going on."

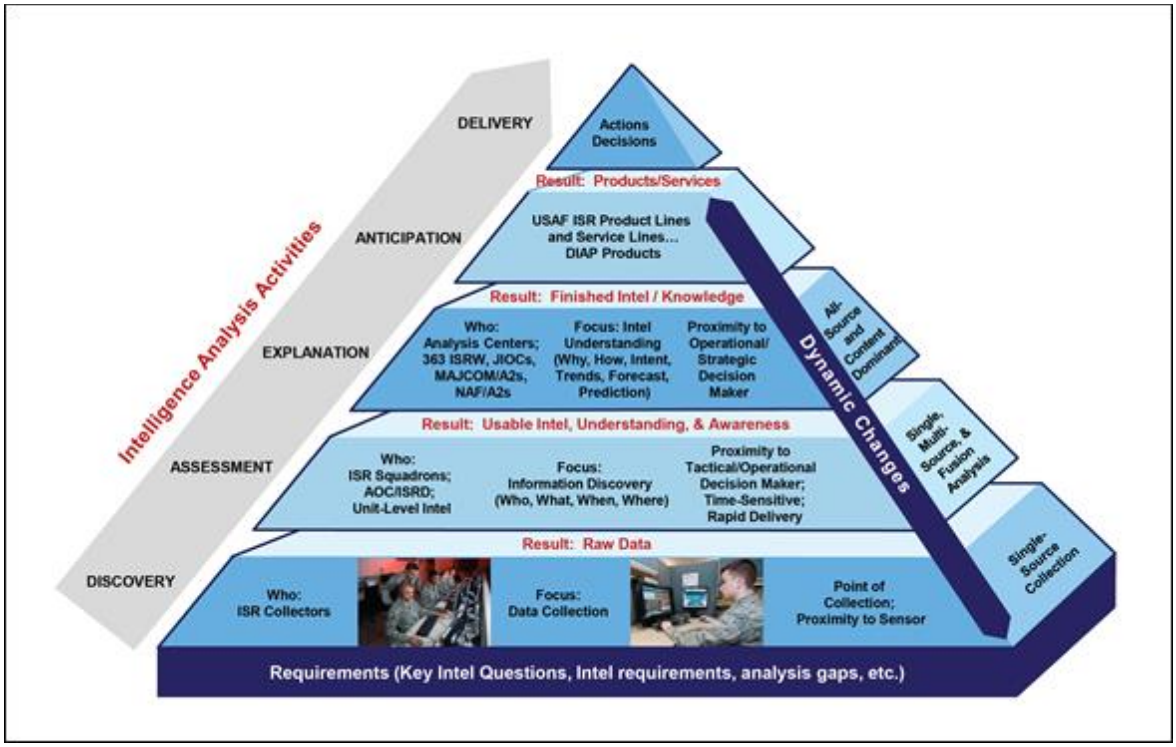
4.2.4. Anticipation is the ability to warn and describe future states of the environment based on the manipulation and synthesis of past and present data. Anticipation includes near-term warning and longer-term forecasting to alert and prepare decision makers for events that could be relevant to their responsibilities.

4.2.5. Delivery is the ability to develop, tailor, and present intelligence products and services according to customer requirements and preferences. Delivery is about classic intelligence products—from tactical reports to in-depth intelligence estimates—and a myriad of intelligence services, ranging from interactive displays and operational pictures, to multimedia crew threat briefings and tablet-embedded, dynamic intelligence assessments, enabling real-time analyst response to requests for information. Delivery is often referred to as production and/or dissemination.

4.2.6. As Figure 4.3, *AF Intelligence Analysis Continuum*, depicts, analysis activities take place across a continuum within the AF, starting with the development of requirements;

progressing through data collection, information discovery, and intelligence understanding; and culminating in services and products that impact commanders' decisions and military actions.

Figure 4.3. AF Intelligence Analysis Continuum.



4.3. AF Intelligence Analysis Tenets. AF tenets of analysis derive from and support IC, joint intelligence, and broader ISR principles, while simultaneously emphasizing analysis attributes of particular interest and priority within the AF. These are the overarching principles held to be true and in common by AF ISR professionals. Collectively, these six tenets cover the most important beliefs about AF intelligence analysis. According to AFI 14-133, while effort should be taken to apply all of these tenets, situations may dictate not all of them being used. The following descriptions are excerpts from AFI 14-133.

4.3.1. Objectivity. Analysis should be based on fact and be clear and truthful about what is *known versus what is judged*. It should *not be distorted by emotion or personal or organizational bias* and shall *be independent of command or political considerations*. Further, it should clearly delineate underlying intelligence, assumptions, and judgments. Analysts should address alternative perspectives and contrary information and avoid being unduly constrained by previous judgments.

4.3.2. Integrity. While closely linked to objectivity, integrity involves a broader focus on all activities, standards, and processes associated with AF intelligence analysis. Integrity calls for *complete honesty* and *reliability in analysis* combined with firm adherence to a code of *professional ethics* and *tradecraft standards* such as *accuracy, timeliness,* and *customer responsiveness*. Integrity includes explaining changes in previous analytic judgments, as well as addressing significant differences in judgment among various U.S. analytic elements.

As stated in JP 2-0, integrity is "the cardinal element in intelligence analysis and reporting, and the foundation on which credibility with the intelligence consumer is built."

4.3.3. Synthesis. AF intelligence analysis requires analysts to *use all available sources of information to maximize completeness*. Analysts should also identify information gaps and, where they exist, they should coordinate with collectors to develop access and collection strategies. Synthesis requires well-honed tradecraft skills, including critical thinking, alternative analysis, and the ability to take the perspective of the adversary. Compatible, service-oriented information technology architectures and tools are also key to facilitating synthesis.

4.3.4. Collaboration. Analysts must *actively solicit opinions and assessments from other analysts and seek to share ideas*. Data, information, and intelligence must be broadly accessed and shared. *Collaboration* should take place internally within the AFIAE, across the IC, and with allies, academia, and other entities outside the IC, when feasible. *Effective collaboration facilitates maximum synthesis*.

4.3.5. Anticipation. Analysis is far more than trend assessment; its true *value resides in warning* and forecasting to be relevant to *decision making, warfighting, operations,* and *acquisition*. Because *information gaps routinely limit our ability to predict with complete accuracy,* it is incumbent on analysts to effectively apply tradecraft standards such as alternative analysis, levels of confidence, assumptions vs. judgments, and appropriate sourcing. Intelligence warning and forecasting are not exact; however, analysts should utilize the most recent data/information for all warning or forecast-related analysis.

4.3.6. Requirements. The AF intelligence analysis mission is motivated by *continuous engagement with customers* to comprehend dynamic needs. Customer requirements can be solicited from a variety of sources such as: understanding their operations; holding working groups or technical exchanges with them; anticipating and listening to their questions; responding to feedback; and addressing documented need statements and derivative data needs. Effectively meeting analysis mission requirements demands an effective balance of customer familiarity, interpreted needs, collaboration, and analytical judgment.

4.4. AF Standards of Intelligence Analysis . The AF has established ten standards by which it measures and assesses analytic excellence and readiness. AF tradecraft standards align with IC standards; however, the AF incorporates two additional attributes: timeliness and customer engagement. AF standards also are in parallel with joint intelligence and GIISR guidance. These standards are used by the AF ISR Enterprise to conduct analysis operations and are integrated into AF Inspection System criteria. Attachment 4 contains a sample methodology and form to evaluate these standards. The following descriptions are excerpts from AFI 14-133. Refer to the AFI for additional details.

4.4.1. Timeliness. Analysis *must be timely* to impact planning, mission objectives, operations and otherwise aid in commanders' decisions. The aim is to deliver information and knowledge at the earliest time and place to enable customers to effectively make decisions and take action.

4.4.2. Appropriate Sourcing. Analysis *cites all sources used,* when feasible, and includes an *objective assessment of the quality, credibility, and reliability of the underlying sources*.

4.4.3. Accuracy. Analysis will *make the most accurate judgments and assessments possible*, based on the intelligence available and in light of known information gaps. A retrospective assessment of the accuracy of a judgment will help identify biases and other potential tradecraft errors for correction in future analysis.

4.4.4. Level of Confidence. To help qualify accuracy and to present analysis in a uniform and consistent manner across the AF, analysts will *indicate the degree of confidence/certainty* associated with analytic judgments and conclusions to the best of their ability, given currently available intelligence. AFI 14-133, Table 3.1, *Confidence Levels in Analytic Judgment*, provides guidance for analysts to use in assigning levels of confidence/certainty.

4.4.5. Assumptions vs. Judgments. Analysis *clearly distinguishes among underlying intelligence, analyst assumptions, and analyst judgments*.

4.4.6. Alternative Analysis. Analysis will *incorporate plausible alternative assessments,* judgments, or hypotheses, *particularly when major judgments contend with significant uncertainties, complexity, or a lack of available intelligence*, or when low probability events could produce high impact results. Whenever possible, analysis should be vetted through at least one other intelligence professional to minimize individual analyst bias.

4.4.7. Relevance. *Analysis is key to decision making*, warfighting, and acquisition efforts. Analysts should make every effort to ensure products and services fulfill the customer's intent and request, while also ensuring products and services are available to others for use beyond the original intent.

4.4.8. Logical Argumentation. Analysis will employ coherent and logical reasoning techniques, be supported by all key relevant information, and be internally consistent.

4.4.9. Utility. AF analytic products and services will *use formats* (written, verbal, visual, etc.) *that best enable understanding by the customer*. Intelligence analysis will be disseminated at the lowest classification and widest releasability levels without jeopardizing its usefulness to the customer.

4.4.10. Customer Engagement. Analysis should fully address customer requirements within time constraints and in a manner most useful. Analyst Airmen will be responsive to customer feedback. While challenging to evaluate, this tradecraft standard is foundational to AF intelligence analysis.

4.5. Beyond the Checklist . The list of analysis activities, tenets, and standards lend themselves to a checklist mentality. This is especially true with the standards, that are the criteria by which the AF evaluates analytical readiness. However, it is vital to remember that intelligence analysis is ***not just a science but also an art***. Following good tradecraft practices aids in developing a sound analytic process and foundation. However, the analyst cannot become paralyzed in making an assessment if all the tradecraft pieces do not fully align. Mistakes will be made – have been made – but we cannot fail to provide decision makers with our best assessment based on what information we had at the time. The analyst Airman learns the fundamentals but then spends many hours of intense effort honing and refining application of the fundamentals in the determined pursuit of excellence. Analysts need to express interest in the analysis activities and be eager to revisit any or all of them for the sake of providing more accurate, mission-relevant analysis for each customer requirement. Analysts need to embrace the

tenets and standards such that they become an intuitive and natural part of all analytical activities. Analysts, supervisors, and commanders also need to hold each other accountable to the tenets and standards.

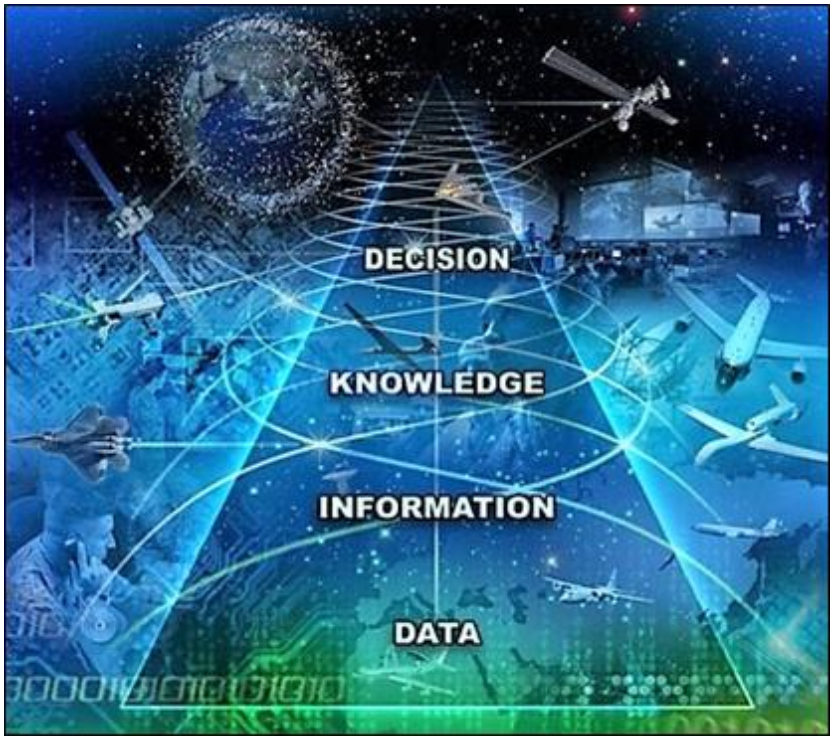
4.6. AF Analytic Ombuds . The AF Analytic Ombuds is the AF representative that responds to concerns raised by intelligence analysts about adherence to AF analysis tenets, standards, and production guidelines. The Ombuds addresses such concerns as lack of objectivity, bias, politicization, or other issues in applying analysis tenets and standards. The AF/A2 appoints the AF Analytic Ombuds in accordance with DNI guidance. In addition, NASIC and each MAJCOM/A2 designate an individual or office to serve as their organization's Analytic Ombuds IAW AFI 14-133.

Chapter 5

ANALYSIS SKILLS AND TRADECRAFT

5.1. Overview. Intelligence analysis is what transforms data into the information and knowledge necessary for warfighters and decision makers to decide and act (refer to Figure 5.1, *Transforming Data to Decisions*). While technology can assist and enable these transformations of data, without human cognition (people "in-the-loop") it is doomed to fail. There are things technology alone is not capable of. The things technology can do depend upon human analysts creating and updating the analytic models, databases, and displays that can be automated or made more efficient. The most basic and necessary unit in intelligence analysis is the analyst. **Note:** Attachment 7 identifies some online resources that contain additional information on analysis skills and tradecraft topics covered in this chapter.

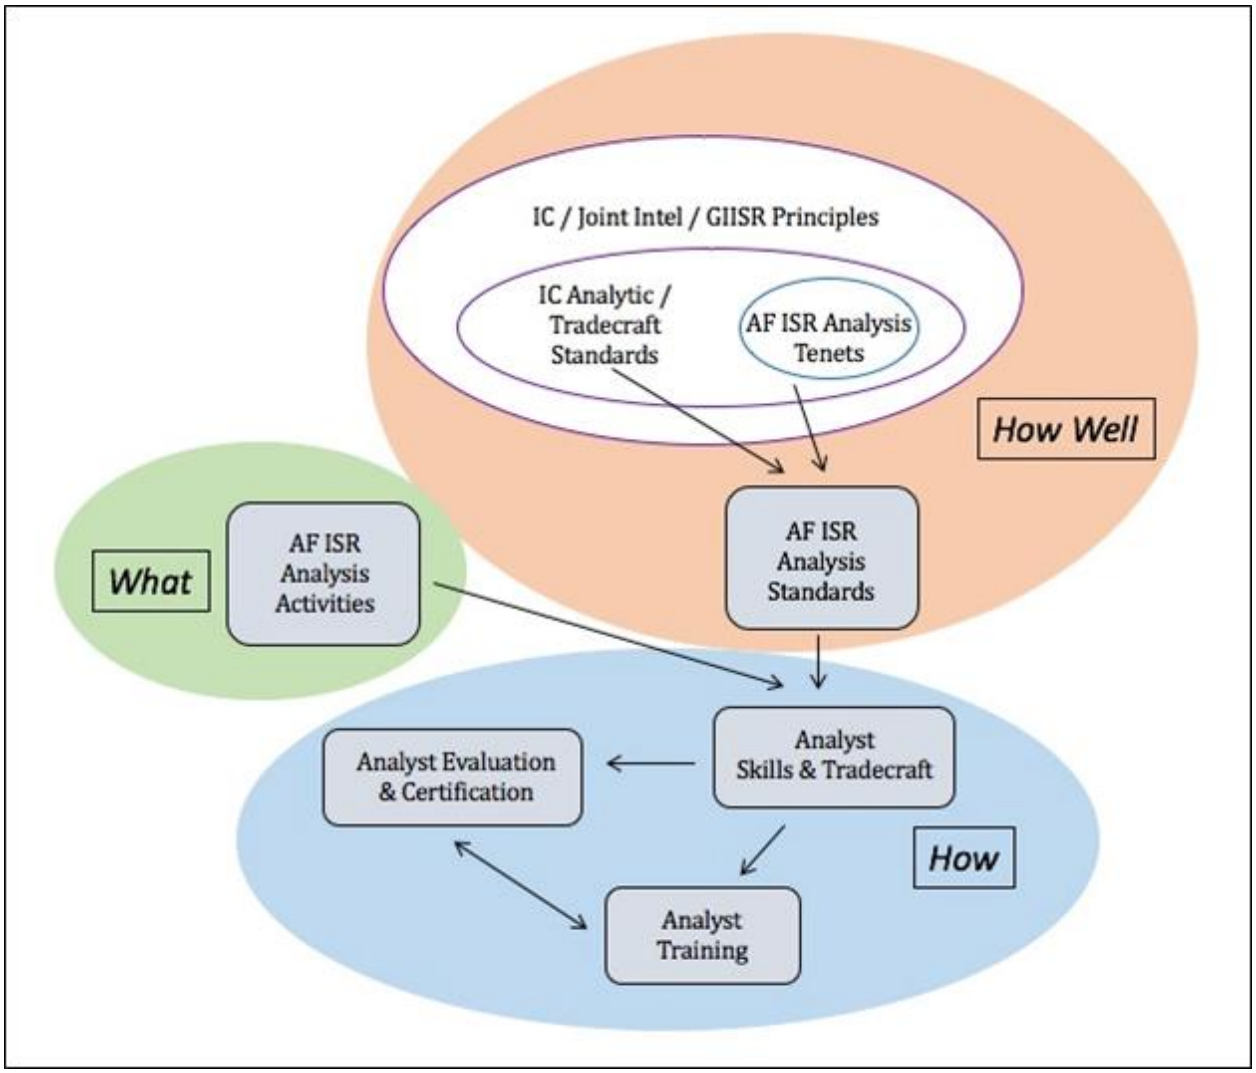
Figure 5.1. Transforming Data to Decisions.



5.1.1. Definitions and Relationships. An analysis skill is a specific ability or collection of capabilities required to competently conduct analysis that is acquired through training and/or experience. Analysis tradecraft is an established or prescribed analysis technique, practice, or systematic process. The relationship and role of intelligence analysis skills and tradecraft is illustrated in Figure 5.2, *Relationship and Role of Intelligence Analysis Skills and Tradecraft*. Whereas the five AF intelligence analysis activities (discovery, assessment, explanation, anticipation, and delivery) comprise "what" analyst Airmen do and analysis tenets/standards establish how well analysis is done, analysis skills and tradecraft are the "how" of analysis. Analysis activities, tenets, and standards drive the skills and tradecraft for which analyst Airmen need to be trained. In turn, analysis skills and tradecraft determine training, evaluation, and certification requirements. Analyst skills and tradecraft highlighted

in this publication are time-tested, repeatable, and proven effective for structured AF intelligence analysis.

Figure 5.2. Relationship and Role of Intelligence Analysis Skills and Tradecraft.



5.1.2. Analysis Transformation.

5.1.2.1. In 2004, Congress passed the Intelligence Reform and Terrorism Prevention Act (IRTPA) in response to several commissions and hearings in the aftermath of 9/11. That act is known for establishing the ODNI; however, the act also set forth a number of tasks and objectives for the DNI to accomplish to improve intelligence and prevent or mitigate the failures that led to 9/11. It is worth highlighting that a majority of those tasks and objectives relate to the conduct of intelligence analysis: Congress directed that U.S. intelligence analysis needed to be professionalized, have set standards, and address many shortcomings in skills and tradecraft through increased guidance and training. Thomas Fingar, the first Deputy DNI for Analysis, later reflected that up until IRTPA and the subsequent transformation of analysis in the IC, analysis had largely been a craft in the IC: skills learned only on-the-job, under the tutelage of 'journeymen' and 'masters,'

where the language and processes used could differ from shop to shop, region to region, and advancement was informally recognized and locally derived. **Note:** For more information on this topic, see Thomas Fingar, *Reducing Uncertainty: Intelligence Analysis and National Security*.

5.1.2.2. This is not to say that some agencies or elements in the IC did not have more established vocabulary and tradecraft, and even so-called training and intelligence colleges, such as the CIA and DIA. However, this kind of professional approach was not widespread, and where it was present, organizations were not sharing standards or efforts. IC standards began to promulgate through DNI-approved ICDs and other policy, while shared training and vocabulary were established through collaboration, development, and sharing of IC analysis training. As these directives, policy, and training matured, efforts began to focus on defining the fundamentals of intelligence analysis as a means to true certification of all analysts in the IC. Today, these analytic standards are not only reflected in ICDs, but are standards for AF compliance, as highlighted by AFI 14-133 and associated unit Management Internal Control Toolset (MICT) Self-Assessment Communicators (SACs).

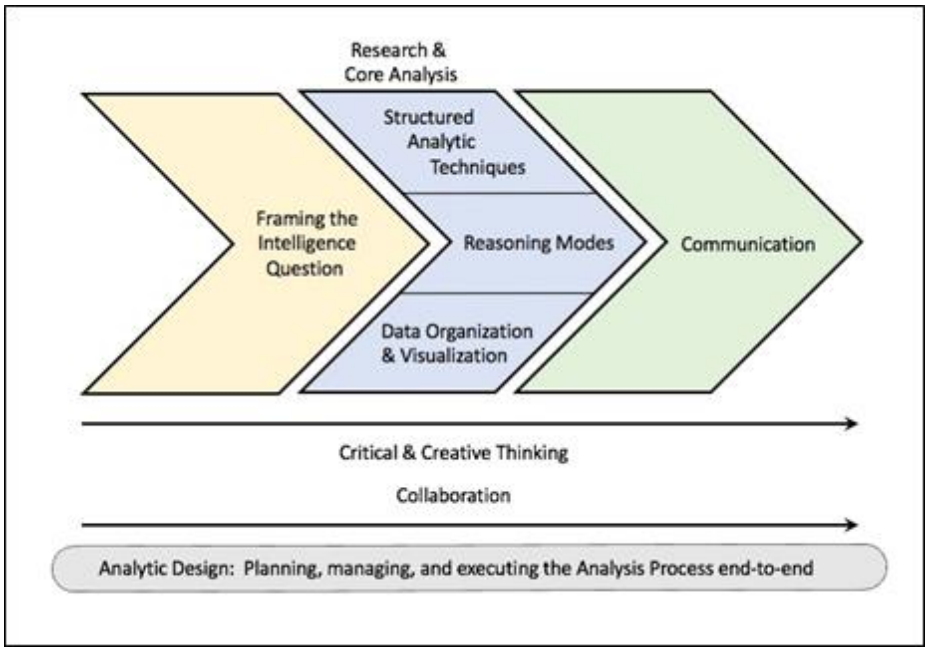
5.1.3. Analysis Certification Programs.

5.1.3.1. All-Source Analysis (ASA) Certification Program. The ASA Certification Program is a USD(I)-approved and DIA-led analysis qualification program for the DoD. The program assesses a candidate's knowledge and performance of ASA skills. The program is in the nascent stages. Initial qualification is focused on the fundamentals of intelligence analysis and open to all military and civilian intelligence analysts. The intent is for the program to expand to follow-on or higher levels of qualification. The AF ISR Force Management Division (AF/A2FD) is the AF OPR for the ASA Certification Program.

5.1.3.2. Other Certification Programs. The IC has also established certification programs for various fields of single-source analysis and activities closely linked with ASA. As one example, the Geospatial Intelligence (GEOINT) Certification Program is part of a broader USD(I) initiative to further professionalize the DoD intelligence workforce. The program applies to all cleared DoD civilian, military, and contractor practitioners in GEOINT-related work roles. Another example is the DoD Collection Management Certification Program, which ensures that collection managers possess the knowledge and skills associated with the competencies necessary to successfully carry out DoD collection management functional tasks.

5.2. Skills and Tradecraft Fundamentals. While analysis skills and tradecraft are taught in varying forms and emphasis across the IC and in AF entry and advanced training for core AF intelligence AFSCs (14N, 1NX, 9SX, 1A8X, and 0132), all AF intelligence analysts require competency in these areas. Figure 5.3, *Fundamental Skills and Tradecraft of the Analysis Process*, portrays the fundamental skills and tradecraft associated with the analysis process. Although the figure suggests an alignment, the order in which the analyst Airman applies the skills and tradecraft techniques varies depending on the requirement and is not as important as ensuring all skills and tradecraft are considered. This section will describe each of these areas.

Figure 5.3. Fundamental Skills and Tradecraft of the Analysis Process.



5.2.1. Critical and Creative Thinking.

5.2.1.1. Critical thinking is considered to be a foundational AF analysis skill. AFI 14-133 defines it as the intellectually disciplined process of actively and skillfully conceptualizing, applying, analyzing, synthesizing, and/or evaluating information gathered from or generated through observation, experience, reflection, reasoning, or communication, as a guide to belief and action. The concept of critical thinking and its associated improvements to coherent cognition arose from the philosophy departments of schools and universities in the mid-1990s. Many observers feel it was because managers and leaders across the private, commercial, and government worlds began demanding people who could "think better and deeper." **Note:** See Peter A. Facione, *Critical Thinking: What It is and Why it Counts*, p. 3. Critical thinking may be better understood by contrasting it with "normal" thinking. In everyday thinking, people often find themselves with a central thought but are distracted by other thoughts or topics as they occur either physically or mentally. They strive to get to a destination, but may wander and stall before reaching it, with little recognition of where they have been. In contrast, with critical thinking, conscious effort occurs to focus on a particular thought and additionally be "critical" (the origin of the phrase) or reflective and purposeful, using more rigorous reasoning. Reflective reasoning—thinking about how we think, or metacognition—is the key difference between normal and critical thinking.

5.2.1.2. The need for critical thinking in analysis is often paired with another adjective: "creative." Creativity has always been difficult to define, but in the context of intelligence analysis, the 9/11 Commission report abounds with calls for U.S. analysts to have more imagination: to be able to link disparate happenings and facts, to see a "bigger picture," to envision alternatives which are not spelled out. In rigorous thinking, creativity is often associated with "abductive" reasoning: the process of generating a novel hypothesis to explain given evidence that does not readily suggest a familiar

explanation. **Note:** See section 5.2.4 for additional information on reasoning. Creativity "characterizes the analyst's ability to come to a conclusion spontaneously, often without a sense of having consciously taken definable steps to get there. While the abduction process may not be easily defined or taught, it may be encouraged by providing analysts with a wide array of research material and experiences, and by supporting the expenditure of time and energy on creative thinking." **Note:** See Lisa Krizan, *Intelligence Essentials for Everyone*, pp. 31-32, and LCDR William G. Schmidlin, *Zen and the Art of Intelligence Analysis.*

5.2.1.3. Both critical and creative thinking are supported in intelligence analysis by the application of methods known as Structured Analytic Techniques (SATs) and an understanding of analytic reasoning and the role of biases, addressed below.

5.2.2. Framing the Intelligence Question. A well-framed intelligence question is the most important factor in assuring the overall quality of intelligence analysis, helping analysts to anticipate emerging trends and developments and focus efforts on addressing issues most relevant to consumers of intelligence. The question drives information discovery, the selection of analytic approaches and methods, and ultimately the analytic message conveyed to intelligence consumers. Successfully framing the intelligence question consists of clearly articulating the key intelligence issues and deconstructing the question to identify the primary factors to be considered in answering the question. A well-framed question also requires the analyst to have an adequate understanding of air/space/cyber power and the missions the analyst directly supports. Framing the question includes identifying intelligence gaps, understanding the information base, and knowing how to drive collection.

5.2.2.1. Intelligence Gaps. An intelligence gap is information that is needed to appropriately conduct intelligence analysis and help answer an intelligence question but is absent from reporting—what we know we don't know. Identifying gaps helps focus the research and collection required to close the gaps. Moreover, awareness of intelligence gaps aids analysts in properly conveying the resulting level of confidence associated with analytic judgments.

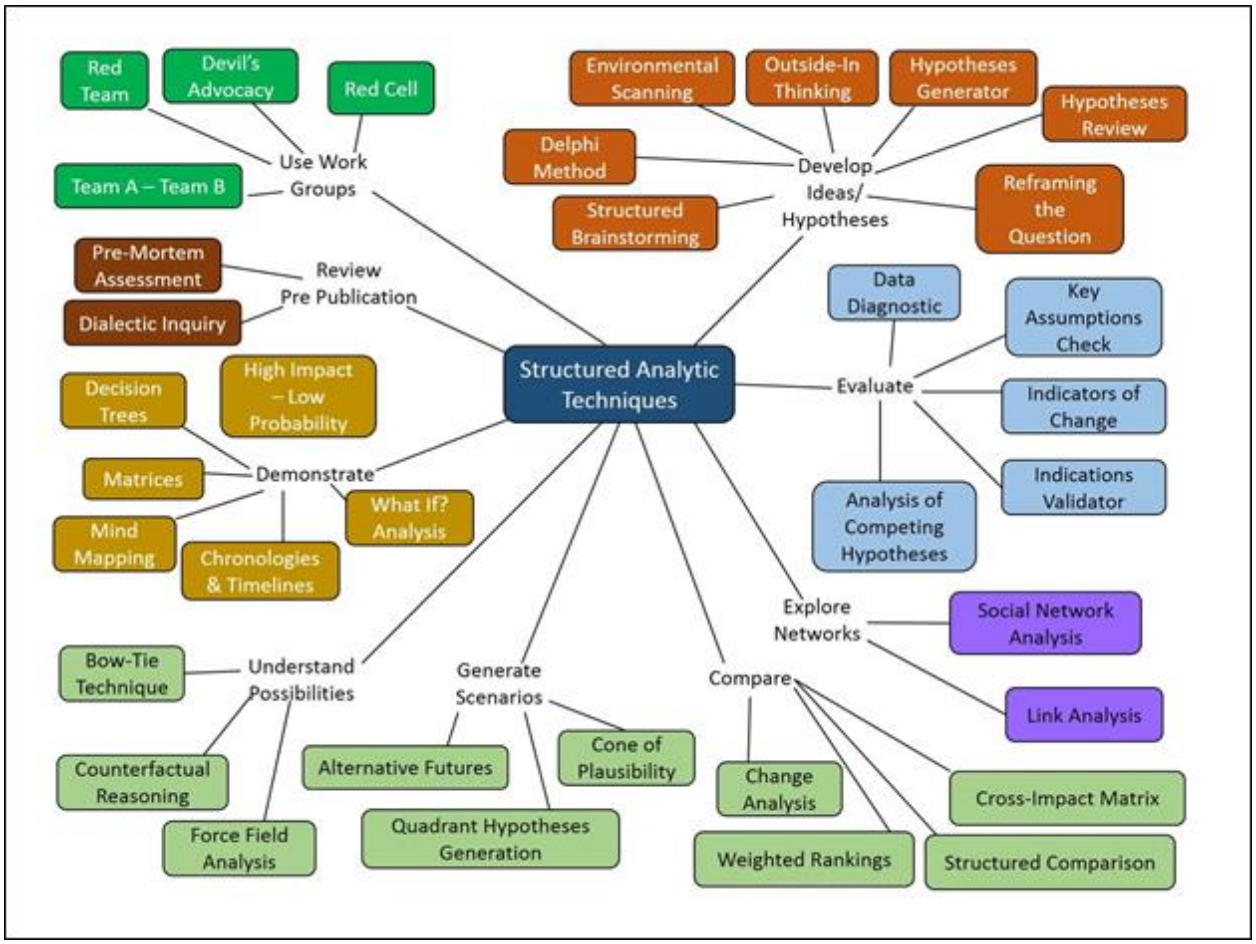
5.2.2.2. Understanding the Information Base. To effectively marshal information needed to answer intelligence questions, analysts require a solid understanding of the available information base. They need to identify what data and information is required, establish whether it is available, and determine where it can be found. In addition, they know the strengths and weaknesses of potential sources of information, are able to assess the quality of that information, in part by knowing where it comes from and how it was processed and disseminated, and understand the role analysis plays in transforming this data and information into knowledge that provides value to intelligence consumers.

5.2.2.3. Driving Collection. Analyst Airmen need to understand how information is collected and processed in the AF and more broadly in the IC to identify which sources of information are most useful in answering their intelligence questions, to assess quality and credibility, and to task collectors to collect information to fill intelligence gaps.

5.2.3. Structured Analytic Techniques (SATs). After properly framing the intelligence question, the analyst dives into the heart of the analysis process. There are several critical skills associated with this core research and analysis phase of the process, one being the application of SATs.

5.2.3.1. In *Structured Analytic Techniques For Intelligence Analysis*, Richards J. Heuer, Jr. and Randolf H. Pherson describe structured analysis as "a step-by-step process that externalizes an individual analyst's thinking in a manner that makes it readily apparent to others, thereby enabling it to be shared, built on, and critiqued by others. When combined with the intuitive judgment of subject matter experts, such a structured and transparent process can significantly reduce the risk of analytic error." **Note**: See Richards J. Heuer, Jr. and Randolf H. Pherson, *Structured Analytic Techniques For Intelligence Analysis*, p. xvi. SATs rose to prominence in intelligence analysis as part of a broad effort to transform the tradecraft following 9/11. Most SATs are not unique to intelligence analysis, but have been developed in other fields that utilize analysis. Many of these techniques, shown in Figure 5.4, *SATs*, broadly fall under the field of operations research, management tools, and general decision-making aids.

Figure 5.4. SATs.



5.2.3.2. Why are SATs important? Their application helps the analyst take a systematic approach to problem solving, mitigate bias and error, and enhance analytic credibility. SATs are useful by both individuals and teams in breaking down problems or "decomposition," generating ideas or "brainstorming," testing ideas or reviewing alternatives, and checking solutions or assessments. Structured techniques offer an effective means of applying scientific methodologies to the operational art of analysis.

Advanced analytic courses, such the AF Critical Thinking and Structured Analysis Course (CTSAC), offer focused training on SATs. Attachment 5 contains a tradecraft guide that details some of the key SATs commonly used by analyst Airmen.

5.2.4. Analytic Reasoning and Bias.

5.2.4.1. The heart of the definition for critical thinking is purposeful, reflective reasoning. Logical reasoning is defined as the process of establishing a justified belief by using premises (rules), evidence (facts), and argument (relationships). Three types of basic reasoning include:

5.2.4.1.1. Deductive reasoning—Sometimes called deductive logic, deduction is reasoning in which a conclusion is a logical consequence of the premise. A deduction moves from general rules and some evidence to particular cases.

5.2.4.1.2. Inductive reasoning—The intellectual process of drawing generalizations on the basis of observations or other evidence. Induction takes place when one learns from experience.

5.2.4.1.3. Abductive reasoning—The process of generating a novel hypothesis to explain given evidence that does not readily suggest a familiar explanation. Abductive reasoning starts from a set of accepted facts and creatively proposes their best explanation.

5.2.4.2. More recently, social scientists have helped to expand the horizons and suggest there are analytical *modes* of reasoning, most of which are familiar in description yet have significant research behind them. Reasoning is the process of forming conclusions, judgments, facts, opinions, or inferences. Reasoning assists in forming arguments based upon evidence about observed activities. It is the job of an analyst Airmen to make sense of a complicated mass of information—to understand and explain the current situation, to reconstruct the past that led to it, and to use it as the basis of predictions for the future. **Note:** See Barbara Spellman, "Individual Reasoning*"* in *Intelligence Analysis: Behavioral and Social Scientific Foundations*, p. 117. As human beings with developed intellects, we generally may be said to have six modes of reasoning:

5.2.4.2.1. Status Quo—Making immediate judgments and inferences.

5.2.4.2.2. Authoritative—Drawing inferences from expert testimony or strong belief.

5.2.4.2.3. Comparative—Drawing conclusions from examples, cases, or analogies.

5.2.4.2.4. Empirical—Drawing conclusions from personal interaction with real evidence.

5.2.4.2.5. Scientific—Drawing casual inferences using facts, premises, and logic.

5.2.4.2.6. Market—Drawing conclusions from a structured consensus of persons.

5.2.4.3. We use many of these modes of reasoning every day, and there are analytical equivalents used in the process and mission of intelligence. However, bias remains one of the most common detractors in applying the modes of reasoning. Cognitive biases are mental errors caused by our simplified information processing strategies. When people reason, they employ various simplifying strategies and rules of thumb to ease the burden of mentally processing information to make judgments and decisions. "I always get

enchiladas at Mexican restaurants; the interstate is always faster; or I always get my news from an online news source." These simple rules of thumb may be acceptable for surviving the daily grind, but not for performing intelligence analysis. Analysts have to remain detached from normal survival biases and start fresh with each new problem.

5.2.4.4. Common types of cognitive biases include:

5.2.4.4.1. Bandwagon Effect—Tendency to believe something because many others believe it.

5.2.4.4.2. Clustering Illusion—Tendency to overvalue small runs, streaks, or clusters in large sets of data.

5.2.4.4.3. Confirmation Bias—Tendency to overvalue data supporting initial assumptions or expectations, and undervalue that which contradict.

5.2.4.4.4. Framing Effect—Tendency to draw different conclusions from the same data if it is presented differently.

5.2.4.4.5. Illusory Correlation—Belief that two events are related when they might not be.

5.2.4.4.6. Insensitivity to Sample Size—Tendency to underestimate the variation in data from small samples.

5.2.4.4.7. Mirror Imaging— Assumption that others see events and react to them just as we do.

5.2.5. Data Organization, Visualization, and Analytic Modeling.

5.2.5.1. As analyst Airmen begin to acquire information related to their intelligence question, either as part of a focused research effort or routine monitoring within their areas of responsibility, they need to employ a systematic approach to triaging and organizing information to identify trends, patterns, and relationships relevant to their intelligence question. The use of visualization techniques can assist analysts in deriving meaning from large volumes of fragmented information.

5.2.5.2. Visualization and analytic modeling are companion concepts to SATs. Effective visualization helps the analyst Airman analyze and reason about data and evidence. Analytic models can often help capture and expose knowledge, focus collection on the right needs, and apply analytics to the right questions. Visualization and analytic modeling apply to both the analytic process itself, and the delivery of information to consumers. Their importance was a key factor in establishing the analytic tradecraft standards of "effective visual information" by the IC and "utility" by the AF.

5.2.5.3. Like analysis, visualization and analytic modeling are both art and science. The advent of big data and data analytics has begun to emphasize the science and created the field known as data science. Data scientists find, interpret, and merge rich data sources; ensure consistency of data sets; create visualizations to aid in understanding data; build mathematical models using the data; and present and communicate data insights and findings to specialists, scientists and non-technical audiences.

5.2.6. Communication. Effective communication is essential to the craft of intelligence and even the best intelligence analysis falls short if communicated poorly. Consumers often

judge the validity of analysis by the quality of how it is communicated. The importance of communication is underscored by ICDs 203, 206, and 208 and AFI 14-133, which prescribe standards and principles for dissemination and require annual assessments for compliance. Analysts use multiple vehicles and formats to communicate their assessments to consumers.

5.2.6.1. Analytic Writing. Well-written products share a common set of attributes. First and foremost, good intelligence writing is analytic. That means, it does not simply report events; it explains the significance of those events and much more. Intelligence assessments are structured so that busy consumers can quickly grasp the main message and underlying reasoning, and be clear, precise, and convincing. In particular, analysts minimize the chance for misinterpretation of the findings, the certainty behind them, or how they were arrived at. Even the best analysis, if presented poorly, could cause the customer to question its credibility.

5.2.6.2. Visuals. Whereas data visualization during core research and analysis helps the analyst to "discover" the story, visualization for presentation helps "tell" the story. Visual presentation uses graphics—from charts and graphs to maps and complex tables, and both hardcopy and digital—to make relationships between data more easily understood.

5.2.6.3. Briefings. Briefings are a key mechanism for communicating analytic judgments to customers and can foster two-way communications to ensure that customer intelligence questions are addressed. Effective briefings consist of a well-organized, clear message relevant to the target audience; appropriate, tailored visual aids to reinforce the message; and a presentational style that keeps the audience focused on the message. Briefing is a skill that is honed through practice.

5.2.6.4. Multimedia Products. Significant innovations in multimedia tools have emerged that make possible sophisticated products that go beyond static graphical presentations. Multimedia products are generally either interactive or use full-motion video or animated web graphics to display content. Some techniques are particularly useful for depicting changes in data over time or comparing complex or multivariate data by allowing users to choose which variable they want to see. Despite these different ways to communicate analysis, the fundamentals remain the same: analysts need to present their analysis with clarity and sound logic.

5.2.7. Collaboration.

5.2.7.1. Similar to critical and creative thinking, collaboration is a skill that extends across the entire analysis process. Effective intelligence analysis depends on strong interpersonal relationships among analysts within and across intelligence agencies and the way the analysts relate to collectors, customers, and other experts within and outside the IC. Analysts are expected to collaborate and team to tackle complex intelligence questions, coordinate analytic products, and engage in regular discussions with colleagues that explore and challenge analytic judgements and prevailing assumptions. As one of the six AF intelligence analysis tenets, collaboration is considered a fundamental attribute and priority in AF analysis. Further, collaboration is the catalyst to every IC member's responsibility to "provide, discover, and request" as mandated in ICD 501.

5.2.7.2. An important aspect of collaboration and teaming is analytic outreach, which ICD 501 defines as the open, overt, and deliberate act of an IC analyst engaging with an individual outside the IC to explore ideas and alternate perspectives, gain new insights, generate new knowledge, or obtain new information. Outside experts include those in academics, business, non-governmental organizations, scientists, and others. Various methods of analytic outreach include conferences, seminars, exchanges, sabbaticals, and the building of trusted professional relationships.

5.2.7.3. Skills required for effective collaboration include employing tools to facilitate scheduling, access to data, and the sharing of analysis; effective team management practices; social networking techniques; constructive criticism—both giving and receiving; and interpersonal skills. Analysts need to also be aware of and take measures to avoid impediments to teaming, especially the "What's in it for me?" mindset. A study of the collaboration environment in the IC in 2007 identified six imperatives to help overcome such mindsets: mission criticality, mutual benefit, mutual trust, common understanding through common lexicon and transparent rules of the road, access and agility to identify collaborators and form collaborative communities, and incentives. **Note:** Derived from Integrated Concepts Development Office, *Achieving a Robust Collaborative Environment*.

5.2.8. Analytic Design. Analytic design is the activity of planning, managing, and executing the analysis process end-to-end—from the development of the right intelligence question, research, and core analysis to the crafting of an assessment that captures and communicates analytic insight for customers. Although analytic design is described last in this chapter's list of skills and tradecraft, it takes place up-front and then continues throughout the analysis process. In analytic design, the analyst outlines the plan for framing the question, applying SATs, reasoning and mitigating biases, organizing and visualizing data, communicating the analysis, collaborating with all applicable entities, and employing critical and creative thinking skills. Then, as the plan is put into action, the analyst revisits and revises the plan, as needed, to comprehensively address the requirement. More information on this subject is available at the following site: *ICAT-G/Products Analytic Design Portal*, Joint Worldwide Intelligence Communications System (JWICS) Caution-url: **https://intellipedia.intelink.ic.gov/wiki/Portal:IC_Analytic_Tradecraft_Gateway/Analytic_Design**.

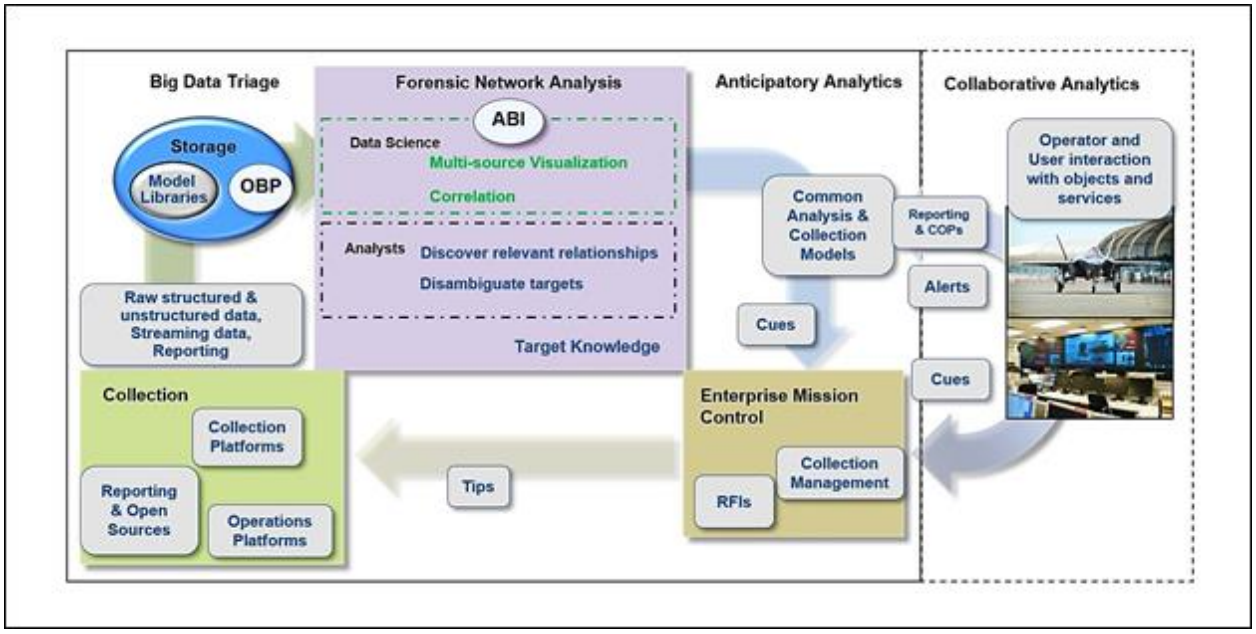
5.3. Key Analysis Concepts.

5.3.1. Big Data, Data Analytics and Data Science.

5.3.1.1. According to the *AF Future Operating Concept: A View of the AF in 2035*, the term big data describes large volumes of high-velocity, complex, variable data that require advanced techniques and technologies to enable the capture, conditioning, reliability, storage, distribution, management, and analysis of the information. The significance of big data extends beyond the sheer volume, complexity, and diversity of data; it is profoundly changing the way we think about data and creates new knowledge and information. **Note**: Paul B. Symon and Arzan Tarapore, "Defense Intelligence Analysis in the Age of Big Data," *Joint Forces Quarterly*, p. 4. Big data is driving us from a perspective of "causation" to one of "correlation." Rather than the traditional perspective of analyzing discrete amounts of data to understand the past cause and effect

(the why) and use that as a predictor of future behavior, data analytics enables analysts to harness the massive amounts of data available to draw correlations and use patterns of life (the what) as a predictor of future behavior, even if we do not understand "the why." **Note**: Kenneth Neil Cukier and Viktor Mayer-Schoenberger, "The Rise of Big Data: How It's Changing the Way We Think about the World," *Foreign Affairs*. Figure 5.5, *Data Analytics Framework*, depicts a general framework for data analytics.

Figure 5.5. Data Analytics Framework.



5.3.1.2. Data Science is at the heart of adapting the AF ISR Enterprise to the evolving big data environment. It can generally be described as the practice of exploiting and deriving valuable insights from data. This involves extracting knowledge from data sets that may be small, large, structured, multi-modal, multi-lingual, semi-structured or unstructured. Since data science is an inherently technical and specialized field, it is best performed by individuals trained and qualified in the complex and specialized nature of the work. As the DCS for ISR White Paper, *Data Science and the USAF ISR Enterprise* conveys, rather than train analyst Airmen to be data scientists, the AF approach is to develop a force of ISR professionals, operators, and knowledge managers that understand and leverage the capabilities that data scientists bring to the fight. Figure 5.5 highlights the role of data science relative to analysts in the process of data analytics.

5.3.1.3. The implications of big data, data analytics, and data science for intelligence analysis cannot be overstated. In recognition of this, the IC has embarked on a number of analytic modernization initiatives to exploit emergent big data capabilities, improve intelligence integration, and accelerate intelligence decision cycles. Two major initiatives are object-based production (OBP) and activity-based intelligence (ABI).

5.3.2. Object-Based Production (OBP).

5.3.2.1. Traditionally, analysts spend a great deal of time and effort assembling, collating, and parsing diverse data sources that pertain to a given intelligence problem.

As Figure 5.5 illustrates, OBP is a framework for organizing and sharing information. It is defined as the act of organizing intelligence around objects of interest—not by collection or data type—which allows users to aggregate intelligence information from across multiple intelligence domains and associate it with particular objects of interest. All intelligence that relates to something that physically exists in the real world is assembled and made centrally available as an object that all collectors, producers, and consumers can access. Objects include physical things (e.g., ships, buildings, vehicles, persons, and political boundaries), as well as abstract things (e.g., events and issues). The intent of OBP is to provide a consolidated perspective about the behavior of objects and their interaction with one another.

5.3.2.2. Traditionally, the output of each intelligence discipline is assembled by an analyst in order to understand the who/what/where/when of the object. The OBP alternative enables analysis to be directly attached to the object in question to allow delivery of complete find, fix, and track information direct to operational users. Thus, intelligence analysis is not stove-piped or the end result of a linear process. Instead, in this synthetic model, known information is dynamically assembled within the intelligence process. Automatic exploitation systems and manual intelligence analysis work in tandem to dynamically populate a shared community of objects that all analysts have access to. The result is that analysts can better understand intelligence activity by more clearly identifying and managing intelligence gaps and spending less time assembling information.

5.3.3. Activity-Based Intelligence (ABI).

5.3.3.1. ABI emerged from the experiences of analysts working dynamic targets and analytic problems. It centers on the discovery and association of unknown activities. DIA, the National Geospatial-Intelligence Agency (NGA), and the National Security Agency (NSA) describe ABI as an analytic method applied to structured data from all sources, to discover objects (e.g., high-value target location), relationships (e.g., supplier/consumer), or behaviors (e.g., pattern of life) by resolving significant activity.

5.3.3.2. NGA has delineated four ABI tenants that apply to a variety of missions and problem-sets: 1) geo-reference to discover; 2) integration before exploitation; 3) data neutrality; and 4) sequence neutrality. As geo-referenced activity becomes the starting point of discovery, that allows for the rapid integration of multi-INT data and allows for analysis without data-source or sequence biases presented by the traditional linear collection process. Successful ABI analysis relies heavily on geo-referenced data that did not lend itself to an immediate application when it was collected, but eventually enhanced the larger context or provided more accurate characterization and understanding of data collected at a later date.

5.3.3.3. As ABI and OBP have grown to become IC-wide methodologies, NGA has advocated and developed a concept called Structured Observation Management (SOM). SOM is the practice and method of organizing and sharing multi-sensor data that is not focused on objects (e.g., activities or events), in order for the resulting data to be consistent with, and in support of, both ABI and OBP processes. It can be thought of as a 'bridge' between the new analytic processes of OBP and ABI.

5.3.3.4. AF ISR analysts need to innovate to implement ABI in our mission sets. One such effort is Scoped Activity-based Intelligence for Nodal Targeting (SAINT), an ACC-developed capability that operationalizes ABI, predominantly in support of deliberate targeting. SAINT's strength lies in the rapid fusion of data and information to create multi-source intelligence as early in the intelligence cycle as possible, and close to the point of collection in order to enable collection refinement. Figure 5.6, *Traditional Model for Target Discovery*, depicts the traditional model of a linear production chain that combines to contribute to content-dominant analysis, a time-consuming approach to Joint Intelligence Preparation of the Operational Environment (JIPOE) and ultimately target development. In contrast, Figure 5.7, *ABI/OBP Integrated Model for Target Discovery*, highlights the SAINT construct, in which OBP enables fusion analysis and micro-target system analyses (TSAs) in a time-dominant environment. This model makes possible a symbiotic analysis/collections relationship to support strategic, operational, and tactical objectives simultaneously.

Figure 5.6. Traditional Model for Target Discovery.

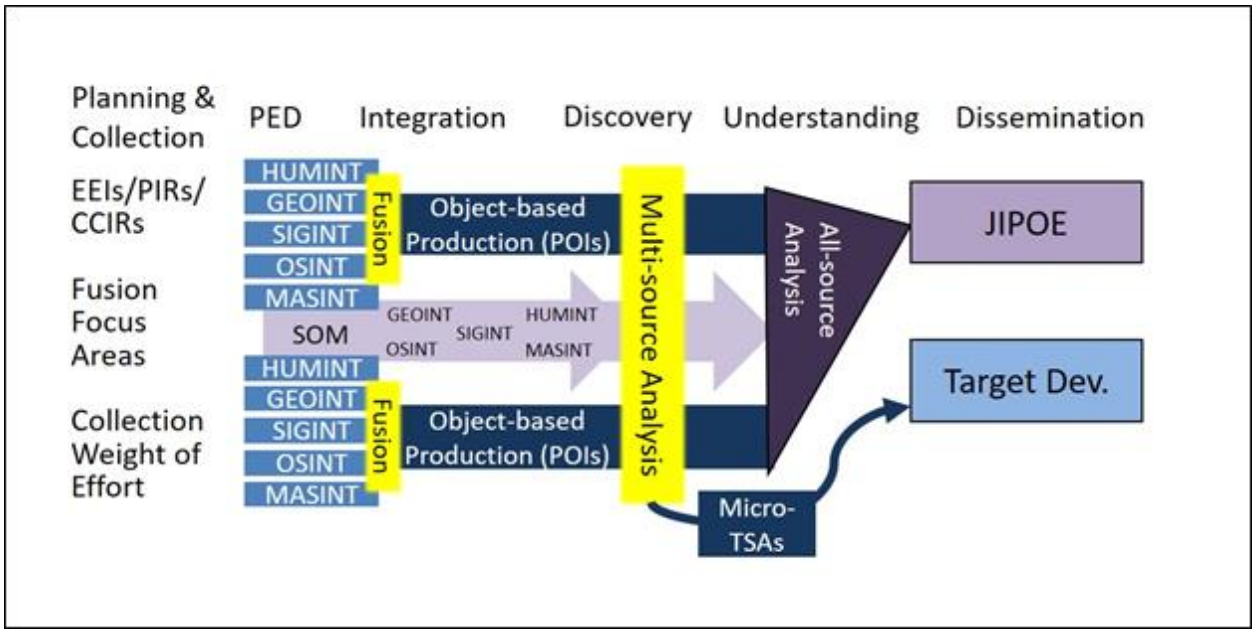
Figure 5.7. ABI/OBP Integrated Model for Target Discovery.



Note: Source is Michael Kreuzer and Denis Dallaire, *Targeting the Islamic State: Activity-based Intelligence Empowering Air Force Targeting*.

5.4. Additional Tradecraft Resources.

5.4.1. IC Analytic Tradecraft Gateway (ICAT-G). The ICAT-G serves as a repository for the ICs collective knowledge of the analytic process, methods and techniques, and best practices. It is a useful, comprehensive reference aid for analysts and a valuable resource for analytic training. It is located on JWICS at Caution-url: **https://intellipedia/intelink.ic.gov/wiki/ICAT-G**.

5.4.2. Online Critical Thinking and Analysis Environment (OCTANE). OCTANE is a 25 AF online initiative for analysts to find mentors and exchange information through an analyst mentor network, practice tradecraft, compete with peers through IntelTrivia, and download free applications and games for use on mobile devices. The OCTANE site is on the Nonsecure Internet Protocol Router Network (NIPRNet) at **https://www.25afoctane.com**.

5.4.3. Center for Marine Expeditionary Intelligence Knowledge (CMEIK). The CMEIK is dedicated to advancing analytic tradecraft across the Marine Corps intelligence enterprise. The CMEIK offers courses, tradecraft notes, and video podcasts on a variety of analysis topics that are applicable to all military services. Several examples include a writing guide, SAT pocket guide, intelligence preparation of the battlespace template, and a collaboration page. CMEIK information is available on the SECRET Internet Protocol Router Network (SIPRNet) at Caution-url: **www.mcia.usmc.smil.mil/cmeik**.

Chapter 6

REQUIREMENTS AND PRODUCTION

6.1. Intelligence Requirements and Analytic Focus.

6.1.1. Questions, Requirements, and Customers.

6.1.1.1. Intelligence analysis and production are driven by leading questions or requirements for intelligence to fill a gap in knowledge or understanding of the environment, adversary capabilities, centers of gravity, or intentions. Questions may be more formal, such as Key Intelligence Questions (KIQs) from AF and IC Programs of Analysis (PoAs), or more informal, such as those that stem from direct, near-term support to operations. All questions are based on an intelligence organization's relationship with its customer and an understanding of customer needs.

6.1.1.2. Intelligence analysis and production are also driven by priorities at all levels of command, from the President of the United States down to the tactical level of operations. At the national- and IC-level, this primarily manifests itself in the National Intelligence Priorities Framework (NIPF).

6.1.2. National Intelligence Priorities Framework (NIPF**)**. Published annually and reviewed quarterly, the NIPF is the primary mechanism to establish, manage, and communicate national intelligence priorities. Guidance from the President and National Security Advisor determines overall priorities. Secretaries and cabinet-level heads of departments and agencies provide formal input to NIPF development. The DNI is responsible for developing and managing the NIPF. All IC activities, including those of the AF, adhere to the NIPF priorities. **Note:** See ICD 204, *National Intelligence Priorities Framework*, for NIPF policy and responsibilities.

6.1.3. Programs of Analysis (PoAs).

6.1.3.1. Per DNI direction, each IC member publishes an annual PoA to provide comprehensive analysis and production focus for their organization. Collectively, the IC PoAs offer a framework for collaboration with customers, stakeholders, and IC partners. The DNI has directed each IC organization to annually publish a PoA to provide comprehensive intelligence analysis and production focus for their organization.

6.1.3.2. The AF ISR PoA (AFISRPoA) is organized into broad, overarching analytic categories, each with multiple KIQs that represent the most pressing analysis required in each category. AF analysis organizations use these categories and KIQs to guide their analytic focus.

6.1.3.3. All PoAs are to reference NIPF priorities when possible. Additionally, a new DoD Integrated Defense Intelligence Priorities (IDIP) process is being implemented to identify and describe intelligence priorities for the diverse set of DoD customers: policy, operations, and acquisition. The IDIP is the DoD intelligence inject into the NIPF and provides an additional layer of data with traceability to analytic stakeholders. Analysts reference both the NIPF and IDIP for understanding of analysis and production priorities, and reference these priorities, when feasible, in development of respective AF intelligence products and services. Additionally, the IDIP can be used by analysts to help

frame internal resource and planning discussions across the Planning, Programming, Budgeting, and Execution (PPBE) cycle.

6.1.3.4. AFI 14-134 directs development of the AFISRPoA and sub-echelon PoAs for NASIC, and the 363 ISRW via 25 AF and ACC. The intent is for every major AF ISR production element to eventually develop its own PoA to focus on analysis priorities and production. The desired end-state resulting from the AFISRPoA and subordinate level PoAs would be a more unified AF ISR analysis and production enterprise.

6.1.3.5. JWICS Intellipedia lists and provides access to all AF and IC PoAs. A listing of associated AF ISR and IC PoAs resides on JWICS Intellipedia at Caution-url: **https://intellipedia.intelink.ic.gov/wiki/Programs_of_Analysis**. Analysts reference and leverage KIQs that are specific to their analysis mission area, enabling them to work toward common AF and IC goals, improve efficiency through elimination of redundant analytic efforts, and expand their collaboration both within and outside the AF.

6.1.4. Across the AF, DoD, and IC, various terms are used when referring to an intelligence question and/or requirement, including request for information (RFI), request for support (RFS), intelligence need, intelligence requirement, KIQ, and production requirement (PR). Henceforth, this publication will use RFI to refer to all types of intelligence questions and/or requirements. RFIs range from informal to formal and from verbal to formally documented requests. They originate from an intelligence customer (also called an intelligence consumer), which includes but is not limited to, operational units, acquisition organizations, national policy makers, other intelligence elements throughout the AF, DoD, and IC, and counterintelligence units, such as AFOSI. While RFIs may be explicitly stated, analysts anticipate and help shape RFIs, based on known mission needs and a thorough understanding of operations. Supervisors help ensure their analysts are able to engage with the customer, as needed.

6.1.5. Requirements deemed most important to mission accomplishment are identified as priority intelligence requirements (PIRs). By definition, these are the critical requirements that must be satisfied for a commander and staff to understand an adversary and the operational environment in order to successfully plan and conduct a mission. PIRs are general statements of intelligence need, such as, "What is the operational status of the adversary's integrated air defense system?" or "What terrorist groups are active within the area of interest?" PIRs provide the framework for prioritization of all GIISR operations within a CCMD. PIRs, combined with a commander's friendly force information requirements (FFIRs), constitute the commander's critical information requirements (CCIRs).

6.1.6. PIRs drive the development of detailed essential elements of information (EEIs). EEIs further define the commander's PIRs by outlining specific information requirements, such as, "What is the current location of the adversary SA-20 battalion?" The designation of PIRs and EEIs help ensure efforts are focused on critical information needed to support warfighters.

6.1.7. Priority requirements in acquisition intelligence are identified as critical intelligence parameters (CIPs). A CIP is a factor that defines the threshold at which the performance of a foreign system/capability would likely degrade or nullify the effectiveness of an acquisition program or details of a developmental U.S. system, the disclosure of which could allow an

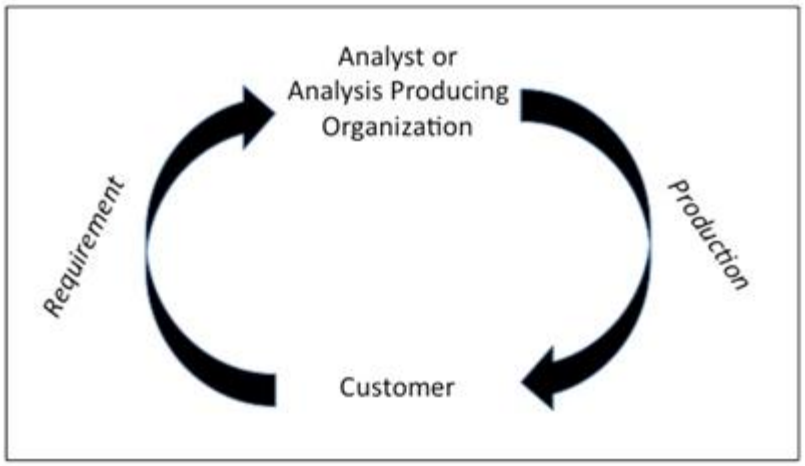
adversary to effect countermeasures to degrade mission effectiveness of the system, if it were to be fielded. CIPs are a key concept for an operational MAJCOM's requirements process/documents, as well as for an acquisition program. They are essentially a PIR for new capabilities going through the requirements and acquisition systems.

6.2. Intelligence Production .

6.2.1. Intelligence production is the development, tailoring, and presentation of intelligence knowledge via products and/or services that meet or address customer requirements. Production is an all-encompassing term that ranges from formal, published products on one end of the spectrum (e.g., a formal intelligence summary) to informal, impromptu updates on the other end (e.g., a location update on a tactical threat as a pilot steps to the aircraft). In some cases, analysts tailor existing intelligence to answer customer requirements. In other cases, analysts perform analysis on existing data, information, and intelligence to create new intelligence and knowledge. Still, in other cases analysts request collection of new data to consider in their analysis.

6.2.2. Ultimately, production culminates in at least one intelligence output for a customer, bringing the cycle full-circle, as depicted in Figure 6.1, *Requirement–Production Cycle*. An output may be an intelligence product or an intelligence service.

Figure 6.1. Requirement–Production Cycle.



6.2.3. An intelligence product is defined as tangible information in written, visual, digital, and/or verbal form that: 1) conveys information of intelligence value (e.g., written assessment, threat map, targeting materials, database, etc.); or 2) facilitates the accomplishment of an intelligence mission (e.g., assessment checklists, training folders, etc.). This definition is sufficiently broad to capture products that both directly and indirectly contribute to mission accomplishment, including those associated with intelligence analysis. The IC has established certain standards that products should meet. See Attachment 4 for a sample methodology and form to evaluate product standards.

6.2.4. An intelligence service is defined as assistance provided to another entity during the performance of ISR support, including: 1) the actual action of delivering or conveying intelligence to a user (e.g., presenting a briefing, tipping and cuing, collaboration, threat modeling, etc.); and 2) the process of enabling an ISR mission (e.g., exercise planning, skill

knowledge training, security clearance indoctrination, etc.). Some intelligence services result in additional intelligence products. Similar to intelligence products, this definition includes services associated with all categories of ISR mission accomplishment, one being intelligence analysis.

6.2.5. AF products and services are grouped into 14 product lines and 14 service lines. See Attachment 2 for descriptions of each product and service line.

6.3. Request for Information (RFI) and Analysis/Production Process . AFI 14-134 establishes and details the AF RFI and analysis/production process. Figure 6.2, *RFI and Analysis/Production Process*, illustrates the basic RFI flow that occurs at each organizational level. Figure 6.3, *RFI and Analysis/Production Process across the AFIAE*, depicts the flow across the whole analysis enterprise. The RFI and analysis/production process operationalizes the layered, distributed, mutually supporting AFIAE. It is the construct through which AF intelligence entities address customer requirements, share analytic findings, tap into analysis expertise across the IC, and collaborate on production. It is the mechanism that enables the AFIAE to achieve decision advantage. Refer to AFI 14-134, **Chapter 3** for specifics on the RFI process, categorization, tracking, and timelines.

Figure 6.2. RFI and Analysis/Production Process.

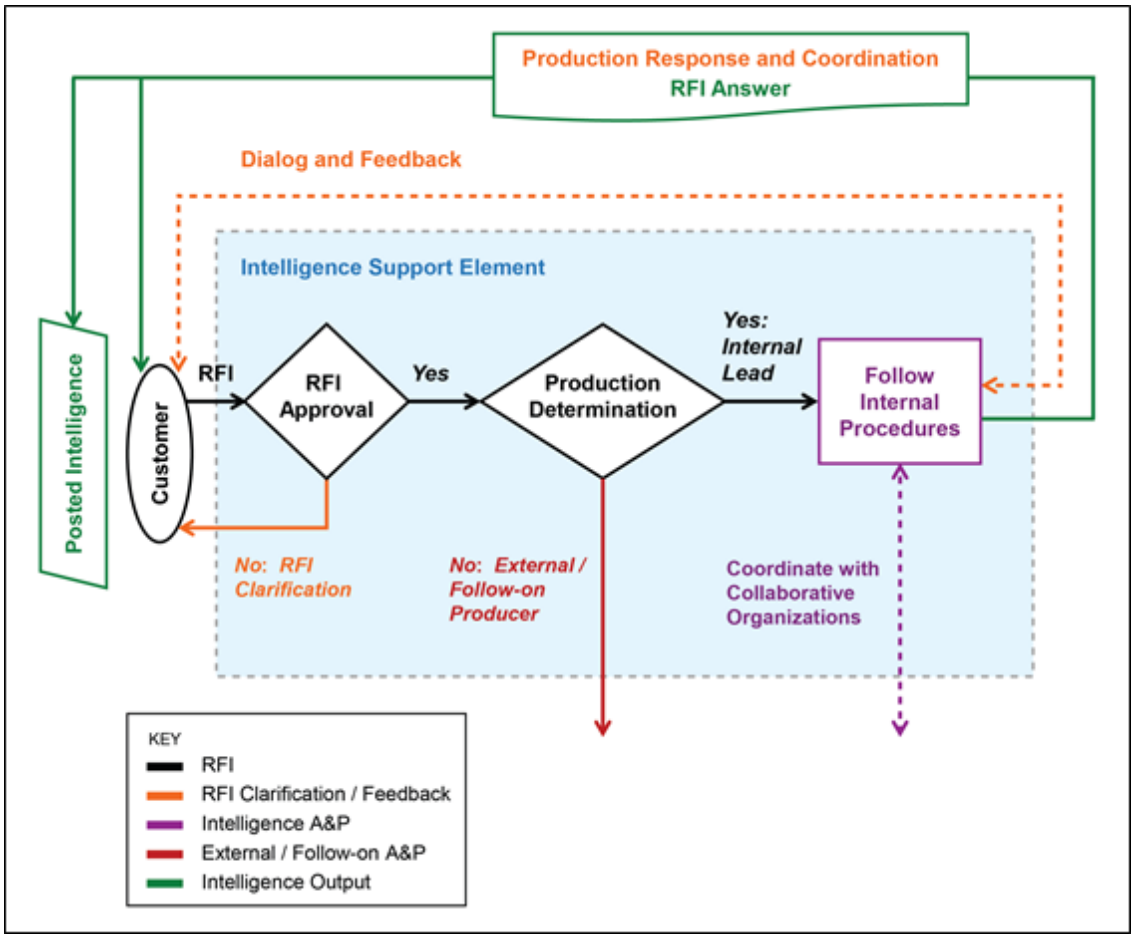


Figure 6.3. RFI and Analysis/Production Process across the AFIAE.

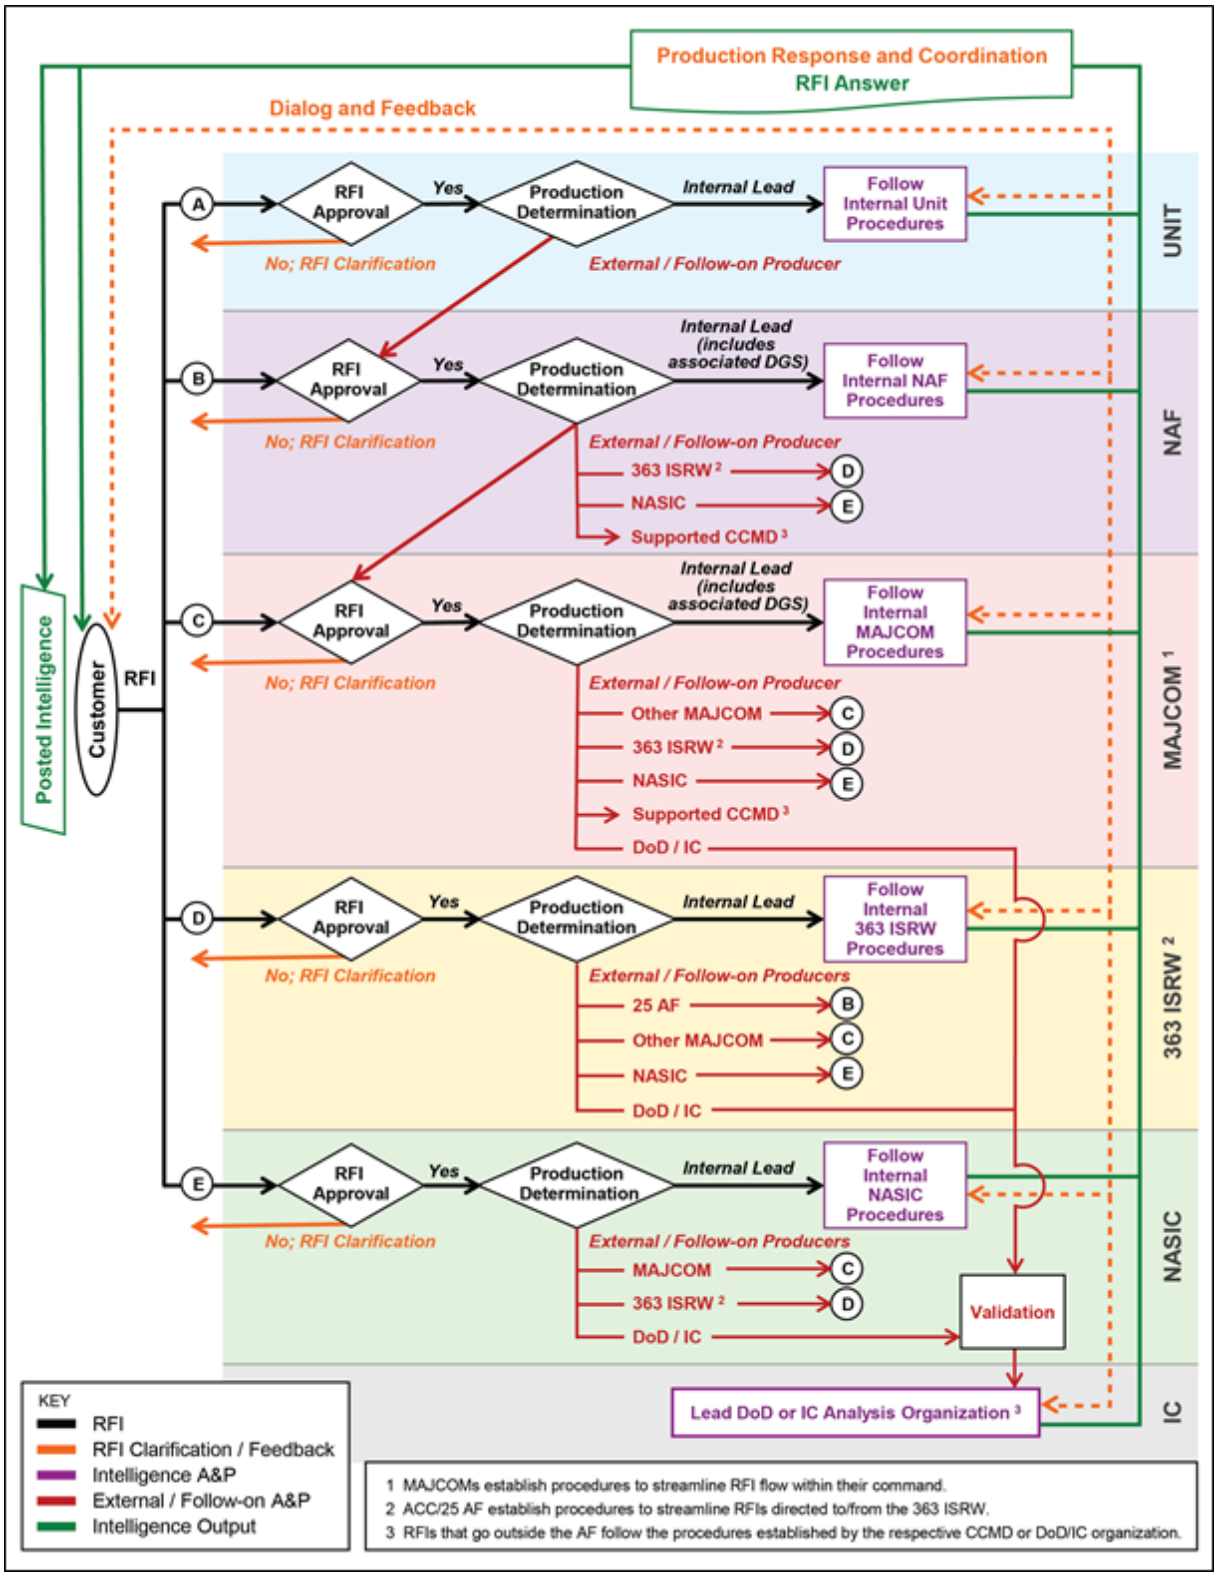

6.4. Acquisition Intelligence Production. Intelligence analysis and production are integral to the entire life cycle process of requirements definition, acquisition, and sustainment of weapon

systems. Acquisition customers require the production of specific threat assessments and potentially unique forms of data to support research, development, test and fielding of warfighting capabilities. Acquisition intelligence analysts support acquisition programs and initiatives by helping to identify and document intelligence dependencies (such as Intelligence Mission Data [IMD], modeling and simulation, etc.) that provide critical input to intelligence production efforts and the development of product/service requirements. As part of threat support to acquisition, NASIC and other service intelligence centers continually monitor and produce intelligence on adversary capabilities deemed critical to operational success for the developing capability. In partnership, acquisition intelligence specialists, operational command intelligence planners, and service intelligence center analysts provide direct support to acquisition decision processes, as defined in the *DIAP Users Guide* and DoD directives and instructions. These documents provide additional guidance for specific requirements and resourcing activities.

VERALINN JAMIESON, Lt Gen, USAF
Deputy Chief of Staff, Intelligence,
Surveillance, and Reconnaissance

Abbreviations and Acronyms

A/DNI—Assistant Director of National Intelligence

A&P—Analysis and Production

A2—Director of Intelligence

A2/AD—Anti-Access/Area Denial

ABI—Activity-Based Intelligence

ACC—Air Combat Command

ACIC—Army Counterintelligence Center

ACWG—Analysis Capability Working Group

AF—Air Force

AF NTI—Air Force National Tactical Integration

AFCO-CFA—Air Force Cryptologic Office Advanced Analysis & Training Branch

AFFOR—Air Force Forces

AFH—Air Force Handbook

AFI—Air Force Instruction

AFIAE—Air Force Intelligence Analysis Enterprise

AFISRAI—Air Force Intelligence, Surveillance, and Reconnaissance Agency Instruction

AFISRPoA—Air Force Intelligence, Surveillance, and Reconnaissance Program of Analysis

AFLCMC—Air Force Life Cycle Management Center

AFLLP—Air Force Lessons Learned Program

AFMAN—Air Force Manual

AFOSI—Air Force Office of Special Investigations

AFPD—Air Force Policy Directive

AFR—Air Force Reserve

AFRIMS—Air Force Records Information Management System

AFRL—Air Force Research Laboratory

AFSC—Air Force Specialty Code

AGILE—Advanced Global Intelligence Learning Environment

AIS—Air Intelligence Squadron

AMC—Air Mobility Command

AN—Anticipation

ANG—Air National Guard

AOC—Air Operations Center

AOR—Area of Responsibility

AS—Assessment

ASA—All-Source Analysis

BDA—Battle Damage Assessment

BOG—Board of Governors

Btn—Battalion

C-MAJCOM—Component MAJCOM

CAIAC—Civil Aviation Intelligence Analysis Center

CCIR—Commander's Critical Information Requirement

CCMD—Combatant Command

CCP—Consolidated Cryptologic Program

CFACC—Combined Forces Air Component Commander

CFETP—Career Field Education and Training Plan

CFLI—Core Function Lead Integrator

CGCIS—Coast Guard Counterintelligence Service

CGIS—Coast Guard Investigation Service

CIA—Central Intelligence Agency

CID—Criminal Investigation Command

CIP—Critical Intelligence Parameter

CMEIK—Center for Marine Expeditionary Intelligence Knowledge

CSA—Combat Support Agency

CTSAC—Critical Thinking and Structured Analysis Course

CY—Calender Year

CYBERCOM—Cyber Command

DART—Distributed Common Ground System Analysis and Reporting Team

DCGS—Distributed Common Ground System

DCS—Deputy Chief of Staff

DDII—Deputy Director of National Intelligence for Intelligence Integration

DE—Delivery

DEA—Drug Enforcement Agency

DHS—Department of Homeland Security

DI—Discovery

DIA—Defense Intelligence Agency

DIAAE—Defense Intelligence All-Source Analysis Enterprise

DIAD—DIA Directive

DIAI—DIA Instruction

DIAP—Defense Intelligence Analysis Program

DIRINT—Director of Intelligence

DNI—Director of National Intelligence

DoD—Department of Defense

DoDD—Department of Defense Directive

DoDI—Department of Defense Instruction

DoDM—Department of Defense Manual

DOE—Department of Energy

DOS—Department of State

DOTMLPF-P—Doctrine, Organization, Training, Materiel, Leadership and Education, Personnel, Facilities, and Policy

EEI—Essential Element of Information

EVE—Evaluation of Evidence

EX—Explanation

FAC—Framework for Analytic Cognition

FBI—Federal Bureau of Investigation

FFIR—Friendly Force Information Requirements

GDIP—General Defense Intelligence Program

GEOINT—Geospatial Intelligence

GIISR—Global Integrated Intelligence, Surveillance, and Reconnaissance

HPW—Human Performance Wing

HUMINT—Human Intelligence

IAW—In Accordance With

IC—Intelligence Community

ICAT-G—Intelligence Community Analytic Tradecraft Gateway

ICC—Intelligence Coordination Center

ICD—Intelligence Community Directive

ICS—Intelligence Community Standard

ID—Identification

IDIP—Integrated Defense Intelligence Priorities

IMD—Intelligence Mission Data

INSCOM—Intelligence and Security Command

INT—Intelligence

IRTPA—Intelligence Reform and Terrorism Prevention Act

ISR—Intelligence, Surveillance, and Reconnaissance

ISRD—Intelligence, Surveillance, and Reconnaissance Division

ISRW—Intelligence, Surveillance, and Reconnaissance Wing

ISSO—Intelligence Systems Support Office

JCA—Joint Capability Area

JCS—Joint Chiefs of Staff

JIDA—Joint Improvised-Threat Defeat Agency

JIOC—Joint Intelligence Operations Center

JIPOE—Joint Intelligence Preparation of the Operational Environment

JLLIS—Joint Lessons Learned Information System

JLLP—Joint Lessons Learned Program

JP—Joint Publication

JTF—Joint Task Force

JWICS—Joint Worldwide Intelligence Communications System

KIQ—Key Intelligence Question

LL—Lessons Learned

MAJCOM—Major Command

MASINT—Measurement and Signature Intelligence

MCIA—Marine Corps Intelligence Activity

Mgrs—Managers

MICF LANT—Maritime Intelligence Fusion Center Atlantic

MICF PAC—Maritime Intelligence Fusion Center Pacific

MICT—Management Internal Control Toolset

MIP—Military Intelligence Program

MOM—Motive, Opportunity and Means

MOSES—Manipulability of Sources

MQT—Mission Qualification Training

MSIC—Missile and Space Intelligence Center

NAF—Numbered Air Force

NAI2O—National Aviation Intelligence Integration Office

NASIC—National Air and Space Intelligence Center

NCIS—Naval Criminal Investigative Service

NCTC—National Counterterrorism Center

NGA—National Geospatial-Intelligence Agency

NGIC—National Ground Intelligence Center

NGP—National Geospatial-Intelligence Program

NIP—National Intelligence Program

NIPF—National Intelligence Priorities Framework

NIPRNet—Nonsecure Internet Protocol Router Network

NOFORN—Not Releaseable to Foreign Nationals

NRO—National Reconnaissance Office

NRT—Near-real-time

NSA—National Security Agency

NSC—National Security Council

NTI—National Tactical Integration

OBP—Object-Based Production

OCTANE—Online Critical Thinking and Analysis Environment

ODNI—Office of the Director of National Intelligence

ONI—Office of Naval Intelligence

OPR—Office of Primary Responsibility

OSINT—Open-Source Intelligence

OV-1—Operational Viewpoint-1

PACAF—Pacific Air Forces

PCPAD—Planning and Direction, Collection, Processing and Exploitation, Analysis and Production, Dissemination and Integration, Evaluation and Feedback

PED—Processing, Exploitation, and Dissemination

PIR—Priority Intelligence Requirement

PoA—Program of Analysis

POP—Past Opposition Practices

PPBE—Planning, Programming, Budgeting, and Execution

PR—Production Requirement

RDS—Records Disposition Schedule

RDT&E—Research, Development, Test, and Evaluation

RFI—Request for Information

RFS—Request for Support

RPA—Remotely Piloted Aircraft

RT—Real-time

SAC—Self-Assessment Communicator

SAINT—Scoped Activity-based Intelligence for Nodal Targeting

SAT—Structured Analytic Technique

SecDef—Secretary of Defense

SIGINT—Signals Intelligence

SIO—Senior Intelligence Officer

SIPRNet—SECRET Internet Protocol Router Network

SMC—Space and Missile Systems Center

SOC—Squadron Operations Center

SOM—Structured Observation Management

TRANSCOM—Transportation Command

TS/SCI—TOP SECRET/Sensitive Compartmented Information

TSA—Target System Analysis

TTPs—Tactics, Techniques, and Procedures

USA—U.S. Army

USAF—U.S. Air Force

USAFE-AFAFRICA—U.S. Air Forces in Europe & Air Forces Africa

USCG—U.S. Coast Guard

USD(I)—Under Secretary of Defense for Intelligence

USMC—U.S. Marine Corps

USN—U.S. Navy

Terms

Abductive Reasoning—The process of generating a novel hypothesis to explain given evidence that does not readily suggest a familiar explanation. Abductive reasoning starts from a set of accepted facts and creatively proposes their best explanation.

AF Intelligence Analysis Enterprise (AFIAE)—The global community of analyst Airmen and the AF ISR organizations that employ the core competency of intelligence analysis.

All-Source Analysis—Intelligence analysis that employs all available sources of data and information to enable the creation of new intelligence and knowledge.

Analysis Center—An organization with a predominant mission of all-source analysis. Analysis centers provide timely, accurate, and relevant intelligence analysis to support national and defense policymakers, warfighters, and the acquisition community.

Analysis Skill—A specific ability or collection of capabilities required to competently conduct analysis that is acquired through training and/or experience.

Analysis Tradecraft—An established or prescribed analysis technique, practice, or systematic process.

Analyst Airman—An AF ISR professional who is skilled and certified in tradecraft to perform the core competency of intelligence analysis.

Analytic Ombuds—Representative that is responsible for addressing organizational concerns regarding lack of objectivity, bias, politicization, or other concerns in the application of analysis and production standards.

Analytic Production Steward—Senior AF official designated to represent the analysis and production activities that their respective element is authorized to conduct, and to make determinations regarding the dissemination to or retrieval by authorized personnel of analysis produced by that activity.

Best Practice—A method or technique that has consistently shown results superior to those achieved with other means.

Big Data—A concept used to describe the explosion of available data as a result of the information environment.

Counterintelligence—Information gathered and activities conducted to identify, deceive, exploit, disrupt, or protect against espionage, other intelligence activities, sabotage, or assassinations conducted for or on behalf of foreign powers, organizations, or persons or their agents, or international terrorist organizations or activities.

Counterintelligence Analysis—The process of examining and evaluating information to determine the nature, function, interrelationships, personalities, and intent regarding the intelligence capabilities of a Foreign Intelligence Entity.

Covered Analytic Product—A subset of disseminated analytic products or services that is officially designated by the respective IC element as falling under the authority of ICD 206.

Critical Intelligence Parameter—A factor which clearly defines the threshold at which the performance of a foreign system/capability will likely compromise the program / mission effectiveness of the U.S. system.

Critical Thinking—The intellectually disciplined process of actively and skillfully conceptualizing, applying, analyzing, synthesizing, and/or evaluating information gathered from, or generated through observation, experience, reflection, reasoning, or communication, as a guide to belief and action.

Deductive Reasoning—Reasoning where a conclusion is a logical consequence of the premise. A deduction moves from general rules and some evidence to particular cases.

Defense Intelligence All-Source Analysis Enterprise (DIAAE)—The collective set of all DoD organizations that execute all-source analysis activities in production of defense intelligence.

Defense Intelligence All-Source Analysis Enterprise Board of Governors (DIAAE BOG)—A body comprised of representatives of the organizations of the DIAAE that provides a forum for issue identification and resolution; improving transparency and synchronization across the DIAAE; implementing DIAAE strategies and processes; providing support to the DoD Functional Manager for All-Source Analysis; and making resource recommendations based on changes to priorities and emerging requirements.

Essential Element of Information (EEI)—A specific information requirement that supports a more general Priority Intelligence Requirement (PIR).

Fusion Analysis (also called Time-Dominant Fusion)—Analysis in a time-sensitive environment in close proximity to the point of collection that entails quickly melding new information with baseline knowledge to meet a specific operational need. Emphasis is on the process of managing information and on timeliness over completeness.

Inductive Reasoning—The intellectual process of drawing generalizations on the basis of observations or other evidence. Induction takes place when one learns from experience.

Intelligence Analysis—A cognitive activity–both art and science–applying tools, processes, tradecraft, methods, and judgements to data and information to create and deliver new intelligence, insights, and knowledge, with the goal of providing a decision advantage to commanders and decision makers.

Intelligence Customer (also called Intelligence Consumer)—A requestor or user of intelligence, including an operational unit, an acquisition organization, a national policy maker, or an intelligence organization.

Intelligence Production—The development, tailoring, and presentation of intelligence knowledge via products and/or services that address customer requirements.

Intelligence Requirement—(also called Request for Information, Production Requirement, Request for Support, or Key Intelligence Question)—A need for intelligence to fill a gap in knowledge or understanding of the environment, adversary capabilities, centers of gravity, or intentions.

Intelligence Support Element—An AF intelligence organization at any echelon whose focus is on providing intelligence for AF planning, operation, or decisions.

ISR Activity—A task undertaken by a member of the ISR community that is associated with the accomplishment of an intelligence mission. An ISR Activity could result in one or more intelligence outputs. ISR Activities do not include tasks carried out by ISR personnel that are unrelated to a specific intelligence mission, such as security force augmentation, honor guard duty, professional military education, or physical training.

ISR Output—The result of an ISR Activity. An output is categorized as either an ISR product or an ISR service. Single or multiple outputs may derive from one activity, or one output could be derived from multiple Activities. All outputs relate directly or indirectly to the accomplishment of an intelligence mission.

ISR Product—A specific type of output from an ISR activity that consists of tangible information in written, visual, digital, and/or verbal form that conveys information of intelligence value (e.g., written assessment, threat map, and targeting materials) or facilitates the accomplishment of an intelligence mission (e.g., ISR program element code build, self-assessment checklist, or training folder).

ISR Service—A type of output from an ISR Activity. Assistance provided to another entity during the performance of an ISR mission: (1) the actual action of delivering or conveying intelligence to a user (e.g., presenting a briefing, tipping and cuing, collaboration, or threat modeling), or (2) the process of enabling an ISR mission (e.g., exercise planning, skill

knowledge training, or security clearance indoctrination). Some ISR Services result in additional ISR Products.

Key Intelligence Question—A strategic, high-level question that states the primary unknown, or information need, about an intelligence issue or problem, which subsequently drives intelligence analysis and/or production within an organization.

Lead/Designated Producer—The primary analysis and production organization responsible for integrating collaborative analysis with its own to provide a comprehensive and accurate intelligence product or service to a customer.

Lesson Learned—An observation that, when validated and resolved, results in an improvement in military operations or activities at the strategic, operational, or tactical level and in long-term, internalized change to an individual or an organization.

Multi-Source Analysis (also called Multi—INT Analysis)—Intelligence analysis that makes use of more than one source when access to additional potential sources is limited by reasons of timeliness, system access, location, or security levels.

Priority Intelligence Requirement (PIR)—A critical requirement that a commander and staff need to understand the adversary or operational environment to conduct the mission. A PIR is typically comprised of multiple, specific Essential Elements of Information (EEIs).

Production Response—An agreement between a lead/designated producer and a customer for the production of intelligence, containing sufficient detail to permit customer acceptance, rejection, or modification of the proposed intelligence output.

Service Intelligence Center—The analysis center designated for each military service. The AF has designated NASIC as the service intelligence center for the AF.

Single-Source Analysis (also called Exploitation)—Intelligence analysis that employs a single source or expertise in a functional area to characterize events, people, or things. Such analysis is limited to describing, rather than evaluating, the topic of a particular analysis due to restrictions inherent in single-source intelligence collection, precluding the ability to provide fully contextualized intelligence assessments.

Attachment 2

PRODUCT AND SERVICE LINES

A2.1. As Table A2.1, *Product and Service Line Categories*, illustrates, AF products and services are grouped into 14 product lines and 14 service lines, which can be further classified into four general categories: awareness; mission-specific; representation; and enabling. Sections A2.2 and A2.3 describe each product and service line.

Table A2.1. Product and Service Line Categories.

Category	Product Lines	Service Lines
Awareness	Intelligence Assessment Threat Study Intelligence Summary Intelligence Report Intelligence Alert	Analysis Situational Awareness Collaboration Intelligence Supportability Analysis
Mission Specific	Mission Document Targeting Document Requirement	Mission Operations Targeting Mission Readiness Operational Mission Training Requirements Management
Representation	Database Briefing Display Model	
Enabling	Policy, Plan or Program Mission Support Document	ISR Professional Training Policy, Planning, and Programming Force Management ISR Systems Security

Notes:
1. Some Product and Service Lines have similar labels. A good rule of thumb in distinguishing between them is that a Product Line is focused on a tangible output while a Service Line is focused on the action, process or function that results in the Product Line.
2. Product Lines include sanitized and releasable versions of products.
3. The scope, focus, and window of analysis decrease from Assessments to Alerts.
4. The Enabling category includes those products and services that indirectly contribute to substantive intelligence but, in and of themselves, do not have a primary purpose of

substantive intelligence.

A2.2. ISR Product Lines.

A2.2.1. **Intelligence Assessment** –Strategic, longer-term, analytical publication; focused on future capabilities and intentions; usually broad in military and/or political scope.

A2.2.2. **Threat Study** –Longer-term analysis that is more narrowly scoped than an assessment; usually focused on a threat system or category of threat systems; generally strategic or operational in scope.

A2.2.3. **Intelligence Summary** –Roll-up historical analysis of multiple events or missions; shorter timeframe than an assessment or a study (e.g., daily or weekly summary).

A2.2.4. **Intelligence Report** –Analysis from a single event or mission; includes results from a single-source intelligence collection; often associated with mission results; generally tactical or operational in scope.

A2.2.5. **Intelligence Alert** –High priority intelligence update with potential urgency and/or mission impact; usually focused on a singular threat or data point.

A2.2.6. **Database** –Systematically arranged collection of data, structured for convenient access and manipulation, generally in a computer.

A2.2.7. **Policy, Plan or Program** –Official ISR policy; guidance; plans; TTPs; research, development, test, and evaluation (RDT&E) efforts; agreements; and resourcing data, to include PPBE-related documentation.

A2.2.8. **Mission Document** –Text-based materials associated with conducting an ISR-specific mission or other air/space/cyber operational mission; does not include target materials.

A2.2.9. **Targeting Document** –Text-based analysis, reports, lists, or publications associated with targeting, weaponeering, or battle damage assessment (BDA); includes hard copy and soft copy formats; does not include target briefings or stand-alone target graphics.

A2.2.10. **Requirement** –A need for intelligence information, such as a request for information, a collection need, and essential mission information.

A2.2.11. **Mission Support Document** –Text-based materials that assist in the accomplishment of some enabling activities, such as training, exercises, conferences, security, and continuity.

A2.2.12. **Briefing** –Graphic-based presentation that is usually delivered verbally. Often times, a briefing is developed to visually summarize and verbally present the results of a text-based product (e.g., assessment, study, target document or mission support document). The most common form of a briefing is a Microsoft PowerPoint presentation.

A2.2.13. **Display** –Visual representation of analysis. Formats include maps, charts, videos, graphics, and diagrams. Displays are often incorporated into briefings or text-based products.

A2.2.14. **Model** –Physical representation of a threat or threat system or artificial representation of how a threat system will perform in actual operations.

A2.3. ISR Service Lines.

A2.3.1. **Analysis** –Services associated with the evaluation, interpretation, and often times integration of intelligence from available data sources and types. Includes the conduct of single-source, multi-source, and all-source analysis.

A2.3.2. **Mission Operations** –Services associated with the conduct of air/space/cyber operational missions, including ISR collection and processing, exploitation, and dissemination (PED) missions.

A2.3.3. **Situational Awareness** –Services provided to assist leadership and operators, including other ISR professionals, in comprehensively understanding the threat environment in which they are focused.

A2.3.4. **Intelligence Supportability Analysis** –The process by which intelligence, acquisition, and operations analysts identify, document and plan for requirements, needs, and supporting intelligence infrastructure necessary to successfully acquire and employ AF capabilities.

A2.3.5. **Targeting** –Services associated with the development of target materials, weaponeering, and BDA.

A2.3.6. **Mission Readiness** –Services that support the preparedness or capability of ISR or operational units to carry out their assigned missions.

A2.3.7. **ISR Professional Training** –Services involving the training and education of ISR personnel in ISR-related skills and tradecraft. Includes Mission Qualification Training (MQT) of ISR personnel.

A2.3.8. **Operational Mission Training** –Services associated with *threat-related* training of operational mission crews. Includes threat training for ISR personnel assigned to operational crews, such as cyber defense mission crews.

A2.3.9. **Requirements Management** –Services focused on managing ISR capability needs, requests for intelligence, and requests for assistance, forces, resources, or essential mission information.

A2.3.10. **Policy, Planning, and Programming** –Services involving the development of ISR policy, guidance, plans, TTPs, RDT&E efforts, agreements, and resource management, to include PPBE support.

A2.3.11. **Force Management** –Services associated with governing or guiding ISR manpower and personnel.

A2.3.12. **ISR Systems** –Services involving the establishment, accreditation, maintenance, and employment standards of ISR information technology systems.

A2.3.13. **Security** –Services associated with the protection, sanitization, and disclosure of classified information and with the establishment/maintenance of classified facilities.

A2.3.14. **Collaboration** –Services that explicitly facilitate the sharing of information both within and outside of the ISR community. While all Services involve "sharing information" to a certain extent, the Services in this Service Line are functions whose primary purpose is to share or exchange information.

Attachment 3

COMMON ANALYSIS LESSONS

A3.1. Table A3.1, *Common Analysis Lessons,* captures some of the general considerations broadly accepted across the AF ISR Enterprise and proven effective in improving analysis capabilities throughout time. Key sources for the lessons in this table include subject matter experts with extensive operational and tactical experience, various AF/A2 reviews of intelligence analysis, and a study by RAND Corporation. The table is organized by chapters in this handbook. The identification (ID) column refers to the AFH chapter associated with each lesson along with a unique alpha designator. To the right of the lessons are five columns that correspond to the five analysis activities: Discovery (DI), Assessment (AS), Explanation (EX), Anticipation (AN), and Delivery (DE). Those five columns indicate the primary (large, bold, upper-case X), secondary (standard, upper-case X), and tertiary (lower-case x) analysis activities associated with each lesson.

Table A3.1. Common Analysis Lessons.

ID	LESSON	ANALYSIS ACTIVITIES				
Chp 2	**AF Intelligence Analysis Enterprise (AFIAE)**	**DI**	**AS**	**EX**	**AN**	**DE**
2A	Increase your knowledge of different analytic and PED organizations to best understand AF ISR capabilities, enhance your network, and improve your tradecraft.	**X**	x	x		
2B	Be knowledgeable of air/space/cyber power strategy and theater objectives to help your assessment of developments.		**X**			
2C	Understand the larger context of the theater, problem set, or operation in which you are focused—applies to all analysts.	**X**				
2D	Check with area of responsibility (AOR) analysts to help collaborate your assessment of activities in that theater.		**X**
